THE ARCHITECTS' JOURNAL & Architectural Engineer

23343/7 Ref

It is our aim, our ambition, our aspiration even, to build our journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious art; for the disciplined ranks of a distinguished profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a iamb.

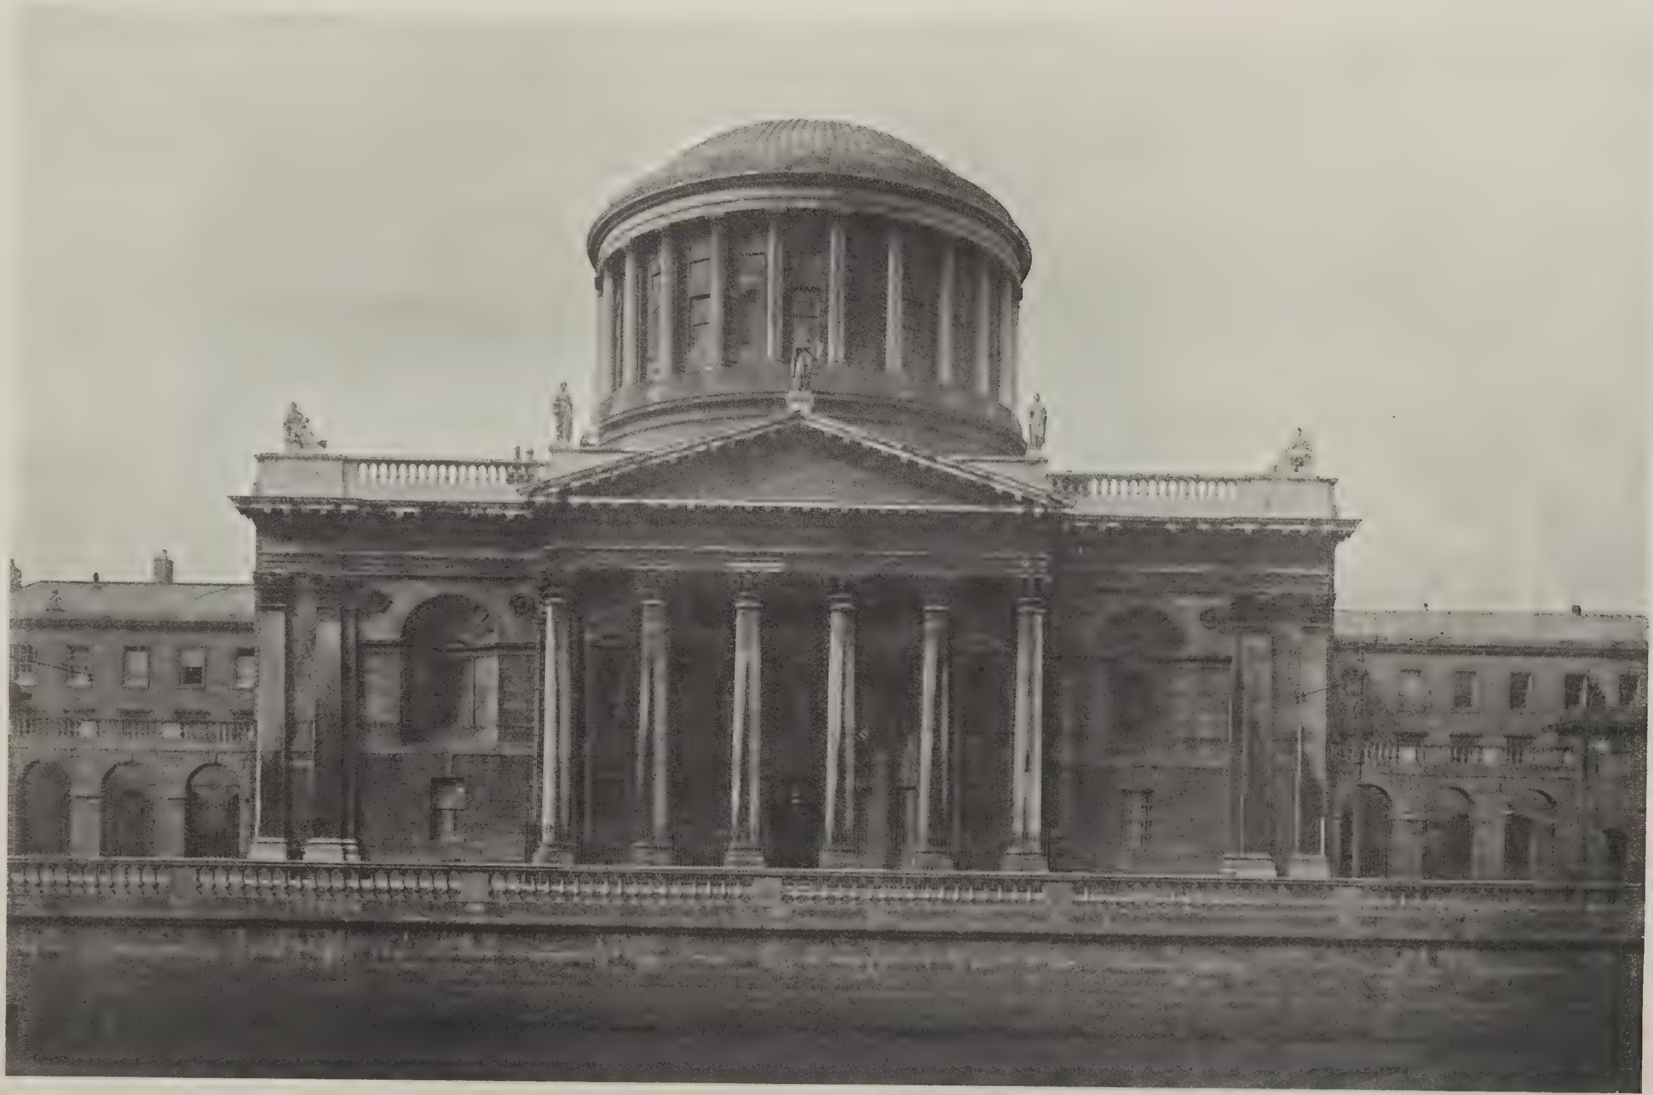
Architecture of the Eighteenth Century. 18.—The Four Courts, Dublin: River Front

Thomas Cooley, Architect



The Four Courts building (which was burnt out during the civil warfare which broke out last week in the Irish capital) was designed in 1776 by Thomas Cooley. It was completed by James Gandon, the architect of the Custom House—another building that has suffered extensively as a result of the unsettled conditions in Ireland.

The New Land Laws and the Building Industry

LAND-LAW reform has come at last, or is well on its way. It should give an immediate impetus to building. But does the architect, or does the builder, realize all that it means for him? Of course not; for it may turn out that the most important consequences are impossible to foresee, and will become apparent through experience of the working of the new law.

This new property law—the Birkenhead Act, as it has been promptly christened—has come upon us so suddenly and so noiselessly, if not altogether unexpectedly, that the architect and the builder, than whom nobody is more intimately concerned in its effects, have had but scanty opportunities of considering what the voluminous Act means to them in its professional and business aspects. They are, we think, in general agreement as to the salutary character in freeing the land from many impediments to its easy transference from vendor to purchaser, and by removing many anomalies of tenure.

Wonderful in the telling, land-law reform has come to us through the lawyers, who were always popularly regarded as its chief opponents. It were as ungracious as futile to speculate as to whether the lawyers have acted on the instinct that, reform being imminent and inevitable, it had better come voluntarily from within rather than compulsorily from without; but certainly the new law is peculiarly qualified to be considered lawyer-made, for Lord Birkenhead and the Solicitor-General, in drafting the property reforms Bill which when these lines were written awaited the Royal assent to become in a double sense "the law of the land," have had the assistance of the Honourable Society of Lincoln's Inn and of the Law Society.

On the face of it, this zeal for the simplification and consolidation of our complicated and lawyer-ridden property laws is an act of extraordinary self-abnegation. But lawyers have never been popularly credited with a reckless disregard for their own professional interests; and, in dealing on former occasions with this same question of the reform of our antiquated and almost prehistoric land laws, we have always held that what the various grades of conveyancers chance to lose on the roundabouts (a term of special significance where legal procedure is involved), they will certainly recover on the swings. That is to say, in simplified land transfer there will be quicker movement if less circumlocution.

It is hardly possible to secure drastic reform of any kind without disturbing vested interests; but as the Birkenhead Act is not to come into operation until 1925, those persons—and there is a large army of them—whose livelihood largely or entirely depends on conveyancing fees, stewardship, estate management, and the like, will have a fair amount of time in which to adjust themselves to the new conditions. For there can be no doubt that the new law will render obsolete many activities and much knowledge relating to hoary and complicated customs that will now disappear as an inevitable consequence of consolidating, revising, reforming the laws and abolishing many of the customs relating to the land.

Simplification being the primary object and the dominant keynote of the Bill, it was necessary above all things to unify the diverse systems of tenure—freehold, leasehold, and copyhold—and it was impossible to expect that so radical an operation could be entirely painless.

Already a bitter cry has gone up concerning the abolition of copyhold tenure, of which ancient system the doom was foreshadowed in the report issued by the Land Enquiry Committee in 1914. The first paragraph in their "Summary of Conclusions" pronounced copyhold to be "an inconvenient and irritating form of tenure which has long since outgrown its usefulness," and recommended in plain terms that "it should therefore be abolished immediately." This advice the promoters of the new Bill have taken to heart.

Sir G. A. Clayton East, however, deplores the effect of the abolition of copyhold. In this respect, he declares, the new law "imposes a cruel tax upon those persons who, like myself, are tenants on a copyhold property. We have paid our fines," he continues, "and the tenancy was a practical freehold during our lives. Now, whether we like it or not, we shall be compelled to purchase the freehold, which we do not want." He adds, with some causticity, "it is an admirable Bill for enriching lawyers." If that be so, the Bill simply follows well-established legal precedent; and it is to be feared that many worldly-wise persons, on observing a measure prepared by lawyers with the ostensible object of simplifying the law, will indulge certain philosophic doubts, suspecting "a catch somewhere."

Copyholders ought not to suffer hardship and loss from the abolition of this essentially feudal system of tenure. Sale under it was a clumsy enough process. "Should the tenant wish to sell his holding, he must follow the always cumbrous system of the manor. Instead of conveying directly to his purchaser, he first enters into a 'covenant to surrender' his holding to the lord; next he executes an actual surrender, and the lord then admits the purchaser to the holding as a tenant. A 'fine,' sometimes fixed, sometimes arbitrary, is payable to the lord on the transaction." When the holder dies his successor must pay the "fine." Sometimes the tenant must pay an annual "quit rent," in lieu of the services or supplies exacted by the old feudal lord; and some copyhold tenancies are subject to "heriots"—that is, when a tenant dies, the lord may claim his best chattel or beast; and if that beast happens to be a thoroughbred horse, or valuable bull, sheep, pig, coursing dog, its value may be—and has been known to be—greater than that of the holding on which it was bred or fed.

There are other quaint iniquities and anomalies of copyhold tenure: among them this—that a copyhold tenant may not cut down the timber on his holding, nor need he permit the lord to enter on his land to do it—a dog-in-the-manger arrangement that has given rise to many a Gilbertian situation. Nor has the tenant any mineral rights. They belong to the lord of the manor, who, however, may not dig for them without his tenant's permission. Under the new law such anomalies will cease; but there is some ground for Sir Gilbert Clayton's alarm about enfranchisement; for the copyholder must either relinquish, in 1925 or thereabouts, the holding which he had reason to suppose to be his for life—a privilege for which he had paid by the customary "fine," or he must be prepared to pay a further amount which will be calculated on an estimate of the "fines" that would accrue to the lord's estate on successive changes of tenancy, and on the estimated value of timber and mineral rights. In compensating the landlord and the steward for the loss of these and other rights and privileges, the small man may come nigh to financial ruin. The copyholder has a distinct grievance against the Bill.

As to leasehold tenures, these are not to be renewable for shorter terms than 2,000 years; and the additional rent to be exacted from the lessee in commutation of fines for renewal will be regarded by most holders as an unfair burden which is being imposed on them for the benefit of posterity. Leases now terminable by the death of the lessee are to be converted into leases for ninety years—a salutary change that will be beneficial to business in general and to the building industry in especial. It will be seen, indeed, that greater security of tenure, equally with simplification of transference, is a cardinal feature of the new law, which is less feudal than the old, and more equitable as between landlord and tenant. Greater security of tenure, less arbitrary power on the part of the landlord, will encourage tremendously the desire and the resolve to build, to repair, to improve, to decorate. The simplified law will be a sharp spur to enterprise. The shopkeeper, for instance, will be free from the haunting dread that any improvements or developments he may effect on his business premises will, on the expiration of his very short lease—three to six years, perhaps—add enormously to the cost of renewing that lease, whether he himself take it up or relinquish it to some possible rival in trade. Under the much longer term of enjoyment conferred by the new law, he will be able and anxious to spend money on building and decoration, from which the short-lease system had deterred him. Under the longer term many more theatres, cinemas, commercial premises, factories, workshops, warehouses, will spring into existence or be renovated or rebuilt.

Other aspects of the Birkenhead Law deal with such matters of importance in relation to buildings as easements, way-leaves, and rights of light; but consideration of these issues must be deferred to another occasion.

Town-planning and Fire Hazards

In matters of town-planning we English have been always absurdly happy-go-lucky. In the unusually large number of fires reported in the papers a few days ago our chronic weakness in this respect was emphasized in several instances. A fire occurred at the Metropolitan Railway power-generating sub-station in Moor Lane, Fore Street, in what is known as the City "danger zone." It was put out before the mischief could spread; but was it necessary to place an electricity generating station within the "danger zone" of a great city? And why should there be a "danger zone"? None would have grown up if, in the early days, the City had been properly town-planned; "the danger zone" came into existence before the need for town-planning had been realized. Then, from the report of a timber-yard fire at Redhill, it appears that the firemen "succeeded in confining the area of the fire, and prevented it from spreading to the gasworks and to premises in which were stored large quantities of petrol." Very courageous and clever of the firemen; but how comes it that the gasworks, the petrol store, and the timber-yard, are in proximity? Our municipal local authorities seem to need elementary lessons in town-planning—nay, in common sense. Will not the "Safety First" sages take them in hand? The burgesses who permit in such a town as Redhill the assemblage of gasworks, petrol stores, and timber-yards, should be put under restraint. In the account of the great fire at Pembroke Dock, which occurred at about the same time as the above-mentioned fires in London and at Redhill, it is grievous to read that some relics of wooden men-of-war, some figureheads captured by Nelson, some models of ships, and a number of valuable records, were all destroyed in the fire. That this interesting collection of combustibles was lodged in a moulding shop we cannot well believe; the reporter must have been misinformed.

Mr. Taft and Sulgrave Manor

Large numbers of American citizens kept Mr. Taft company on his visit to Sulgrave Manor last week-end. It was a proud day for "The Daily Telegraph," by whose efforts the home of George Washington's ancestors was purchased as a memorial to the Father of his Country and as a monument to the amity of the two great English-speaking nations. While the manor is more interesting historically than architecturally, it is, nevertheless, a typical specimen of its period and provenance. On that account it will be admired by the American visitors, who, however, would regard it with equal reverence if it had much less claim, or none at all, to any sort of architectural distinction. It was the ancestral home of the Washingtons, and that is enough to constitute it a shrine to which all good Americans must needs make pilgrimage before they recross the Atlantic *en voyage* for the Statue of Liberty. England is indeed honoured by the almost simultaneous visits of two such distinguished Americans as Mr. Taft and Mr. Thomas Hastings—a great statesman and a great architect; and considers herself indeed fortunate in being able to engage and to share their interest in such a monument to kinship and amity as Sulgrave Manor.

The Danger to Dublin Buildings

It is only too certain that some fine Dublin buildings will have suffered cruelly in the siege operations to which they have been subjected. The Four Courts, we know, is in ruins. According to the latest reports, repair is entirely out of the question: "Destruction," says a daily newspaper correspondent, "more terrible and complete it is hard to imagine. A few frail walls hang together, but they are shattered and shaken and may tumble at any moment . . . The interior of the building simply does not exist: it is burned away." It is devoutly to be hoped that no harm may befall the other noble buildings, Trinity College and the City Hall, for instance, in which, for so comparatively small a city, Dublin is—or was, it may be, alas!—singularly rich. Their quiet dignity is a silent reproach to the base uses to which they have been turned by the belligerents on both sides. The Courts were begun in 1776, from designs made by Thomas Cooley, who, however, died before the building was far advanced, and it is probable that in taking over the work Gandon did not vary it much, except in a few details. With the destruction, first, of the Custom House, and now the Four Courts, the work of Gandon has suffered heavily in Dublin.

The Alhambra in Decay

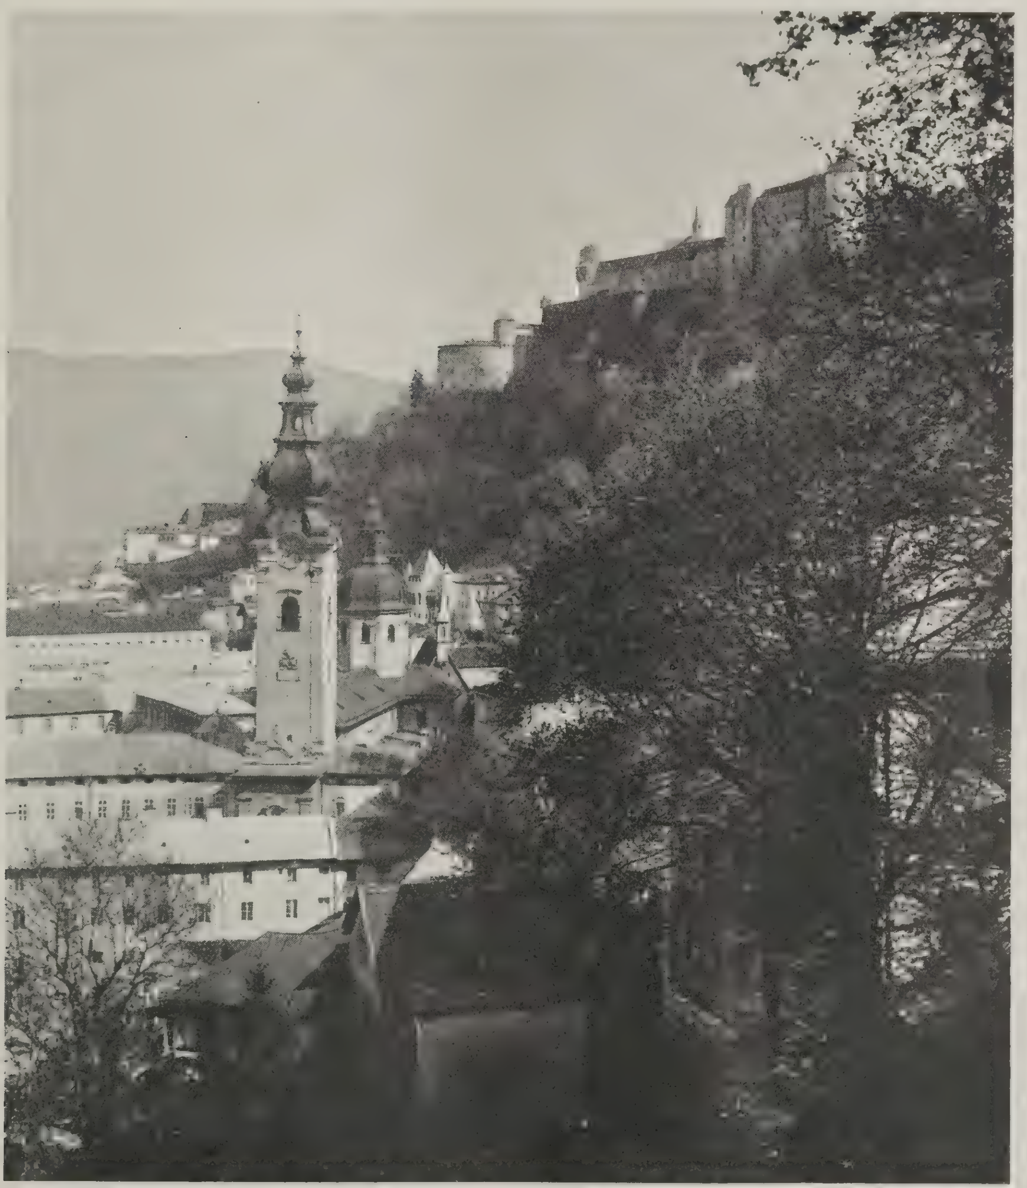
A writer in "The Times" having drawn attention to the neglect of the Alhambra, Granada, two correspondents of our contemporary confirm the lamentable report that parts of the Palace are being allowed to fall into "visible decay." The city is wealthy enough to afford the cost of repair, but it seems that there is a little difference of opinion as to how the repair should be done. Some would have it restored in Moorish style, and would, indeed, like "to get rid of every vestige of Renaissance building, and to restore the Palace to what it originally was before the arrival of Ferdinand and Isabella." Others think the Renaissance parts as beautiful as anything in the building. What is wanted, however, is, as Mr. J. B. Trend remarks, not restoration, but preservation. It is a pity there is any disagreement about it; for while the doctors are quarrelling the patient is perishing for want of a little timely attention—first aid, indeed, seems all that is necessary.

Salzburg

By H. J. BIRNSTINGL, A.R.I.B.A.

ON arrival at a strange town, especially at one about which there has been much pleasant anticipatory speculation, the mind, in its avidity to secure a quick impression, is apt to seize upon any evidence, such as may be afforded by the character of the streets or by a conspicuous building, and at once to assume it to be typical of the whole town. An impression so formed, however erroneous, is subsequently readjusted only with much difficulty. The mind is particularly liable to such a mistake in those towns which are dominated by one large building, so disposed upon an eminence as to be always visible, so that it appears to brood over the town, which is seen rather as a subsequent and dependent growth, as if men had consciously sought for inspiration or protection under its shadow. As, indeed, has so often happened. But whereas the town itself may, in the course of time, have undergone many ravages from fire or warfare, so that but little of its original fabric now remains, the presiding building maintains, to some extent, its ancient form, and so it is that any connection that may still exist between the two in the mind of the beholder is in its nature subjective rather than objective.

Such a town is Salzburg. Part hewn out of, and part built upon, high impregnable rocks, so that at times it seems more like a growth of nature than a building of man, is the old fortress; a vast and complicated structure which, despite additions and alterations of successive ages, still retains its mediæval character, a character that it seems to impart to the whole town, whose constant yet ever-changing background it is. This building, together with the confined position of the town in a narrow strip of the Salzach valley held by rocks and tree-covered hills, sufficiently excuses a quick impression of mediævalism: an impression which is slowly modified upon further acquaintance.

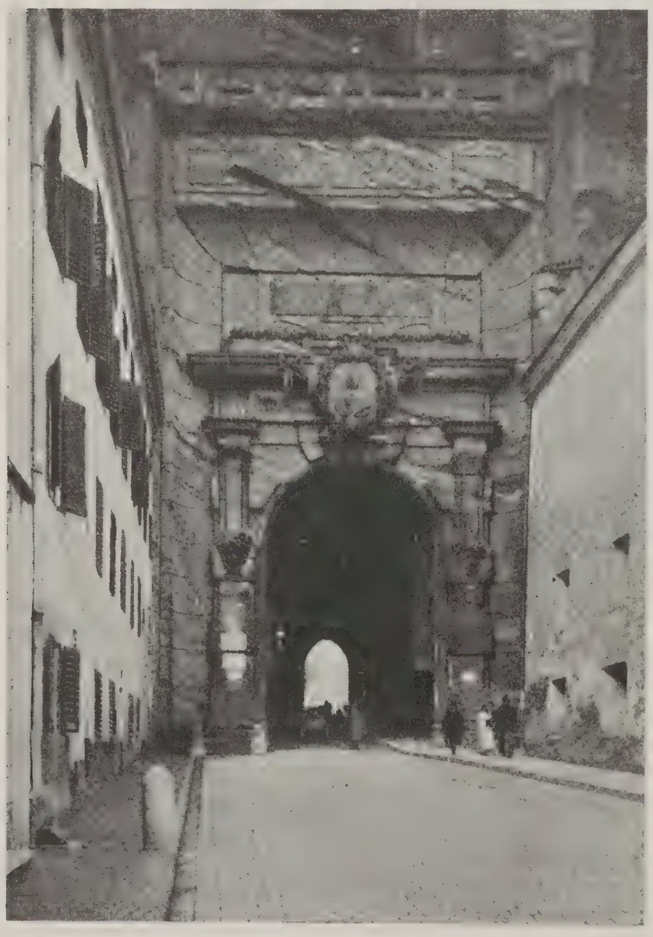


SALZBURG: SHOWING ST. PETER'S IN THE FOREGROUND, THE DOME OF THE CATHEDRAL, AND THE FORTIFICATIONS

It is soon apparent that the town, for the most part, is the work of the seventeenth and eighteenth centuries, and where the visitor expects to find narrow tortuous streets, revealing but a strip of sky between the overhanging upper parts of the houses, he is amazed at an arrangement of fine spacious squares flanked by churches and placid-fronted palaces, leading from one into the other up to the very base of the confining rocks. Fountains there are, too, and steps, so that he is slowly reminded of Italy, and more particularly Rome, except when he walks along the river, which evokes memories of the Lungarno. And there is ample justification for these thoughts, for the spirit of Italy has indeed been imparted by some of a succession of pleasure-loving and politically intriguing archbishops who for a thousand years lived in and dominated Salzburg, seeking to realize in their city some of the wonders that had amazed and delighted them on their pilgrimages to the papal throne. From this union of Latin and Teuton influences a particular charm emerges: a splendour modified by the simplicity of the North, and an austerity modified by the gaiety of the South.

Salzburg was the birthplace of Mozart, and this fact has more than the usual historical significance that attaches itself to the birthplaces of great men. The spirit of Mozart can be felt to-day, so that he has become as much a factor in moulding the city's character as the archbishops who moulded its form, albeit an influence less easy to define. For whereas, in his music, Mozart stands for the classical, for restraint, for pure form and economy of material, the contemporary architecture shows a superabundance of ornament, an utter disregard of classical form and idiom, which it distorts and degrades. Yet it is not without a certain coarse grace, a clumsy elegance; but the connection would appear to be primarily one of association. For Mozart has, in our minds, a particular eighteenth-century setting; a setting in which secular and ecclesiastical architecture are drawn closely together, for to both church and theatre the same abundance of decoration has been applied. And thus it is to-day: to assist at high mass is to witness a scene in which ornate figures move slowly to an accompaniment of a hidden orchestra and a choir of boys' voices, in a building profuse with twisted columns, with broken or inverted pediments, with figures of every conceivable scale, with huge cherubs seated on plaster clouds that break into the main entablature, with small cherubs swinging swags of fruit, with ceiling paintings from whose complicated perspectives emerge the heads of saints or the feet of apostles, with pulpits that look like opera boxes, and with altar-screens that look like triumphal arches. But that all this riot of ornamentation was spontaneous there can be no doubt. How else can we account for the treatment of the Franciscan Church, between the tall arches of whose beautiful Late Gothic chancel there has been added a series of erections looking like highly decorated eighteenth-century house-fronts, complete with balconies and glazed windows? These incongruous additions would seem to be a kind of overflow from the Residence Palace, which adjoins the church, and to which it is connected by an upper passage, so that by a quick transition the archbishops could pass from temporal seclusion to the supervision of spiritual duties, without too sharp a shock to their architectural susceptibilities. The Residence Palace still maintains its eighteenth-century splendour, and the visitor may pass through an endless succession of magnificent apartments in which both French and Italian influence is apparent. From other great palaces the glory of the past has vanished. One of them, euphoniously called the Palace Mirabell, was built by Archbishop Wolf Dietrich for the delight of his mistress, and still retains its elaborate marble staircase, upon the voluptuous curves of whose balustrade cherubs disport themselves; another has been taken over by the municipal authorities.

If proof were needed of the assertion that the eighteenth century was an architecture-loving age, it is afforded here in Salzburg, where there are more churches built within a short period than are to be met with in most other towns



NORTHERN ENTRANCE.

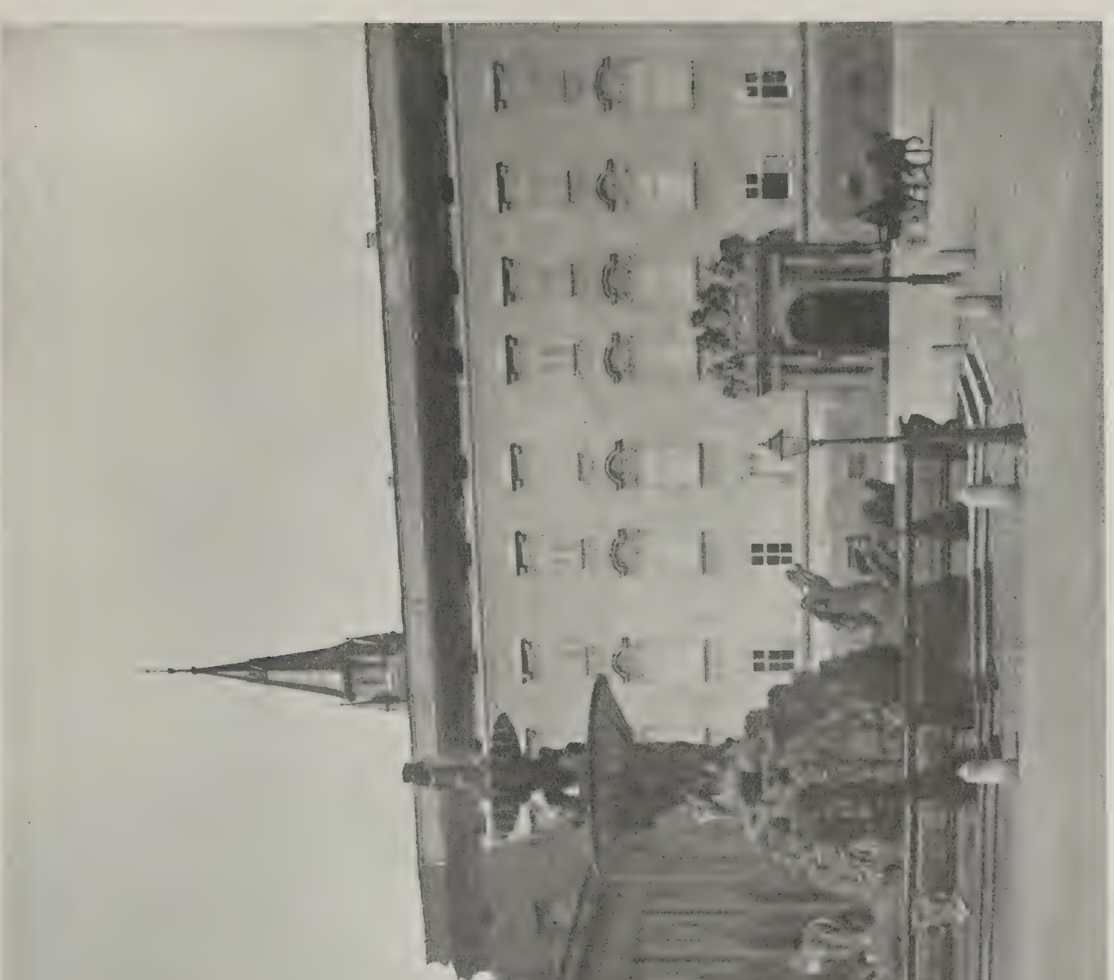
THE TUNNEL, SALZBURG.

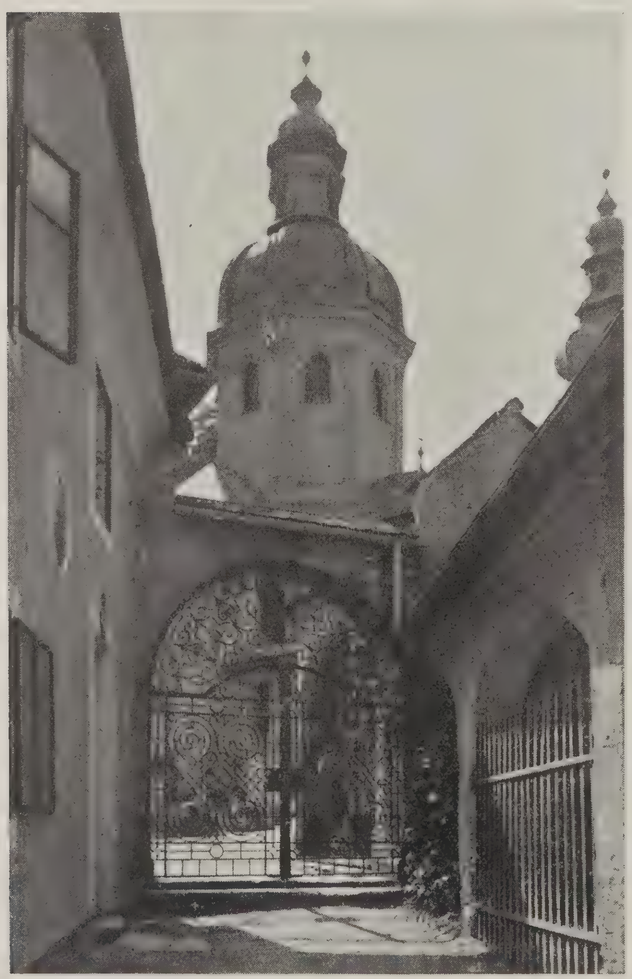


RESIDENZ PLATZ, SALZBURG.

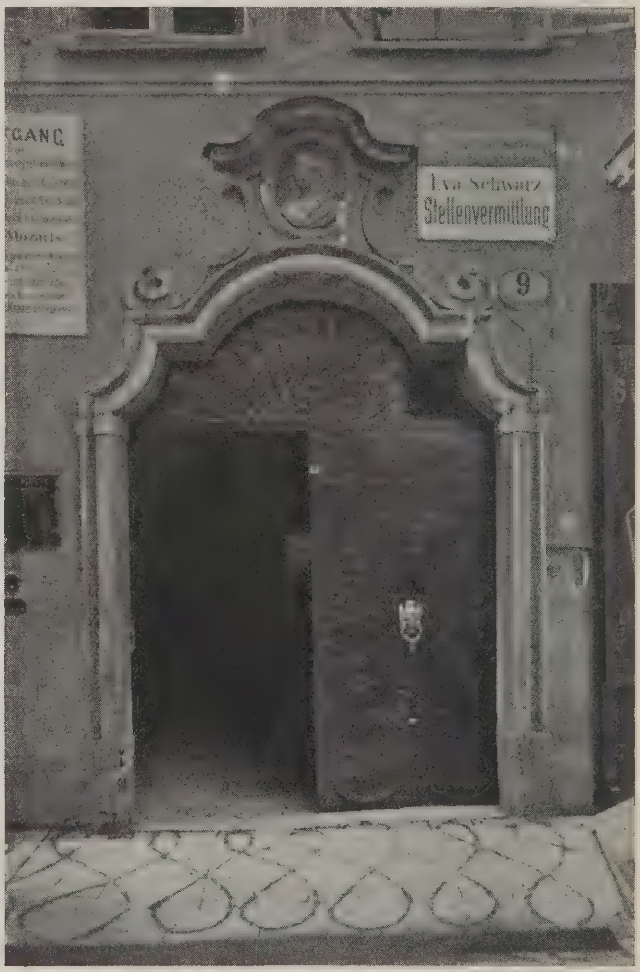
of like population. The Cathedral, built in the seventeenth century upon the site of its eighth-century predecessor, which was burned, so a rumour has it, by the then archbishop that he might have a grand new church in the fashionable classical style, is a vast, cold, and pompous building designed by Santino Solari and modelled, at the episcopal command, upon St. Peter's, of Rome. But lack of funds, the Thirty Years' War having seriously depleted the exchequer, necessitated sudden economies, so that only the western front shows the architect's original intentions. The Collegian Church has all the rich voluptuousness of the succeeding century, and St. Peter's is an orgy of febrile Rococo ornament grafted on to a Romanesque portal. St. Sebastian is a more delicate contemporary, in which is the grave of Paracelsus. But it was not only by means of ecclesiastical buildings that these archbishops sought to enrich their town. From visits to Rome they had learnt that a town may be beautified and the spirit refreshed by the sight of running water, and so an abundance of fountains was designed; the spirit of emulation going so far as to seek direct inspiration from the Fontana Trevi, which is here to be seen in miniature. Another, the work of Antonio Dario, is a bold composition of men and horses, such as the Italians love, hewn out of a mighty monolith..

It must not, however, be presumed that these churchmen were so devoid of inspiration that they must needs ever turn to Rome. One of them conceived the idea of hewing three tiers of galleries from the solid rock from which he might look down into a grass arena upon equestrian sport, and so that in winter he might not be denied this pleasure he built alondside a winter riding-school with sumptuously fitted marble mews. Another, Archbishop Sigismund, pierced the wall of rock with a tunnel, and so allowed the hitherto compressed town to expand southwards, hewing, as he did so, upon the solid faces of the breccia two fine architectural compositions around the arched openings.

Political intriguing and schemes for self-aggrandisement, of which the beautifying of their town was but an outward manifestation, did not, it would seem, occupy all the time and energies of this worldly line of prelates; and at Hellbrunn, about three miles outside the fortifications of Salzburg, Archbishop Marcus Settich built himself a summer palace. Here, between two tree-capped knolls in the middle of the fertile Salzach valley, which stretches like a riband of luminous green between the purple and sepia tones of the mountains streaked with snow and with the sinister shades of firs and pines, he laid out pleasure grounds which combine with the formality of the French gardens the romance of the Italian. But the particular spirit of the age, which was one that loved graceful pleasures, and of the country, which is one that loves simple toys, projected itself, for the delectation of the archiepiscopal humour, into a series of fountains and water toys. Here native craftsmanship, which excels in the execution of painted wooden figures—the plentiful supply of soft wood providing an industry whose wares still fill the toy shops of the world—aided by foreign ingenuity, has produced a series of mechanical toys whose motive power is running water. Flanking a formal avenue the visitor is surprised to find sheltered amongst the thick green foliage a row of minute grottoes, each enshrining a little set-piece which springs to life and performs a series of angular convolutions. In the choice of the subjects a fine eclecticism has been displayed, classical myth and local activities alike supplying the subject; thus side by side Perseus rescues Andromeda, and the potter turns his wheel. But the masterpiece of the collection is a theatre

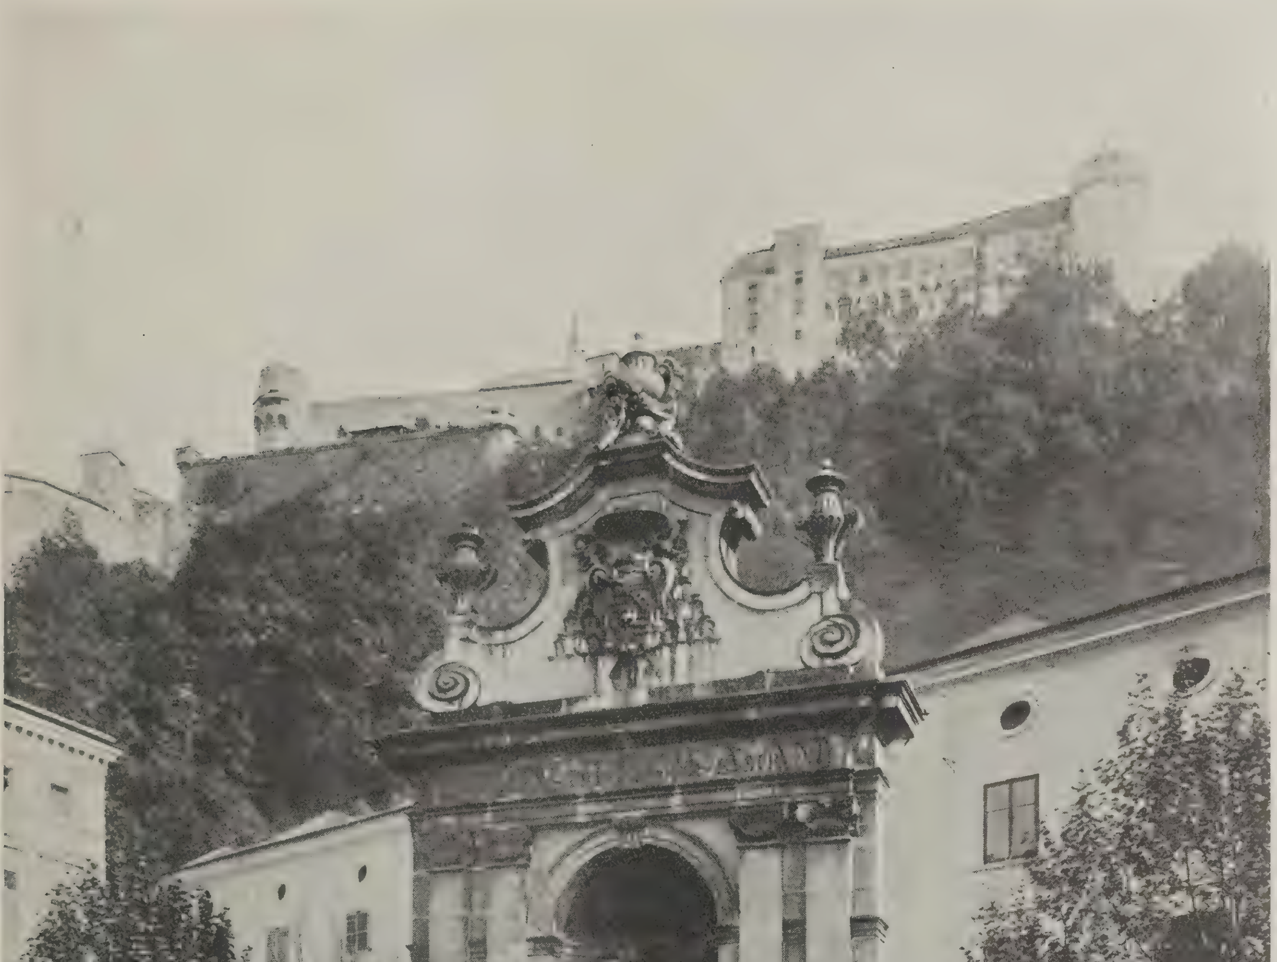


THE CATHEDRAL FROM ST. PETER'S CEMETERY,
SALZBURG



AN EIGHTEENTH-CENTURY DOORWAY,
SALZBURG

The Neptune Fountain, Dom Platz, Salzburg



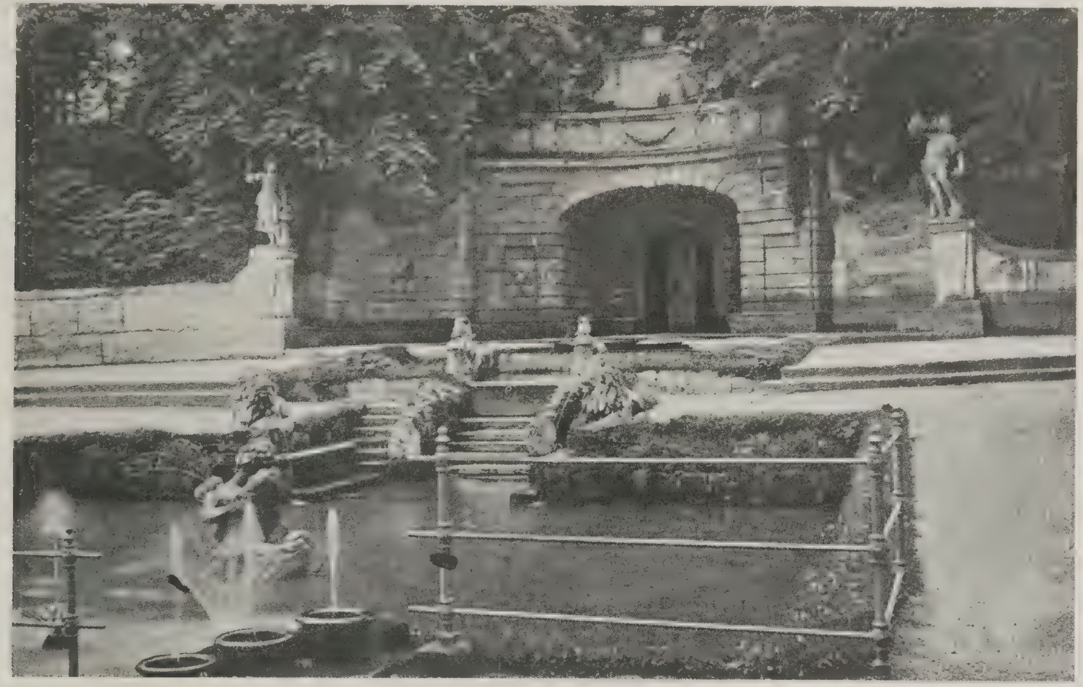
Salzburg, a picturesque town of Austria, adjoining Bavaria and the Tyrol, is built against high impregnable rocks. It contains a wealth of eighteenth-century architecture, whose distinctive character is well shown in this view of the Neptune Fountain. The fortifications are seen in the background.

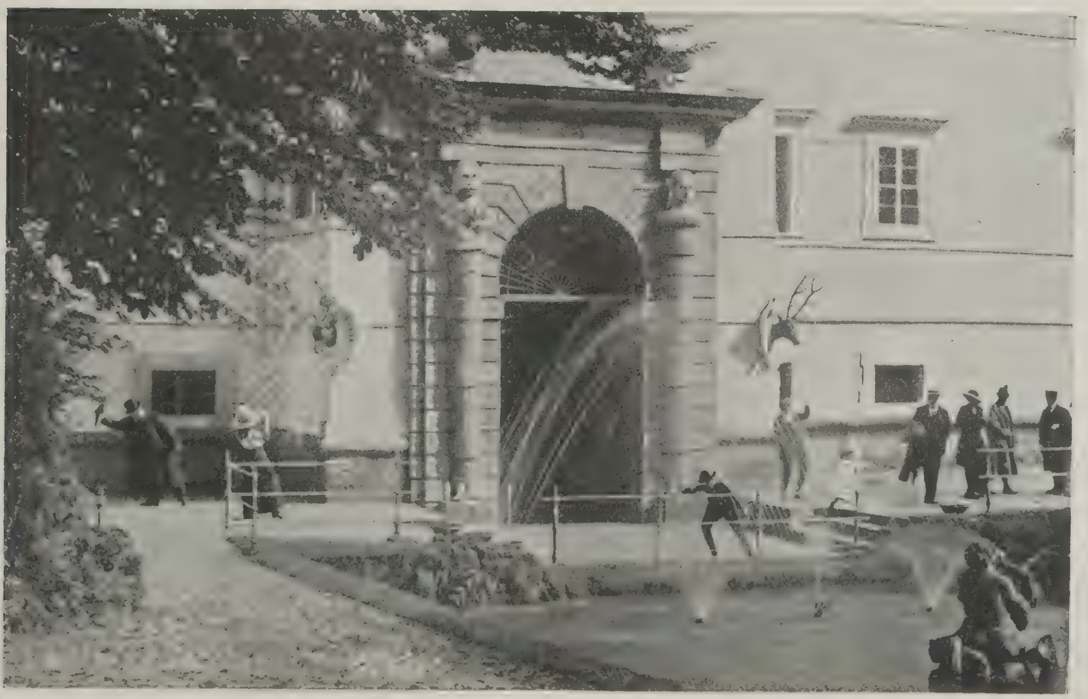
THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

set with hundreds of figures, which, upon the turning on of a tap, are all set in motion to a subdued organ accompaniment. In the square of a busy town every kind of activity and occupation is animately shown: the performing bear, and the itinerant dancer; the barber shaving his customer; the bootmaker, the smith, and the baker; the fine lady and her attendants; the politician addressing a crowd from a central monument; the quack doctor, the lawyer, and the beggar; while on one house which is in course of construction the entire hierarchy of the building trade is seen at its labours. (See page 12.)

The fountains themselves, some of which display an inventive ingenuity, as when a crown is slowly raised and lowered on a jet of water, or when a sheet of water encircles, without moistening, a freshly gathered bunch of flowers, often show a certain vein of practical humour, so that an unconventional welcome might easily have been prepared for any unsuspecting visitor. Water is made to spurt from the ground or from the horns of antelope, or artificial rain descends in torrents from the ceiling of a grotto. To those now reconciled to the harsh bargain by which leisure is sacrificed to speed, these amusements may seem fatuous and scarcely worthy of the high dignitary of the Church at whose command they were devised.

But nothing which assists in an understanding of the spirit of a past age is to be despised, even by those whose minds are now attuned to other things. And these toys, with their innocent childlike simplicity, afforded a rich contrast in leisure hours to brains wearied with politics and intrigue, and to minds burdened with a constant administration of spiritual matters, and they indicate to us something of the mentality of those to whom they yielded a brief relief. The palace itself, in which a small and insignificant chapel seems to confirm an impression that here at least an indulgence in temporal pleasures is of more importance than attention to religious duties, is not of much architectural value. Its mural decorations by Mascagni are examples of that skilful perspective with

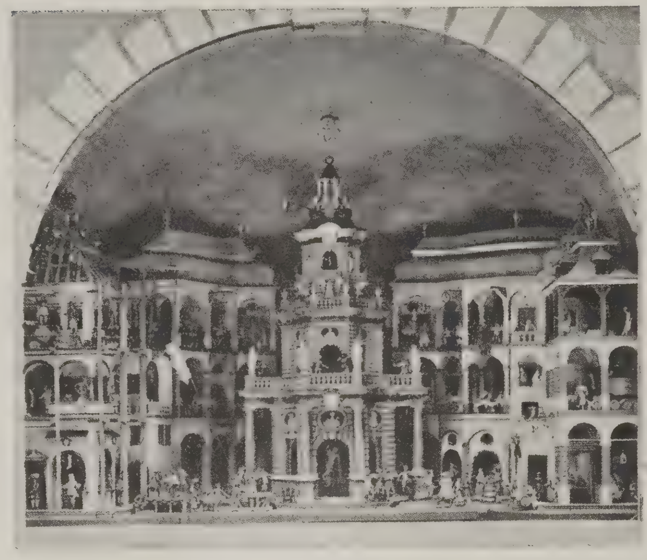




GROTTO AND FOUNTAINS, HELLBRUN CASTLE.

which the walls and ceilings of so many contemporary buildings, both ecclesiastical and secular, are covered.

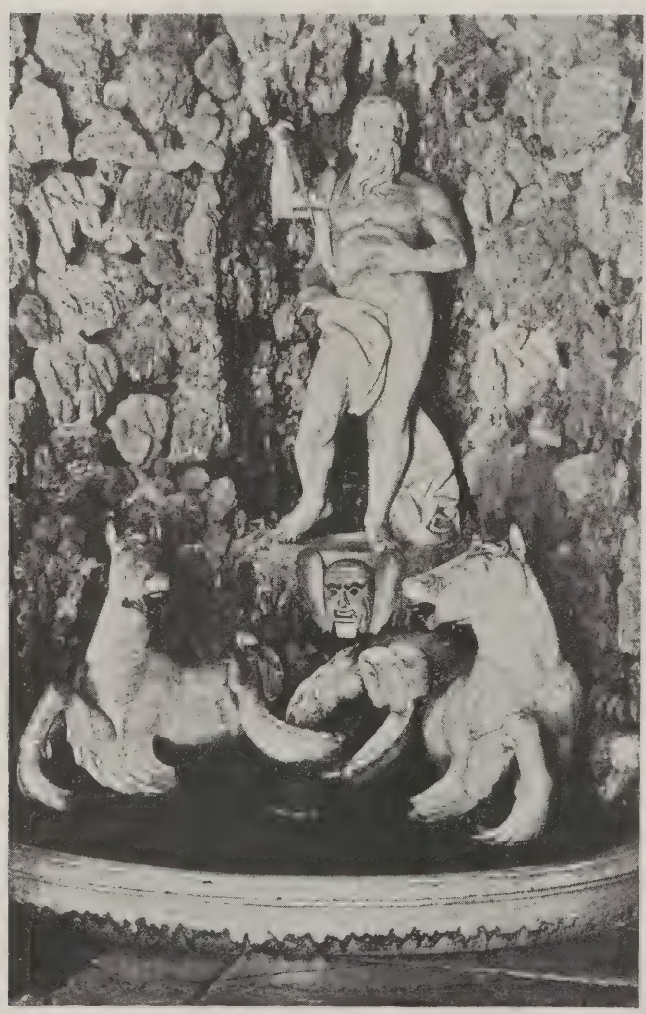
A popular manifestation of this love of simple objects is to be seen in the many brightly coloured wooden figures that abound in churches and in the wayside shrines, and of simple amusements in such devices as a set of mechanical chimes and a mechanical organ, which, thrice daily, like huge music-boxes, lisp faltering tunes to a spellbound multitude. The fact that these inventions were built from public funds as recently as in the middle of last century shows that something of the spirit that animated the archbishops at Hellbrun is still surviving to-day.



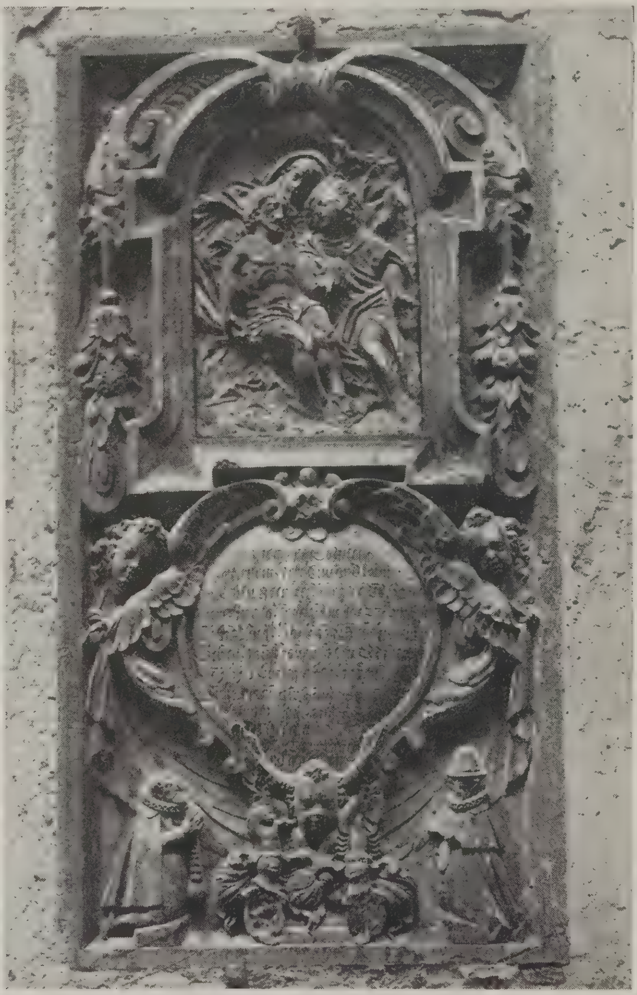
THE MECHANICAL THEATRE, HELLBRUN CASTLE.

In earlier centuries, when the activities of the Church and her ministers were more obviously militant, the dominating fortress of Hohensalzburg, which dates from the twelfth century, was the archiepiscopal dwelling. And gradually a veritable township grew up behind the three ranges of encircling fortifications, which guaranteed immunity from the fiercest attacks. The succeeding centuries saw many additions to the structure, and in the Late Gothic state apartments the rich polychromatic effects of the period have been preserved. The present church, appropriately dedicated to St. George, which stands in the innermost court of the fortress, was built by Archbishop Leonhard at the beginning of the sixteenth century, and on one of the exterior walls of the church he is seen in marble relief, fully robed and with his arm extended in an act of benediction. Despite the presence of a ubiquitous restaurant on one of the walls, and a total negation of the castle's erstwhile defensive isolation by its present connection with the town by an unobtrusive cable railway, the fortification still affords a rare opportunity for those bent on studying the architecture, defences, or habits of the middle centuries.

On the northern side of the river the confining hill is of a gentler configuration, whose natural roundness is further softened by a wood of beech-trees, the young leaves of which in springtime transmute the sunlight into a bright pellucid green. Perhaps it is this fact, coupled with its unsuitability for defensive purposes, that caused its dedication to less vigorous pursuits. An arched doorway from the street below leads to a long flight of steps which, flanked by life-sized groups of plaster figures in fourteen shrines representing the stations of the cross, forms a veritable Calvary, at the head of which, behind the crucifixion, there

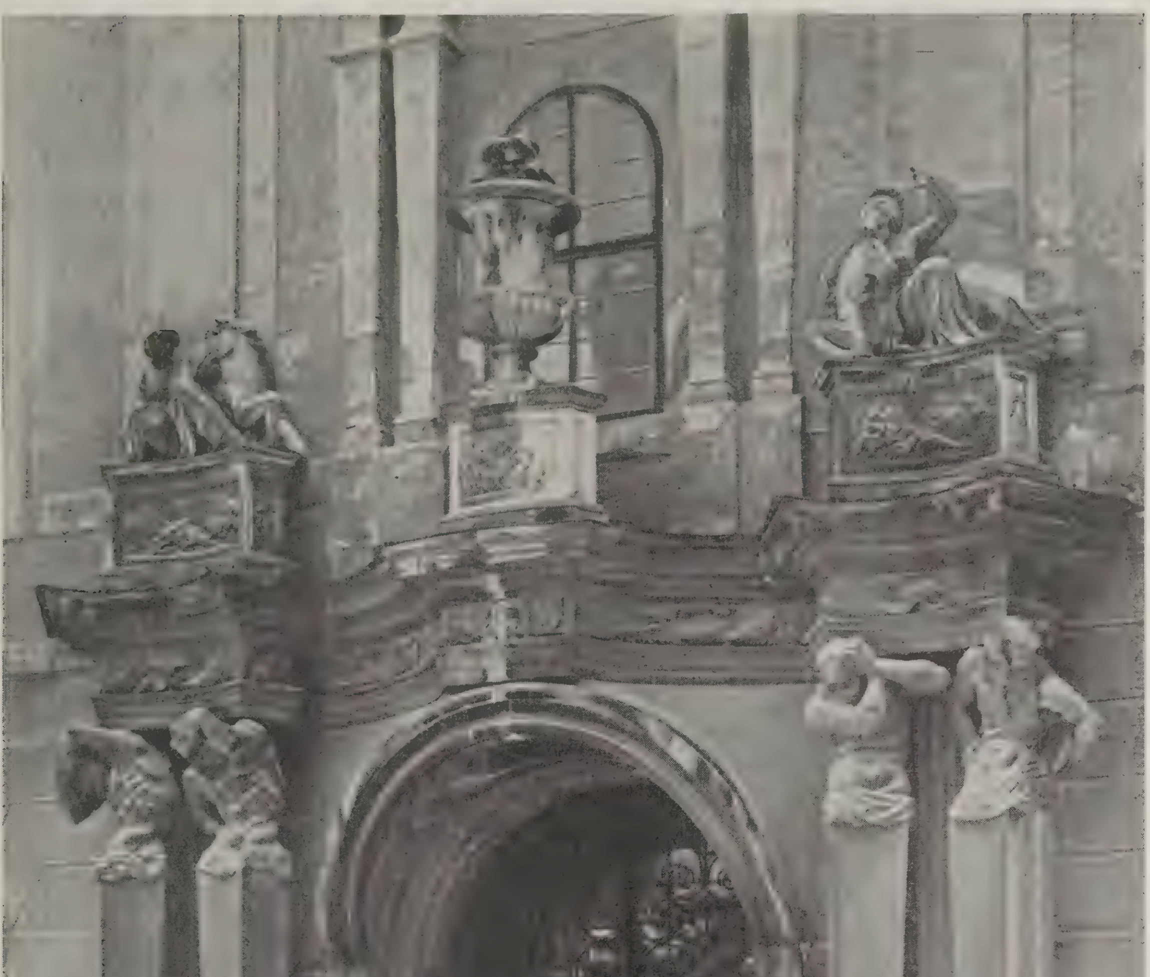


NEPTUNE FOUNTAIN, HELLBRUN CASTLE



A SIXTEENTH-CENTURY TOMBSTONE, ST. PETER'S CEMETERY, SALZBURG.

A Typical Baroque Doorway, Salzburg.



Salzburg has its due quota of Baroque work. The above doorway lacks nothing of the grace of contour and fluency of line that are commonly associated with the style in its highest development in rather more famous cities of Central Europe.

UNIVERSITY OF ILLINOIS

stands a Capucine monastery. Also on this hill there has been re-erected the little wooden summer-house in which Mozart composed "The Magic Flute."

Within the ancient boundaries of the town the nineteenth and twentieth centuries have scarcely made their mark, and the only notable addition, which owes its existence to an earlier influence, is the Mozarteum, an institute endowed by lovers of music whose nationality is in no way restricted to that of their patron. The building was completed in 1914, and it is a fine example of modern German architecture. It is simple and dignified, free from an everlasting enslavement to the orders, and purged of the aggressive spirit of the earlier work of this century. Yet, despite its modernity, from it there emanates something of the eighteenth-century tradition; something Mozartian. This is particularly noticeable in the smaller concert hall, which is decorated with large bolection-moulded irregular-shaped panels, in a scheme of gold and white and cream, with expanses of pale mauve and green. It is, in its secession from a cold classical restraint, somewhat reminiscent of that architectural gaiety that constituted the background for Mozart's activities, and the simple boldness of the mouldings and the fresh brightness of the colours seem to be indigenous to a wood-carving country and the counterpart of its abundant painted and gilded figures. In it the traditions of the past press forward into a strong and vital modernity, and the test is its complete harmony with surroundings so richly laden with far-reaching historical associations. In Salzburg, indeed, succeeding centuries had added to, but never disturbed, the city's charm, and there are few incongruities. Even the announcement on the label of a beer bottle that the brewery was founded in 1380, or over the door of a chemist that his business—now represented by a precise array of bottles and medicines—is directly descended from a fifteenth-century predecessor, whose concerns, it may be presumed, were rather with the transmutation of metals and the discovery of the elixir of life than with the sale of prophylactics, constitutes a sentient thread, trailing away into the past, that is not without its value to the imaginative traveller.

Presentation of the Royal Gold Medal to Mr. Thomas Hastings

As an observer of the presentation, at the R.I.B.A., of the Royal Gold Medal to Mr. Thomas Hastings, I was deeply conscious of a quiet and simple quality of the dramatic in the proceedings. It would have been difficult to escape it, or lose its significance. One of the greatest honours in the artistic professions was about to be conferred on a man of international repute, and not only were there present the great men that we have in and around our profession, but the character and personality of Mr. Thomas Hastings himself is such that it immediately commanded one's attention and admiration. I am old-fashioned enough to expect a great man to look great, and Mr. Thomas Hastings did not disappoint. One knew of what he was capable by what he has done. But one likes to see the man from whence it all comes, and be satisfied.

One was first of all impressed by the clear-cut quality of the jaw and especially the turn of the underlip, then the immense forehead, then the eyes. He has energy; he has strength; he has firmness and decision; one could see that, and from his eyes one could see that he is sensitive and humorous.

Mr. Paul Waterhouse's finely constructed address was impressive and very sincere, for in the fullest beauty of our mother tongue he said what all those present would have said.

"In the name, Mr. Hastings, of our Gracious King, and as the spokesman of my brother architects of England, I transfer to you the greatest testimony we have to offer, and in doing so I thank you and your colleagues in America for the encouragement you give to our ancient art, and congratulate you with the warmest cordiality on the fact that your line of thought, your line of work, and your spirit of achievement are the very spirit, work, and thought that have for centuries bound into a timeless brotherhood the architects of Europe."

A simple and impressive scene, and no one was more sensible of it than Mr. Hastings. If we are to allow emotion to come into our professional life then surely this was the moment.

Mr. Hastings's reply to the address of Mr. Waterhouse, which was published last week, is given below. It is worth reading again and again. In it, one feels that he has summed up a great deal of his life's experience. He has discovered, as we all shall discover eventually, that Truth and Beauty are one.

"Truth is Beauty, and Beauty Truth. That is all ye know on earth, And all ye need to know."

The artistic interpretation of a problem is in fact the practical one. But the so-called Practical man is a danger to civilization.

Was it not Napoleon who said "A practical man is a man with one eye and a bag of tools"?

F. E. T.

Mr. Hastings's Reply.

Mr. Hastings thanked the Royal Institute not only for the great honour which had just been conferred upon him, but also for the fact that he had lately been admitted among them as a member. He said that while Americans had inherited the English language, and, consequently, had no right to complain, he must confess that on that occasion he found the English vocabulary quite inadequate—there were no words to express his grateful appreciation of the honour which His Gracious Majesty the King had conferred upon him. Realizing that it was prompted by the action of that time-honoured Institution, he would like to feel that it was in recognition of such services as the profession in his country had rendered in the interest of contemporaneous architectural education. In all sincerity he would rather believe that by example he had, in some way, influenced others in the right direction than to be conscious of individual success, or feel that what he had done were worthy of their commendation.

As they knew, he believed they should return to follow and respect the tradition which obtained before the present modern confusion, that they should be careful of the direction in which they worked, and thoughtful of their influence upon future generations. While the question of modernity was most important, it was, after all, the true inborn sense of beauty which assured the architect his success. Goethe said: "The Beautiful is a manifestation of secret laws of nature, which, but for this appearance, had been for ever concealed from us."

The layman, too frequently, only superficially understood beauty in defining its attributes, as though it were a mere appeal to the emotions, a pleasure-giving luxury, or a refining influence. It was rather an organic vital provision of nature, manifestly a part of the order of the universe—divinely ordained for the specific purpose of promoting permanency in all things, and giving life and enthusiasm wherever it might find its resting-place. It was, indeed, a force in life capable of stimulating the noblest endeavour, and capable of making virtue appeal to the senses, and making truth endure.

Nowhere was that so vividly illustrated as when they considered architectural design. The practising architect, if he continued, as he should, to be a draughtsman all his life, must realize that beauty of design and line build well in construction, and with greater economy and endurance than construction which was mere engineering. All form and all design were the natural and legitimate outcome of the nature or purpose of the object to be made. The practical and the artistic were inseparable. There was beauty in nature because all nature was a practical problem well solved. The truly educated architect would never sacrifice the practical side of his problem. Some of the greatest economic as well as architectural calamities had been executed by so-called practical men with an experience mostly bad, and with no education.

The science of modern engineering had too frequently divorced the architect from many of the larger and more interesting so-called utilitarian problems of construction. Some of them were entirely and legitimately architectural problems, while in other cases the architect should collaborate with the engineer. There might be no question of decoration or ornament involved, but architecture and practically all construction should be inseparable. An earnest appeal should be made for that collaboration, not merely in the interest of beauty, but rather in the interest of economy—beauty would follow in its natural sequence.

In the first years of his architectural career he was accused by his fellow-countrymen of attaching too much importance to the artistic study of the floor plan; it was constantly asserted that he was trying to inculcate the Paris Beaux-Arts methods of education into their American architectural practice, his critics not realizing that those methods of study in plan had been adhered to at all times since the beginning of architecture.

They little realized that if the floor plan, determining two of the three dimensions in space, was well studied, beautiful in proportions, with a proper distribution of piers, thickness of walls, logically disposed and with good circulation, there would be no structural difficulties, and that that principle had obtained ever since the dawn of architectural history. The plan lent itself to thinking in three dimensions. When the plan looked well it built well, constructed well, so that they found they needed very little of the analytical mathematics to assist them, excepting as a mere matter of verification. Until modern times, architects knew but little about analytical mathematics as compared with what they were now given to learn, but they knew their stereotomy better than most of them did to-day. They knew but little about the strength of materials, but they understood constructive principles; for, after all, analytical mathematics was a comparatively modern science. While there existed graphical rules for the approximate determination of the thrusts from arches as early as the thirteenth century, yet it was practically only within the last century that the correct principles of constructive analysis had been fully developed.

If an arch or a bridge looked well it would build well, when it was the outcome of a well-studied plan. There must have occurred many serious calamities in the past because of bad art and no analytical means of verification; but, just as nature was beautiful when fit to survive, so the great buildings and monuments of the past that had survived were beautiful in plan, form, and proportion. He believed that buildings had stood for centuries solely because their plans, as seen on paper, were so thoroughly artistic and beautiful. They were told that the cell of the bee was built at that angle which gave the most strength with the least wax, so that the line of beauty was the result of perfect economy. Emerson realized the truth when he said it was a rule of largest application, true in a plant, true in a loaf of bread, that in the construction of any fabric or organism any real increase of fitness to its end was an increase of beauty.

They Americans too little realized that they really came to Europe in a large measure because of what man had done with art to beautify nature. As music was more beautiful than any merely natural sound, so Nature was generally either greatly enhanced by the human interest when man had made his impress upon it, or it was cruelly and unnecessarily sacrificed.

Art and a proper artistic sense of the fitness of things completed the picture. When far away from civilization, surrounded by primeval nature, a man, if in his normal state of mind, soon longed for the warmth and colour of fertile fields, the thrift of farms; he thought of forests interwoven by winding roads or vistas intelligently conceived. The pageantry of sea and sky, the starlit night, the rugged mountains or deep crevices, the bewildering beauty of the flowers, could never awaken the same human emotions and sympathy as when, with art, they were made more beautiful, wedded to weather-beaten walls, the castle or the shrine, or the distant romantic village nestled in the crevice or perched on the mountain-side.

He had said that he believed it to be a law of the universe that the forms of life that were fittest to survive—indeed, the very universe itself—were beautiful in form and colour, and that nature's selections were beautifully expressed. Ugliness, deformity, and self-indulgence were synonymous. And so it was in every economy of life; what would survive must be beautifully expressed.

It was equally true that one trained in the understanding of beauty could more profoundly fathom the laws of nature than one who had neglected to develop that side of his education. Indeed, if the way of the artist was undertaken with philosophy and humility, the things that were divine, God in the universe, would be believed, be more clearly revealed to him, more impressively, more convincingly, than when approached by way of theological discussion or scientific research. The horizon of his vision contained more, within a larger circle, with visions of things more ennobling, more uplifting.

Truth or precept, as well as fiction, would only penetrate the human heart and demand respect and obedience when clothed in beauty. The proverbs, the bywords of the ages, were only familiar truths beautifully expressed with forceful simplicity and precise epigram; even mathematics had a beauty of their own, and, while in some ways allied with beauty in art, both were different phases of what they might call generalized beauty. Every mathematical equation had a certain quality of beauty because it was orderly and complete in its visible expression of a truth. All the natural lines of stresses and strains in a solid were things of beauty, and every structure built to those true lines, *ipso facto*, was beautiful.

Newton's laws of motion, so simple, so fundamental, so inclusive in their scope, could only be formulated with such elegance of expression as to make their enunciation endure for ever. The divine word of God, as it had been revealed in any enduring philosophy or religion, had always been enshrined in language immortal. There was beauty everywhere, and there was no such thing as poverty, if only they realized the universal ownership of beauty in nature and art.

They might own the land, but not the landscape! They might have physical possession of a great picture or a building, but if they were really great the man who truly owned them was the man who most appreciated their beauty. In the light of that truth in written word, in painted canvas, or chiselled stone, or in the harmonies and melodies of sound and in the beauty of nature all around, the happiest and richest man in the world was he who saw most and best understood the laws of nature as expressed in beauty.

A New Factory at Londonderry

THIS steel-framed building has been erected on an island site in Strand Road, Londonderry, overlooking Lough Foyle, by Messrs. Bryce and Weston, Ltd., of London, for the manufacture of shirts and collars. Mr. P. J. Westwood, A.R.I.B.A., was the architect. The accompanying block plan shows the final lay-out of the buildings. The portion now completed faces Strand Road, and has a frontage of 324 ft. The building has been set back 25 ft. from the main road, and the forecourt is grassed. Red brick pavilions have been designed at the ends of the building. All the other bricks are of concrete (brick size) pressed on the site, those for the interior being finished smooth face, and those for the exterior being cemented. Cast concrete has been used for the caps to the bases and cornices, and the floors are of reinforced concrete finished in wood.

The basement, which is 70 ft. long, was partly blasted out of rock, and in it are placed the laundry and heating boilers, fuel, and engineer's shop. On the ground floor are offices of a temporary character (until the future office block is erected), cutting-machine room, stock room, and laundry, on the first floor an ironing room, with a local lift to the ground floor, sorting and boxing and stock rooms. The second floor is devoted entirely to sewing

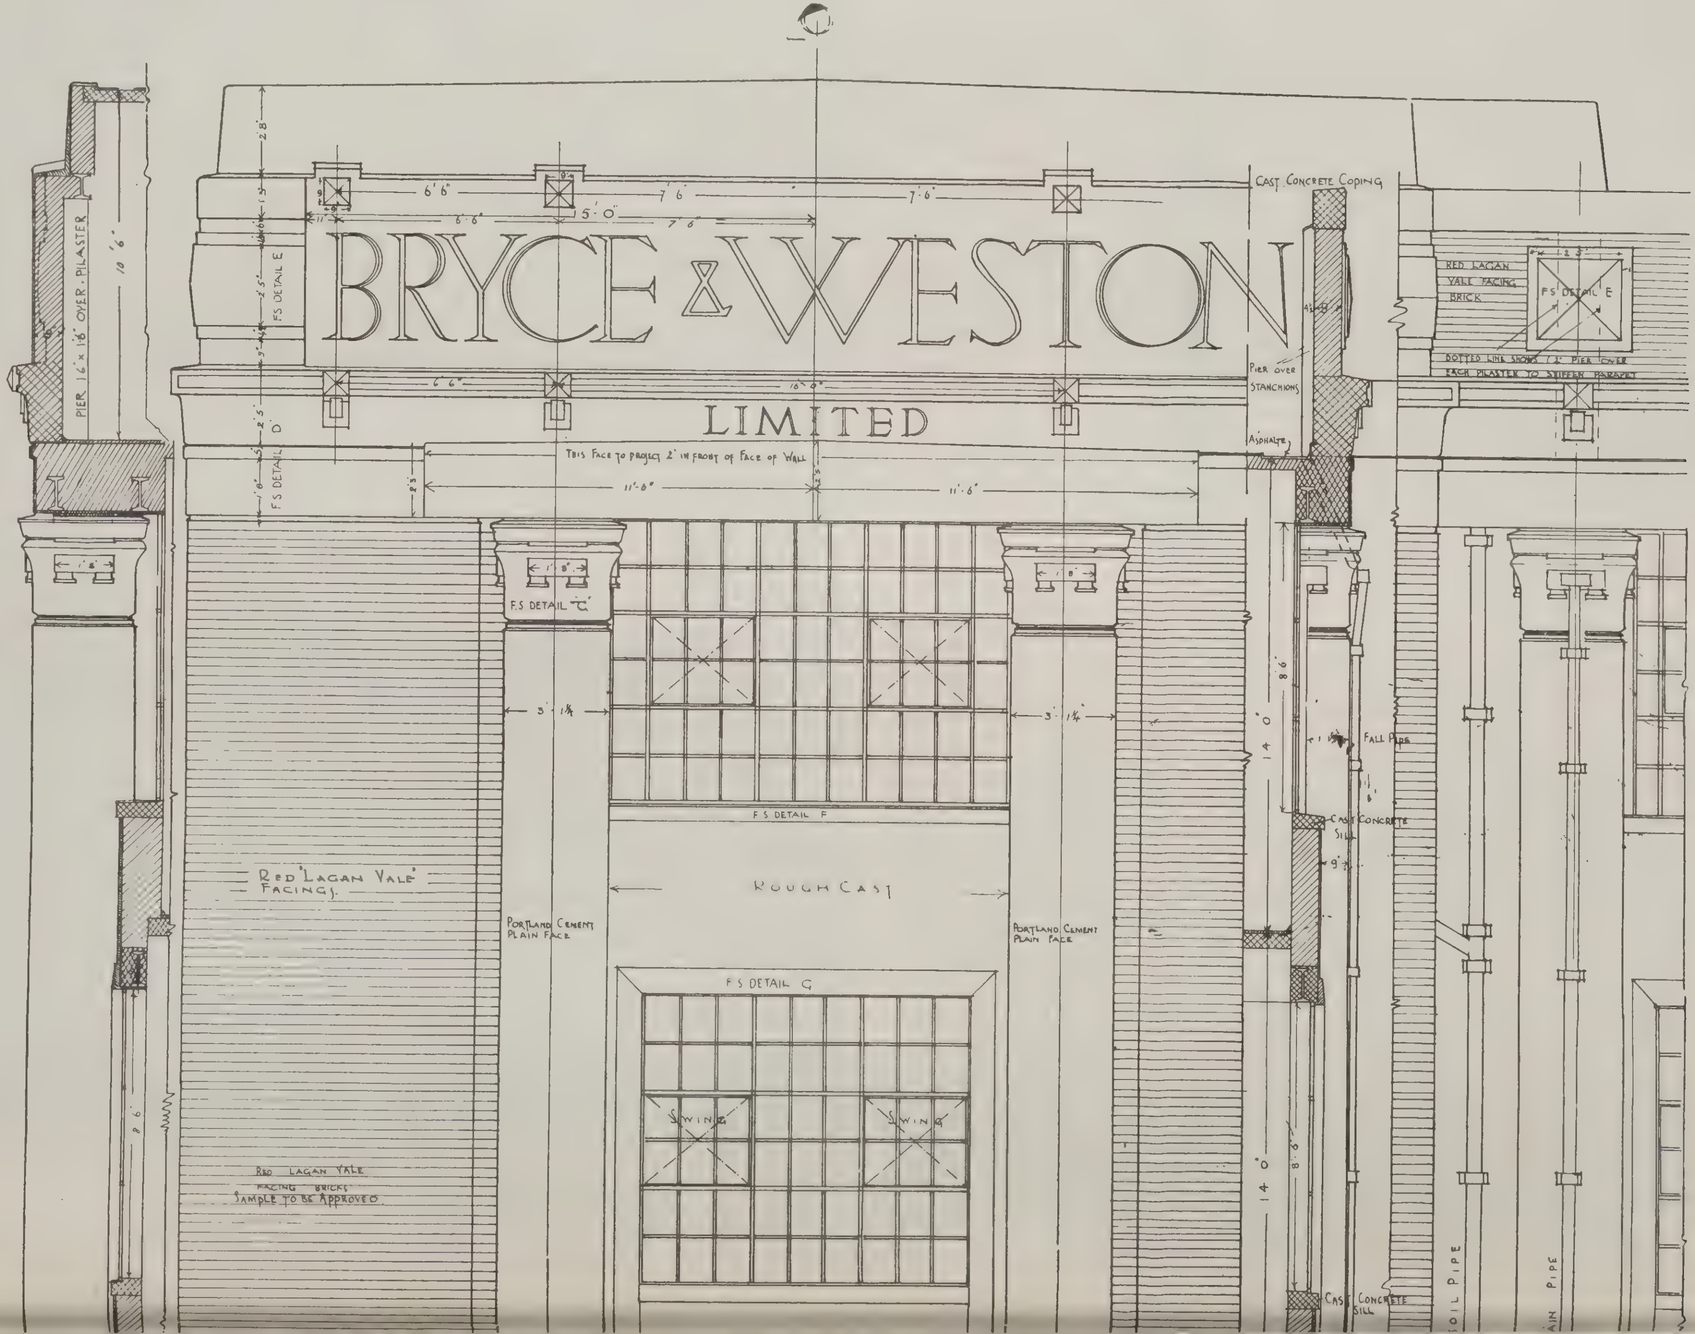
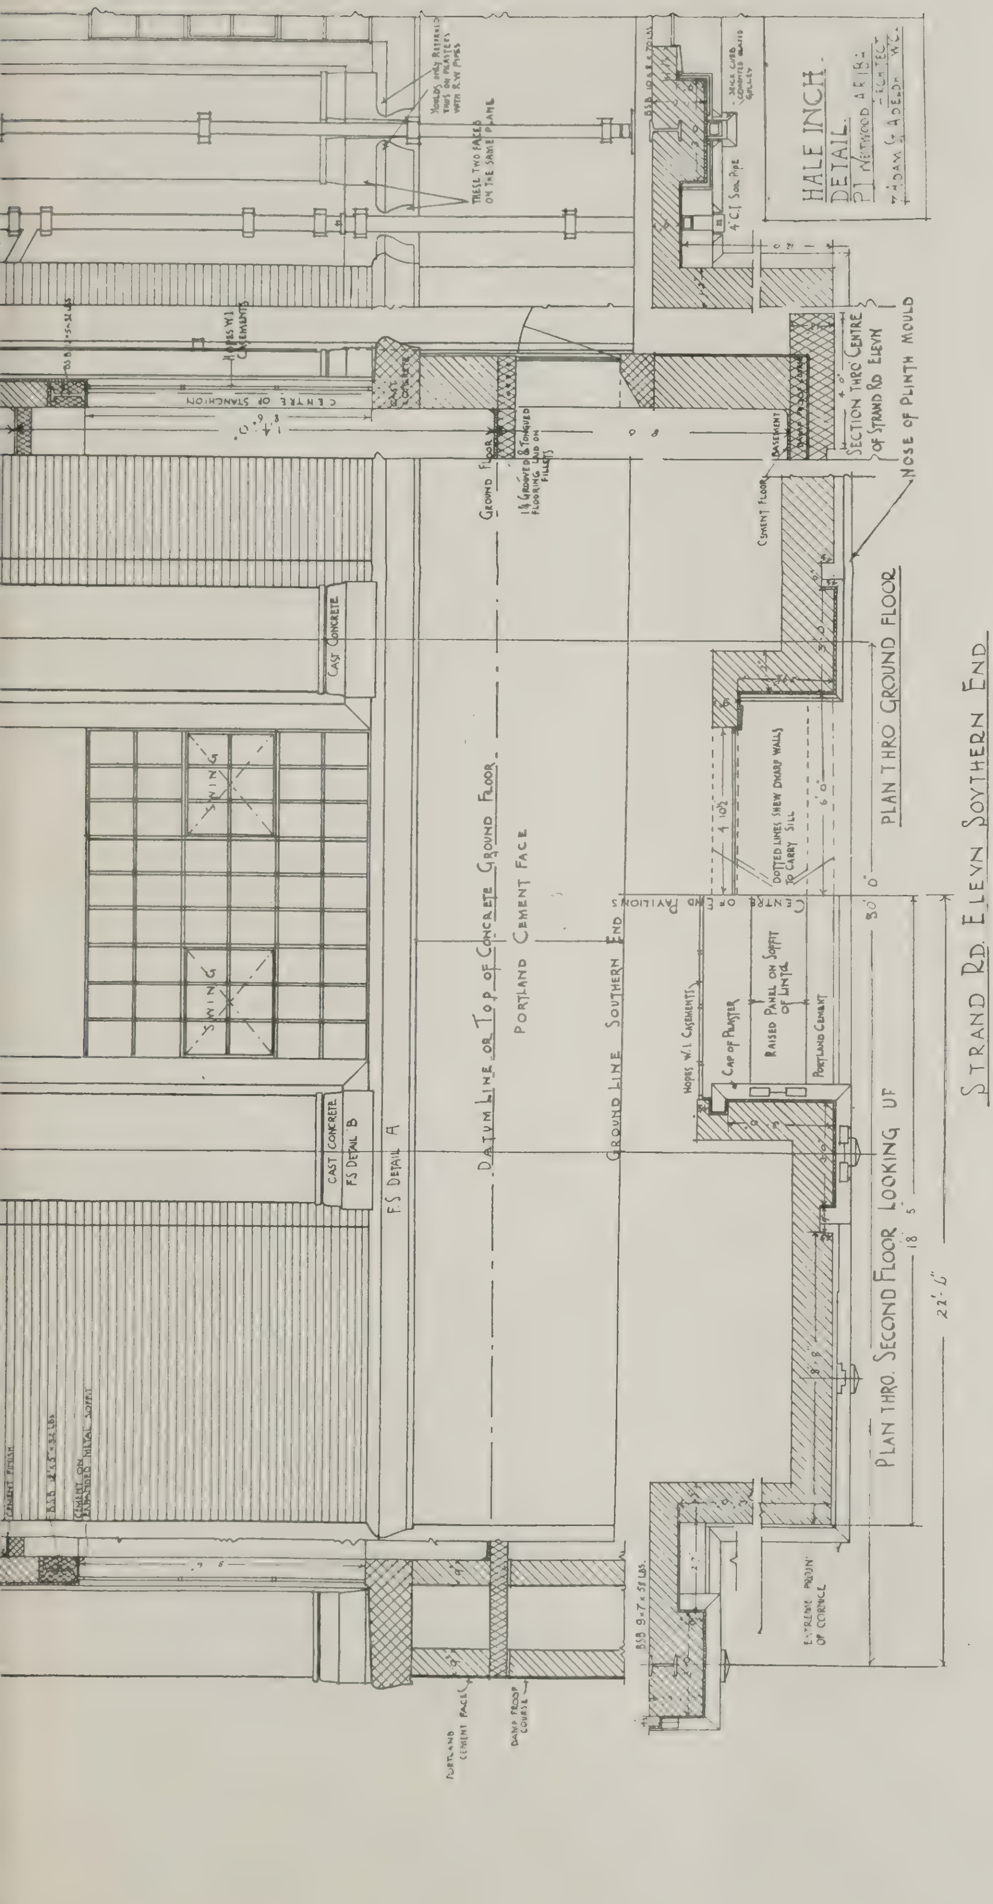
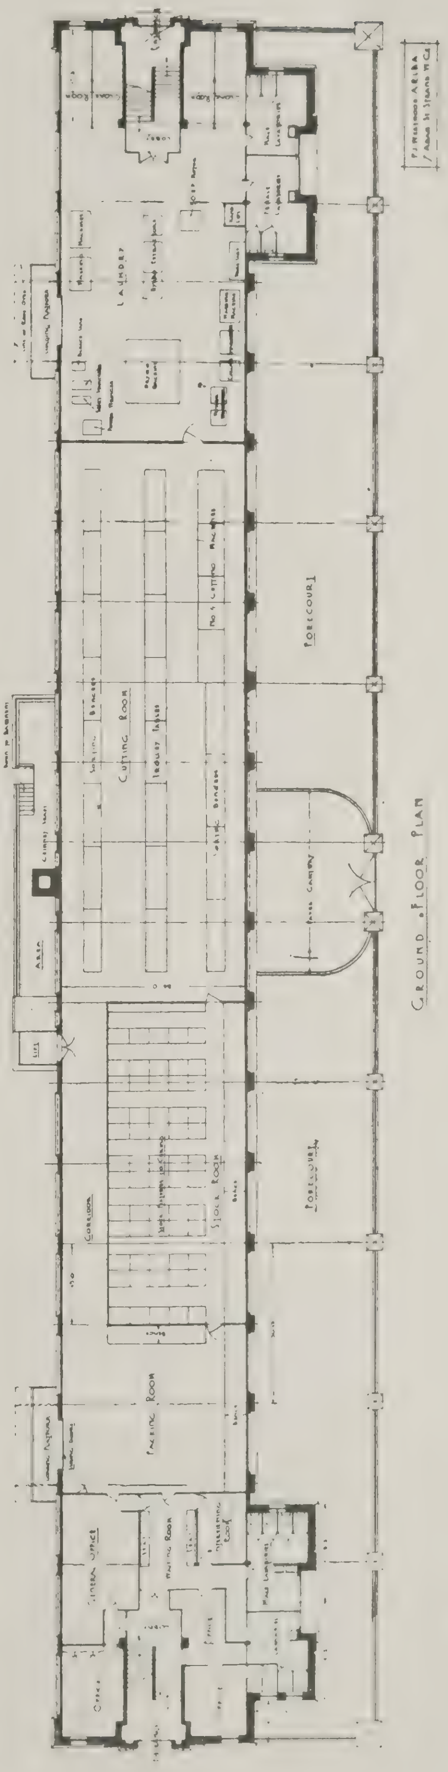
Architects' Working Drawings. 57.—New Building for Messrs. Bryce and Weston, Ltd., Londonderry: Detail of End Pavilion

P. J. Westwood, A.R.I.B.A., Architect







This building is of steel-frame construction, the pavilions at each end of the principal elevation being of red brick. Cast concrete is used for the caps to the bases and cornices, the floors being of reinforced concrete finished in wood. Further particulars and illustrations are given on page **17.**

machinery and tables for completed work. The upper portions of the pavilions are fitted as canteens, with doors at roof level, and the flat roof can be used partly for recreation and partly for storage of cases, etc. Machinery and lighting are by electrical power. At present the main goods lift is exterior to the building, but it will come within a future addition. This lift delivers from the basement to the roof level.

The general contractors were Messrs. Robert Colhoun, of Strand Road, Londonderry; the chief sub-contractors being as follows: Messrs. Redpath Brown, Ltd. (steel and erection); Messrs. C. P. Kinnell & Co., Ltd. (heating); Mr. May, Londonderry (electric lighting); Messrs. Henry Hope and Sons, Ltd. (steel sashes); Messrs. Aublet Harry & Co., Ltd. (laundry machinery and equipment complete); Messrs. Smith, Major and Stevens (lifts); and Messrs. Yannedis & Co. (ironmongery).

Messrs. Sir Douglas Fox and Partners were consulting engineers; Messrs. Buchanan and Reid, civil engineers, Londonderry, superintended the erection under the architect's direction.

Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

Housing by Local Authorities.

Sir A. Mond, in reply to a question from Mr. Gilbert, said that there was nothing in the Housing Acts to prevent a local authority at present from building houses on its own responsibility and without any approval from the Ministry of Health, except in the case of schemes intended to rank for assistance from the Exchequer. Where, however, a local authority desired to raise a loan for the purpose of a housing scheme, his sanction was required, and he should be glad to give the most favourable consideration to all applications of this kind. In the case of Metropolitan borough councils, the sanctioning authority for loans was the London County Council. He had no doubt that their policy in the matter would be the same.

Conversion of Houses into Flats.

In answer to Major Barnes, Sir A. Mond said that schemes for the purchase and conversion of houses into flats had been carried out by or on behalf of forty-six local authorities; the number of flats provided being 752. In respect of 319 flats on behalf of eight local authorities, the work of conversion was undertaken by the Office of Works; in other cases by the local authorities themselves. The properties were in the possession of the local authorities concerned.

Housing Progress.

Sir A. Mond further stated that 116,000 houses had been completed to date by local authorities under the Housing Acts of 1919, but the bulk of these were included in contracts still proceeding. Final accounts had been passed at the end of April for less than 5,000 houses, and the actual cost of building in these cases worked out at an average of £916 for the house alone. It was estimated that the total "all-in" cost of the houses would be £1,076 each.

Book Notice

Fletcher's History of Architecture.

Our old friend "Fletcher's Comparative" has been amplified and improved almost out of knowledge. Always an unfailing help on all that pertained to the history of architecture, it is now, in the sixth edition, so comprehensive in scope and detail as to be positively encyclopædic in character. The student who contrives to master its contents need fear no examiner in the history of architecture, and the practising architect who has it on his shelves will find in it every item about which he can reasonably desire information relating to the history of architecture, on which subject there is no better work of reference in existence. It might be said with equal confidence that there is no modern work in English that, all things considered—the fact that it is in one volume instead of several, while its three thousand five hundred illustrations are so finely produced and are so conveniently arranged for instant and instructive comparison, taken in conjunction with the admirable efficiency and clearness with which so vast a mass of matter is digested and classified—can be said to equal it in merit. The author triumphantly demonstrates the comparative method that, we believe, he was the first to adopt for a history of architecture. Not that he invented the comparative method, but he has certainly applied it with unqualified success to a subject for which it is peculiarly suitable. So familiar is "Fletcher's Comparative" that there is no need to describe its contents in detail—to do so, in fact, would take up an inordinate amount of space. It is sufficient to say that the work has been re-written and enlarged, and—what will seem impossible to readers acquainted with the earlier editions that seemed to have reached finality—is greatly improved in the process; and it has been amplified throughout. This, in fact, is no merely perfunctory re-issue of a standard work, but a complete remodelling of it, to unquestionable advantage. The labour bestowed on it must have been prodigious, and has certainly placed it beyond all hope of rivalry.

"A History of Architecture on the Comparative Method for Students, Craftsmen, and Amateurs." By Sir Banister Fletcher, Architect, F.R.I.B.A., etc., etc., Barrister-at-Law of the Inner Temple, etc. Sixth Edition, Rewritten and Enlarged, with about 3,500 Illustrations. London: B. T. Batsford, 94 High Holborn. Price £2 2s.

A.A. Visit to Rushymead

A large number of members of the Architectural Association paid a visit, on June 24, to Rushymead, of which Messrs. A. Dunbar Smith and the late Cecil C. Brewer were the architects.

Rushymead is a post-war house situated at the top of Coleshill, Amersham, and commanding an extensive view of Buckinghamshire. Happily for its owner and its architects the house shows no lack of good materials, and its breadth of treatment almost convinces one that it belongs to pre-war days.

At the present moment few opportunities occur for architects to design houses on this scale. Domestic architecture, while showing healthy signs of recovery, has not yet reached its pre-war stride, and Rushymead is probably one of the few houses that equals the work done in the more generous days of 1914.

The house is built of 2 in. multi-coloured bricks, with wide joints and with stone dressings. The beautiful wall texture has already a charm of colour to which green shutters are in delightful contrast. Externally the house is Queen Anne in feeling, but there are many successful touches that reveal the skilful departure from the traditional motifs.

Internally the rooms are simple and unaffected, both in disposition and decorative treatment. Of the many rooms seen, the drawing-room with its apsidal ends, and the octagonal dining-room, are particularly successful. The staircase hall, with its curved stairs and balustrading, is also a fine example of design and craftsmanship, and this success is repeated where the first-floor corridor ends and the staircase to the second floor begins.

The house throughout reveals the personality of the architect, and in the kitchen and bathrooms much thought and ingenuity has been displayed in masking the necessary plumbing without sacrificing the need for easy access should things go wrong.

Not the least of the merits of Rushymead is the way in which the subsidiary buildings take their place in the garden scheme. The chauffeur's and gardener's cottages are particularly charming, both in their design and setting.

The members were entertained to tea by the owner, Mr. Forbes. Mr. Dunbar Smith was present and explained the many points and difficulties of the problem he has solved in so splendid a fashion.

R. W. S.

Measured Drawings: An Invitation to Readers of "The Journal"

The Editors of THE ARCHITECTS' JOURNAL are always glad to receive measured drawings of fine old buildings and fine craftsmanship, and they herewith invite readers to send in any drawings they may have by them with a view to publication in these pages.

There is no restriction as to subject, so long as the example is good of its kind; but preference is naturally given to work that is capable of a modern application.

Plans, sections, and elevations of old work—domestic, communal, ecclesiastical, and so forth—are welcome, and drawings of special architectural features and of decorative detail are particularly desired.

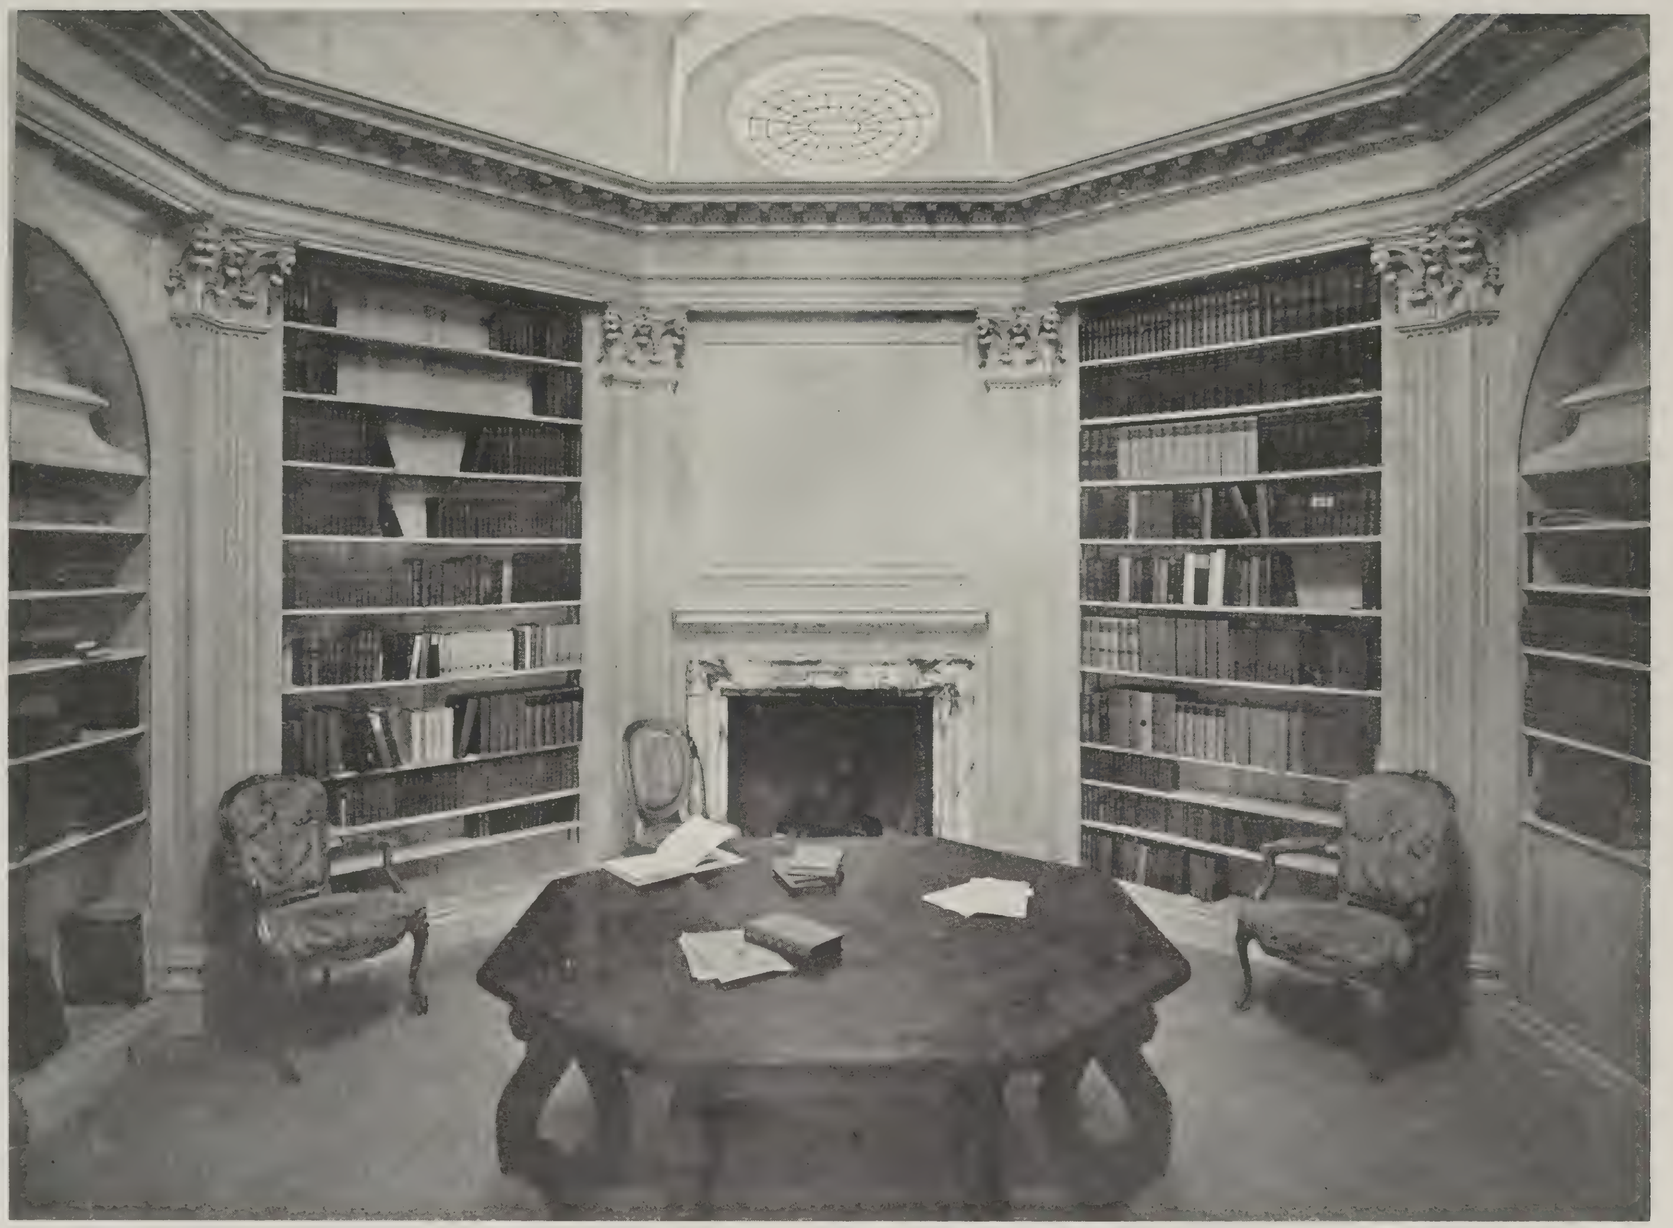
For example: Doorways, chimneypieces, architraves, cornices, friezes, ceilings, staircases, consoles, balustrades, balconies, windows, chimneystacks, mouldings, and decorative detail of all kinds—woodwork, ironwork, and plasterwork.

Drawings—which should preferably be in line, though wash rendering is also acceptable — should be sent to the Editors of THE ARCHITECTS' JOURNAL, 27–29 Tothill Street, Westminster. All drawings accepted will be paid for.

Photographs, if they are available, should be sent with the drawings, together with descriptive notes.

Modern Domestic Architecture. 39.—A Library Interior

Philip Tilden, Architect



This is a view of the small octagonal library in Sir Philip Sassoon's house at Lympne, Kent. The room is panelled in sycamore. A special feature is a domed ceiling with ornamental plasterwork.

OF THE
UNIVERSITY OF ILLINOIS

The British Pavilion at the Rio de Janeiro Centenary Exhibition

THE British Pavilion at the Rio de Janeiro Centenary Exhibition is being erected from the designs of Messrs. John W. Simpson and Maxwell Ayrton, FF.R.I.B.A., architects. The building is of concrete-steel and brick construction, finished with white cement stucco, the terrace and portico being paved with black and white marble. Above the windows at the back of the portico are three centre panels in coloured faience representing the Royal Arms and the Arms of Brazil and Rio respectively. These tablets were designed by Harold Stabler and S. Kruger Gray, and executed by Messrs. Carter, Stabler, and Adams, of Poole, Dorset. The main frieze running round the buildng is filled with tiles of a transparent blue colour. Bronze grilles are fitted to the windows, bronze being also used for the entrance doors and the standard amps on the terrace piers.

The main floor, which is on the higher evel, 17 ft. above the pavement, is reached by wide flights of steps at either end of the terrace, which is 14 ft. wide. The portico or loggia is 19 ft. deep and 70 ft. long, with entrances at each end to the galleries and staircases down o the lower or street level. The central hall or gallery is 46 ft. square and 32 ft. high, with a well 24 ft. square open to the lower floor. Entrance lobbies separate the central hall from the two side galeries, which are each 58 ft. long by 25 ft. wide and 28 ft. high. All three galleries are top and side lit. Large mural paintngs representing the Seven Seas form the decoration of the walls of the central hall, and the dome ceiling light is filled with tained glass. On the lower level are hree galleries of the same dimensions as those above, but 12 ft. 6 in. high.

Before being shipped out to Rio de Janeiro the interior decorations were exhibited at No. 9 Clifford Street, London, ent for the occasion by Messrs. Clayton and Bell, the artists in stained glass to he King. The panel of the North Sea, which will decorate the main hall, is 10 ft. 6 in. by 10 ft. 6 in., and is the work of Mr. Charles Sims, R.A., R.W.S., Keeper and Trustee of the Royal Academy, and Trustee of the National Gallery of British Art. Four panels of similar size representing the North and South Atlantic are by Professor Gerald Moira, R.W.S., Professor of the Royal College of Art at South Kensington. Professor Moira's best known work was the mural decoration of the Central Criminal Court and of Lloyd's Register, London.

The triptych by Professor Moira presents in the centre panel a large central figure symbolical of Brazil with typical figures on either side. The small panels depict the North Atlantic, England bordering one side with Canada on the other. The garland which is the connecting link between the three panels represents the interchange of produce between the countries shown and the sea at the base.

A model of the pavilion made from the drawings of the architects by Messrs. Kerridge, of Cambridge, to a scale approximately ½ in. to the foot, was also exhibited. The back of this model is removable, and a good idea of the interior of the central hall and its flanking galleries can be obtained, the interior having been decorated and containing scale copies of all the mural paintings and a scale model in colour of the large central dome which has been painted in glass by Mr. Reginald Bell, of the partnership of Messrs. Clayton and Bell.

A full-sized panel by Mr. Anning Bell, A.R.A., Professor of Design at the Royal College of Art, whose mosaic tympanum over the main entrance at Westminster Cathedral is well known, was also shown. This panel represents the Mediterranean.

In the stained-glass dome itself Mr. Bell has used some 6,500 pieces of glass, held together by over 7,000 ft. of leaded strip. This dome surmounting the central hall occupies 270 sq. ft. of ceiling space, and contains over 400 ft. of richly coloured glass weighing approximately three-quarters of a ton. The predominating colour is blue. The four curving sides taper upwards to a circle at the summit in which is set a sun with radiating shafts of gold, surrounded by the star of the Southern Cross, which form a part of the Brazilian national emblem. Each of the four curving side panels contains a symbolical figure, one of which represents the British Empire and the Eastern World, and another the Brazils and the Western World. At night the dome will be illuminated from the exterior.

The building and decoration of the pavilion signalizes a very definite step in the attainment of that ideal combination of the architect and the artists responsible for the decoration. These gentlemen have been in the closest collaboration throughout, thus assuring that the whole building from foundations to the frescoes on the walls and the stained glass in its windows shall be one complete and harmonious whole. Signs are not lacking that the art of stained glass has regained its position as an architectural decoration which it held during the Middle Ages, and in this case the stained glass has been considered from the first as part and parcel of the scheme of interior colour decoration.

The erection of the building was begun on December 28, 1921, and the roof timbers were already being fixed on April 17, 1922, and the entire building is to be completed by August 1, 1922. The building of the pavilion is being undertaken by the English contractors in Rio de Janeiro, Messrs. Scott and Urner, to whom great credit is due for the excellence and speed of their work.

Among the sub-contractors associated with the work are the following: Associated Portland Cement Manufacturers, Ltd. (cement); British Challenge Glazing Co. (glazing bars); F. Braby & Co., Ltd. (copper sheets); Pilkington Bros., Ltd. (plate glass); Blundell, Spence & Co., Ltd. (paints and varnish); Dryad (cane furniture); British Thomson-Houston Co., Ltd.,

Advice to Engineering Students

Sound advice to intending students of heating, ventilating, and domestic engineering is given in a booklet which has just been prepared by the Education Committee of the Heating and Domestic Engineers' National Joint Industrial Council. It is now generally admitted that no satisfactory progress can be expected in the study of any branch of engineering unless the student is taught to develop his faculties in several directions, and that no single subject or branch can be profitably pursued without some training in other subjects and branches which are nearly akin to it. It is essential, therefore, that the instruction should be organized in group courses. The syllabus of studies at evening classes outlined in the booklet cover a period of six years.

According to Mr. Ernest M. Beal, M.I.Mech.E., President of the National Association of Master Heating and Domestic Engineers and Chairman of the Heating and Domestic Engineers, National Joint Industrial Council, who has prepared notes on the booklet, the Joint Industrial Council are now forming local Education Committees—consisting of three employers, three operatives, and a representative of the local education authority—in the following centres, to advise students, watch their progress, and develop the technical education work in the industry: London—Brixton School of Building, East Ham Technical School, Willesden Polytechnic, Kilburn, N.W.; Birmingham — Municipal Technical School; Liverpool—Municipal Technical School; Manchester—School of Technology; Newcastle-on-Tyne—Rutherford Technical School; Sheffield—Department of Applied Science, St. George's Square; Bristol—Merchant Venturers School; Leicester—Municipal Technical School; Nottingham—University College; Norwich — Municipal Technical College; Brighton—Technical College. The booklet can be obtained, price 2d., from Mr. W. G. Hollinworth, secretary to the Heating and Domestic Engineers National Joint Industrial Council, 38 Victoria Street, S.W.1, or from the secretary of the National Association of Master Heating and Domestic Engineers, 12 Great James Street, Bedford Row, London, W.C.1. The booklet is carefully compiled and sets out in concise and methodical terms information of the greatest importance to engineering students.

The Stability of Walls.—VIII. The Pressure on Foundations

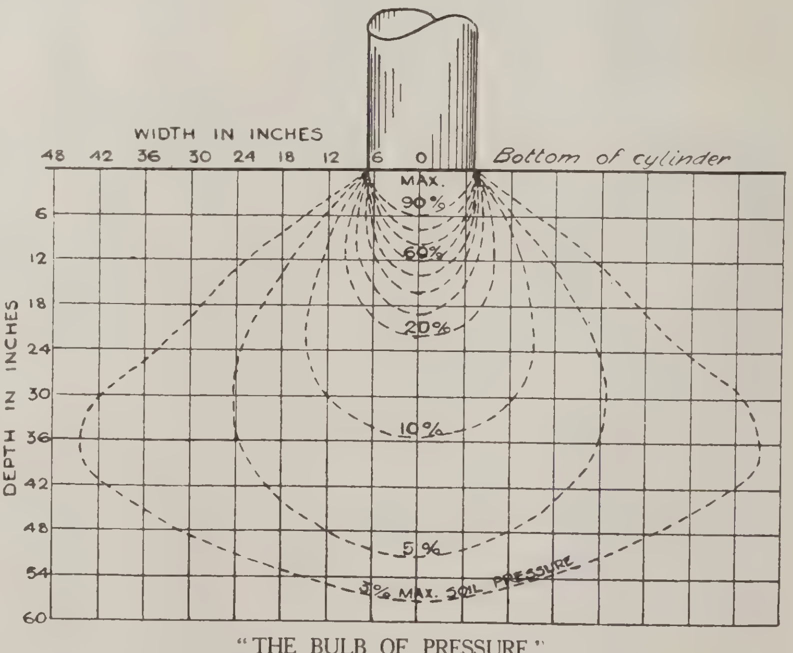
By PROFESSOR HENRY ADAMS, M.Inst.C.E.

It has been shown by Prof. Unwin that the pressure due to a uniformly loaded foundation is not spread uniformly over the soil beneath, but that, owing to the greater facility of the earth round the margin to escape from the pressure, it is less there than in the centre. He found that the mean pressure over the whole area being taken as p, the maximum in the centre will be about $\frac{8}{5}p$, and the minimum at the edges about $\frac{4}{5}p$, so that if a foundation be designed to give a pressure of $1\frac{1}{2}$ tons per square foot over the whole area, the actual pressures will be about 2·4 tons per square foot in the centre, and 1·2 tons per square foot round the edges. Roughly, we may say that at the centre the pressure will be $1\frac{1}{2}$ times the mean and round the edges $\frac{3}{4}$ of the mean, but it would naturally vary with the area compressed. As a general rule no attention is paid to this variation of pressure in designing foundations and no mishap seems to have resulted from ignoring it.

In American practice the carrying of concentrated loads on a poor soil depends upon what is called the "bulb of pressure," which is fully described by Mr. A. E. Wynn, B.Sc., A.M.Am.Soc.C.E., in a paper in "Concrete and Constructional Engineering" for June 1922. The explanation is as follows: "The pressure in a soil carrying a load is distributed in all directions, and varies in intensity from a maximum immediately under the load to a minimum a certain distance out from and beneath the load. The shape of the surface formed by joining up all points of equal pressure is approximately a bulb. It is the soil within the bulb which sustains the load by the cohesion of its particles. So long as the load is kept constant the bulb of pressure will be maintained, but if part of the load be removed the cohesion amongst the particles will be broken and the soil will be incapable of carrying its former load until a new bulb of pressure is set up by the addition of more load. This will explain why piles which have successfully withstood certain test loads will often settle when much smaller loads are later applied."

The details of the bulb of pressure were determined by the engineers of the U.S.A. Public Service Commission, and are extremely interesting. The accompanying diagram, inserted by permission of the Editor of "Concrete and Constructional Engineering," shows the extent of various contours of equal pressure due to a concentrated load. When the load is closely concentrated, as in this case, there will not be much variation of pressure on the soil immediately under the load, but as the effect widens out so the intensity is reduced, and practically proves the common assumption that a point load on a surface reduces in proportion as the sub-area increases, taking an angle of 45 degrees all round.

(*To be continued.*)



"THE BULB OF PRESSURE."
(Carrying of concentrated loads on poor soil.)

Correspondence

Some Pricing Puzzles

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I enclose lists of tenders and would draw attention to the extraordinary disparity between the estimates of the various builders tendering in several of the lists. Perusal of the tenders received in recent months for building work shows this disparity is by no means exceptional, even in cases in which proper quantities have been supplied. I can only suggest that pricing is not as closely studied by builders as the subject warrants.

F. S. I.

[The following particulars are abstracted from the lists enclosed: Coventry painting work, eight tenders varying from £119 (accepted) to £639 17s.; Gloucester, redecoration of Guildhall, eleven tenders varying from £355 to £1,140 12s. 2d. Lowest but one, for £622, accepted. Walker (Northumberland), twenty-two tenders, block of thirty-six flats, varying from £8,900 to £15,987. Lowest accepted. Perhaps some of our readers may be able to offer an explanation of the extraordinary differences shown in these prices.—Editors A.J.]

Co-operation between Architect and Craftsman

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I was much interested in the views of Mr. Voysey on the above subject published in your issue for June 21, but why should he go to the trouble of making a full-size drawing of his panel if he wishes the sculptor to feel quite free to do what he himself thinks best? Surely this will have the opposite effect? Obviously he intends the sculptor to execute his design, or, as he says, decline the commission.

I would suggest that a much more satisfactory way of co-operating with the sculptor would be to furnish him with a small sketch of what is intended, and ask him to develop it on a full-size drawing if he requires one. It is an architect's business to select a sculptor whose work is likely to be in harmony with his style of building.

Much of the dull, uninteresting, and lifeless work on modern buildings is, I am well aware, executed from architects' full-size details, and by so-called craftsmen, who naturally have no other interest in the job than the amount of money to be made out of it.

The fact is that no good work has ever been done from full-size drawings made either by the architect or the sculptor. Is it conceivable that the fine figure and ornamental sculpture of Chartres or Wells was done in this way? Surely not. Was t not designed and executed "in situ" by men who were thoroughly conversant with their material, and were able to work it freely and spontaneously unencumbered by drawings or models?

Every sculptor knows that in working stone or marble in this way delightful qualities of form, texture, and design reveal themselves, and the material will design for him if he has the courage to let it! But, of course, the result may not be in harmony with the architect's Néo-Grec or sham Gothic building, and woe betide him if he lets himself go in this way!

ARCHITECTURAL SCULPTOR.

Unification & Registration

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I have been out of town, and have only just seen Mr. Hiorns' letter in your issue for June 7, in which he pays me the compliment of criticizing at some length certain views which I expressed in a letter which appeared in "The Daily Telegraph" and other newspapers, and which you were kind enough to quote in your issue for May 24 last.

I see no reason to modify the views and statements which I then expressed, nor the necessity for adding to the information I then gave as to the probable extent to which the practice of architecture is regulated in other countries.

Mr. Hiorns appears to be a pessimist in regard to the prospect of Statutory Registration, and possibly he objects altogether to the proposal. However that may be, the position is that the appointed representatives of the profession on the Unification and Registration Committee have decided in favour of Statutory Registration, and any differences of opinion are confined at present to the question as to whether Unification is to precede or to follow Registration. Personally I think that Unification in some form, not necessarily as at present proposed, is essential as a preliminary to obtaining Statutory Registration, but I am not prejudiced in favour of that proposal to the exclusion of any others; all that I am concerned with is to obtain Statutory Registration at the earliest possible moment.

C. McARTHUR BUTLER,
Secretary of the Society of Architects.

Competition News

Newport War Memorial.

Mr. E. Guy Dawber, F.R.I.B.A., the assessor, has made the following awards in the Newport War Memorial Competition:—

First (Design No. 16): Messrs. Cyril F. Bates, A.R.I.B.A. and Colin L. Jones, M.S.A., Newport (Premium £100).

Second (Design No. 10): Messrs. V. O. Rees, A.R.I.B.A. and V. Ware, A.R.I.B.A. 32 Blandford Road, Bedford Park, London, W.4.

Third (Design No. 17): Messrs. Griggs and Vaughan, Newport.

Highly Commended.—Design No. 3: Messrs. Cyril F. Bates, A.R.I.B.A., and Colin L. Jones, M.S.A., Newport; No. 6: Messrs. Wheeler Bros. (of Reading), Ltd., 6 Suffolk Street, Pall Mall, London, S.W.1; No. 9: Mr. G. Valentine Shepherd, Newport; No. 18: Mr. John Hall, F.R.I.B.A., 28 John Street, Sunderland; and Design No. 22: Mr. E. A. Remnant, P.A.S.I., 9 Southampton Street, Bloomsbury, London, W.C.1.

Mr. Guy Dawber, in the course of his report, says: I have examined the twenty-three designs submitted for the Newport War Memorial to be erected in Clarence Place. I have visited the site and considered the position selected at the junction of the various roads and approaches, and have borne this in mind in judging the drawings submitted. I have made a detailed and exhaustive examination of the whole of the designs, and with few exceptions they are of a high order of merit and show that the competitors have carefully studied the problem and produced some admirable solutions. I have no hesitation in placing first the design marked No. 16, a fine dignified composition, which, although frankly based on the Whitehall "Cenotaph," would look well in the position selected. The detail is restrained and suitably treated, and concentrated with bold effect at the top of the memorial. The absence of any unnecessary ornament, panels, or inscriptions, and the well-placed wreaths at either end, all mark this design as one eminently suitable for its purpose. The bronze wreath lying on the top might be omitted, as only the edge would be seen, and this would be better in stone. At the same time I would suggest the entire memorial from above the steps being in Portland stone, as there seems no adequate reason for using granite in the lower portion, and it is questionable whether the variation in colour and texture would be satisfactory. I consider the memorial could be erected well within the stipulated sum. There are many other excellent designs, and I would place them in order of merit: Second No. 10, and Third No. 17, and Highly Commend Nos. 3, 6, 9, 18, and 22.

Big American Competition.

To commemorate its seventy-fifth anniversary "The Chicago Daily Tribune" is offering prizes aggregating $100,000.00 for designs which shall provide the "Tribune" and the city of Chicago with the most beautiful building in the world. Competitors must submit a design showing only the south and west elevations of the structure, and a perspective from the south-west. The competition will be conducted under the rules of the American Institute of Architects, and will open August 1, 1922, and close November 1, 1922. The accepted design will be executed regardless of cost. The material in which their designs shall be executed is left to the discretion of competitors. The jury of award will include the Chairman and next President of the Illinois Chapter of the American Institute of Architects. The prize money will be distributed as follows: $50,000.00 for the design selected; $20,000.00 for the design ranking next; $10,000.00 for the third; ten prizes of $2,000.00 each will be awarded to ten architects to be especially invited to enter into this project. The competition is open to architects of all countries.

Little Harwood War Memorial.

The design of Messrs. L. H. Maxwell and G. G. Dickinson, of Blackburn, architects, has been accepted in competition for the Little Harwood War Memorial.

(*The list of competitions open remains the same as published last week.*)

Rome Scholarship Awards

As briefly announced in our last issue the Rome Scholarship in Architecture has been awarded to Mr. Stephen Welsh, A.R.I.B.A., and the Henry Jarvis Studentship offered by the R.I.B.A. to Mr. George Checkley, A.R.I.B.A. These awards have been made by the Commissioners of 1851 on the recommendation of the Faculty of Architecture of the British School at Rome.

Mr. Stephen Welsh is a student of the University of Liverpool, is thirty years of age, and was born at Forfar, where he served his articles. He afterwards acted as architect's assistant in Glasgow for two and a half years, during which time he attended the Glasgow School of Architecture. He served during the war for over four years with the Royal Engineers.

Mr. George Checkley is twenty-seven years of age, and was born at Akaroa, New Zealand. He also is a student of the University of Liverpool, which he entered with a New Zealand Government Scholarship after serving for three and a half years with the New Zealand Expeditionary Force.

The Rome and Jarvis Scholarships are of the value of £250 a year, tenable at the British School at Rome for a period of three and two years respectively. Both awards were open to British subjects under thirty years of age with an allowance for war service. The Jarvis Studentship is offered to the student or associate of the R.I.B.A. who passes next in order of merit to the winner of the Rome Scholarship.

The competition, which is conducted by the Faculty of Architecture of the British School at Rome, was in two stages. The results of the preliminary competition were exhibited at the Royal Academy in February last at the annual exhibition of the British School. Nine of the competitors in the preliminary round were selected for the final stage, which lasted for a period of ten weeks and was preceded by a thirty-six hours *en loge* test, the subject of the competition being a design for a Royal Academy. The winning designs, together with those of the unsuccessful finalists, will be publicly exhibited for a fortnight at the R.I.B.A. as from July 17. The Jarvis Studentship has been awarded in two successive years to New Zealanders, Mr. E. W. Armstrong, of Auckland, being the winner of the Jarvis in 1921.

MR STEPHEN WELSH, A.R.I.B.A (LIVERPOOL UNIVERSITY), WINNER OF THE ROME SCHOLARSHIP.

Society of Architects Design Competitions

Nine out of the ten successful competitors in the preliminary test in connection with the Society of Architects' Half-Yearly Design Competitions, 1922, submitted designs in the final. The drawings were numbered as received, and the jury of assessors, after careful study of the various designs, awarded a prize of £30 to Harold Anderson, of Blean, student, author of the design marked No. 7, and one of £10 to H. Scott Dalby, of Weaverham, Licentiate, author of the design marked No. 1, subject to the conditions set forth in the Regulations.

Design No. 7, Harold Anderson, was placed first on account of the plan, which has fewer faults. The draughtsmanship is poor and the elevations ordinary.

Design No. 1, H. Scott Dalby, was marked very low on the plan, which is bad in many particulars, and high on its draughtsmanship and elevations. Had the plan been good first place would have been awarded this competitor on account of the high qualities of draughtsmanship.

Design No. 9 was placed a close third; Design No. 3 was placed some way behind. The remainder of the designs were not marked.

The jury were encouraged by the improvement shown in the general standard of design and draughtsmanship.

The Victory Scholarship

The entries received this year for the Society of Architects' "Victory Scholarship" preliminary competition were even more numerous than those of 1921, and numbered sixty-six. Fifty-six designs were received from competitors sitting at Cambridge, Glasgow, Leeds, Liverpool, London (two centres), and Sheffield, on Saturday, June 10, from 10 a.m. to 10 p.m. The programme, which was handed to each competitor upon arrival, consisted of a Ceremonial Staircase. The jury of assessors, Messrs. Arthur J. Davis, Edward R. F. Cole, T. Harold Hughes, F. Billerey, H. C. Hughes, L. Sylvester Sullivan, Howard Robertson, and L. H. Bucknell, selected ten drawings bearing the following index numbers for the final competition: 63, 65, 68, 71, 81, 95, 97, 99, 107, 116. The authors of these designs were then declared to be as follows: J. A. Jellicoe, of London (63); J. C. Shepherd, of London (65); N. C. Mackey, of London (68); D. Brooke, of Liverpool (71); G. F. Shanks, of Glasgow (81); E. N. Channon, of London (95); H. St. John Harrison, of London (97); A. S. Knott, of London (99); Keith D. P. Murray, of London (107); P. Hardy, of London (116). The jury of assessors also fixed the final programme, which will not be disclosed until Saturday, July 15, the date of the final competition. The whole of the esquisses are on exhibition at 28 Bedford Square, W.C.1, from 10.0 to 5.0 daily (Saturdays 1 o'clock), until Friday, July 14.

Liverpool University Examination Results

Appended are the results of the examinations of the University of Liverpool. With regard to all architectural and constructional subjects the work for the Degree and Diploma courses is identical for the five years, the only difference being that the Degree men have matriculated before entering the University and the Diploma men have not. The names of those who failed in the examinations, a percentage of about five, are not published. These students have to remain in their year and take the year's course over again, which generally means they leave the school. This is an important point, because it shows how the school acts as a sieve through which only the better men can proceed :—

Dawnay's Sports Club Annual Outing

Dawnay's Sports Club (which is run by the works and staff of Messrs. Archibald D. Dawnay and Sons, Ltd., of Battersea, constructional engineers, has spent its first annual outing at Worthing. The party proceeded by chars-à-bancs, and arrived at Worthing at 12.30 p.m. after a most delightful journey.

After being welcomed by their president (Mr. E. A. Willson, managing director) the party of 127 had dinner at the Institute, Montague Street. During the dinner Mr. Thorne (director) stated that the president would like to drink their health, and later that the president would like to drink to the health of those who had been with the firm twenty years or more. To this about fifteen stood up and were given a hearty reception. At the end of the dinner the president proposed the health of "H.M. the King," and there was then distributed to each man present a parcel on which was the remark, "With the Directors' Compliments." This contained cigars, cigarettes, and matches.

Mr. Footman (in the unavoidable absence of Mr. J. Hough) proposed the toast of "Archibald D. Dawnay and Sons, Ltd.," pointing out the very fine consideration shown to the employees by the directors in supporting the sports club, slate club, and giving holidays. He was sure that this was fully appreciated by the employees.

Mr. E. A. Willson, the president, in responding, mentioned that the firm were going through hard times, but they did their best to keep the works going, and it was up to all to pull together. He was looking forward to the future for increased work, which meant better times for all. He also mentioned the very recent promotions made necessary by the increased volume of business of the company. These promotions had been made from the ranks, and it was their intention to offer every inducement to the men to remain with the company.

Mr. H. Thorne (director) said that he had been intimately connected with the men as their works manager for some twenty years or more, and he would look back on that period with an immense amount of pleasure. He was now leaving them to be "inside" entirely with the other directors. He was sure all would give the new foreman, Mr. Footman, and the new works manager, Mr. J. Hough, the same support and respect as they had done to him. It was with much pleasure he had been able to assist the sports club. He proposed the "Dawnay's Sports Club," coupling with it the name of its secretary, Mr. F. H. Page.

Mr. F. H. Page, in responding, thanked Mr. Thorne and the other directors for their support to the club. He thought the private ground at South Lodge Farm, Mitcham, provided by the directors, could not be better. It had been fitted out with a pavilion, and was complete in every way. At football they had been very successful, and they would be in the Wimbledon and District League and the Hospital Charity Cup for the season 1922–23. At cricket they had not been so good, but they were in the making, and doubtless next season would do better. He thanked the directors on behalf of those present for all they had so very kindly done.

Mr. Greenwood proposed the health of the "Vice-Presidents," and Mr. A. P. Lander responded.

After this the party broke up to enjoy the afternoon in Worthing. They reassembled for tea at 5 o'clock, after which a concert was organized until the chars-à-bancs were ready. The company arrived back in London at 10.45.

The National Physical Laboratory, Teddington

Between 800 and 900 guests, including some of the leading lights of the scientific and technical world, journeyed to Teddington on June 27, where they were received by Professor Sir Charles S. Sherrington, G.B.E., F.R.S., President of the Royal Society, and Professor Sir Joseph E. Petavel, K.B.E., D.Sc., F.R.S., Director of the Laboratory.

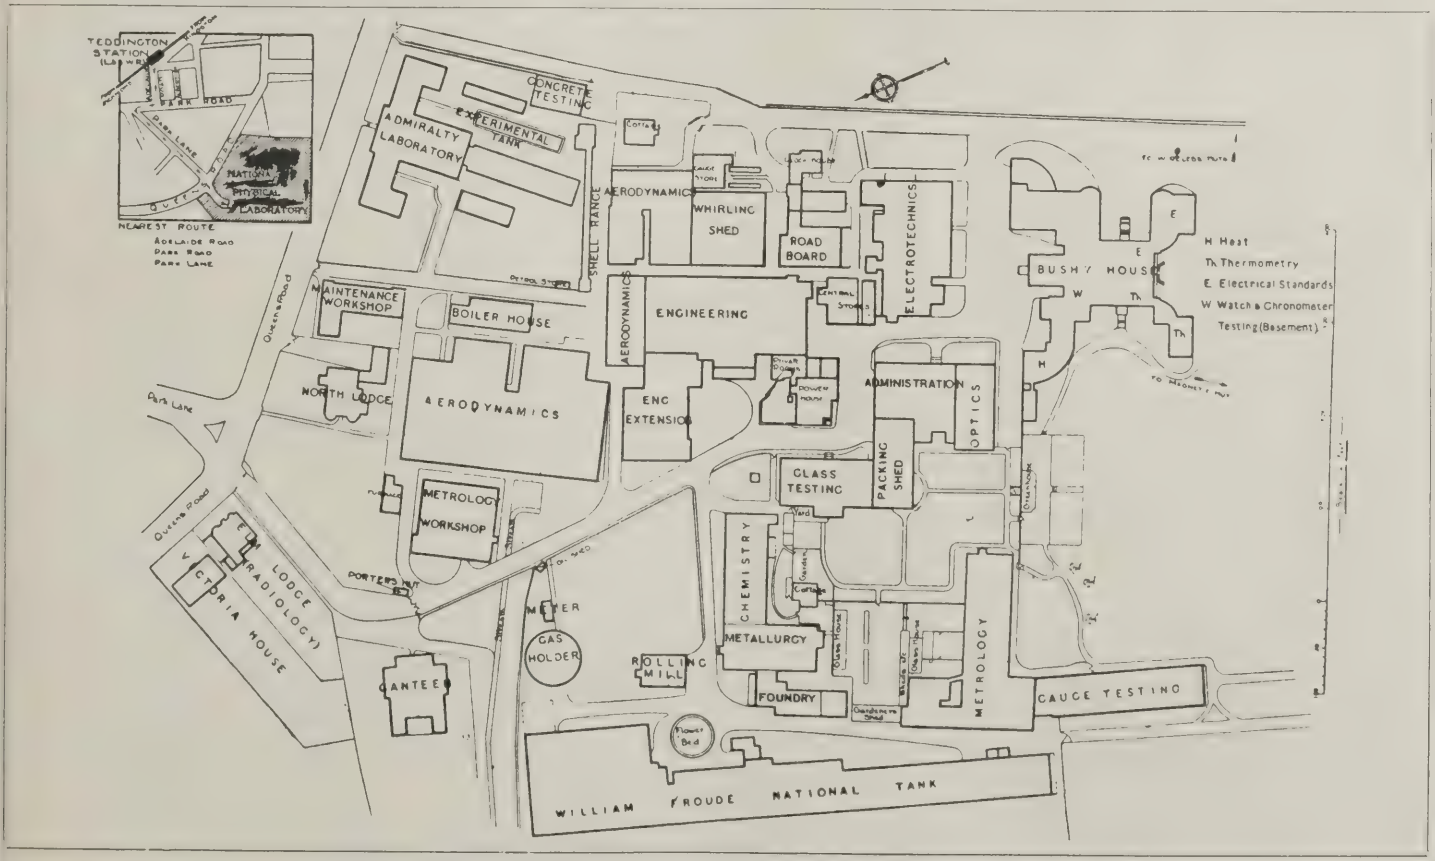
The annual inspection by the General Board was the occasion, and the laboratory buildings contained a great deal to interest the layman as well as the expert.

The Froude National Tank, in which ship models are tested in artificially created waves, had a constant procession of visitors, and in the wireless hut one could hear a technical lecture being delivered at Croydon.

In the Aerodynamics Department apparatus for testing the stability of an aeroplane in flight was of particular interest in view of the problem of safety in aviation.

The Engineering Department showed a test of the compressive strength of steel-concrete columns. The exhibit consisted of a steel column cased with concrete which had failed in the testing machine under a strain of fifty-five tons. Side by side was shown an exactly similar steel column not so cased which failed under a strain of four tons. A new plant by Ransome for the Ministry of Transport for mixing asphalt carpets for roads was also exhibited.

The Engineering Research Board proposes to continue the investigation of the phenomena of cracking in iron and steel and other metals, and also to investigate the phenomena which occur when mild steel under stress is exposed at various



LAY-OUT OF THE NATIONAL PHYSICAL LABORATORY, TEDDINGTON.

temperatures and pressures to the action of caustic soda solutions of different strengths. Apparatus for this purpose is being designed and will be constructed and put into use. In this connection, investigations will be made of any cases coming under the notice of the department of cracking in boiler plates.

A programme of research is also to be arranged with the Cast Iron Research Association.

The extensions to the Engineering Department sanctioned by the Treasury in 1919 have been completed during the year. These consist of a large test-room 96 ft. by 50 ft., having a three-ton traveller over the whole bay. The height of the building has been arranged so that any piece of apparatus can be taken by the traveller from or to any part of the bay without disturbing the other test plant. A section of this bay has been enclosed for engine testing; the traveller goes over this enclosure, and will facilitate the handling of engines to be tested.

On the west side of this bay a much needed block of offices (in two stories) has been erected, while on the north side there is a laboratory (20 ft. by 40 ft.) for steam research. This building is necessary because of the disturbances in the existing position due to currents of cold air. The space vacated by the steam apparatus will become the carpenters' shop.

The dark-room has been extended to take the projection apparatus, and the workshop lavatory and engineering store-room accommodation has been increased in the old building.

Of great value are the special investigations carried out, against payment, for individuals and firms. These often deal with problems of considerable interest, and it may be added, to the credit of British industrial undertakings, permission to publish results of general value is rarely withheld when the Laboratory considers publication desirable. As might be expected, such work has increased appreciably since the war.

New Inventions

Latest Patent Applications.

16504.—Gouyard, G. M.—Method of constructing reinforced concrete arches. June 14.

180887.—Dyson, E.—Flooring.

Abstract Published.

178929.—Chimneys; hearths.—Mathews, J. F., 29 Heathfield Avenue, Dover.—Chimneys formed of metal sections supported in channels provided for the purpose during building are suspended from their upper ends. As applied, for instance, in a concrete building, the upper end of the chimney, Fig. 1, has a flange which engages over an iron chimney-pot *f*. Intermediate sections may be supported by the respective floors, and the sections are coupled by means of clips *i* which allow the necessary temperature changes in length. A coupling similar to *i* connects with the fireplace, In Fig. 2 the arrangement is such that the fireplace may be inserted bodily into position, after which the hearth *o* is secured in a recess in the floor, a rib *q* thereon serving to position the fireplace. The channel containing the chimney may be formed of special slabs secured to the wall, Fig. 4, or built into wall, Fig. 5. A panel such as *r*, Fig. 2, which may be held in place by the mantelpiece, gives access where desired to the chimney.

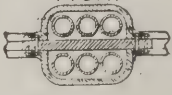

FIG. 5.

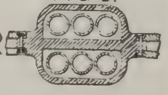
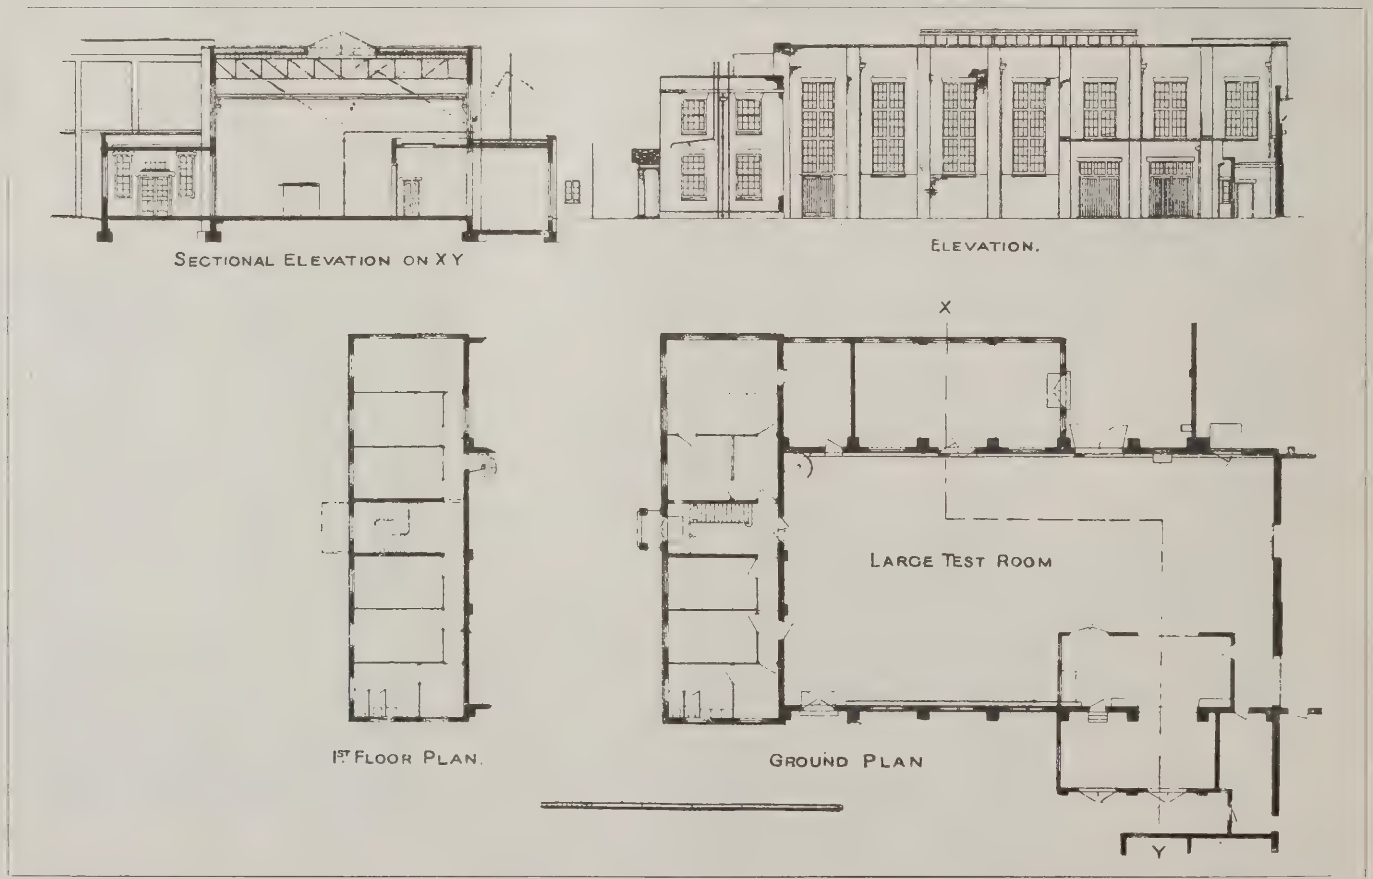


The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.



EXTENSION OF THE ENGINEERING DEPARTMENT, NATIONAL PHYSICAL LABORATORY, TEDDINGTON.

The Week's News

Romford Housing.

Romford Council is to borrow £12,000 to build working-class type of houses.

Road from Newcastle to the Coast.

The Transport Ministry is to receive a deputation from local authorities concerned in a scheme for the construction of a road from Newcastle to the coast.

Blyth Housing Progress.

The first instalment of Blyth Council's house-building scheme of 1,000 houses, consisting of 250 houses, is nearing completion, and a commencement has been made with the second 250.

New Ironmongers' Hall.

The Ironmongers' Company have acquired a site at Shaftesbury Place, Aldersgate Street, on which to erect a new hall in place of the one in Fenchurch Street destroyed by German bombs.

St. Michael's, Chester Square, Memorial.

The War Memorial in St. Michael's, Chester Square, recently dedicated, takes the form of a Chapel of Thanksgiving and Remembrance. The architect was Mr. G. Gilbert Scott, R.A.

County Architect for Somerset.

Somerset County Council have decided to appoint a full-time architect at a salary of £500 a year and travelling expenses, and to provide him with the necessary offices and assistance.

New "Skyscraper" in U.S.A.

An eighteen-story building in rein-orced concrete, and known as the "Hide and Leather Building," has just been ompleted in New York. This consti-utes the tallest building of its type in the United States of America.

A Correction.

A correspondent writes to point out hat the Phœnix Fire Office in Trafalgar square (now demolished, and illustrated nder "Pictorial Review" in our last ssue) was designed not by C. R. Cockerell, ut by J. M. Gandy.

Clock Tower for Little Harwood.

The design of Messrs. L. H. Maxwell nd G. G. Dickinson, architects, of Bank Chambers, Lord Street West, Blackburn, as been accepted, in competition, for he Little Harwood war memorial clock ower, which will have four dials.

Rhyl Improvements.

The Rhyl Council have entered into an rrangement for the removal of the huge ank of gravel at the Foryd Estuary, which has for years been the subject of ontroversy, and which, it is said, has aused coast erosion.

The late Mr. J. T. Middleton.

We regret to announce the death of Mr. John Thomas Middleton, of Woking, who had been connected with the firm f Sir Walter Scott and Company, imited, contractors, and Portland ement manufacturers, of Newcastle, for ore than fifty years. Mr. Middleton as seventy-five years of age.

Epsom's Oldest Brewery.

Some oak-pinned tiles, between 300 nd 400 years old, which are being removed from the roof of Epsom's oldest brewery, have been purchased by a New York racehorse owner. Part of the brewery is to be devoted to parochial purposes.

Brighton Aquarium to Go.

In spite of great opposition, the site of the Brighton Aquarium is to be leased to the Southdowns Motor Service for sixty years and converted into a garage, with accommodation for 200 motor-coaches and omnibuses.

Downside School War Memorial.

Work has begun on the Downside School War Memorial, which is to be the Nave of the Abbey Church, and will consist of seven bays to be built to the design of Mr. G. Gilbert Scott, R.A. It is expected that the nave will be completed in 1925.

London Police War Memorial.

At New Scotland Yard a mural tablet has been unveiled by Brig.-General W. T. F. Horwood, to the 345 members of the Metropolitan Police who sacrificed their lives during the war. The actual war memorial of the force will be at Twickenham Orphanage, where a new hospital is being erected.

Housing at Warwick.

Given seventy-two weeks for completion of the whole block of 142 houses on the Capesite part of the Old Deer Park, at Warwick, the contractors have finished them in sixty-five weeks. All the houses are occupied. The Ministry are expected to sanction the building of a further block completing the scheme.

Sir Henry Wilson Memorial.

The Army Committee have been invited to subscribe towards a special memorial to the late Field-Marshal Sir Henry Wilson, and in view of the deep interest taken by Sir Henry in the completion of the Royal Military College War Memorial Chapel at Sandhurst it is thought that no more fitting site could be chosen.

Islington War Memorial.

Islington War Memorial Fund Committee have resolved to adopt as the borough memorial an extension of the Royal Northern Hospital which will form a complete casualty department, with adequate observation wards. On oak panels in the new building will be recorded the names of 1,200 Islingtonians who gave their lives in the war. The estimated cost of the building is £11,700.

Housing at Oakengates.

The opening ceremony has been performed of the third housing scheme carried out by the Oakengates Urban District Council (the Snedshill scheme). The total number of houses forming the three schemes is over 200. The Snedshill scheme comprises eighty-seven houses, twelve parlour and sixty-five non-parlour. The architects were Messrs. Farmer and Hickman, of Walsall and Sheffield.

Islington's Town Hall.

The foundation-stone of Islington's projected addition to its Town Hall has been laid. The cost is estimated at £74,000, and a loan for this amount has been sanctioned. Mr. E. C. P. Monson, the Borough Council's architect, is responsible for the plans of the building, which is being erected by the authority's own employés. It will be a structure of steel frame and brick, of four floors, with a Portland stone base, and will be, as far as possible, fire-resisting.

Reading Exhibition of Drawings.

An exhibition of architectural drawings will be opened at the Art Gallery, Reading, by the Mayor of Reading, Mr. W. Roland Howell, F.R.I.B.A., on Thursday, July 6, at 3.0 p.m. The exhibition will consist of the R.I.B.A. Prize Drawings for 1922, a selection of the British Prix de Rome Drawings, illustrations and models of the works of members of the Berks, Bucks, and Oxon Architectural Association, and measured drawings and students, testimonies of study. The exhibition will remain open until July 14.

Wandsworth Bridge.

The Fulham and Wandsworth Borough Councils are of opinion that steps should be taken by the L.C.C. to deal with the scheme for improving Wandsworth Bridge and its approaches. A deputation from the two Councils is to wait on the L.C.C. Plans of a revised scheme for improving the southern approaches to the bridge were approved by the Wandsworth Council on May 5, 1915, and forwarded to the L.C.C. with a view to the improvement being made after the war. The cost of the improvement was then estimated at £90,000.

A.A. Students' Drawings at Amsterdam.

A public exhibition of drawings by students of the Architectural Association School of Architecture has been opened at the State Academy, Amsterdam. The exhibition was sent over at the invitation of the Dutch Association for the Higher Education of Architects. The President of the Society, Mr. Jan de Meyer, in opening the exhibition, spoke of the great inspiration Dutch architects had found in the domestic architecture in England. He said how greatly they were impressed with the exhibition, and the obvious thoroughness of the Architectural Association's educational system, from which they had much to learn.

The Civil Engineers at Home.

"Sumpshous" but poorly expresses the magnificence of the conversazione at the Institution of Civil Engineers last week. The stateliness of the halls and staircase was softened by masses of flowers and greenery, downstairs the band of the Royal Artillery discoursed sweet music, and in the theatre Edna Thornton and the Gresham Singers gave liberally of their best. The President and Mrs. Worthington received an apparently interminable procession of guests, whose decorations bore witness to the achievements of the profession in both peace and war, and the great hall resounded with recognitions and greetings between engineers from the four corners of the earth. Their womenfolk were there too, very numerous, and beautifully arrayed; but it was pre-eminently the men's night out.

Rates of Wages in the Building Trades*

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, masons, carpenters and joiners, woodcutting machinists, slaters, plumbers,* plasterers, painters †) and labourers in the building industry. The labour rates for London are given in the Table of Current Prices on pages xxi, xxii.

* In the case of towns printed in *italic type* below, the rates shown in the Table for craftsmen do not apply to plumbers.

† Except in Scotland.

‡ Excluding Liverpool and Birkenhead, where the rates are 1s. 11d. for plumbers, 1s. 10½d. mason's fixers, 1s. 10d. for other craftsmen, including painters, 1s. 6d. scaffolders, 1s. 5½d. for tradesmen's labourers, and 1s. 5s. for general labourers and navvies.

§ In the South Western Counties the Grades are known as "Grades I, II, III, and IV."

‖ In the case of bricklayers, masons and labourers employed by members of the Scottish Building Contractors' Association in the Glasgow and West of Scotland district, the rates are 1s. 10d. for craftsmen and 1s. 5d. for labourers.

¶ In Scotland, labourers are not included in the general grading scheme.

Grading of Towns.

The localities in which the above rates have been reported to be in operation are as follows. In the case of localities printed in *italic type*, the rates shown in the above Table for craftsmen do not apply to plumbers.

NORTH EAST COAST :—

Birtley, Bishop Auckland, *Blackhill*, *Blyth*, *Chester-le-Street*, *Consett*, *Darlington*, *Durham*, *Gateshead*, *Hartlepools*, *Hebburn*, *Hexham*, *Jarrow*, *Lanchester*, *Leadgate*, *Middlesbrough*, *Morpeth*, *Newcastle*, *North and South Shields*, *Seaham Harbour*, *Shotley Bridge*, *Stanely*, *Stockton*, *Sunderland*, *Thornaby*, *Tynemouth*, *Wallsend*, *Whitburn*, and *Whitley Bay*.

YORKSHIRE :—

Grade A.—*Barnsley*, *Batley*, *Bingley*, *Birstall*, *Bradford*, *Brighouse*, Calder Valley, Castleford, *Cleckheaton*, *Colne Valley*, *Crosshills*, *Dewsbury*, *Doncaster*, *Gomersal*, Grimsby, *Guiseley*, *Halifax*, *Harrogate*, *Hebden Bridge*, *Heckmondwike*, Holmfirth, *Horbury*, Huddersfield, Hull, *Ilkley*, Immingham, *Keighley*, *Leeds*, *Liversedge*, *Mexborough*, *Mirfield*, *Morley*, *Normanton*, *Ossett*, *Penistone*, Pontefract, Pudsey, *Rawdon*, *Rotherham*, Scunthorpe, *Selby*, *Sheffield*, *Shipley*, *Sowerby Bridge*, *Stocksbridge*, *Wakefield*, *Wombwell*, *and Yeadon*.

Grade B.—Barnoldswick, Beverley, Bridlington, Goole, Hornsea, Scarborough, Skipton, *Whitby*, and York.

Grade C.—Driffield, Kirby Moorside, Malton, Norton, Pickering, and Wetherby.

NORTH WESTERN COUNTIES :—

Grade A.—*Accrington*, Adlington, *Alderley Edge*, *Altrincham*, *Ashton-under-Lyne*, *Atherton*, *Bacup*, Barrow, Birkdale, Bispham, *Blackburn*, Blackpool, Blackrod, *Bolton*, Broughton (Flints), *Burnley*, *Bury*, Carlisle, Chester, Chorley, *Church*, Cleveleys, *Clitheroe*, *Colne*, Connah's Quay, Dalton-in-Furness, *Darwen*, *Denton*, *Droylesden*, *Eccles*, *Farnworth*, Fleetwood, Frodsham, *Glossop*, *Great Harwood*, *Haslingden*, Hawarden, Helsby, *Heywood*, Higher Kinnerton, *Horwich*, *Hyde*, Lancaster, *Leigh*, Leyland, *Littleborough*, Longridge, Lymm, Lytham, *Manchester*, *Middleton*, Morecambe, *Mossley*, *Nelson*, *Ormskirk*, *Oswaldtwistle*, *Oldham*, *Padiham*, *Pendlebury*, Poulton, *Preston*, *Prestwich*, Queensferry, *Radcliffe*, *Ramsbottom*, *Rawtenstall*, *Rishton*, *Rochdale*, Runcorn, St. Anne's-on-the-Sea, St. Helens, *Saddleworth*, *Sale*, *Salford*, *Shaw*, Shotton, Southport, *Stalybridge*, *Stockport*, *Swinton*, Thornton, *Todmorden*, *Tyldesley*, *Walkden*, *Warrington*, Westhoughton, *Whalley*, *Whitefield*, Widnes, Wigan, and *Wilmslow*.

Grade B.—Askam, Broughton, Buxton, Cleator Moor, Congleton, Coniston, Crewe, Distington, Egremont, Grange-over-Sands, Harrington, Knutsford, *Macclesfield*, Maryport, Market Drayton, Middlewich, Millom, Mold, Nantwich, *New Mills*, Northwich, Sandbach, Tarporley, Ulverston, Winsford and Over, Whitehaven, Workington, and Wrexham.

Grade C.—Ambleside, Bala, Bangor, Bowness-on-Windermere, Carnarvon, Colwyn Bay, Conway, Grasmere, Holyhead, Holywell, Kendal, Langdale, Llandudno, Llandudno Junction, Mostyn, Penrith, Prestatyn, Rhos, Rhyl, and Windermere.

MIDLAND COUNTIES :—

Grade A.—Alfreton, *Belper*, Bilston, *Birmingham*, *Blackheath*, *Chesterfield*, Coalville, Coventry, *Derby*, Heanor, Hinckley, *Ilkeston*, Kenilworth, *Leicester*, Lincoln, *Long Eaton*, *Loughborough*, *Mansfield*, *Nottingham*, *Nuneaton*, Oldbury, Ripley, *Sutton Coldfield*, *Sutton-in-Ashfield*, West Bromwich, Willenhall, and Wolverhampton.

Grade B.—Atherstone, Bewdley, Boston, Brierley Hill, Bromsgrove, Burton-on-Trent, Cannock, Coseley, *Darlaston*, Dudley, Gainsborough, Gornal, Grantham, Halesowen, Hednesford, Kidderminster, Knowle, Leamington, *Leek*, Lichfield, Louth, Malvern, Markey Harborough, *Matlock*, Melton Mowbray, *Newark*, Northampton, Oakengates, Old Hill, Peterborough, Redditch, Retford, Rugby, *Rugeley*, Sedgley, Shifnal, Shrewsbury, Skegness, Sleaford, Solihull, Southwell, *Stafford*, Stamford, Stourbridge, Stourport, Stratford-on-Avon, Swadlincote, Swanwick, Tamworth, *Walsall*, Warwick, *Wednesbury*, Wellington, Worcester, and Worksop.

Grade C.—Ashbourne, Bridgnorth, Church Stretton, Kettering, Ludlow, Newport, Oakham, Oundle, Raunds, Rushden, Spalding, Thrapston, Uttoxeter, Wellingborough, and Wirksworth.

Grade D.—Buckden, Eaton Socon, Huntingdon, St. Ives, and St. Neots.

EASTERN COUNTIES :—

Grade A.—Baldock, Bedford, Berkhamsted, Biggleswade, Braintree, Brentwood, Chelmsford, Cambridge, Colchester, Halstead, Hatfield, Harpenden, Hemel Hempstead, Henlow, Hertford, Hitchin, Hoddesdon, Ingatestone, Ipswich, Letchworth, Luton, Norwich, Ongar, St. Albans, Sandy, Sawbridgeworth, Stevenage, Stotfold, Ware, Welwyn, and Witham.

Grade B.—Aldeburgh, Ampthill, Attleborough, Aylsham, Braughing, Chatteris, Cromer, Dovercourt, Dunstable, Ely, Fakenham, Felixstowe, Gorleston, Halesworth, Harwich, King's Lynn, Leighton Buzzard, Leiston, Lowestoft, March, Much Hadham, Newmarket, North Walsham, Puckeridge, Renthem, Saxmundham, Southwold, Standon, Stowmarket, Wickham Market, Woodbridge, Wymondham, and Yarmouth.

Grade C.—Bungay, Coltishall, East Dereham, Royston, Saffron Walden, and Tring.

SOUTHERN COUNTIES :—

Grade A.—Abingdon, Addlestone, Amersham, Ascot, Ashford (Middlesex), Banbury, Beaconsfield, Bournemouth, Bracknell, Brighton, Byfleet, Chalfont, Chesham, Christchurch, Cremborne, Eastbourne, Eastleigh, Egham, Eton, Gerrard's Cross, Goring, Gosport, Gravesend, Guildford, Henley, Hove, Laleham, Maidenhead, Marlow, Northfleet, Oxford, Poole, Portsmouth, Reading, Southampton, Staines, Stanwell, Sunningdale, Sunninghill, Tilehurst, Tonbridge, Tunbridge Wells, Wallingford, Windsor, Winkfield, Woking, Wokingham, and Wycombe.

Grade B.—Arundel, Ashford (Kent), Aylesbury, Bagshot, Basingstoke, Bexhill, Bicester, Bletchley, Bognor, Bosham, Broadstairs, Brockenhurst, Buckingham, Burgess Hill, Camberley, Canterbury, Chatham, Chichester, Chipping Norton, Cranleigh, Deal, Dover, *Dorking*, Fareham, Faringdon, Faversham, Fenny Stratford, Folkestone, Gillingham, Godalming, Hailsham, Haslemere, Hastings, Havant, Herne Bay, Horsham, Hythe, Lambourn, Liphook, Littlehampton, Lymington, Lyndhurst, Maidstone, Margate, Midhurst, Milford, Milton Regis, Newbury, New Milton, Newport Pagnell, Oxted, Pangbourne, Petworth, Ramsgate, Redhill, Reigate, Rochester, Sandgate, St. Leonards, Sevenoaks, Sittingbourne, Strood, Stony Stratford, Stow-on-the-Wold, Ealmer, Wantage, Wendover, Westerham, Westgate, Whitstable, Winchester, Winslow, Witney, Wolverton, Woodstock, and Worthing.

Grade C.—Andover, Ardingley, Farnham, Godstone, Hawkhurst, Haywards Heath, Horley, Isle of Wight, Lingfield, Liss, Petersfield, Rye, Smallfield, Staplehurst, Steep, Turners Hill, and Uckfield. (Gravesend and Northfleet, skilled tradesmen (excluding painters) employed on local housing scheme, 1s. 6d.)

SOUTH WESTERN COUNTIES :—

Grade I.—Bristol.

Grade II.—Plymouth * and Devonport.*

Grade III.—Dartmouth,* Exeter,* Newton Abbot, Paignton, Portishead, Stroud,† Taunton, and Torquay.

Grade IV.—Barnstaple, Povey Tracey, Bradford-on-Avon,* Bridgwater, Bridport,* Bruton, Burnham-on-Sea, Calne,* Castle Cary, Cheddar,* Cirencester,* Clevedon, Coleford,* Corsham,* Crewkerne,* Dawlish, Dorchester,* Exmouth, Fairford,* Frome,* Glastonbury, Lydney,* Melksham,* Midsomer Norton, Minehead,* Radstock, Shepton Mallet, Street, Swanage,* Teignmouth,* Tetbury,* Thornbury,* Totnes,† Trowbridge,* Wells, Westbury,* Weston-super-Mare, Weymouth,* and Yeovil.*

[N.B.—Bath, Cheltenham, Gloucester,* Hereford,* Swindon,* and Tewkesbury * :—craftsmen, 1s. 5d. ; labourers, 1s. 0¾d. Bideford :—tradesmen, 1s. 4½d. ; labourers, 1s. 0½d. Camborne Falmouth, Hayle, Newquay, Penzance, Redruth, St. Ives and Truro :—tradesmen, 1s. 4d, ; labourers, 1s.

SOUTH WALES AND MONMOUTHSHIRE :—

Grade A.—Aberavon, Aberdare, Abergavenny, Ammanford, Barry, Bridgend, Briton Ferry, Brynmawr, *Cardiff*, Chepstow, Duffryn Valley, Ebbw Vale, East Glamorganshire and Monmouthshire Valleys, Garw Valley, Gorseinon, Llanelly, Maesteg, Merthyr, Mountain Ash, Neath, Newport, Ogmore Vale, Pontardulais, Pontypool, Pontypridd, Porthcawl, Port Talbot, Rhondda and Rhymney Valleys, Sirhowy Valley, Swansea, and Tredegar.

Grade B.—Haverfordwest and Pembroke.

[N.B.—Brecon and Carmarthen :—craftsmen, 1s. 10d. ; labourers, 1s. 5½d.]

SCOTLAND :—

Grade A.—Airdrie, Alloa, Alva, Ayr, Bathgate, Bellshill, Bridge of Weir, Buckhaven, Burntisland, Clydebank, Coatbridge, Dumbarton, *Dundee*, Dunfermline, Edinburgh, *Falkirk*, Glasgow, *Gourock*, *Grangemouth*, *Greenock*, Haddington, Hamilton, Irvine, Kennoway, Kilmarnock, Kirkcaldy, *Larbert*, Leith, Leslie, Leven, Methil, Motherwell, Neilston, Newmains, Paisley, Pencaitland, Perth, *Port Glasgow*, Renfrew, *Stenhousemuir*, Stirling, Uddingston, Wemyss, Windygates, and Wishaw.

Grade B.—Arbroath and Peebles.

Grade C.—*Dumfries*, Galashiels, Hawick, and *Maxwelltown*.

Aberdeen :—slaters, 1s. 8d. Peterhead :—masons, joiners and plasterers, 1s. 7d. ; plumbers, 1s. 8½d.

---

* The rate for painters is 1d. per hour less than that shown for craftsmen in the above table.

† The rate for painters is ½d. per hour less than that shown for craftsmen in the above table.

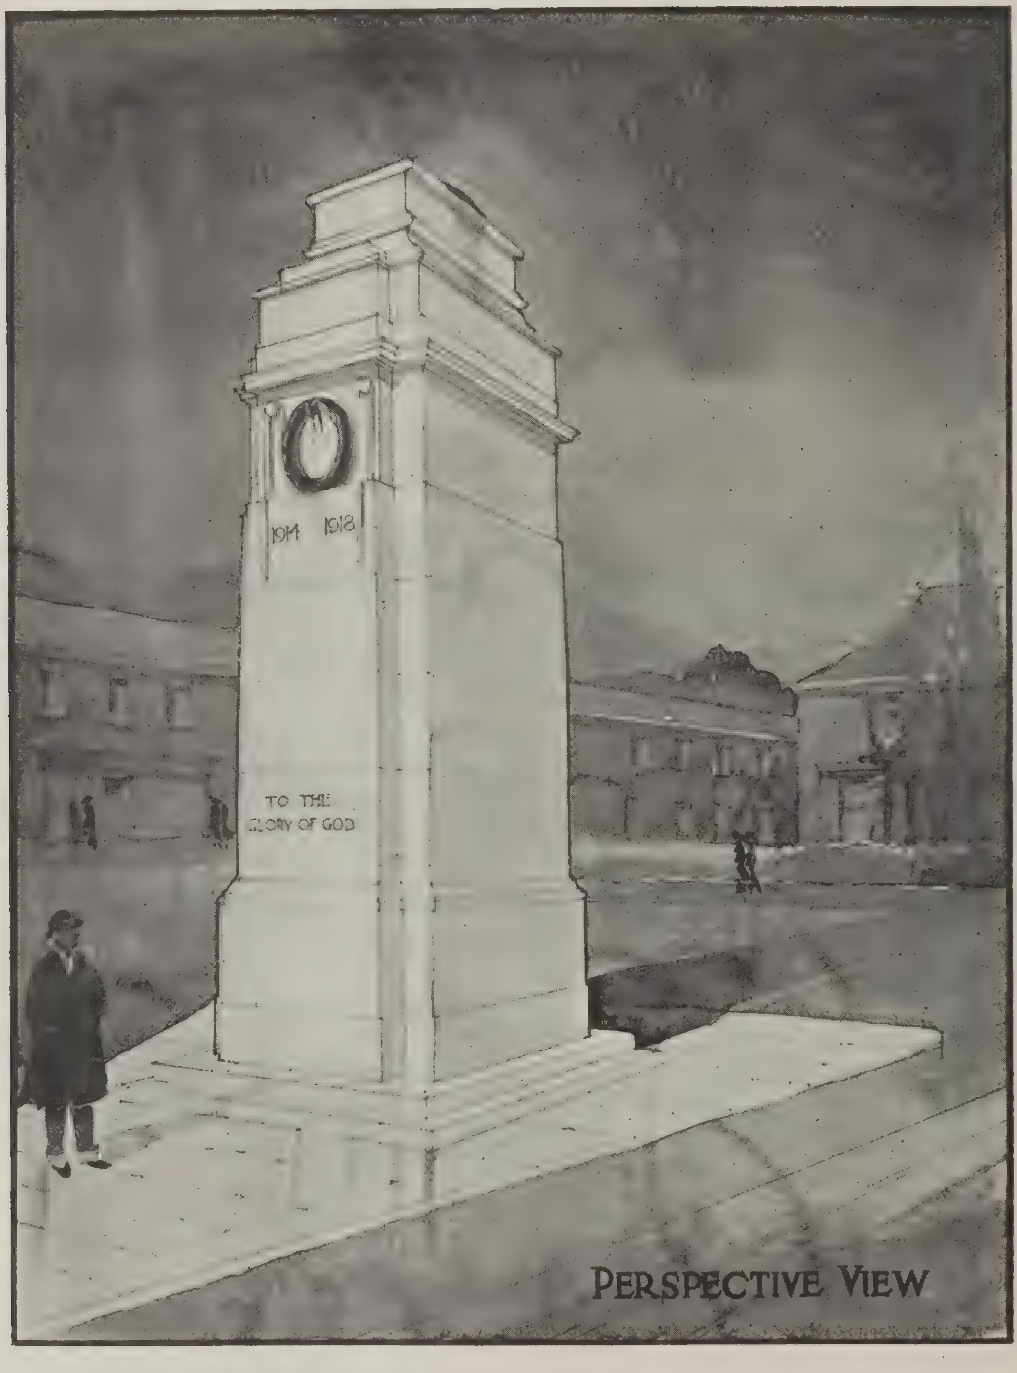
Newport War Memorial Competition : Perspective of First Premiated Design

Cyril F. Bates, A.R.I.B.A., and Colin L. Jones, M.S.A., Architects



The full awards in this competition were announced in our last issue. Commenting upon the design selected for first place, the assessor, Mr. E. Guy Dawber, F.R.I.B.A., observes: "It is a fine dignified composition, which, although frankly based on the Whitehall 'Cenotaph,' would look well in the position selected. The detail is restrained and suitably treated, and concentrated with bold effect at the top of the memorial."

University Degrees in Architecture

EVERYDAY art, or the art of common things, or the popularizing of art, is again the subject of vigorous discussion in "The Times." Mr. Sydney W. Carline has given it a fresh start and a new direction. He wants to see art taken up seriously by the universities. His argument is, in effect, that more specific recognition by the universities of the value of art as an instrument of education would powerfully influence the quality of the art education given in all the schools, and "correct the public indifference" to art.

A "Times" leader-writer, discussing Mr. Carline's letter, declares that "a degree has never been an important landmark in the career of a creator," and from this quite gratuitous assumption he deduces that the influence of the universities "might not benefit the cause of artistic education so directly as Mr. Carline anticipates." Creative artists have not greatly valued degrees for the simple reason that degrees, save those bestowed *honoris causa,* have never signalized accomplishment in creative art; and the leader-writer is very welcome to his opinion that artistic education would not benefit directly by the influence of the universities, because that is so obviously nothing more than speculative conjecture. So, of course, is Mr. Carline's very emphatic opinion to the contrary. Professor Selwyn Image, Mr. Arthur Keen, and Professor Beresford Pite, have all ranged themselves on Mr. Carline's side, and their entrance into the lists will serve to remind the public of what they are much too apt to forget—that architecture is the Mistress Art. That character must be strongly emphasized in any readjustment by the universities of their attitude towards art.

How comes it that art has been so persistently neglected by our universities? No doubt they have dimly perceived it to be a likely means of culture, for they have not seriously resented the intrusion of Slade Professors of the Fine Arts, and Cambridge has actually discovered in architecture a subject she may safely condescend to recognize, seeing that so many of her graduates are members of the Royal Institute of British Architects.

What is the cause of the long estrangement between Britain and Art, and the corresponding coldness of the British universities? Mr. A. B. Walkley, in one of those delightful articles of his that are so vividly reminiscent of the graceful method, now of Ste. Beuve, now of Brunetière, partly accounts for the British indifference to art when he reminds us that "the old Puritans condemned all art as sheer wickedness, because it was not an activity (as they thought) for the glory of God." "Sheer wickedness"—æsthetic wickedness—much alleged art undoubtedly is. Then, again, as Mr. Walkley remarks, "the Tolstoyan condemned all art that was not consciously designed for the service of man."

Although the average citizen of to-day cannot be justly accused of either Puritanism or Tolstoyanism, it is only too certain that he does not sufficiently appreciate art, and it is almost equally certain that he will esteem it much more highly when he observes that the great universities have taken it up to the extent of granting degrees in it. Cambridge, as we have noted, and as Mr. Beresford Pite was careful to remind the public, is already taking this wise course. "In June 1921, the university established an examination in architectural studies for the ordinary B.A. degree, and approved regulations for the inclusion of the history of art among the principal subjects. This new examination in architectural studies will gradually, beginning in the Easter Term, 1922, supersede the other examinations." The sole question at issue, therefore, is not whether architecture is a suitable subject for a university-degree examination, but in what way such examinations were best conducted, and this is a matter in which the many university graduates who are members of the R.I.B.A. are in a position to give, and are ungrudgingly giving, most competent advice.

In rendering this service they are as certainly promoting university education as they are raising the standard of architectural attainment. University status should be within reach of every architect in training. For centuries the older universities made a sort of fetish of the dead languages, until there was a serious revolt against compulsory Greek, and in the course of the controversy that raged round this question and the proposals for alternative subjects, it was grudgingly conceded that living interests may be at least as powerful as dead languages for the "advancement of learning" and the development of taste. It became a recognized principle in education to give a man an opportunity of following his bent rather than to force him to study a subject that may happen to be uncongenial to him.

Supposing, for instance, that a man confesses to a pronounced taste for the art, science, history, and philosophy of architecture; why should not a comprehensive knowledge of that subject be admitted to be a legitimate qualification for a degree, as, indeed, it now is in many British and American universities? Not that the graduate in architecture need be totally exempted from examination in classical subjects. The right study of architecture would seem to involve the classics: is a classical subject in itself. A fair degree of proficiency in the "humanities" would make him the better architect by expanding his horizon. It would bring him nearer to the heart of the history, mystery, and genius of architecture. It seemed so narrow-minded and unfair to deny a man university recognition because his mind had been mainly absorbed in the study of so noble, so humane, so concrete a subject as architecture rather than in that of "words, words, words." There is a sufficient content of culture and philosophy in art as a refining influence on life and thought—an influence that will be the stronger and the more valuable if it is subjected to the salutary discipline of a university course.

These facts being sufficiently clear, it only remains for all the universities to see the subject in proper perspective, scale, proportion. It has been, and is likely enough to be again, objected that the introduction of architecture as anything more than a paragon (let us translate it "side-show") is to risk degrading the university into a "glorified polytechnic." That would indeed be a calamity to deplore, and is not the idea at all. Oxford, or Cambridge, or any other university, is not to supersede the architectural schools, and thus far to forfeit its own distinctive character as a place of liberal education. Rather it will be the fostering mother of the architectural schools, nourishing and encouraging them, inspiring them with the highest educational and cultural ideals, and ultimately crowning their efforts.

At the architectural schools, there would then be greater freedom for practical work. At the universities, practical instruction would be developed and explained theoretically, historically, philosophically. That truly philosophical writer on architecture, Mr. A. Trystan Edwards, M.A.Oxon., in his remarkable book on "The Things that are Seen," lays much stress on the æsthetic advantage of "resolved duality" in design. Two windows ranged in line, for example, never look so well as a group of three, because, while it proverbially takes "two to make a quarrel," it takes three to make a composition—"to resolve duality." It is a notion that suggests itself as applicable to architectural education—a principle that is already well established in lay education, which is regarded as properly primary, secondary, tertiary; whereas in architectural training we get "unresolved duality"—the routine work of the office supplemented by that of the architectural school. It is a truncated system, and the situation yearns for a third or resolving factor—what but the university?

Besides relieving the architectural schools of much purely academical study, which would be much more profitably pursued in the serener atmosphere of the university, the prospect of a university career is undoubtedly an alluring attraction as well as a powerful incentive to study. Many architectural students have abandoned the notion of a university career through fear that it would take them too far away from the intensive study of architecture; and some have been restrained by *res angustus domi*. With a wise co-ordination of educational facilities, both these formidable obstacles would be removed. We venture to predict that they soon will be.

And there will be no mistake about the object; it is not to covet artificial and arbitrary distinctions, nor to encourage any sort of social snobbery. Neither is there any kind of assumption that those schools of architecture which are already allied to universities are superior to those that as yet are unattached. The aim is simply, as we have already said, the advancement of learning—to deepen the knowledge of architecture in its highest aspects, and to increase the respect for it both by its practitioners and in the eyes of those—an enormous number—with whom architecture would gain immensely in prestige if it were more regularly and more directly associated with university culture.

Sir R. Blomfield on Architect and Client

Under the heading "Taste in Architecture," "The Morning Post" refers, in a leading article, to a series of articles contributed to its columns by Sir Reginald Blomfield, R.A. In his articles, Sir Reginald assumed the unassailable position that, as the leader-writer expresses it, "the production of fine architecture depends as much upon the client as upon the architect." The leader-writer agrees, and adds: "As the client pays, he calls the tune. In the second half of the last century he called the tune in the City to such purpose that with a few exceptions the commercial premises of the City are of a surpassing ugliness achieved at an inordinate expense." Rightly our contemporary holds that the necessary compromise between architect and client would accord more frequently and more closely with good taste if clients would "give a little time to the delightful study of the art of architecture." We offer our sincere congratulations to "The Morning Post" on the soundness of its doctrine on this subject, and on its good fortune in enlisting so able an authority on it as Sir Reginald Blomfield.

The Danger to St. Paul's

For nine years work for the preservation of the dome of St. Paul's Cathedral has been in progress, and there remains much more to be done before the fabric can be pronounced safe. The commission of architects and engineers which was last year appointed by the Dean and Chapter to advise on the best means of ensuring preservation has not yet completed its inquiry, but has seen enough to prompt the recommendation that work of a very vital character should be done without delay, the surface of the piers and arches supporting the dome being in a condition that calls for immediate remedy. The Dean and Chapter are therefore appealing for a hundred thousand pounds with which to pay for repairs that are absolutely necessary for the preservation of the cathedral, which, in a specially inspired moment, Canon Alexander has dubbed "the parish church of the British Empire," while "Wren's great dome" is certainly, as the Canon says, "the symbol of London and the central feature of its landscape." As a monument to the consummate genius of its architect, and to the greatness of the race whence he sprang, it must and shall be preserved at whatever cost. A former Lord Mayor, known in that exalted capacity as Sir Marcus Samuel, but afterwards created Lord Bearsted, has given prompt and practical expression to that opinion; for from his sick-bed he sent, through the editor of "The Times," the day after the appeal was issued in that journal, a cheque for £1,000 to be forwarded to Canon Alexander for the St. Paul's Cathedral preservation fund, and we should be glad to see his generous gift speedily multiplied a hundredfold; but that remote possibility need not deter the donors of smaller sums; which, indeed, according to latest advices, seem to be coming along in encouraging numbers.

L.C.C.'s New Regulations as to Theatres

London County Council agenda for last week's meeting was of special interest to architects and builders, as setting out in full the revised regulations for theatre, music-hall, and similar premises. (A summary of the regulations is given on page 64 of this issue.) Although the Theatres and Music-halls Committee of the Council state that they have made no very material change in their regulations except with regard to roofs, it will be found that they have drafted a number of minor regulations, and the amended requirements should therefore be studied throughout with great care, and to that end should be issued in pamphlet form, at a nominal price, and in sufficient numbers to be constantly available for purchase, and not merely kept for consultation at the Council's office, where they are rather less convenient of access, and rather more jealously guarded, than if they were precious legal documents filed at Somerset House. The new regulations with respect to roofs are certainly rather drastic. They refer, like most of the regulations, to fire-protection. Under the old regulations, the theory was that the roof over the stage should be of such flimsy construction that on an outbreak of fire on the stage it would be burnt through at once, thus affording an outlet for the flames, which, with the aid of the fireproof curtain, it would divert from the main building while the auditorium was being cleared. This ingenious safety-valve theory is perpetuated in a modified form. Updraught is to be secured by enlarging the lantern light, which is to be increased from one-tenth to one-sixth of the area of the stage. It is a pity, however, that solicitude for the safety of the audience should involve a suggestion of callousness towards the actors; for whose comfort and welfare, however, additional provision is made in several of the by-laws—as, for instance, in those with respect to dressing-rooms, lighting, heating, and sanitary accommodation. We are told with seeming obliviousness to the ludicrous effect of the homonym, ventilation is to be the subject of separate draft regulations. *Absit omen!*

Short Shrift for Unification

The new Council of the R.I.B.A. has made prompt use of the power given it at the recent elections. Of course, in dissolving the Unification and Registration Committee, the Council is doing only what was expected of it; but this wholesale massacre of the innocents might surely have been done a thought more painlessly. As to drafting a Registration Bill, the Council would now be well advised to spare itself the trouble and expense. No matter how wisely it were drafted, a Registration Bill from a mere fraction of a profession, and from an Institute divided against itself, stands no earthly chance of success in Parliament. It would be dismissed with contemptuous laughter, though not more summarily than the Council have dismissed the Registration Committee.

The Architect and the Theatre of the Future

By HERMON OULD

Editor of the Theatre-Craft section of "The English Review"

"HE who can, does. He who cannot, teaches." Precisely; that is my case. I am not an architect; I know nothing, strictly speaking, about architecture, but I can go one better than the bromidical person who confesses that while he knows nothing about art he knows what he likes; for not only do I know what I like, I know what I want—in theatre architecture. I leave to the professional architect the problem of how to achieve the structural changes which I, as one whose paramount interest is the art of the theatre, wish to see brought about.

Those who have followed the course of development of the art of dramatic presentation will know that since the days when the Greek theatre offered its masterpieces on a stage almost bare of equipment to an audience whose only covering was the sky, the tendency of theatre architecture has been almost constantly in the direction of closing in. The mediæval mystery-plays and moralities were also offered to the people under the dome of heaven, but by that time the process of separating the public from the sphere of the drama had already begun; whether they were presented at the porch of a church or in the market-place, some booth-like erection became the scene of action, punch-and-judy fashion, and the audience was kept at a becoming distance. The sense of rapport between players and audience was maintained, however, by the knowledge that most of the players were local worthies who would probably some day change places with the lookers-on. The theatre was still a social link; something which joined people together by striking chords common to them all. It was probably not until the sixteenth century that there were professional actors—a class apart.

Then came the Elizabethan period, bringing with it a glorious wealth of dramatic literature—and the first closed-in theatre. Not entirely closed in, however. Everybody knows the shape of the three-tiered Elizabethan stage, so admirably adapted to the needs of Shakespearean drama; but does everybody realize that the early Elizabethan theatre, although walled in on four sides, was still practically an open-air theatre? The stage was covered in, but the pit was roofless and the audience exposed to the air.

And then, in 1596, England had a theatre which was entirely walled and roofed in; and the effects of this innovation have hardly been appreciated by students of the drama. It involved, first, a reconsideration of the problem of lighting. Daylight could no longer be drawn upon, and artificial light was then of the feeblest. We who are used to the fierce glare of electric light of incredible voltage can hardly picture the modest lighting equipment of the Restoration stage. But it was a humble little row of footlights which began the whole of the mischief and brought about the complete and final divorce of play from public. Thenceforth the stage performance and the audience became two entirely separated entities, the audience in one box with a wall knocked out, the play in another box with a wall knocked out. The players became more and more impersonal. The culmination of this tendency is shown in the cinema, where the audience is not merely cut off from the players by a row of footlights, but by the distance which separates the picture-palace from the studio where the film-play was photographed.

This divorce between stage and public has had some good results; it has produced the intimate drama. Much of the work of Ibsen, Shaw, Hauptmann, Strindberg, Barker, Masefield, Galsworthy, and Pinero can only be conceived in terms of the "box" setting, wherein their puppets display themselves as if no audience were present. But it has also had the effect of making a cleavage between the theatre and the people which cannot but be regretted. The glory of the Greek theatre was due largely to its intimate contact with the public. The whole of Athens would sit enthralled before the sublimest of the tragedies, and be no less held by the broadest of Aristophanic farces. In ancient Greece the theatre was an essential and integral part of the life of the people; in mediæval times it was scarcely less so; in Elizabeth's reign, with its Chronicle plays, performances in inn-yards, and later in the playhouses, much the same relationship was maintained.

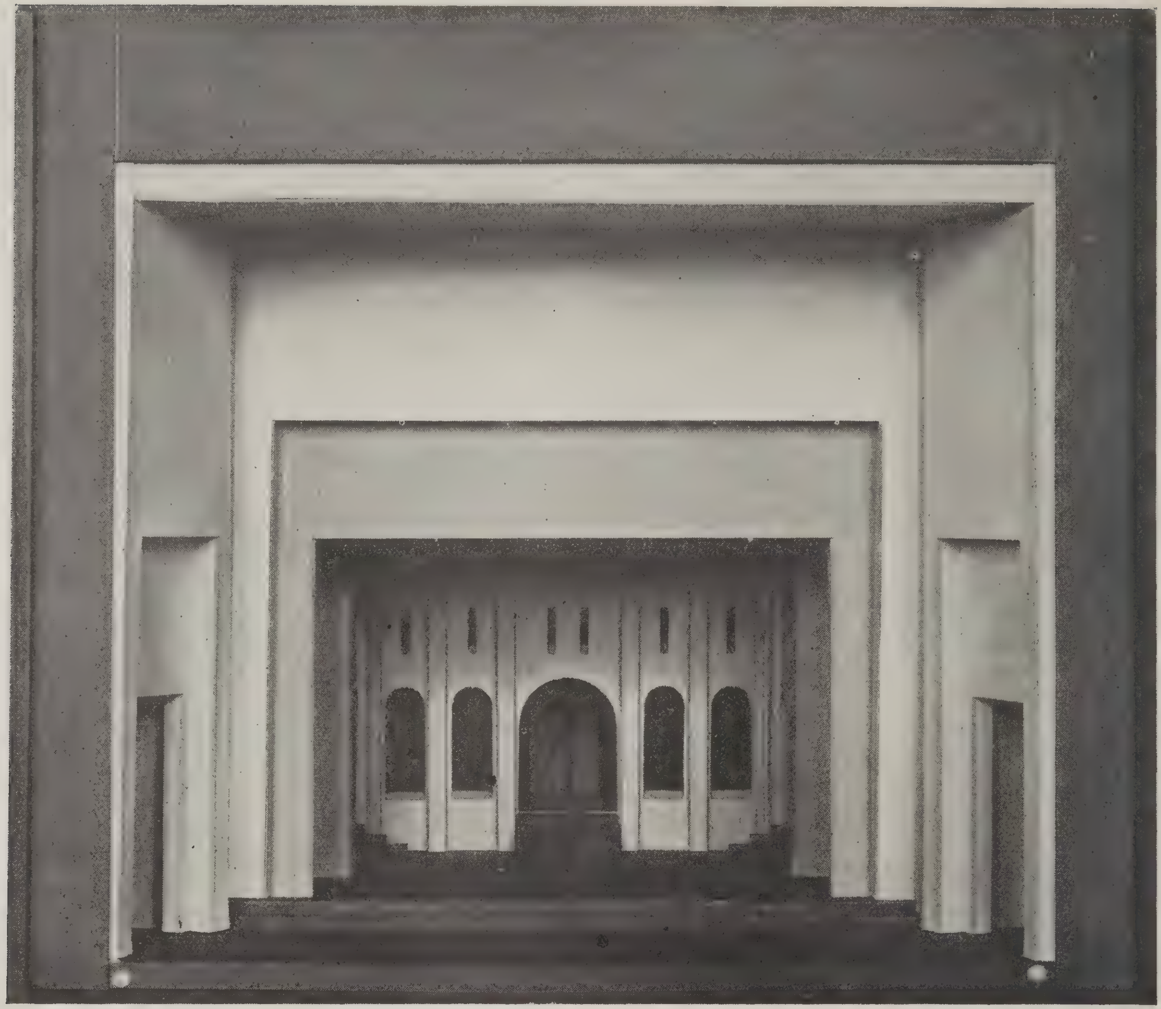
I do not want to return to the Greek, nor to the Elizabethan stage; nothing is ever gained by returning to anything, every age having its appropriate expression. But I do want to see a theatre suitable for the performance not only of so-called realistic plays and of the plays of Shakespeare, the Greeks, Ibsen and Shaw ("Peer Gynt" and "Androcles and the Lion," for instance), and other plays whose spirit protests against the box form of stage, but above all suitable for the performance of those plays which I, assuming the mantle of the prophet, feel convinced will be written as soon as the enormous social importance of the theatre is once more realized, as it was realized in Greece.

In other words, I want an adjustable proscenium arch. That is to say, a proscenium arch which can be reduced to the smallest opening consistent with leaving sufficient stage-space within the range of vision and—more important still—can be got rid of altogether when necessary. I do not know how it can be done; that is a problem for the architect; but I am sure it can be and will be done before many years have passed. The closing in of the stage for intimate scenes is easily enough achieved by building up a frame-work within the proscenium arch. It is the banishment of the arch altogether which presents a real problem.

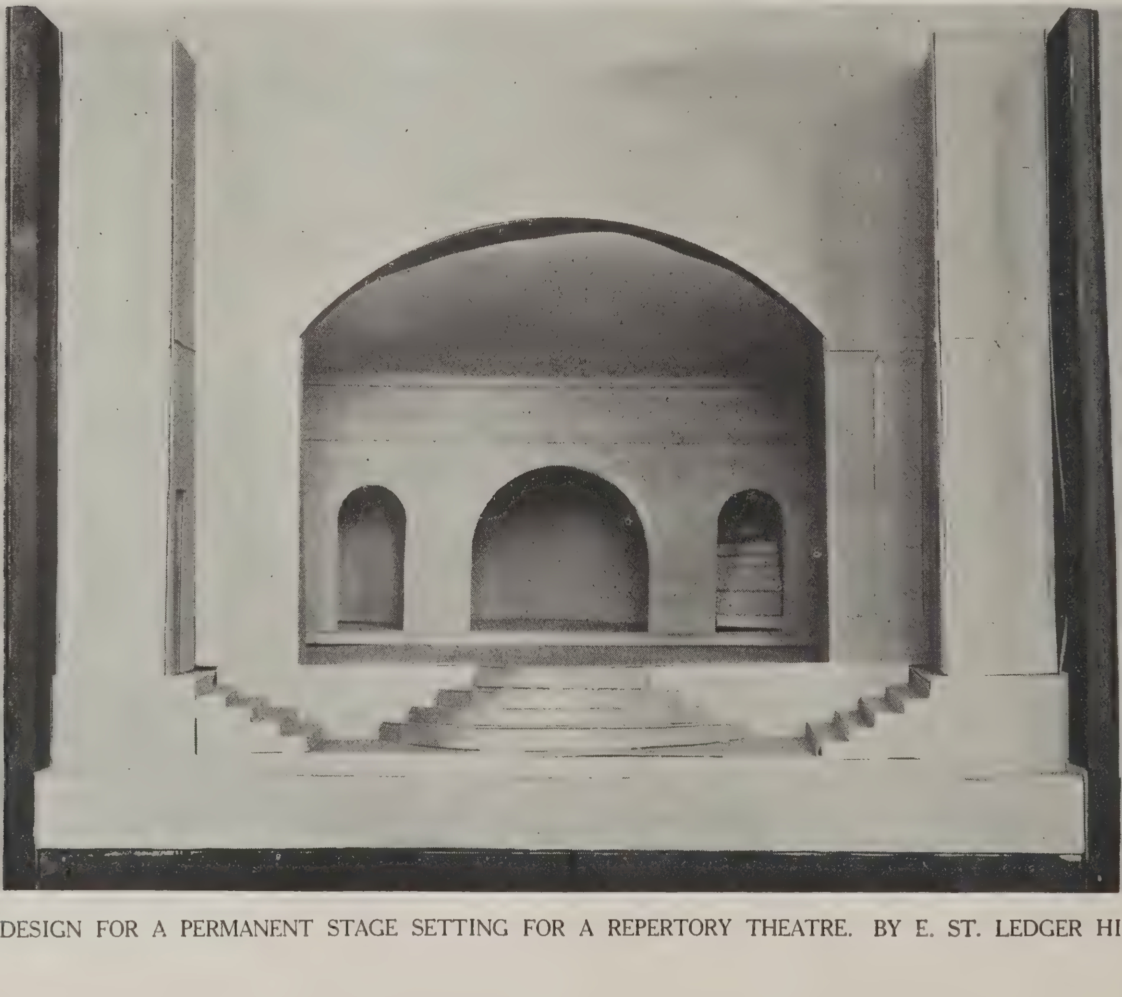
There is a little theatre in Berlin, Die Tribüne, which has no proscenium arch at all, and a performance which I saw there of Shaw's "The Showing-up of Blanco Posnet" (in German, which I only partly understood) provided a thrill altogether different from anything I have experienced from performances on a boxed-in stage; one ceased to be a mere spectator, and became a partaker. I want to experience the same sensation again; I want plays to be written which will quite consciously regard the audience as one of the participants in the performance, and I feel sure that it is only by making the abolition (when necessary) of the proscenium arch practicable that these things will be attained.

It is a problem for architects, and I hesitate in this JOURNAL to suggest ways and means which I think might be workable. But I should welcome architects' suggestions with becoming warmth.

(And may I add parenthetically that I have not overlooked the L.C.C. regulations about safety curtains?)



1.—STAGE SETTING FOR THE MURDER OF DUNCAN SCENE IN "MACBETH." BY NORMAN WILKINSON.



2.—DESIGN FOR A PERMANENT STAGE SETTING FOR A REPERTORY THEATRE. BY E. ST. LEDGER HILL

Stage Settings and Sceneries

By GORDON H. G. HOLT

YET another week, and the greatest exhibition of theatre designs ever seen in London will be closed. I would, therefore, urge all those readers who, upon hearing of its excellences, have determined to see it, but who have made, so far, no move in the matter, to hie themselves to the Victoria and Albert Museum before the week is over, and really see the wealth and diversity of the exhibits shown.

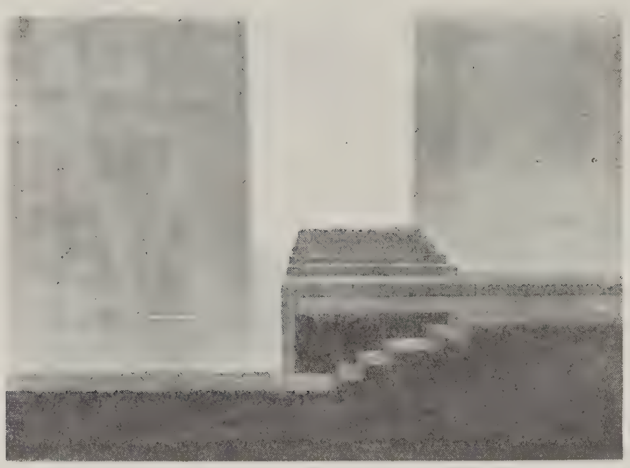
In two former articles bearing on this exhibition I had occasion to dwell upon the more architectural aspects—upon the designs, the plans and elevations, and characteristic features of certain theatres. Let me conclude a necessarily sketchy survey with a few observations upon some of the stage settings and sceneries.

Justly enough, a good deal of attention has been bestowed upon the works of foreign artists. Throughout the exhibition it has been evident that what most struck most visitors (of the less dilettante type) was the quality of work shown by these foreign artists. Again and again the Americans and Russians were much criticized or praised on that score. The Dutch and Germans often; seldom the French. But the Russians have nothing to show in the strictly architectural line, so to speak; all their stuff is concerned with what happens upon the stage itself. The Americans let you go with a free hand, and they, too, are more concerned with focusing the attention upon the stage. Really, it is left to the Germans and Dutch to show how a combined effort, how co-operation, can best produce an effective stage set in a building designed for that purpose. The British, with the exception of an excellent model of a proposed new building for the Everyman Theatre, in London (486a), by Mr. McDermott, also seem to have concentrated upon stage settings, and, as was suggested before, in that respect they are second to none.

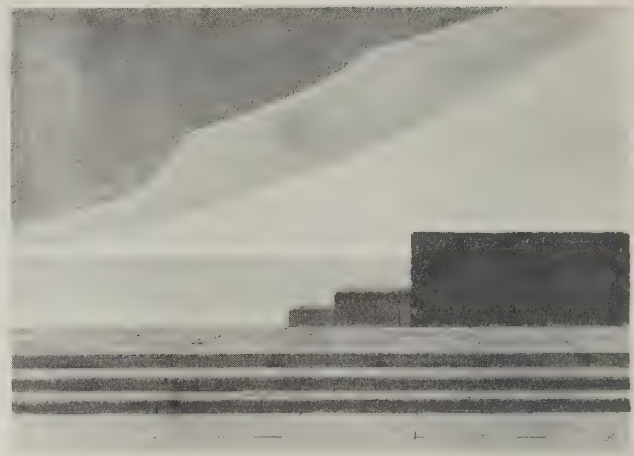
3.—STAGE SETTING FOR ACT 2 OF "THE WITCH," PRODUCED AT THE BIRMINGHAM REPERTORY THEATRE IN 1920 BY PAUL SHELVING.

On the whole, the fine extravagance and reckless conceptions so dear to foreign minds are given a somewhat wide berth by the British. Ours, evidently, is a more cautious mind, and it is natural that, to such, simplicity of presentation should be given a sustained trial. "The world is still deceived with ornament," said Bassanio. Let us not deceive it too far, or, if we do, let the deception be done handsomely within the stage itself, with fine talking and fine acting. But let the stage setting be simple. It will act as an effective foil for the crop of rich and terse emotions born there for our delight. This view is clearly held by Mr. Norman Wilkinson, if we look at the model in Fig. 1, conceived and made for the murder of Duncan, in "Macbeth," where reliance has been placed upon its good proportions and a wise assemblage of its component parts. That central doorway, those thin arch-headed windows, the flat piers, the rhythm of those narrow slits above, all held taut by the rigidity of the rectangular frame, are excellent. And the side doors, in the fore, so often indispensable for Shakespearean acting, are unobtrusive.

Far less successful is Mr. St. Ledger Hill's permanent stage setting for a Repertory Theatre (Fig. 2). Why it is so is fairly obvious. I heard a leading actress remark upon seeing it, that it was too very simple. I don't think this is quite the reason why one does not like this model, because simplicity, as was shown by Mr. Wilkinson, can do the trick any day, if well understood and well applied, which is not the case here. Those three openings within one large opening are quite all right, as a conception. What is wrong here is the detail (such as it is) and, above all, the scale.



4.—STAGE SETTING FOR "ORPHEUS"
BY ADOLPHE APPIA.



5.—A STAGE SETTING FOR "ORPHEUS."
BY ADOLPHE APPIA.

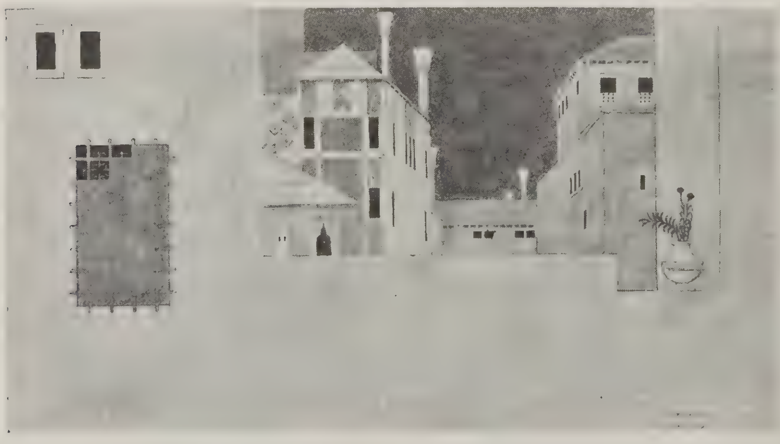
There is no satisfactory relationship between the openings and the steps. Here, the human figure is not seriously considered. We can all assure Mr. St. Ledger Hill that it is not desirable to start the springing of an arch to any door opening, say, 2 ft. 9 in. from the ground. The panelling and the distribution of the steps are also unhappy, and that, taken altogether, is why the effectiveness of this kind of simplicity is defeated.

A rather novel way of backing up the nakedness of a plain frame with more substantial or lively shapes is shown in Fig. 3, of a stage setting for Act II of "The Witch," produced at the Birmingham Repertory Theatre. Mr. Paul Shelving has here tried to bring off a clash between static repose and dynamic activity, the one bursting the other. To my mind, this pleasant bursting is bound to occur, because the frame, for all its width, can only oppose the inertia of its nice flat surface to the incessant vicissitudes of the more active lines held within. Another weakness to be observed is the intense realism of this log-cabin. It will never accord with the blank symbolism of its frame. The way to introduce realism is much easier. . . . This getting busy with actual shapes and trying to fit them in is wrong.

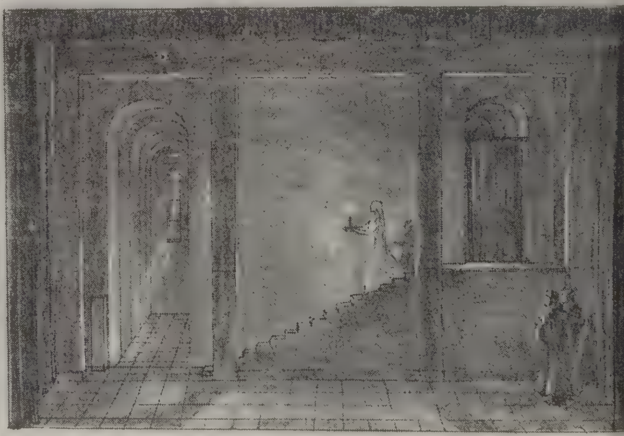
The thing to do is first to think of elimination, and get busy afterwards. The thing to do, as seen by the thing done, is to watch Mr. Norman Wilkinson do it. In Fig. 6, this drop curtain prepares us for the passionate love romance of "Twelfth Night," that last play of Shakespeare's golden period. Throughout the writing there is much to show that the play was designed for performance upon a bare platform stage without traverses or inner rooms or the like. If you remember, the scene changes constantly from anywhere suitable to anywhere else that is equally so; and therefore, under the circumstances, the thing to do to prepare and hold the attention is to give a something typical, but shorn of its anecdotal incidences, and this is where Mr. Wilkinson triumphs. The flatness of his scenery is in its favour. So is the kind of aloof realism shown. The large bare foreground helps the feeling of austerity, and the negative shape of the sky and the positive shapes of the roofs are well studied and skilfully tucked away, neither too small nor too big.

But for epic simplicity, for gorgeous simplicity, let me refer you to Adolphe Appia's work. Our own Gordon Craig, so richly imaginative and so keen, handsomely acknowledges the greatness of Appia, and many wise and learned people hold the view that Appia is the greatest living stage designer; at any rate, the noblest. He seems to possess that most intractable of gifts, to create an enormously rich and magnificent effect by the simplest possible means. With him, one is face to face with eternal principles, with impersonal emotions, with something mighty big and worth while. Figs. 4 and 5, of a stage setting for "Orpheus," may perhaps convey a little of his power. These are only two out of eighteen designs. Eighteen fine designs; eighteen fine drawings. They stir. There is no playing up to the gallery; no swank; no compromise. Just something as beautiful and as simple as possible, but turned out with a care to its parts.

Appia is the man. It looks as though, if it is worth your while to say "Crosse and Blackwell" to your grocer, it should now be worth while to say "Appia" to your theatre producer. I saw, and kept watch on, three such producers at



6.—DROP CURTAIN FOR "TWELFTH NIGHT"
BY NORMAN WILKINSON



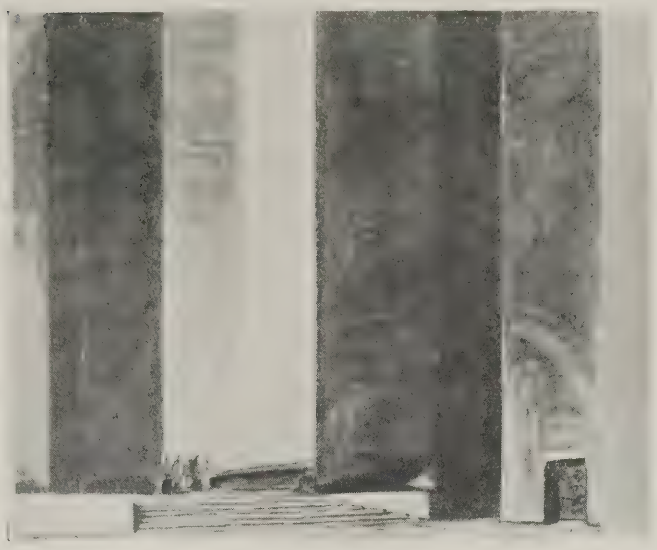
7.—DESIGN FOR A SCENE IN "MACBETH," ACT 5.
BY F. SCHUMAKER

the exhibition; it says much for Appia's power that even they—well known and important as they are—stopped quite a time to look at those drawings, and one of them fairly sighed as he remarked that, by Jove, this was dashed fine stuff; but, of course, it wouldn't pay!

When I first saw the accompanying design for a Shakespearean tragedy by E. de Weerth (Fig. 8), Pearsall Smith's delightful "Apotheosis" came to my mind at once. Maybe that by quoting from it I shall be able to make the reader see the danger of those grandiose designs, all so "dramatic" and huge:—

"But oh, those heavenly moments when I feel the trivial universe too small to contain my 'Attributes'; when a sense of the divine Ipseity invades me; when I know that my voice is the voice of Truth, and my umbrella God's umbrella!"

One of the nicest designs on view at the exhibition is that fine one by Schumaker (Fig. 7) for Act V of "Macbeth." Once again we see a simple treatment of three openings, square-headed this time, so as not to rob the lesser openings at the back of their more intimate charm. This background is fine and subtle. That one landing door on the right-hand side, whose folds have just been noiselessly disturbed by the striking white figure, and also that other opening on the left, with its quattrocentist vista, are both contributing to the general effectiveness of the setting. It were unfair to leave off without paying a deal of praise for the lovely setting to "Pélleas et Mélisande" in Room VII. It is one chiefly of vertical masses of soft colour, all more or less alike in width. It changes in its rhythm as the scene alters, but not enough not to leave a sense of unity throughout the play. Here a distinct sense of sumptuousness, of mystery, of power, can be had. Let the scene be enacted; let words fly; let strong and swift action take place, and let their happenings sink into and emerge out of those vast pools of colour. Thus will you enhance their value. That is one way of showing up the action, of helping to create strong emotions. The Russian way, on the whole, is vastly different, but it is such a powerful one that to miss the room devoted to their work would be to miss the exhilaration of contrasts.



8.—A SHAKESPEAREAN TRAGEDY BY E. DE WEERTH.

As it happens, a good many of the stage settings shown in this room have already been on view two years ago at the Whitechapel Art Gallery; but, of course, it is expecting too much of the London public that it should bother itself to the extent of going to such unseemly and distant regions, so that those extraordinary designs and costumes will seem new.

Not altogether so with Larinow, perhaps. His "Chout" may still be remembered. But Komisarjevsky and Gontcharova should be gazed at. Such a jolly, crazy, and fine medley of colour you never saw. The curtain for "Triana" or for "Foire Russe" are mighty challenges. "Mon dieu! quel bariolage!" uttered Anatole France's little maid, in one of his early writings, upon beholding for the first time a full-throated county fair. "Heavens alive, what *a fine* mess!" said an enthusiastic schoolgirl, as she discovered the costumes for the "Coq d'or." So this room, cubist as it may appear to some, has nevertheless an intoxicating quality, and as such plays its part in stirring the imagination. Beside, one forgives a lot to the Russian artist, for it is not every day or in every country that one comes across such amalgamations of colours; what he creates are no mere fugitive spasms of anger or of delight. Praise be to him, if only because what he does he does so overwhelmingly.

9.—SETTING FOR "PASSION" BY BACH. BY GORDON CRAIG.

Dr. Thomas Ashby on "Recent Excavations at Rome"

IT is proper that we as a nation should be interested in Rome, for have we not become Rome? Through all the vicissitudes of our history, through all the successive increments to our civilization of Norse, Teuton, and Gallic nationalism we have somehow, almost by accident, preserved the Roman tradition. Much has been said of our powers of Empire building, but if there is one faculty which distinguishes us from other nations it is our Roman ability of embodying a conquered nation in our own. Our law, by some strange accident of succession, is Roman, and our language is Roman. Many instances of this similarity of the two nations were referred in the discussion on the paper read before the R.I.B.A. by Mr. Thomas Ashby, D.Litt., Director of the British School at Rome, on "Recent Excavations at Rome."

Dr. Ashby, in the course of his paper, said: My pleasure in accepting your invitation to address you is increased by the fact that I appear to be the successor of Professor Lanciani, my teacher in Roman topography, to whom, in common with many other of his old pupils and friends, I shall always feel a debt of gratitude. Since he delivered his address on "Architectural Results of the Latest Excavations in the Forum," no one has spoken to you on the subject of recent discoveries in Rome.

No discoveries of first-rate importance have been made of recent years within the centre of the modern city, but it is worth noting that the construction of two large banks in the Piazza Colonna, one of them the Banco di Sconto, of which a good many of us heard a little too much at the beginning of the year, led to the discovery of a large group of blocks of houses of the middle of the second century A.D.

The exploration, under the direction of Professor Lanciani, of the substructures of the Baths of Caracalla, have thrown great light upon the details of the construction of these baths, and have brought to light the largest sanctuary of the Persian Sun God Mithras that is known to us—which was introduced there at a later date. Considerable work has also been done in the outlying portions of the baths, which would now form an excellent subject of study for one of our architectural students.

I may add that though there has been a good deal of building activity in the central portion of Rome during the last few years, the other few important outstanding discoveries with which I shall deal have all been made in the outskirts, and all either during or since the war. First of all comes the famous basilica near the Porta Maggiore, which was discovered in 1917 owing to a landslip under the Naples main line, caused by the presence there, hitherto unsuspected, of the light shaft of its vestibule. The exact date to which it belongs, and the purpose which it served, are still the subject of much controversy. Personally, I am inclined to accept the theory that it belonged to the Statilian family, a member of which, T. Statilius Taurus, was accused of magical practices by Agrippina, the wife of Claudius, and took his own life to escape a worse fate. I am inclined to think, too, that the desire for secrecy explains the method of construction. It would seem that the concrete of which the walls and piers were constructed was poured into pits sunk in the virgin soil, which was also used to support the vaults while hardening. When the concrete had set, the earth was removed and the interior of the building cleared from beneath, so as not to attract attention. The walls and vaulting are decorated in white stucco. The figures and scenes are not in themselves difficult of interpretation, though the principle of their selection is not at first sight obvious. Mrs. Strong, however, who interprets the difficult scene in the apse as one of purification by the ordeal of water, points out that all the other scenes can be referred to the wanderings of the soul and its progress towards its final goal.

Not very far off, in the Viale Manzoni, a hypogeum of quite a different character and date has still more recently been discovered. Above it was a lofty brick tomb of a type familiar enough to us in the Via Appia and the Via Latina, in the base of which (the only part preserved) is a sepulchral chamber with arcosolia and burials in the floor. The paintings are damaged, but Adam and Eve may clearly be recognized. Just outside is a staircase leading to a landing, on the left of which is the entrance to a subterranean chamber with vaulted roof and a large light shaft in the centre, and an arcosolium on the right and left. The paintings with which this chamber is decorated have recently excited considerable interest owing to the fact that an incautious correspondent announced the discovery here of contemporary portraits of Peter and Paul. It is not impossible that they may be recognized in two of the twelve male figures which decorate the lower part of this wall, but there is no doubt that the paintings cannot be earlier than the end of the second or the beginning of the third century A.D. The paintings on the upper part of the wall have not yet been interpreted with any certainty. It is generally agreed that they are Christian, but some have desired to see gnostic influence in them. I myself am rather inclined to suppose that there was a certain amount of intentional concealment of their Christian character.

The building we have just described lay close to the Via Prænestina before its divergence from the Via Labicana, and a number of interesting tombs have recently been found on some of the other high roads which radiate from Rome. An especially interesting group is that which has come to light on the Via Ostiensis, near the church of St. Paul, outside the walls. The tombs fall into four different periods, and the best of them are some columbaria (which take their name from the small niches, like those of a dovecote, in which the cinerary urns are placed) belonging to the second period, from the beginning of the empire to the end of the second century after Christ.

Some other columbaria have been found under the church of S. Sebastiano on the Via Appia, which are especially interesting from the freedom of their style and the beauty of their stucco decorations—in one is a peacock with the tail shown in colour, while in the other the ceiling of the principal chamber is covered with the tendrils and bunches of grapes of a vine springing from the angles.

A little beyond the church a tomb has been found which marks the transition between cremation and inhumation (beginning of the third century A.D.), having been constructed from the first, with eleven small niches for urns and three recesses for bodies.

The foregoing account cannot pretend to be in any way complete. Many discoveries of minor interest have, perforce, been omitted, and those which I have described have not been dealt with with as much detail as they deserve.

Discussion.

Professor Lanciani, after referring to his long association with Dr. Ashby in the work of discovering Rome, said that the excavations in Italy were still going on, and that more had been discovered lately than hitherto. Just before he left Italy a tremendous discovery had been made: the remains of an even earlier civilization, dating from the tenth or eleventh century B.C., from which Rome must have sprung. This discovery took the foundation of Rome back several centuries. By this discovery of

Etruscan pottery and Etruscan graves and fragments of building it was likely that they would now be able to settle the birthday of Rome. In Rome they were now engaged on reconstructing the ancient edifices, and had actually begun to form an archæological park.

Professor H. E. Butler, of London University, who seconded the vote of thanks, said that he had not been in Rome for eleven years, so could not speak on recent discoveries. He would like to point out, however, regarding that corner of the Palatine occupied by San Sabastiano, that the Palatine was such a great mass of excavated and unexcavated work that it was difficult for any one to know all its ramifications; and as to that particular corner countless different theories existed.

Professor Beresford Pite said how like Rome London was: it had town-planning committees, and we prevailed upon the distant cities of our Empire to plan their towns, yet London never thought of applying the doctrine to itself. As with us, the original lines of the thoroughfares of Rome were established along the contours and valleys. These roads crystallized and became sacred. It was exactly the same in Athens, that abominable nuisance of the Acropolis was always in the way. It was so interesting to notice that Julius Cæsar, great general and conqueror that he was, should have been so warm-hearted and thoughtful as to contribute towards the amenities of Rome. Roman building took the form of a swelling mass of architectural grandeur in spots, and the planning of those spots was the stock in trade of the modern architectural competition winner. In Rome there was the extraordinary ignoring of the civil conditions of life. Acre after acre of useless public space were given up to the fora or what-not, and the people were practically forced into flats, as we, for different reasons, were forced to do likewise. How interesting it was that history repeated itself; we were the centre of a vast empire, and we were like the Romans, too busy with our cosmopolitan affairs to attend to the simple needs of life.

Mr. Edward Warren said it was strange to find that the Roman civilization, as far as the material conditions of life went, was not very far behind us. True they had not high explosives and electricity, but there were not many things in which we may be said to have advanced beyond them. In 1913 he was privileged to visit some excavated work under the guidance of Commendatore Boni. He remembered in one case there were three houses superposed one upon the other. In another case he was shown what was in fact an hydraulic lift with something of the machinery still left. The Romans had certainly arrangements for heating their buildings. He would like to ask Dr. Ashby how the Roman streets were lit at night and how the street vehicular traffic was controlled, also if iron was used to any large extent in the reinforcement of concrete. The only case he knew was in the Baths of Caracalla.

Mr. A. T. Bolton said was it not a fact that the Romans in some cases built their concrete vaults on earth centering by first piling up the earth, then digging into it to make a mould into which the concrete could be poured, or more likely by digging straight into the earth to make the mould and then clearing out the earth around or under the structure when the concrete had set?

Mr. Paul Waterhouse said that the thanks of the Institute were especially due to Dr. Ashby in that it was the first to receive this gift from his storehouse of knowledge.

Dr. Ashby, in replying to the questions asked, said that of town planning in Rome itself there was a complete absence. The roads in Rome were originally fixed by the shapes of the valleys. What mattered more to the Romans was their great military roads; they were definite; and the points of issue from the city on to those roads were fixed, and any town-planning scheme had to conform to them. As to Roman domestic architecture, the best place to study Roman houses was Ostia. There one discovered how strikingly modern was their planning. The Pompeian house was by no means characteristic of the Roman type of house. The houses were exceedingly well planned, and differed one from the other. The lighting of Roman streets was by lamps, and vehicular traffic was never allowed through Roman streets at night, except in the case of privileged persons. He knew of no other instance of the reinforcement by iron than the Baths of Caracalla. There were other instances of reinforcement, but they were by tiles. The use of earth as vault centering was an exceptional thing. Corbels remaining in buildings go to show that there was wooden centering. F. E. T.

Regional and Vocational Influences in Architecture

A Paper read before the Sociological Society in London

By S. C. RAMSEY, F.R.I.B.A.

> *"The sure and certain hope for the fruition of the New State is in the coming of a generation endowed with a steady outlook towards the future, yet accustomed to turn to the past critically though affectionately. For the future can never be disconnected from the past, but must ever be continuous with it. By deliberate selection from past tendencies surviving into the present, and by judiciously planned recombination of them, we may shape the future."*—"The Coming Polity."

IN a paper which I had the honour of writing for the "Sociological Review," I attempted to describe the regional and vocational influences that produced the ancient architecture of Mesopotamia, Egypt, Greece, Rome, and mediæval Europe—the place, work, and folk, and the resultant habitations. Here I hope to show that the same fundamental conditions of place, work, and folk, when cleared of all modern complexities and complications, still determine and control our architecture.

In all countries throughout the ages, the great building people have always been the agriculturists, the peasants. Some of their best building achievements have been accomplished in conjunction with the shepherd builders of the hills, for the peasants, if left entirely to their own devices, tend to become dull. They require the inspiration of the shepherd, with his mystical imagination, if they are to produce imaginative architecture. But it is when shepherds and peasants meet the sailor at our ports that we get what is the finest architecture—the architecture of capital cities, of Edinburgh, London, Paris, and recently, of New York; or the architecture of great seaport towns such as Venice, Genoa, Bordeaux, and Liverpool. For the sailor possesses an imaginative range that even exceeds the shepherd's. His vocation brings him into contact with foreign countries and men of all nations. He is a disturber and irritant, he comes and goes, sets men's imaginations on fire, always wants to be trying something new—he shakes us out of our rut and sets us travelling along new roads. When he is the dominant factor in a community his influence upon its architecture is profound. I should describe the Elizabethan civilization as a sailor's civilization, and Elizabethan buildings as sailors' buildings.

In our own age, however, it is not the sailor who is the dominant factor; it is the coal-miner. Our age has evolved from the Victorian, and the Victorian civilization was essentially a miners' civilization. Victorian building was of the camp or settlement variety, temporary and muddled, without real tradition, permanence, or ordered beauty.

In the early days of coal-mining in this country, everything, including the housing of the miner, was of a temporary and make-shift character. The whole of the industrial portion of England (not to mention Scotland and Wales) was turned into one vast mining camp, and the ideals of the mining camp—the temporary house, and the no less temporary, but rather more gaudily decorated drinking saloon—rapidly became the models of all our buildings.

If you would wish to take a typical development along the lines of the miners' camp, I cannot do better than refer you to the ribbon towns of the Rhondda Valley in South Wales. Here you see it all; rows of brick transfigured shacks, gaudily decorated saloons or gin-palaces, and as a counter attraction the scarcely less terrible efforts of the modern Welsh chapels. For a long time it puzzled me as to why these Welsh chapels were so bad architecturally, but I believe the answer is that they had to rival the attractions of the miners' saloon—and so we find them, not only in the industrial parts of Wales, but in the agricultural centres as well—for the coal-miner as the dominant vocational type imposes his will on all—and not only in Wales, but throughout England and Scotland.

In the industrial regions enormous tracts of what was once beautiful country were covered with the sprawl and litter of the camp. Around London and the older towns the ever-growing population was housed in row after row of suburban shacks, vainly trying to disguise their miner origin in all kinds of architectural nonsense.

One very striking characteristic of the inhabitants of our pre-war suburbs was the itch for change—at the end of every three years a great number of them, pushed forward by the desire for change, or possibly the vain hope that the new shack would have more amenities than the old, moved from one suburban residence to another. This constant moving round created an atmosphere of instability in which it was impossible properly to develop either the love of home—meaning dwelling—or love of community—meaning town.

In the past the old military camps gave us many a beautiful village and town, but they started with a definite sense of order, and if not permanent themselves they had within them the seeds of permanence; but the most striking feature of our mining camps is that they had no sense of order or organization—they were nothing but muddle.

During the whole of this industrial period we built with feverish energy—the energy of the miner—but with no joy in our building, and consequently no beauty. For the first time in the history of man "to build" was synonymous with "to spoil." Previously, all buildings, or nearly all, whether the single cottage, or house, or the collected buildings forming village, small town or great city, were considered as an added amenity and attraction to the countryside. Then to build was to beautify.

In the North, new towns sprang up with incredible rapidity—mushroom cities as they were called—though they might more aptly have been described as "mining camp cities."

The South did not suffer quite so much in comparison with the North, but only because in the South we build less, for here also the coal-miner's was the dominant influence. I should like to think that it was the old cultural centres that exercised a restraining influence on Southern architecture, but I am afraid such influence was very limited in extent.

Even our cathedral cities and cultural centres did not altogether escape the invasion of the miner-builder. The only places that did were the dead towns and villages, as they were called, of the remote agricultural districts. Such towns as Rye, Sandwich, Winchelsea, and many others, which slumbered, more or less, undisturbed through the nineteenth century, have now become places of pilgrimage for architectural renewal, to which the student goes with notebook and measuring rod, to wrest from them the secret of their serene and triumphant beauty.

One of the saddest results, because of its futility, to my mind, has been the spoliation of so many of our fishing villages and small seaside towns, in the effort to secure them for retreats from the noise of industrialism. The modern history of one small fishing village, turned modern pleasure-town, is very like another in its tragic absurdity.

First, a few enlightened individuals discover its charm and go there for a hoilday—they perhaps communicate their discovery to their friends, and year by year more people go, until some enterprising person puts up some enormous hotel, which is immediately followed by a rival establishment, and then come your rows and rows of hastily conceived villas (in recent years your more hastily conceived bungalows), until presently the few enlightened begin to rub their eyes, and to discover that their charming little fishing village no longer exists, or if it exists it is only as a small corner of still another mining camp.

Probably the most healthy sign for the future of architecture, or good building, is the ever-growing dissatisfaction of the miner with the conditions under which he has to live. The enquiry into the conditions of housing in the mining areas and what it revealed, shortly after the close of the war, profoundly shocked the conscience of this country.

But if the miner is getting dissatisfied with his shack and wants a real house, he is getting no less dissatisfied with his mining towns—his jumbled collection of shacks and gin-palaces.

The need for town planning or town revision is probably more keenly realized, as it is more urgently needed, in the industrial parts of England than anywhere else, and it must not be forgotten that Liverpool appointed a professor of town planning at its University long before London.

The problem for the architect, and, indeed, for all of us, is to realize the best of the life that is going on around us, and to do this we must leave our studios and offices, and in our civic and regional surveys attempt to understand the interplay of the various vocational types.

We want more of the humanitarian and less of the academic note about our work. When we ourselves become the channels of a throbbing and vital reality then, and then only, will our work live.

It is the great common movements of humanity that produce, or do not produce, great artistic periods, and it remains for the artists to note and give expression to such movements.

Sometimes it takes the direction of centralized authority, resulting in impressive monarchical institutions with all their traditions of pageant and splendour and the dominating importance of the individual expressed thereby, as, for example, in the eighteenth-century France and England.

At other times we have the great upward surge of democracy, resulting in localized and communal effort, the sinking of the individual interest for the common good, as, for example, in fifth-century Athens, and as exemplified in the best mediæval work.

We see the same influence at work in the life of the city states of Italy during the earlier part of the Renaissance, though in a less marked degree, and I believe we are at the present time living on the threshold of just such another period to-day in England.

The individualistic ideals of the last century are rapidly giving way to those of a more communal and civic order.

I can imagine that in another generation we shall regard the person who expresses his individual pride in the building of a costly and luxurious private house much as we regard the war profiteer of to-day—as one who, if not exactly to be shunned, will be looked on a little critically. I can imagine that, as in the best period of Athenian civilization, the houses of the chiefs and leaders will differ very slightly, at any rate in size and in importance, from the houses of the people, and that what is saved both in money and energy will be lavished on public buildings for the enjoyment and benefit of the community as a whole.

In conclusion I should like to refer briefly to the post-war Government housing schemes, as in these there seems to me to be the germ of a great hope for the future—that future which shall represent the artistic conversion of the miner, chiefly by the agency of settled housing conditions.

The whole question of housing since the war has become so mixed with bitter political controversy that it is a little difficult for us to take a fair view of it, we cannot see the wood for the trees, and some little time must elapse before we can get the right perspective.

Amidst all the clamour and criticism directed at the Minister of Health for all that has and has not been done in the way of providing houses, one aspect of the problem has largely escaped public attention—and that is, the effect of what may be called the housing movement on the future art of this country.

When the Great War finished there was a general determination that the men who fought and won the war should have opportunities for fuller and richer lives, and as it was impossible to discriminate between those who had fought in the field and those who had served in the workshops and factories at home, it meant, in effect, that all men were to have these opportunities.

These ideas were current before the war, but the war crystallized them and gave them effect, and the first realization of these changes became apparent when the great problem of housing had to be faced.

When the Ministry of Health issued their first Manuals on Housing, in which were laid down certain minimum standards as regards the houses and the disposition of houses, it at once became apparent that a great advance had been made on pre-war standards.

Now it is not pretended that those who framed these regulations were moved by any great artistic considerations. Their problem was that of providing healthy and economical homes.

As we have seen, the average worker's house before the war was a thing of unmitigated horror. Rows upon rows of cheaply and tawdrily built villas, apeing in their wasteful excrescences of coloured glass and distorted stone dressings the dreary habitations of the more superior suburbs. The contrast between them and even the worst of the houses erected under the Ministry of Health is great and instructive.

Mounting prices and the need for rigid economy has lopped off the extraneous and hideous features beloved of the speculative builder. Gone are the coloured lights to the front doors; gone the sham half-timber work to the unnecessary gables; and gone the stone and terra-cotta ornaments that adorned bay windows and porches in unnecessary reiteration from the end of one dull, long street to the beginning of another.

The Government houses have been described as brick boxes with lids on them, but even the most bald have something of that homely air that belongs to the old-time cottage and farmhouse of our agricultural communities.

It was a wise decision of the Government to make the various local authorities responsible for the carrying out of the schemes, rather than attempting to direct them from some centralized office. Control and direction there had to be; but the fact that for the first time in their history the people of these Islands were to have a direct interest in the building of their own homes, is one fraught with a peculiar and far-reaching significance.

Architects who are responsible for the execution of these schemes and for the technical work involved in the planning and building of these villages and small towns, for such in many cases they are, know that not the least intelligent or responsive of local authorities are those councils chiefly composed of what, for want of a better word, is called "Labour," and some of the most responsive are those in the mining districts. They and their kinfolk are to inhabit these houses, and their interest is direct and personal—they are building their own homes.

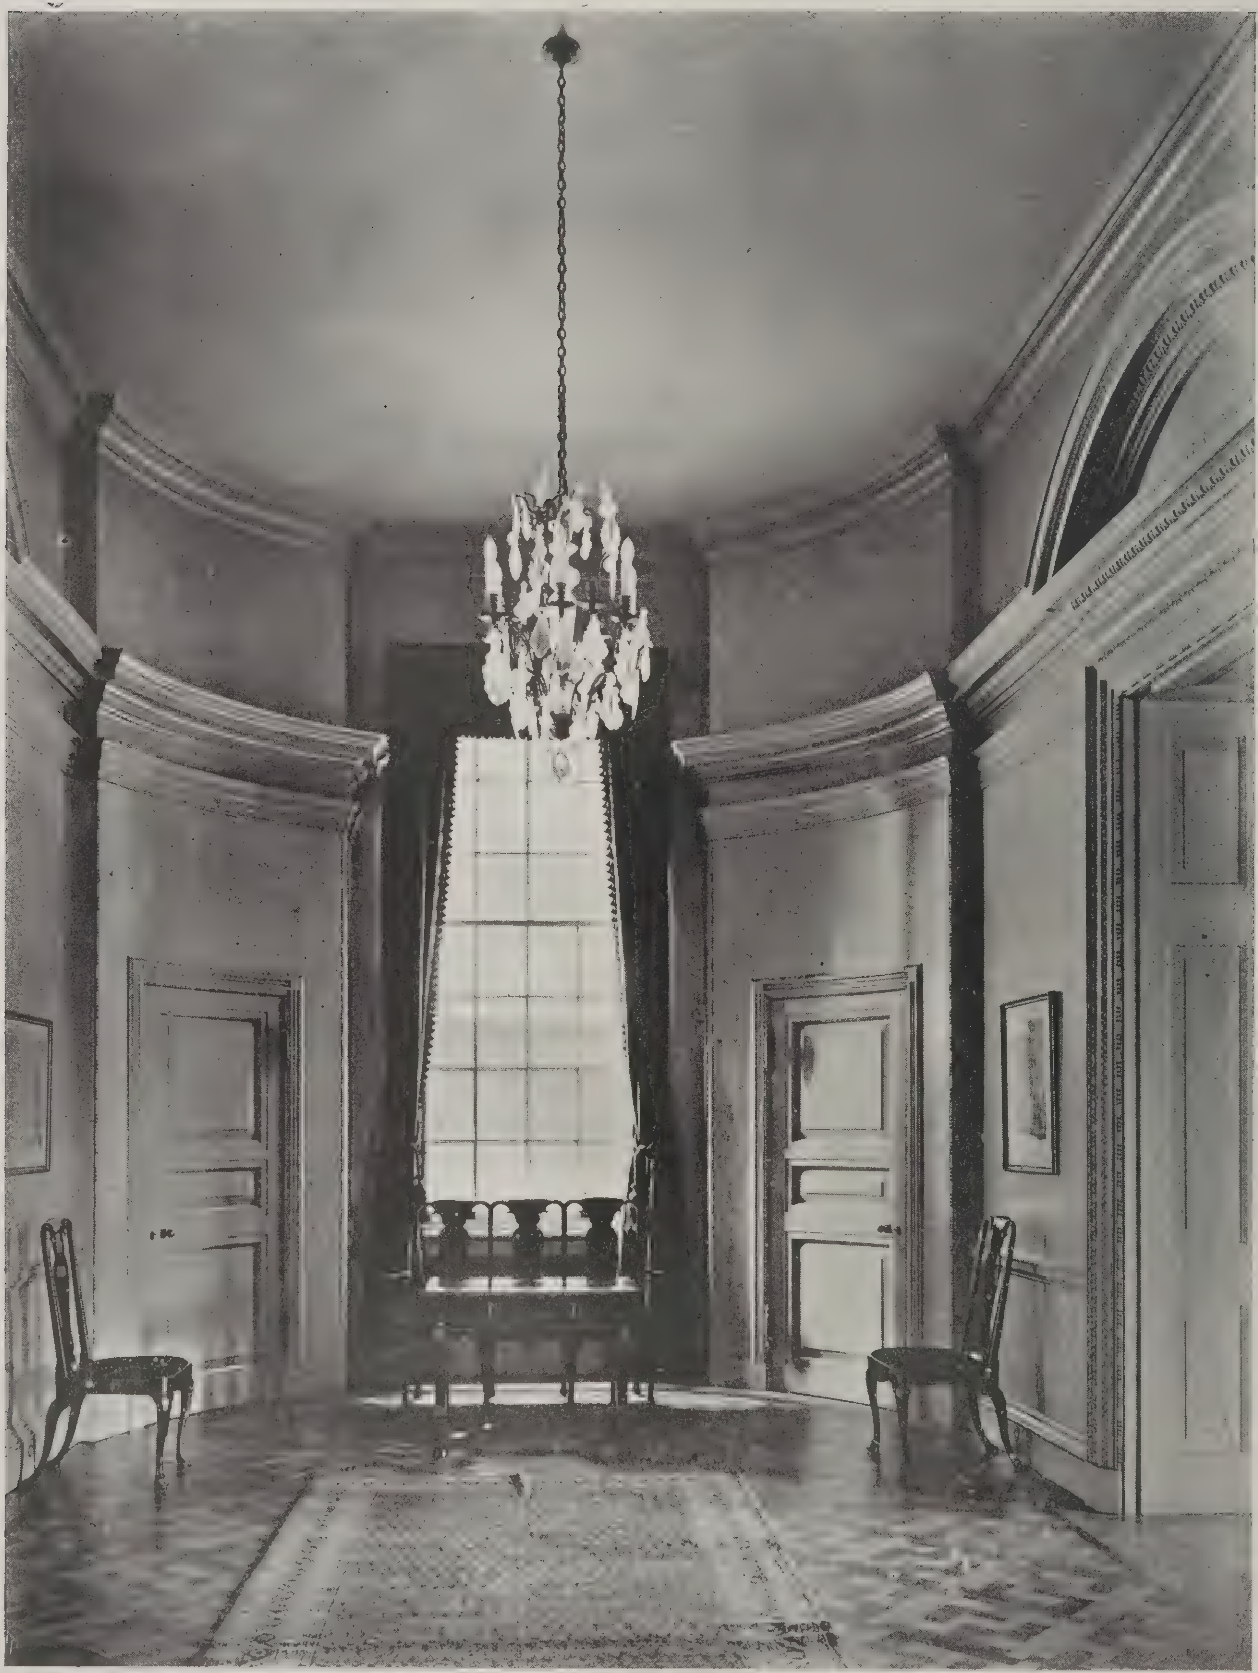
Now it is axiomatic, that before a man can be an efficient citizen he must, in some degree be an efficient man, and it can safely be assumed that before any one can take a general interest in the fine arts, he must take a particular interest in the art of his own home.

And that is why the Government houses which are being built hold so much promise for the future.

They are expressive of the needs and interests of humanity, and starting from this humble beginning, the awakened interest which built them will, I believe, grow progressively until we have not an academic, but a vital art, expressed in beautiful towns with fine streets and squares, adorned with real sculpture and magnificent buildings, the walls of which shall be rich with the glowing visions of great painters.

Some Interior Decorations at 18 Carlton House Terrace, London

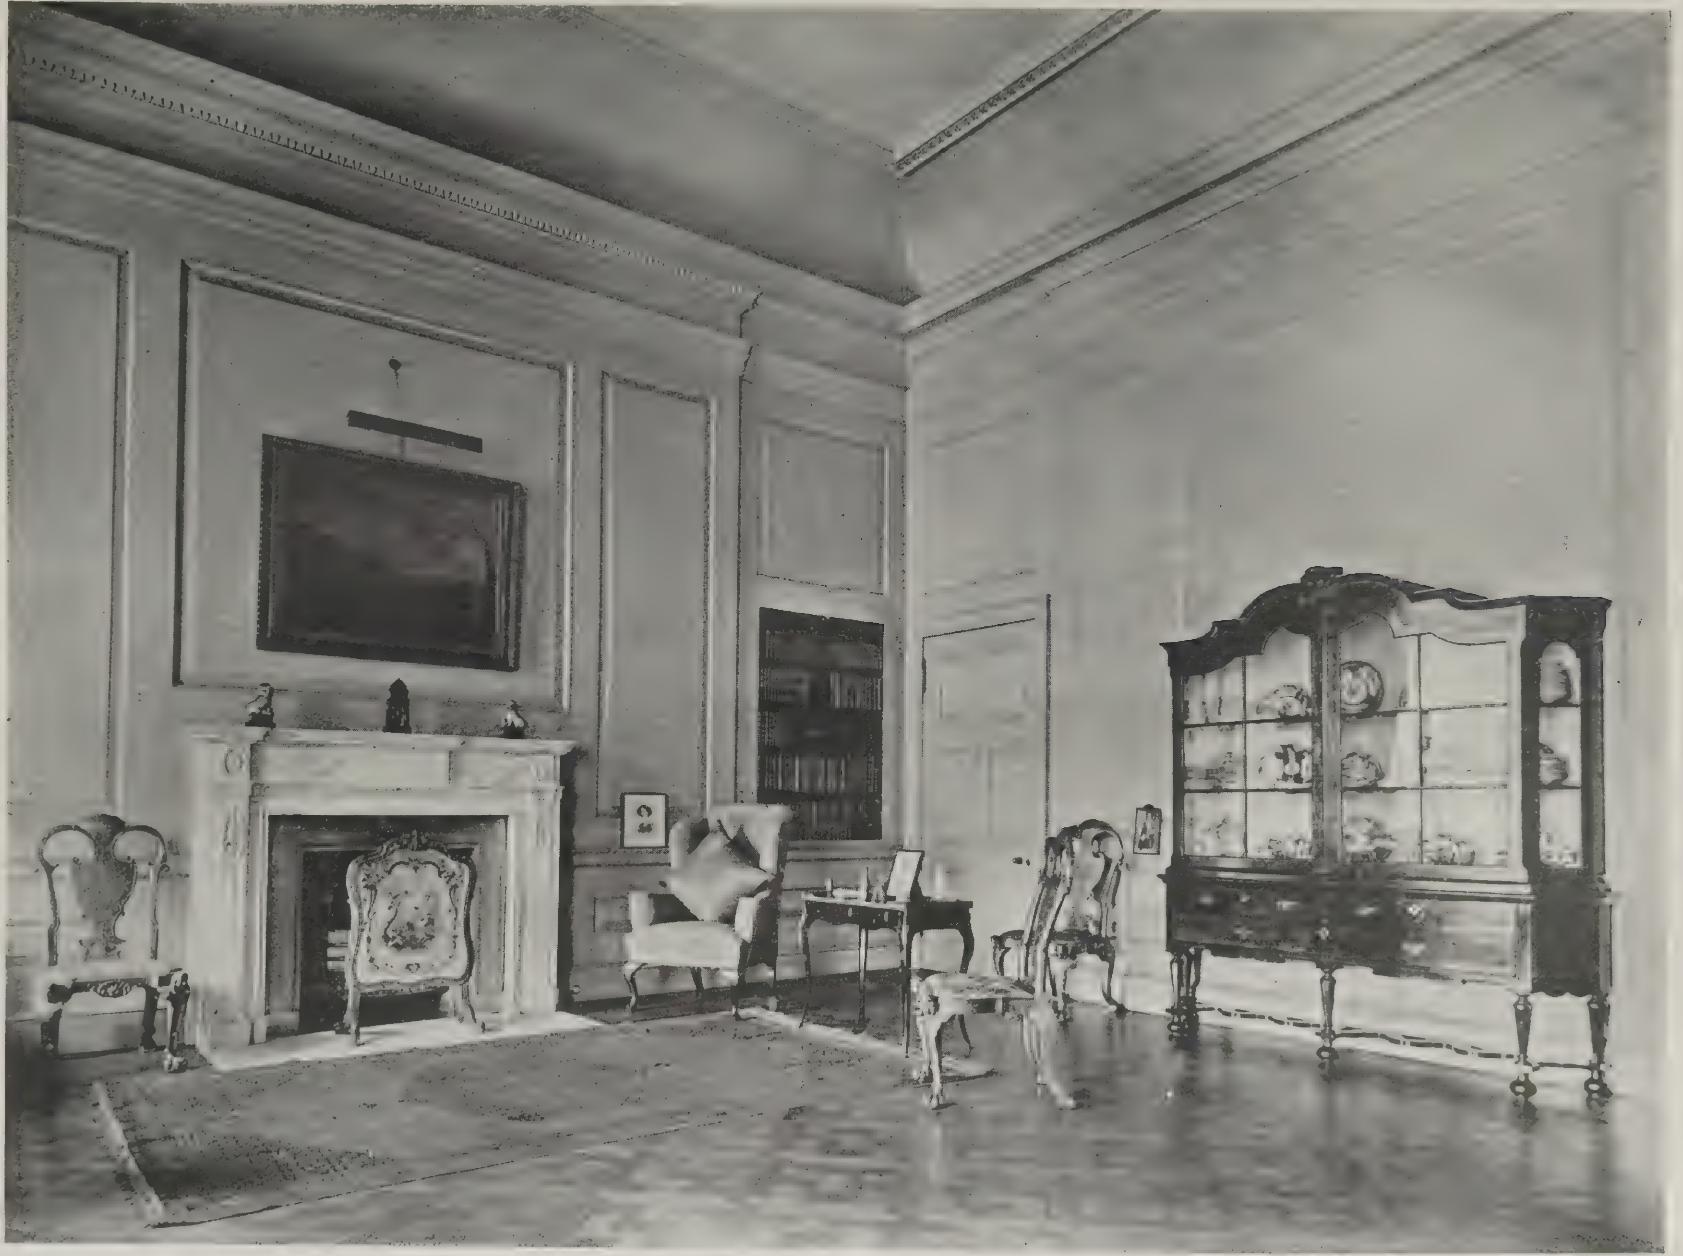
By OSWALD P. MILNE and PAUL PHIPPS, FF.R.I.B.A.



THE ANTE-ROOM.

Modern Domestic Architecture. 40.—The Small Drawing Room, 18 Carlton House Terrace, London

Milne and Phipps, FF.R.I.B.A. Architects



Carlton House Terrace stands between Pall Mall and the Mall, and the houses have a wonderful view across the Mall over St. James' Park to Westminster. No alterations have been made to the existing shell of No. 18, but the whole of the decoration is entirely new. The Small Drawing Room illustrated above is of the colour of very pale café-au-lait, and the shelves and backs of the bookcases are black.

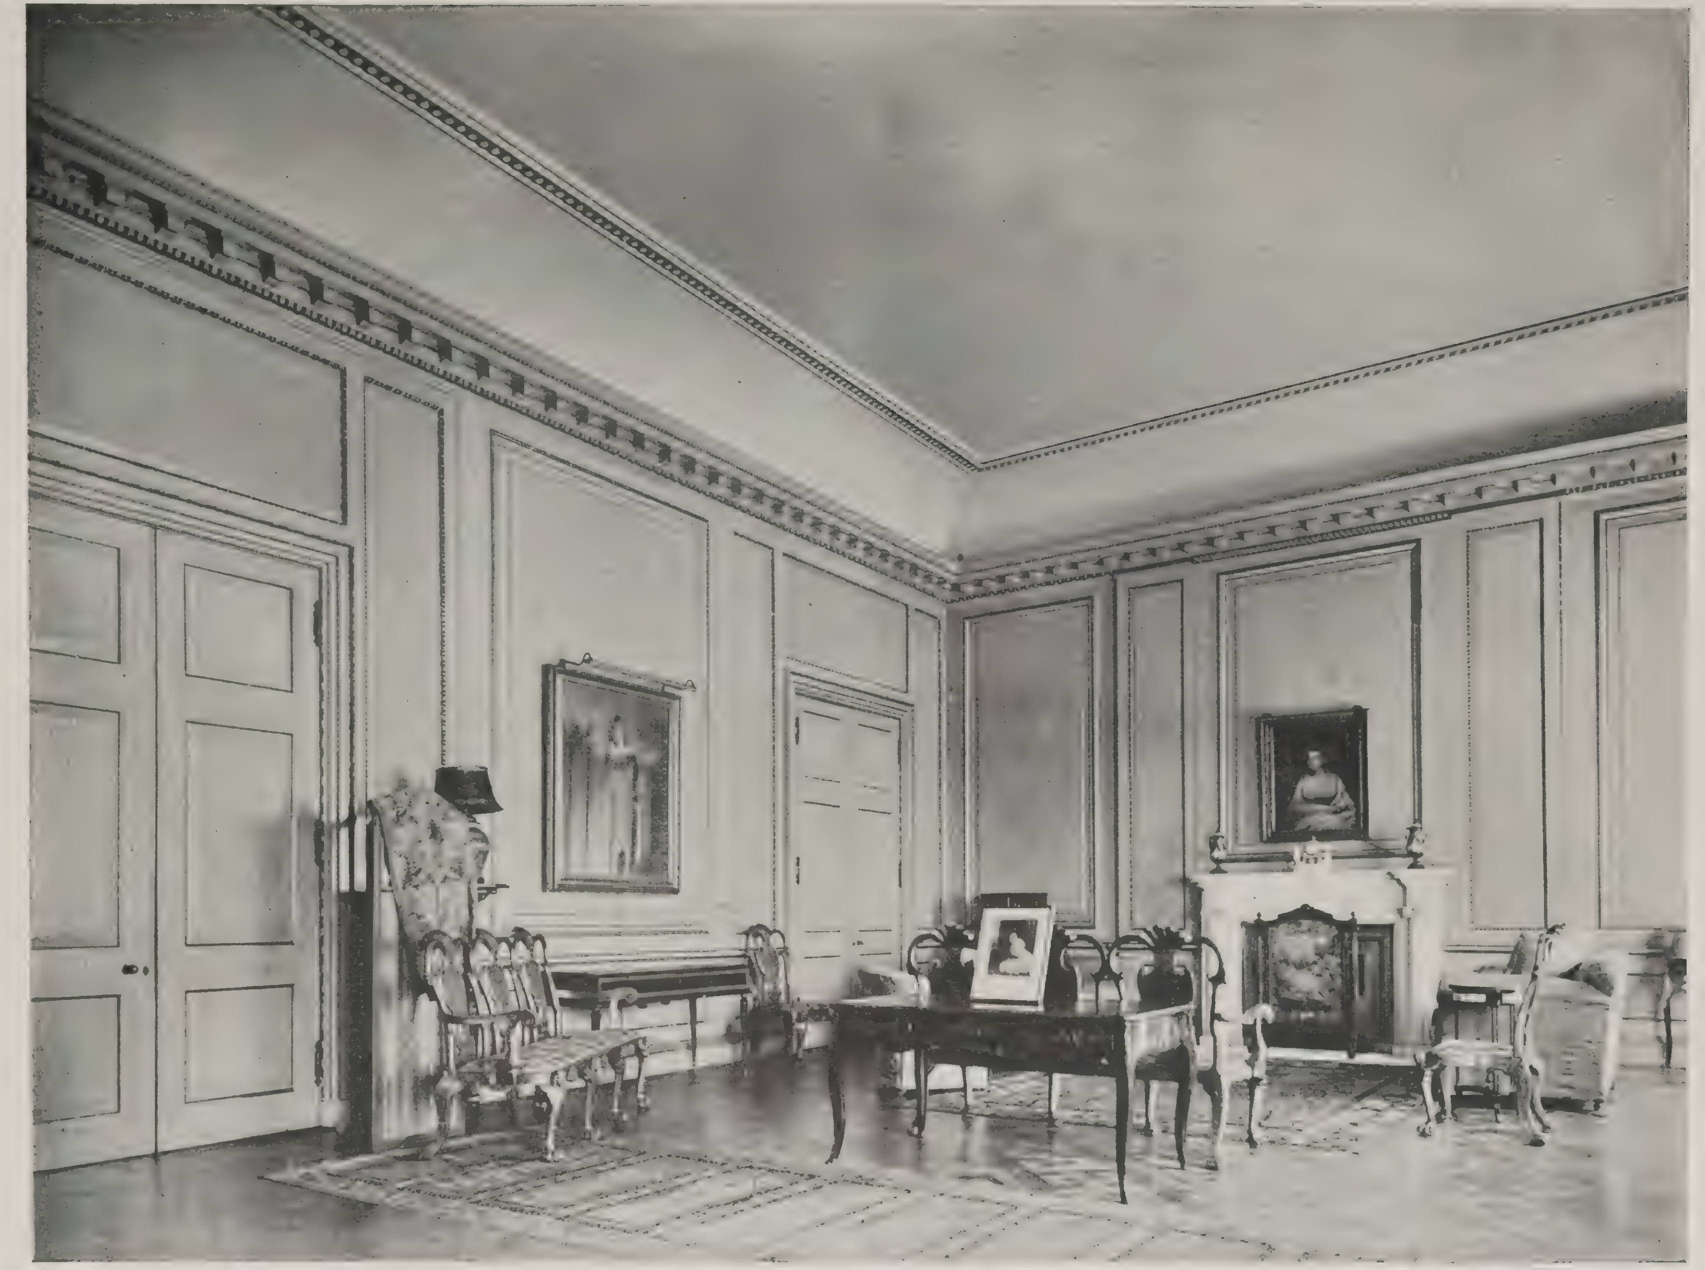
Modern Domestic Architecture. 42.—The Large Drawing Room, 18 Carlton House Terrace, London

Milne and Phipps, FF.R.I.B.A., Architects



This room is carried out in blue and gold, and the architects have obtained a slightly more sumptuous effect than in the other rooms by enriching the mouldings of the panels. They have not lost, however, the air of spaciousness and reserve which makes the attraction of this suite. The plasterwork in this house was carried out by Messrs. Elmes, and the decorative work by Messrs. Muntzer and Son.

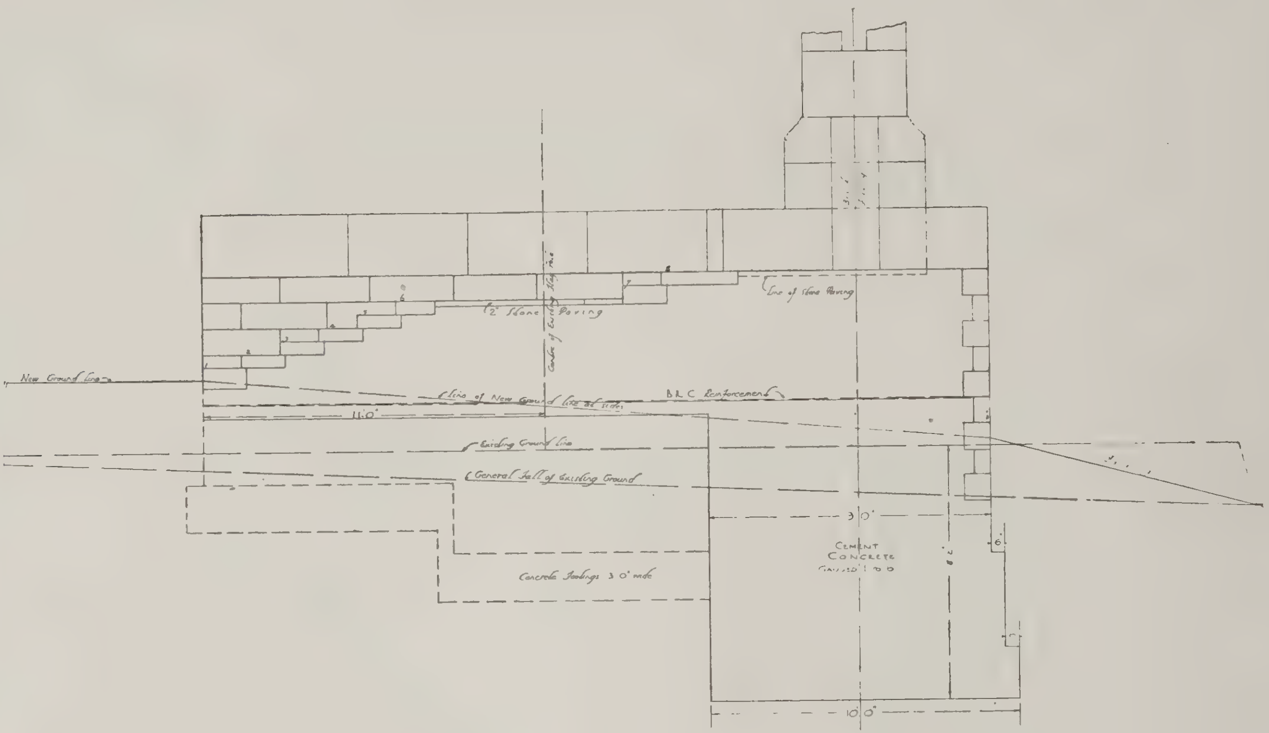
MAY 1922

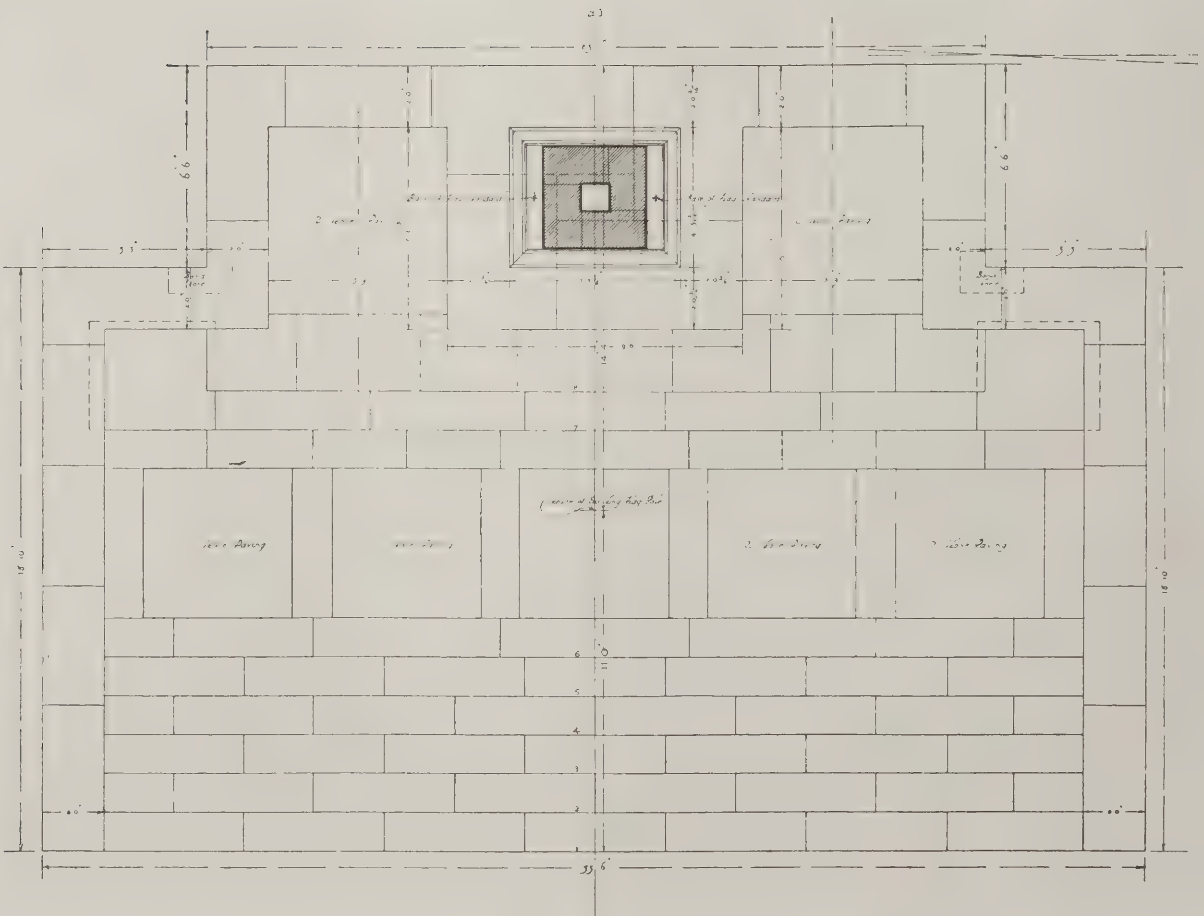
This mantelpiece dates from the early eighteenth century, and was probably designed by Richard Cassel. It is of wood, finely carved, the frieze being decorated with conventional birds, foliage, and animals. In the centre is a griffin's head couped between two wings (the crest of the Gardiner family, Luke Gardiner, Vice-Treasurer of Ireland, having built No. 10 for himself). There is some very intricate and beautiful carving on the two consoles supporting the cornice; the cutting goes through from side to side. The linings of the mantelpiece round the fireplace are of black and gold-veined marble. The mantelpiece has been painted many times and the outline of the carving has been somewhat dulled, but the whole is still in a splendid state of preservation.

Southend War Memorial : Working Drawings

Sir Edwin L. Lutyens, R.A., F.R.I.B.A., Architect



SECTION AB

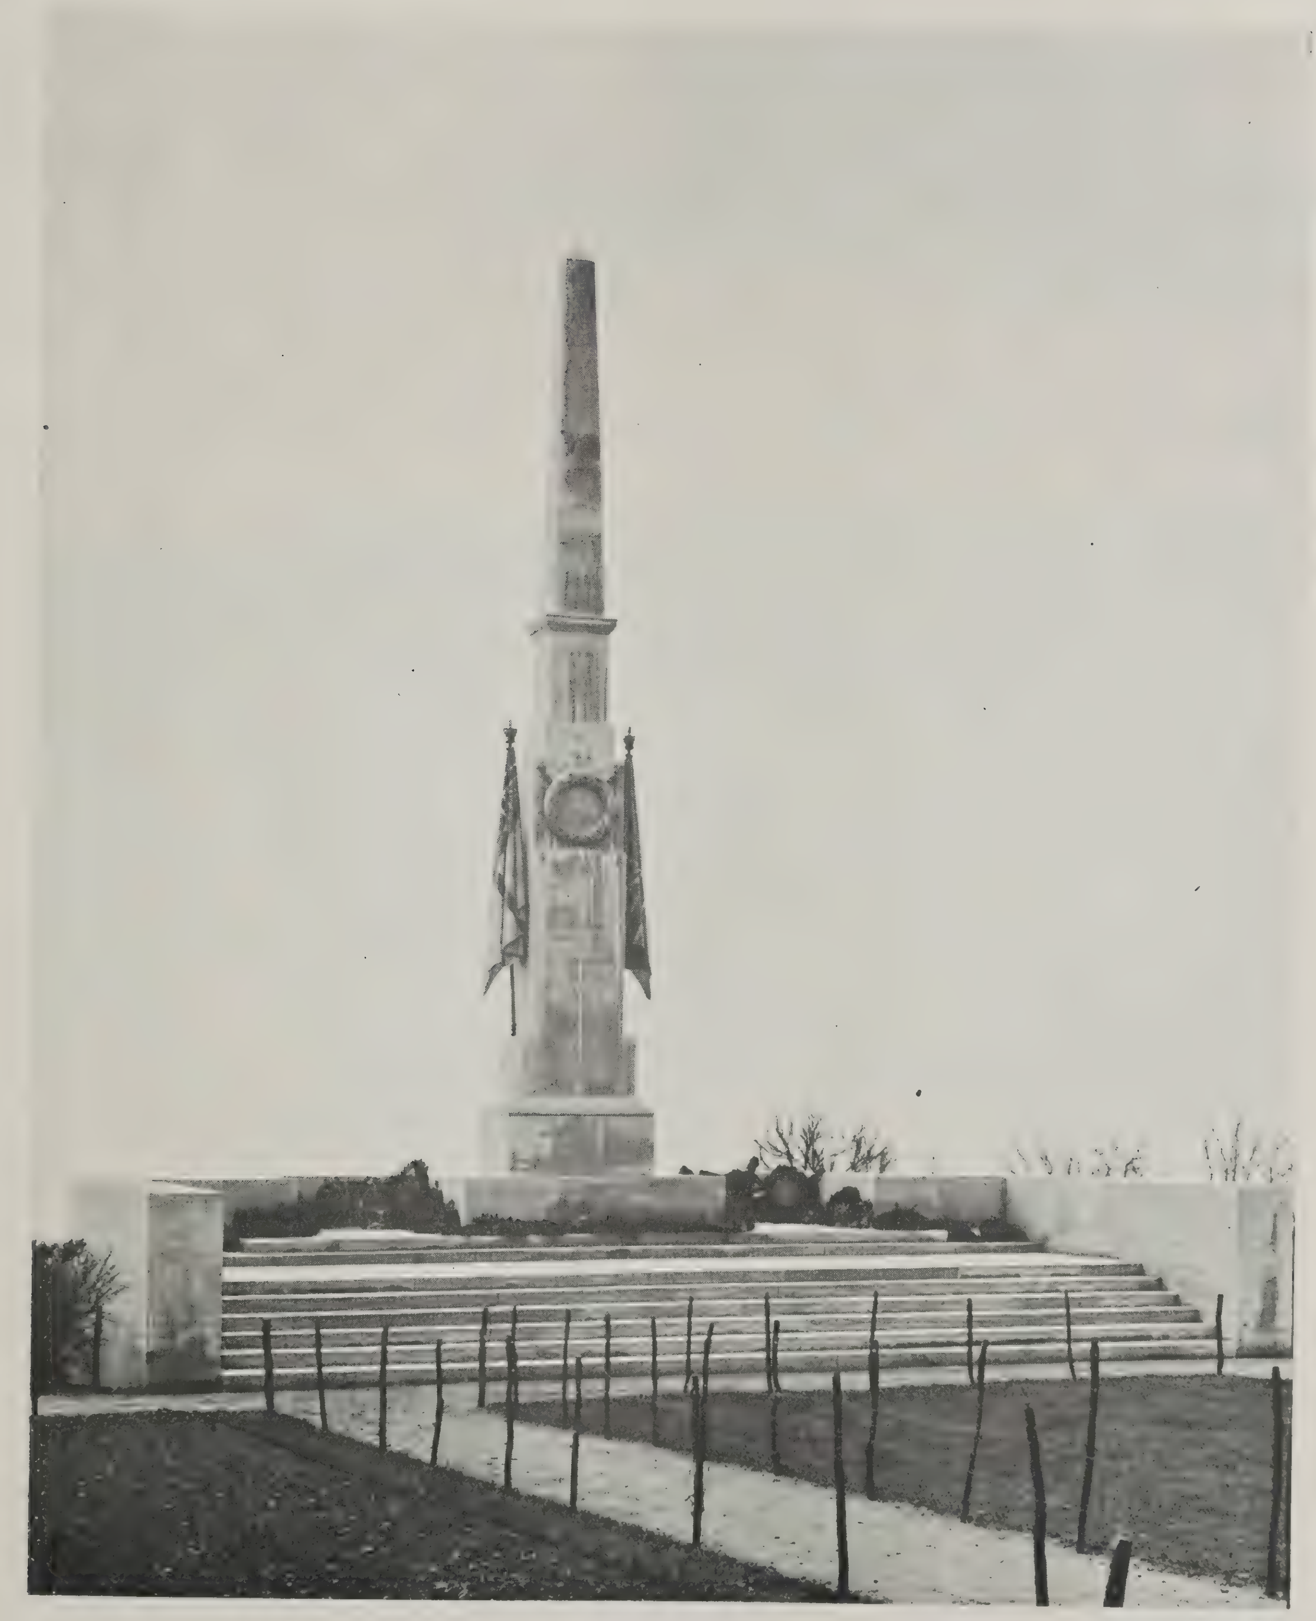


PLAN

(See opposite page.)

War Memorials. 27.—Southend

Sir Edwin L. Lutyens, R.A., F.R.I.B.A., Architect



Forty feet high, this war memorial stands on the edge of the cliffs overlooking the sea. It is in the form of a cenotaph, surmounted by an obelisk, and is constructed of Portland stone, the flags being carved of the same material. Some difficulty was experienced with the foundations owing to the clayey nature of the soil, but this was overcome by reinforcement.

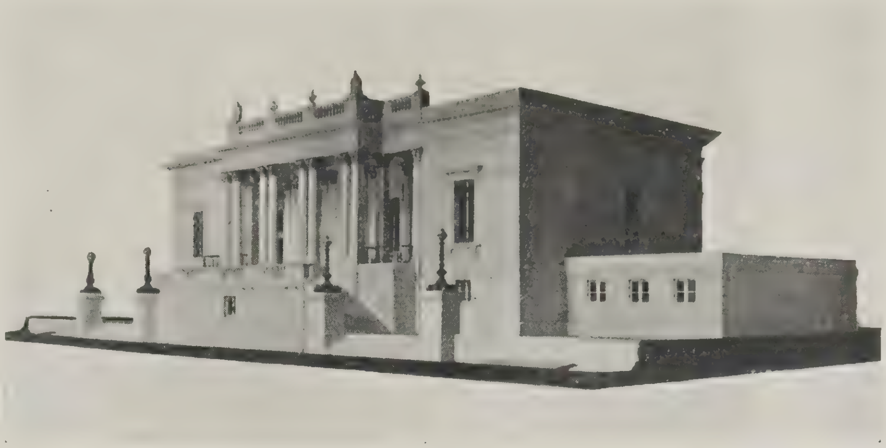
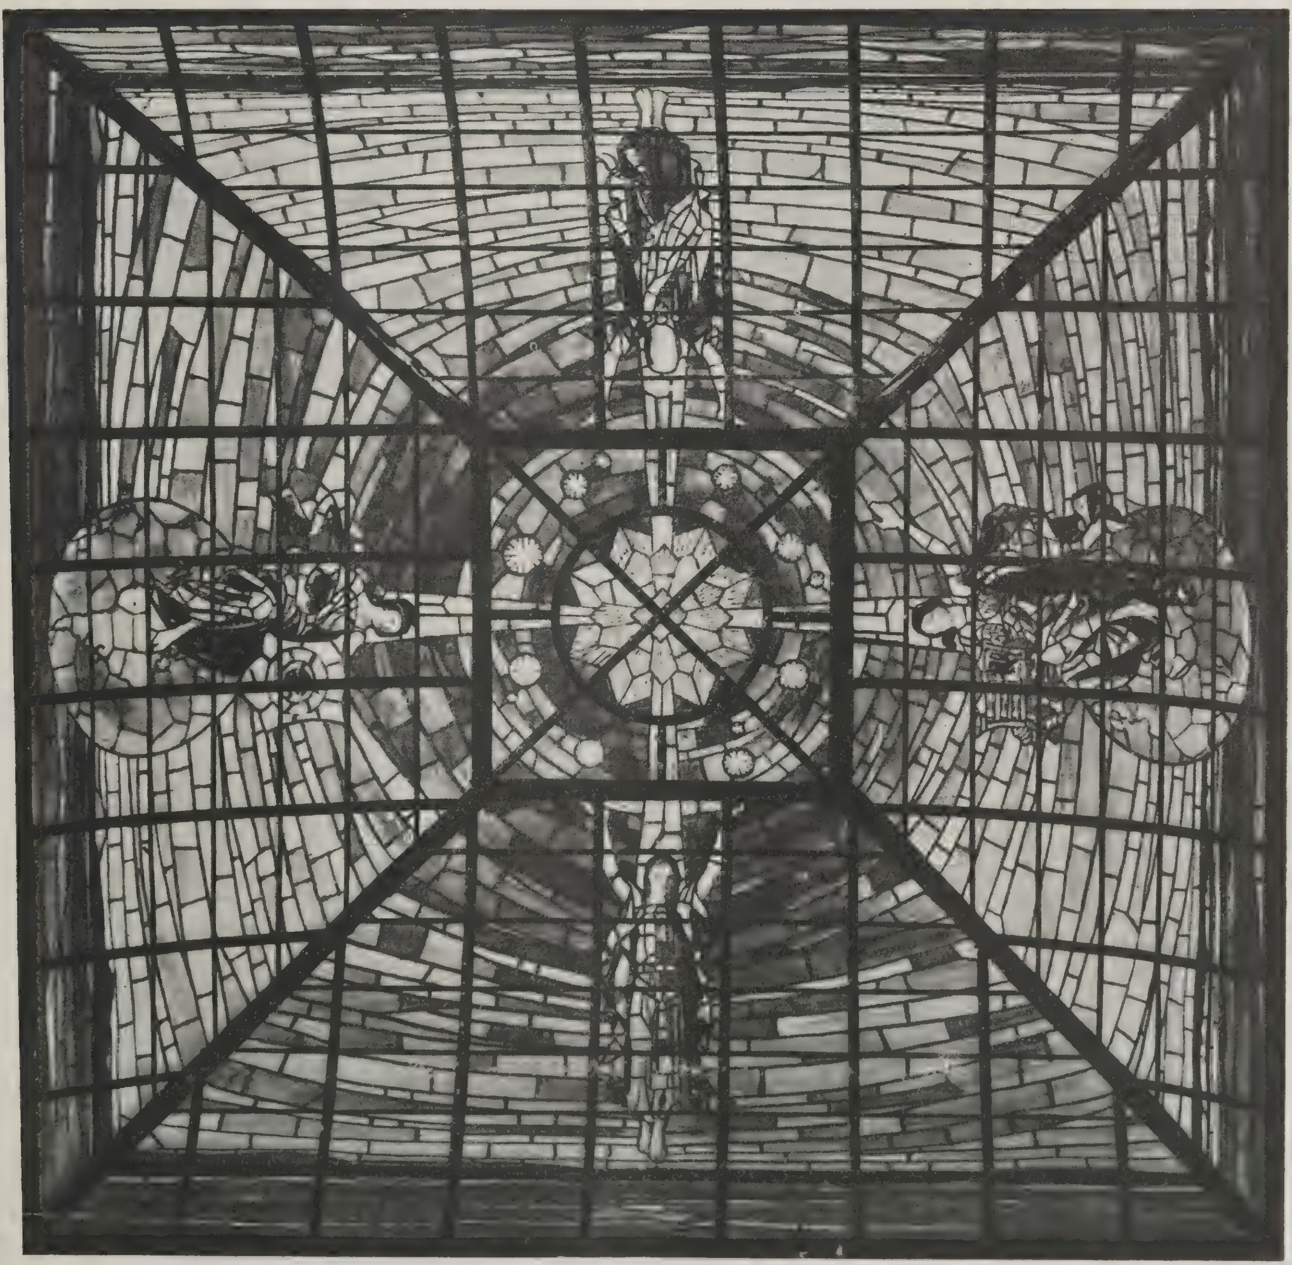
The British Pavilion at the Rio Exhibition



FROM A MODEL.

IN our last issue we published an illustrated description of the British Pavilion at the Rio de Janeiro Centenary Exhibition, which has been designed by Messrs. John W. Simpson and Maxwell Ayrton, FF.R.I.B.A., architects. We are now able to show a photograph of the remarkable stained-glass dome of the building, designed by Mr. Anning Bell, A.R.A. In this dome Mr. Bell has used some 6,500 pieces of glass, held together by over 7,000 ft. of leaded strip. The dome, which surmounts the central hall, occupies 270 sq. ft. of ceiling space, and contains over 400 ft. of richly coloured glass weighing approximately three-quarters of a ton. The predominating colour is blue. The four curving sides taper upwards to a circle at the summit, in which is set a sun with radiating shafts of gold, surrounded by the star of the Southern Cross, which form part of the Brazilian national emblem. Each of the four curving side panels contains a symbolical figure, one of which represents the British Empire and the Eastern World, and another the Brazils and the Western World. At night the dome will be illuminated from the exterior. The work has been carried out by Messrs. Clayton and Bell, of Clifford Street, London.



THE STAINED-GLASS DOME. DESIGNED BY ANNING BELL, A.R.A

The Stability of Walls.—IX. Cracks in Brickwork

(Concluding Article)

By PROFESSOR HENRY ADAMS, M.Inst.C.E.

CONSIDERABLE alarm is caused from time to time by cracks appearing in the brickwork of a building, and a collapse is often feared when the matter is after all a very simple one and due to causes which do not affect the general stability. At other times cracks are more significant than they appear. There are various types of fracture which the writer has met with in the course of a rather long experience. The practice of supporting the floor joists on the front wall makes the load on this much greater than on the cross walls, and a fracture will often be found in the cross wall or party wall near the front, sometimes running only a small way down (Fig. 30), and at other times extending to the floors below (Fig. 31). In the former case it is generally due to the compression of the mortar in the horizontal bed joints of the front wall which, of course, totals up more towards the top; in the latter case it may generally be traced to a settlement of the whole of the front wall on its foundation, and the floors will be found then to have a slight fall to the front. If the floors remain level the crack may be due to pressure from goods stored inside and pushing against the wall. Diagonal cracks as in Fig. 32 are more common and more difficult to account for. They appear to be due to a shear stress in the material due to load or to a yielding of the foundations.

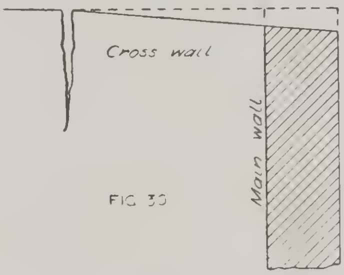


FIG. 30

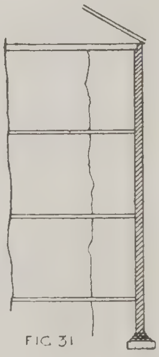

FIG. 31

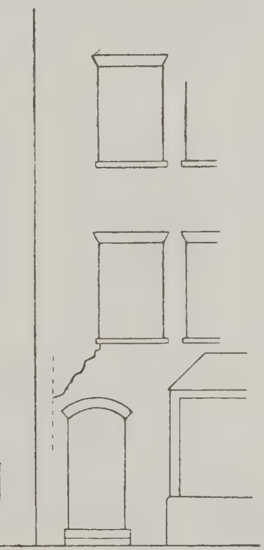

FIG. 34

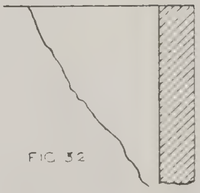

FIG. 32

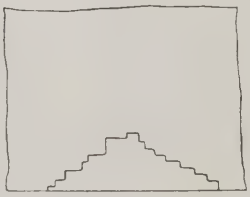

FIG. 33

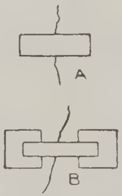

FIG. 35

When a wall has been carried across a piece of bad foundation, a double fracture will be found as in Fig. 33, and the joints may be very open. Semi-detached houses and buildings standing alone will often show diagonal cracks in the front wall, near the ends, as in Fig. 34, which is typical of a large number of houses in the suburbs of London. This is clearly a shear fracture due to the weight of the brickwork above, and it usually terminates where it meets the bonding of the flank wall. It is well-known that unless window sills are bedded hollow they will be cracked by the settlement of the heavy brickwork at the sides, while there is little weight below the sills.

In the case of a large warehouse by the Thames, where the subsoil was rather light, loose, sandy gravel, or drift, a strong reinforced concrete raft was put in extending 6 ft. beyond the face of the outer walls. Soon after completion of the building cracks were found in the cross walls on the top floor, and it was at first supposed that the raft had bent, but it was found still to be level so that the cause was in the brickwork itself, as illustrated in Fig. 30. Upon a clay soil a reinforced concrete raft is practically the only means to prevent movement of the walls due to expansion and contraction of the clay in wet and dry seasons, unless the foundations are very deep. In any case 5 ft. is the minimum.

Other cases of fracture that have come under the notice of the writer have been due to drainage of subsoil due to the construction of a tube railway, to the disturbance of the soil by the escape of compressed air from tunnelling operations, to laying a sewer in the roadway, and to heavy motor traffic.

In churches wall fractures are commonly due to the thrust from arches or from improperly constructed roof-trusses. Sometimes the foundations for the pillars have been insufficient for the load upon them, and in one case of a church on the side of the hill, the upper part of the hill was sliding down, and to stop it someone had put in poling boards and strutted them against the church wall, under the windows, cracking the stonework from the ends of the sills to the ground level.

Special cracks are found due to the vibration of machinery or shafting, but this vibration does not itself cause the cracks, it merely enables any pre-existing strain to show itself. Where, however, the mortar is very poor the bricks may loosen under the vibration and the mortar come away as dust. Plain spur gearing is very trying to brickwork owing to the back-lash, and, except in a factory of one floor where it does not matter, should be replaced by stepped or helical gearing. The vibration from electric light generating stations has been known to cause ceilings to fall in the neighbourhood, but the walls of the buildings are seldom damaged from this cause.

When cracks show in a wall it is well to fix small strips of Portland cement across the crack and put the date on them, as at A Fig. 35, or with a piece of slate across two cement pads as at B, so as to detect any progressive movement and enable necessary precautions to be taken in time.

[NOTE.—In line 20 from the end of Article VIII (published in the JOURNAL for June 28, page 929) "from ground" should be inserted after the word "height."]

R.I.B.A. Council Meeting

FOLLOWING are notes from the R.I.B.A. Council meeting held on June 26, 1922 :—

Robert Gordon's Technical College, Aberdeen.—The Post-Diploma (six years) Course of the School of Architecture, Robert Gordon's Technical College, Aberdeen, has been recognized as exempting from the Final Examination under the usual conditions.

School of Architecture, Cardiff.—The Three Years' Course of the School of Architecture, Cardiff, has been recognized as exempting from the Intermediate Examination for a further period of two years.

Registration of Electrical Contractors.—The Council have accepted the draft proposals for obtaining the sanction of the Board of Trade for the scheme of voluntary registration of electrical contractors in Great Britain, and have agreed to appoint two representatives to sit upon the Board of the Registration Authority.

Liverpool Corporation By-laws.—On the recommendation of the Science Standing Committee, the Council have sent to the Liverpool Architectural Society a criticism of the draft by-laws on ferro-concrete and steel frame buildings proposed by the Liverpool Corporation.

Tendering without Bills of Quantities.—At the request of the London Master Builders' and Allied Industries' Association, the Council have directed that a notice should be printed in the R.I.B.A. Journal recommending that in the case of ordinary works exceeding £1,000 in value contractors who are invited to tender should be supplied with bills of quantities.

Local Officials and Private Work.—At the request of the Devon and Exeter Architectural Society the Council have written to the Ministry of Health on the subject of Surveyors and Sanitary Inspectors in country districts doing private work in preparing and submitting plans to their Council for approval.

Home Office Regulations for Factories and Workshops.—On the recommendation of the Science Standing Committee the Council have decided to press for an inquiry to be held by the Home Office before the proposed Regulations under the Factory and Workshop Act for Buildings in course of construction are issued.

Housing Schemes.—On the recommendation of the Practice Standing Committee the Council have ordered a statement to be printed in the R.I.B.A. Journal on the subject of the relations between consulting architects and panel architects.

The Architects' Benevolent Society. A subscription of £100 has been paid to the Architects' Benevolent Society for the current year.

Liverpool University School of Architecture: Annual Exhibition

(*Contributed.*)

THIS year's annual exhibition of the Liverpool University School of Architecture which has been opened by Lord Riddell at the Walker Art Gallery, Liverpool, is by general admission the best that has so far been held in the history of the school. There are not so many large drawings as were shown last year—none of those vast sheets in which careful draughtsmanship was sacrificed to pictorial effect. There are more plans and more sections, adequately developed, some extraordinarily good working drawings, and no pseudo Beaux-Arts rendering. The whole exhibition is, in fact, quieter, sounder in its aims, and more mature in its effect. That is not to say that imagination and verve are less evident than on previous occasions, but only that these qualities are expressed in better form and with a better technique.

The explanation of so marked an improvement is probably a complex one. To judge from the drawings exhibited a greater stress appears to have been laid in the teaching of the school upon the logical solution of programmes. The plan is the thing. In consequence it is no longer attached as an unhappy afterthought to a preconceived elevation, but itself dictates the composition. Then, again, subjects originating as problems of design on a basis of sound planning are developed constructionally to a pitch that is not required in even the most exacting of English offices. Here is apparent the influence of American practice that shows itself continually in the work of the school. In the United States working drawings are so elaborated that specifications are unnecessary. It is clearly a sound system to adopt for educational purposes, for it involves the student being drilled in the most thorough fashion in the science of building. Finally there is evident a conscious or unconscious reaction against over-ambitious presentation—against endeavouring to imitate a French type of rendering and draughtsmanship for which students in England are not equipped either by tradition or temperament.

The drawings are arranged in three main groups. The first comprises representative examples of the studio work done in the five consecutive years of the new degree and diploma course. Each year makes its own display, and now for the first time the cumulative labours of the entire course can be seen as a whole. The spectacle should deter all but serious candidates from proposing to enter the profession unless they are lured by some of the six-hour sketch designs. These latter range in their subjects from circus cars drawn by teams of elephants, fancy dress costumes and posters to funeral barges, and they presumably provide a relaxation from the rigours of the normal course.

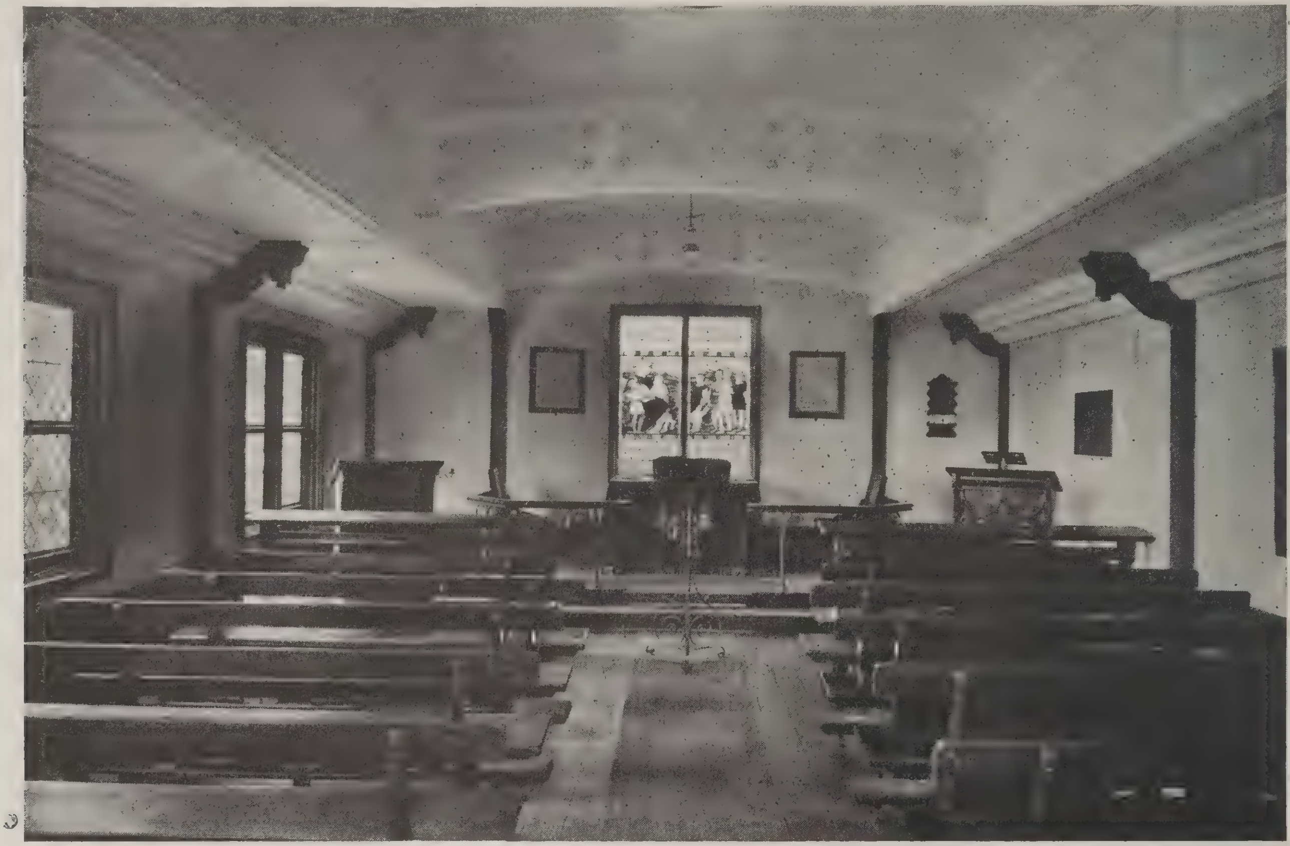
A second section of the exhibition is found by the schemes submitted in the various prize competitions open to students of the school. The Lever Prizes in Architecture and Civic Design, the Holt Travelling Scholarship, the Honan Scholarship (administered by the Liverpool Architectural Society), and the Rane Scholarship and Jarvis Studentship, have all produced sets of drawings of great merit. The most interesting naturally are the schemes submitted for the English Prix de Rome and the Jarvis. Only those presented in the preliminary stage of the competition—when the subject was a restaurant in a public park—are on view; the others, it is understood, are not yet available for exhibition until they have been shown in London. But the preliminary schemes sufficiently reveal the abilities of the competitors, and go a long way to explain how it was that the Liverpool School came to supply eight out of the nine candidates chosen for the final competition.

The School's Department of Civic Design provides the material for the third portion of the exhibition. Civic design may now be taken as an additional subject by students of the school of architecture during the fourth and fifth years of the degree and diploma course. A considerable number of these students appear to be availing themselves of the option—which leads incidentally to a certificate in civic design—as many names that occur in the purely architectural part of the exhibition here reappear in connection with attractive schemes of landscape design, projects for the laying out of parks, the development of town, suburban, and rural areas, and housing schemes. When we compare these drawings with others prepared for similar purposes by surveyors and civil engineers the value and advantages of previous architectural training are manifest.

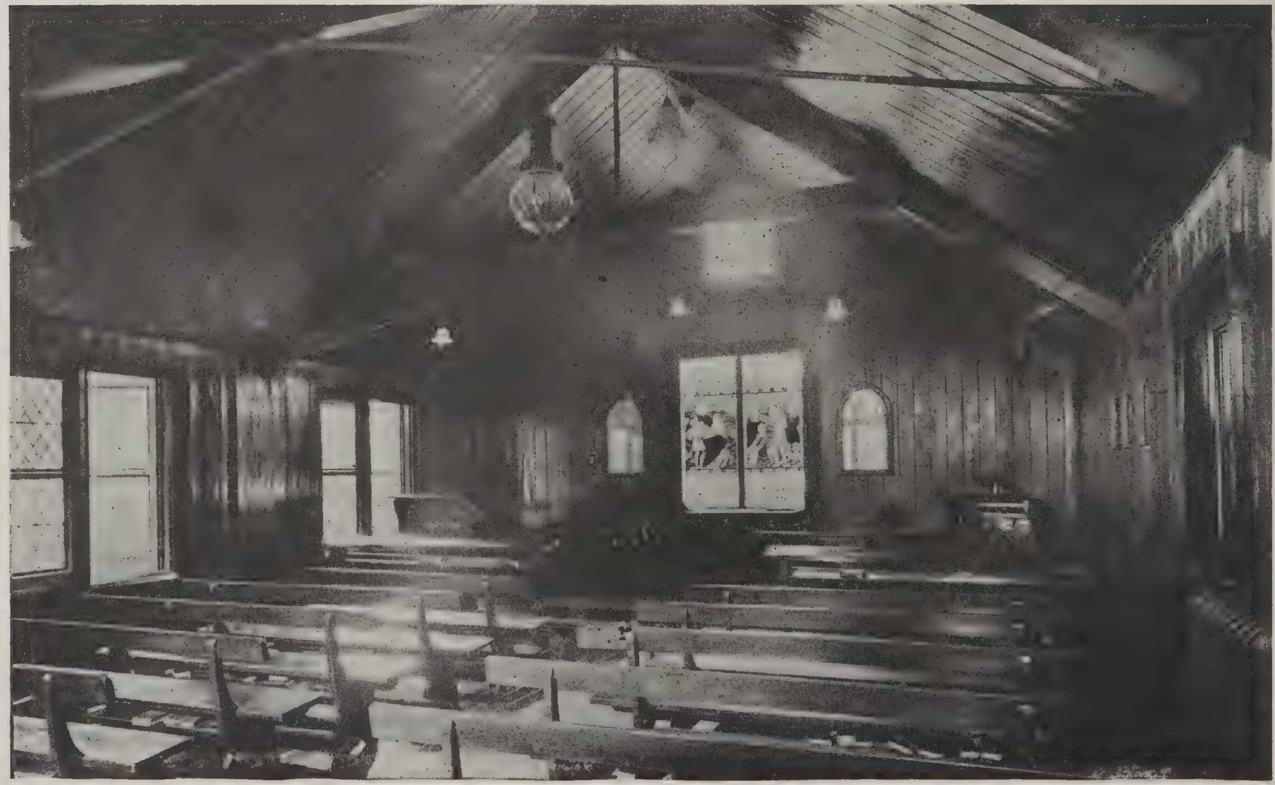
An exhibition of this quality is something more than an entertainment and more than an advertisement. It performs a real educative service. It demonstrates what architectural training is and what it involves, and it establishes a standard of positive achievement that cannot fail to have an effective influence on the development of the profession.

An Interesting Remodelling

ORIGINALLY the chapel at St. Clare School, Walmer, Kent, had the appearance internally of an army hut. The roof trusses and the tie rods were exposed, and the walls and ceiling were of varnished matchboarding. In the remodelled interior, Mr. Colin Hay Murray, A.R.I.B.A., architect, has disguised the trusses by means of large brackets and false beams, the low ceilings at the side being hung up to the trusses. The walls and the curved ceiling are covered with "SX" Board supplied by The Thames Paper Co., Ltd., of Purfleet, Essex. Mr. T. T. Denne, of Walmer, was the builder.



AS REMODELLED.

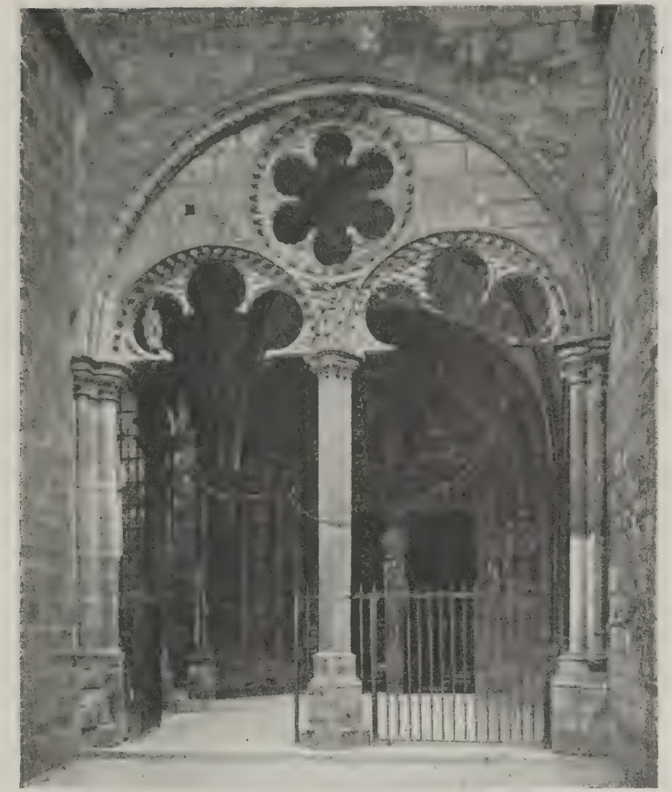


AS IT WAS.

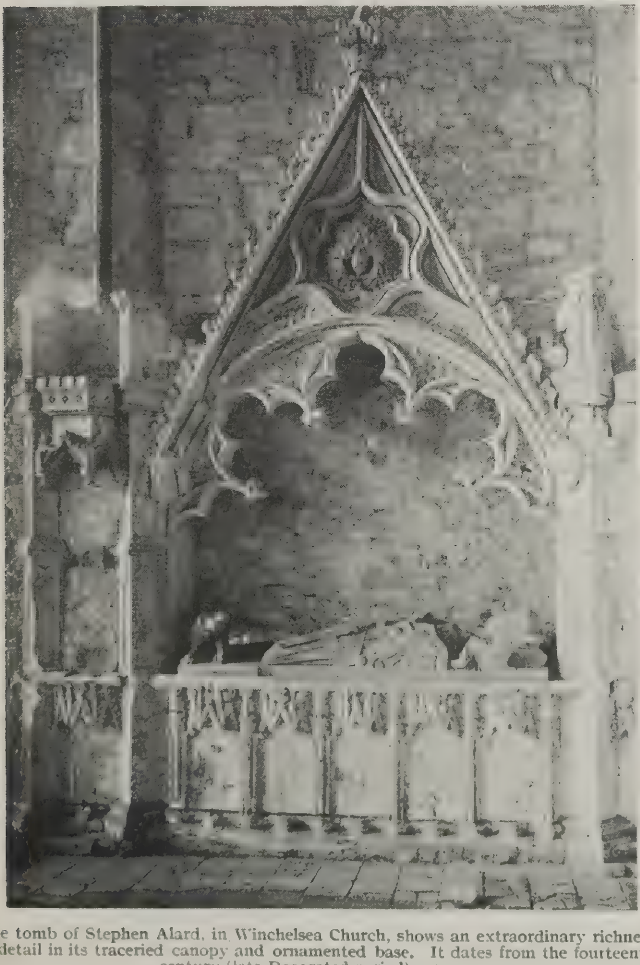
ST. CLARE SCHOOL CHAPEL, WALMER. COLIN HAY MURRAY, A.R.I.B.A., ARCHITECT.

A Pictorial Review

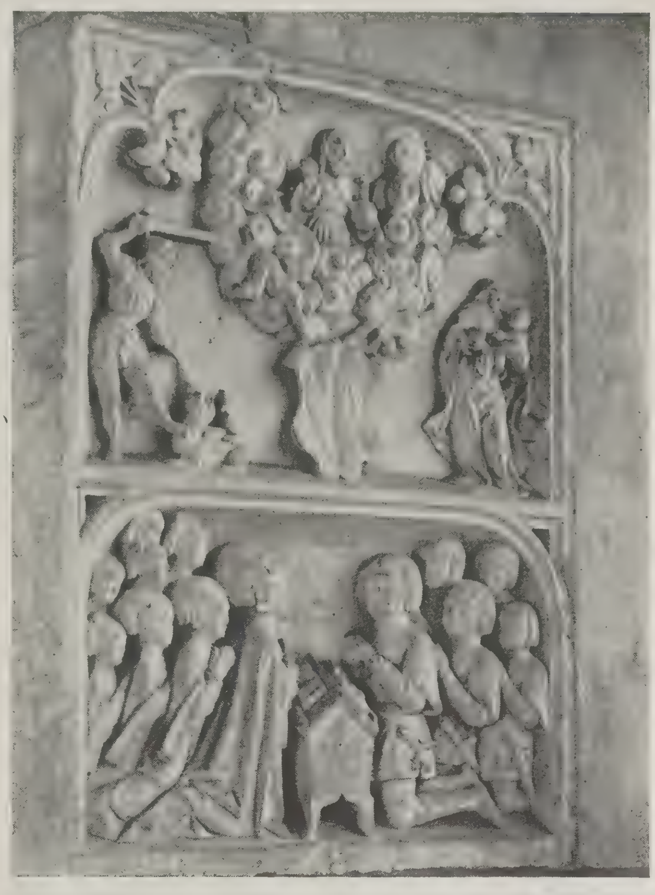
Illustrations of Topical, Practical, or Curious Interest



The south porch of Bourges Cathedral (an example of French thirteenth-century Gothic) has an interesting " screen " entrance, consisting of a central pier supporting a decorative " filling " of double trefoils and a circular multifoil. The porch has an extraordinary effect of lightness and delicacy.—J. R.

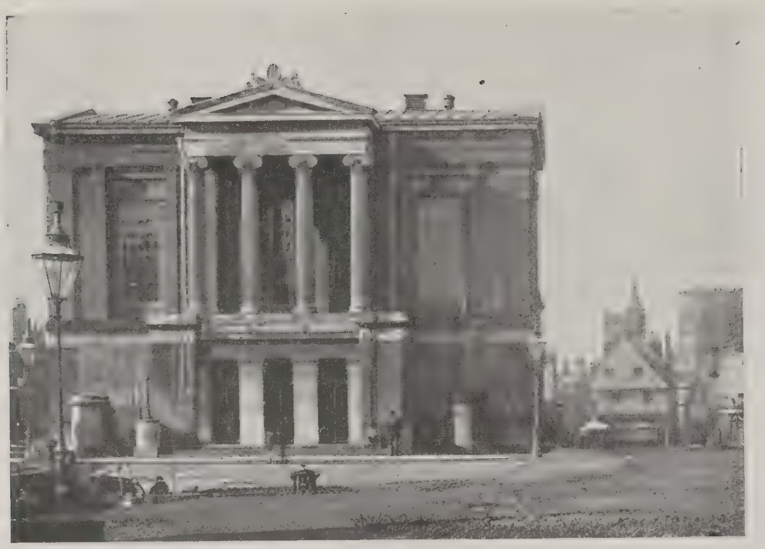


The tomb of Stephen Alard, in Winchelsea Church, shows an extraordinary richness of detail in its traceried canopy and ornamented base. It dates from the fourteenth century (late Decorated period).—S. P.

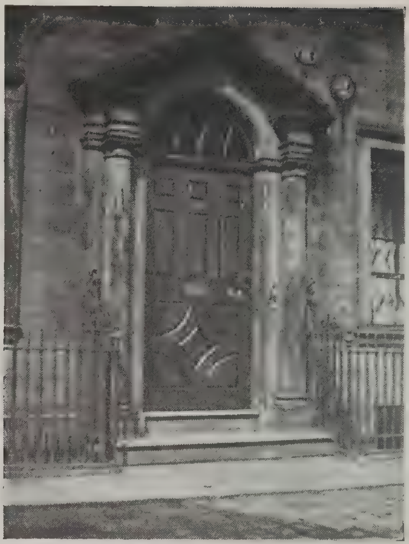


I know nothing of Gothic Art, but I cannot help being struck by the wonderful composition displayed in this piece of sculpture, and by its extraordinary likeness to Raphael's " Transfiguration " in both mass and detail. In each case you get the composition cut boldly in half, and then linked together by a rhythmic play of lines which carry the eye from the top to the bottom of the picture. You also get the crowd at the bottom and the three floating figures at the top. This panel is carved on a window jamb in the south aisle of Goudhurst Church, Kent.—H. H.

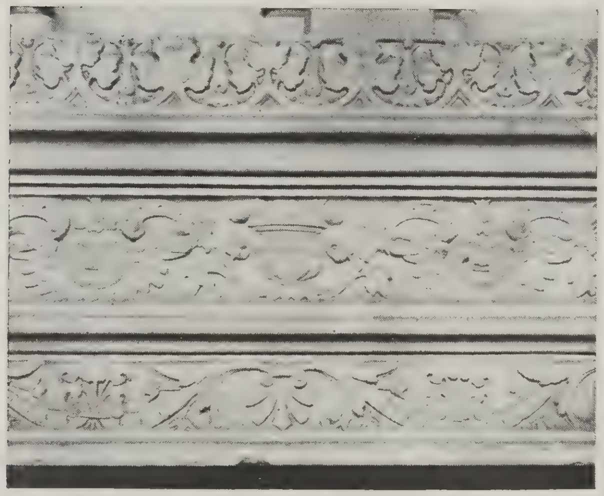
" Admiral's House," Hampstead, although it has no claim to architectural distinction, is interesting to architects by having been at one time the residence of Sir Gilbert Scott.—H. J.



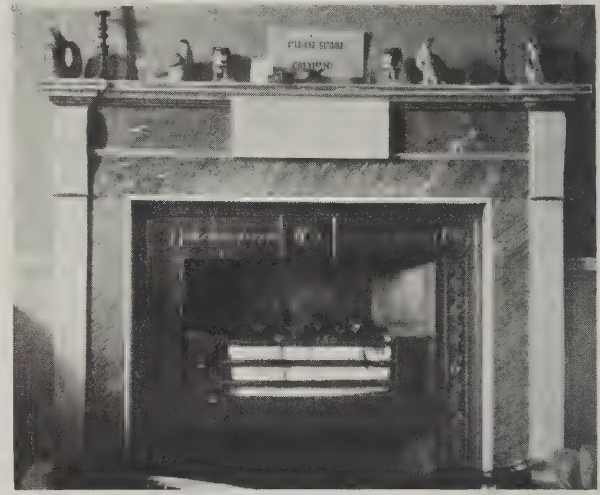
St. Albans Town Hall was built by the architect George Smith in 1830. It is a fine example of the Greek manner of that period, though, to my mind, rather dull, but I submit it especially as an example in comparative prices. To-day the same building would cost anything between twenty and forty thousand. In 1830 it was erected for £6,991—the present price of a small house. The lamp-posts shown in the photograph are also interesting and graceful. I assume that they are contemporary with the Town Hall.—H. E. MERRYMAN.



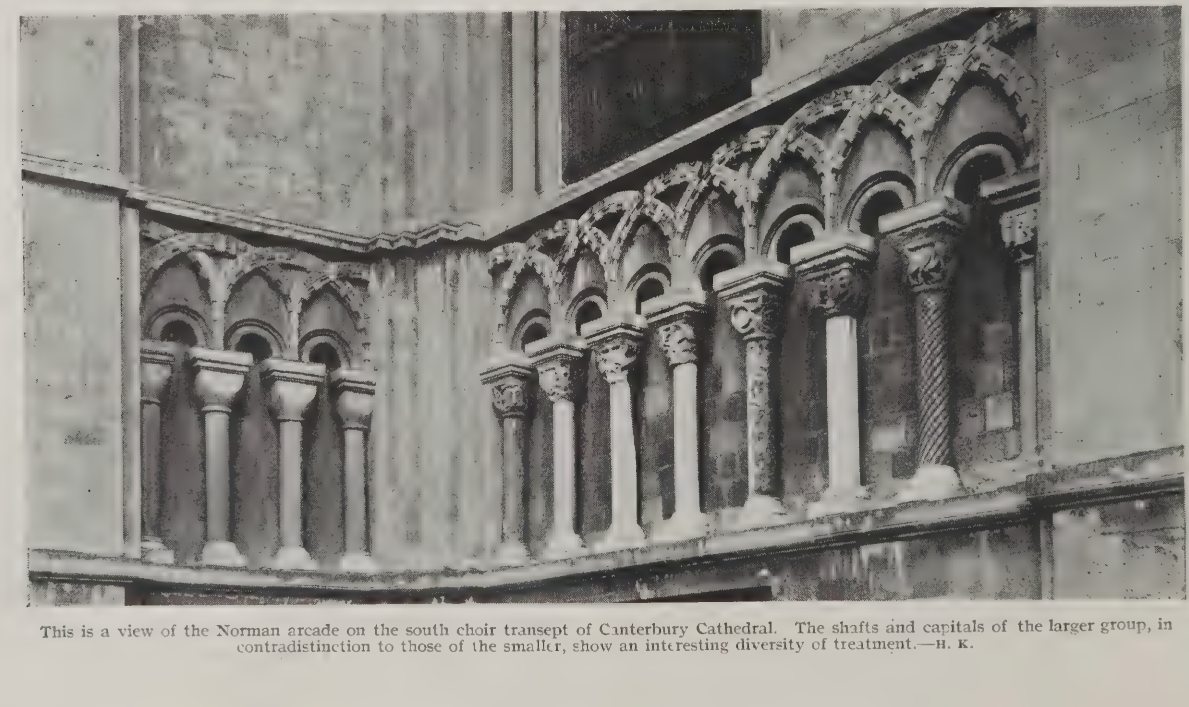
A doorway in High Street, Lancaster, showing the right application of the door-case to the wall of the house. The lines of the columns with their entablatures run through on to a pilaster-like set-off which forms a satisfactory connection with the wall.—R. H. MATTOCKS.



This detail from Salisbury Chantry, Christchurch, Hants, appears to be rather a remarkable example of transitional work. You get the Gothic cresting above, and below a very crude effort at Renaissance ornament with most amusing cherubs whose expressions still retain something of the gargoyle.—W. G. D.



I send you a photograph of a chimneypiece of late eighteenth-century date, which I think peculiarly suitable for modern imitation. The manner in which the coloured marbles are used shows a far greater appreciation of their beauty than can be found in most chimneypieces of the period. The little coloured necking of the pilasters below the trusses is astonishingly effective. Nowadays it is usual to copy the unimaginative Georgian practice of using white marble for all mouldings and decoration, the ground alone being coloured. The chimneypiece comes from Ardgowan, near Gourock, N.B., the house of Sir Hugh Shaw Stewart.—H. S. GOODHART-RENDEL.



This is a view of the Norman arcade on the south choir transept of Canterbury Cathedral. The shafts and capitals of the larger group, in contradistinction to those of the smaller, show an interesting diversity of treatment.—H. K.

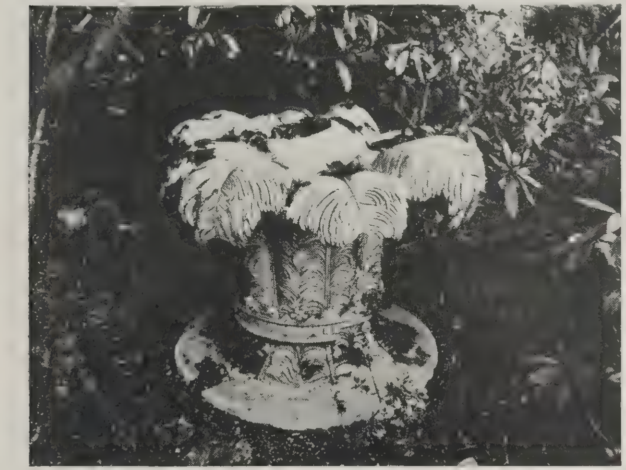
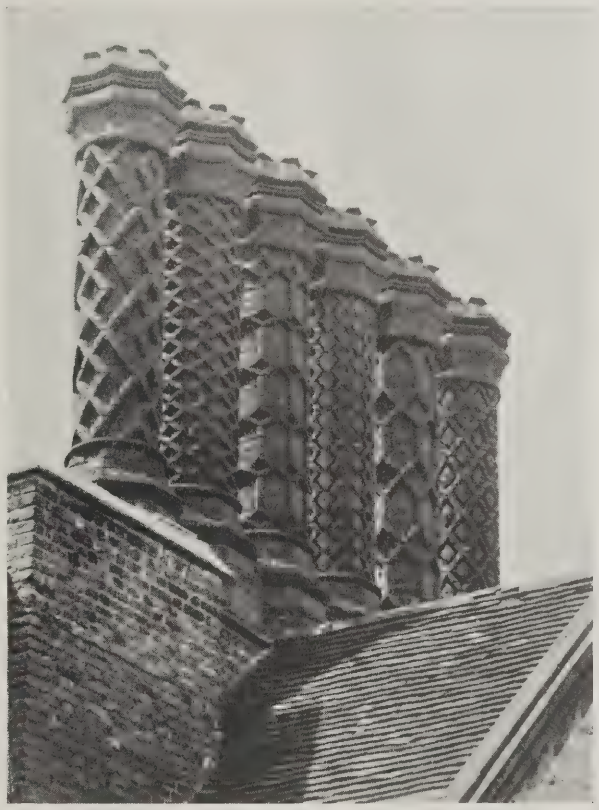
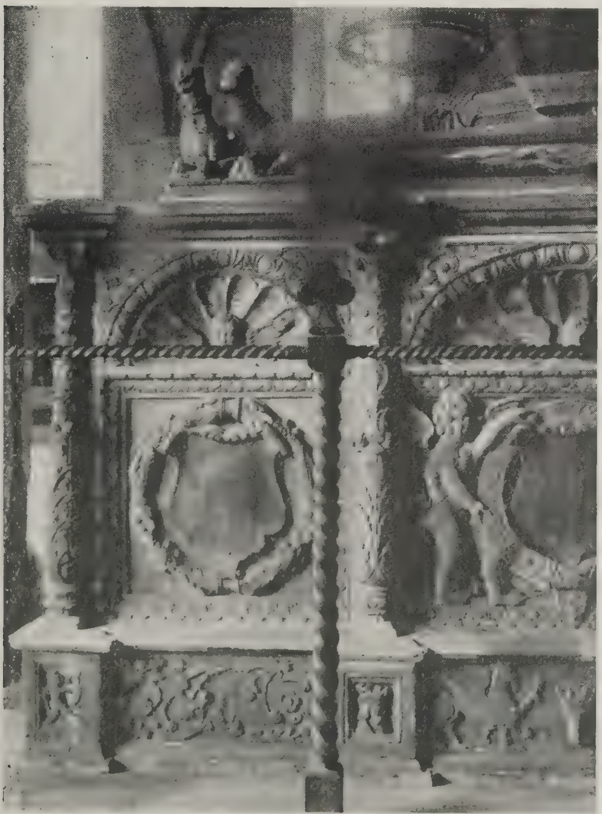
The art of lettering has shown a marked improvement in recent years, as the ubiquitous street hoarding abundantly testifies. The reason for this is to be found in the fact that the artist, following the example of the architect, now takes a good model for his inscriptions. The sixteenth-century specimen of Italian lettering which I send (obviously based on the Trajan Column) is as perfect as one could wish. It is to be found in the choir of Como Cathedral.—J.R.

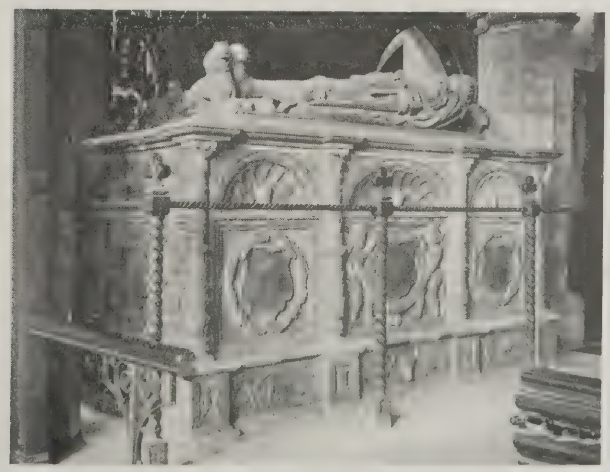


This garden ornament is at Tor Royal, Devon, and dates from 1797. It is of Coade's patent stone, which was a very popular decorative material about that time. An example of its use in London may be seen in the pediment of Somerset House on the Embankment front.—ANON.



Herewith a view of some remarkably fine brick chimney-stacks at Hampton Court Palace. They occupy a position between the Lord Chamberlain's Court and the Master Carpenter's Court. I believe I am right in saying that they are genuine examples of Tudor brickwork.—H. P.





The tomb of Sir Anthony Browne in Battle Church, Sussex, is dated 1540. It is a remarkable example of early Renaissance design, and I imagine it must be the work of some itinerant Continental craftsman. The detail is finely wrought, and exhibits nothing of the crudity generally characteristic of contemporary indigenous work.—X.

New L.C.C. Theatre Regulations

NEW regulations for the protection of theatres, etc., against fire are issued with the L.C.C. agenda dated July 4, 1922. These are summarized in a report by the Theatres and Music Halls Committee (No. 1) as follows :—

1. The existing regulations of the Council under the Metropolis Management and Building Acts Amendment Act, 1878, relating to the construction of theatres, music halls, and other places of public resort kept open for the public performance of stage plays and for public music and dancing were made in 1901 and have from time to time been amended in minor particulars. In many details they are not in accordance with existing practice and in some respects are not sufficiently specific.

We have, therefore, examined the regulations with a view to ascertaining what alterations are necessary in order to bring them up to date, and now submit amended regulations. With the exception of that dealing with the construction of the stage roof, to which reference is made later in this report, we have not considered it necessary to alter the regulations in any important features. The alterations consist mainly of matters of detail, and provision has been made for the special features of new classes of buildings such as cinematograph halls. The amendments have necessitated the re-drafting of the greater number of the regulations, and it is consequently not possible readily to indicate, by comparison with the existing regulations, the alterations which we suggest. The principal alterations are as follows :—

(i) Site (Regulation No. 2).—The regulation as to the site of the building has been amplified, has been made more specific, and now deals with buildings of various sizes and classes.

(ii) Staircases (Regulation No. 16).—Before 1901 the regulations allowed a maximum of only twelve steps in a flight, but this was increased in 1901 to fifteen steps, to enable two interlocking staircases in single flights to be provided within the same enclosure. Fifteen steps of six-inch rise do not, however, give sufficient headroom, and we accordingly suggest that sixteen steps in a flight should be allowed. The existing regulation provides that there shall not be more than two successive flights without a turn, and in order to ensure that the pressure on a staircase in case of a panic shall not be unduly increased we suggest that if there are more than twelve steps in a flight not more than one flight shall be provided without a turn.

(iii) Waiting spaces (Regulation No. 22).—A requirement has been made for the provision in cinematograph halls and, where necessary, at other premises, of suitable accommodation for persons awaiting admission to the seating. Such provision is specially necessary at places where continuous performances are given so as to ensure that persons awaiting admission shall not obstruct the exits.

(iv) Special provision for small theatres (Regulation No. 25).—Provision has been made which will allow of a stage and scenery being used in small halls not accommodating more than 500 persons, without the provision of a brick proscenium and safety curtain.

(v) Stage roof (Regulation No. 26).—The regulation as to the construction of the stage roof, which is of much importance, has been materially altered. The present regulation requires that the stage roof shall not be of fire-resisting material or heavy construction, the object being to provide a ready outlet for flames and smoke in the event of a fire on the stage, and so to obviate the possibility of the flames and smoke being drawn to the auditorium. At the time when the practice of providing a light roof was first adopted only a few of the London theatres were provided with safety curtains, gas was in use on the stage battens, and no satisfactory method of rendering scenery fire-resisting had been adopted. The provision of the safety curtain should keep an outbreak of fire within bounds, and it is therefore desirable not to add unnecessarily to the fire by providing a light inflammable roof which, if it collapsed, might damage the fire curtain. In order, however, to ensure that the up-draught on the stage in the event of a fire shall not be lessened, we propose that the area of the lantern light shall be increased from one-tenth to one-sixth of the area of the stage. The regulation will permit of this increased area being provided by means of one or more lantern lights. Provision is also made that the ventilation of the stage shall be to the satisfaction of the Council.

(vi) Dressing-rooms and scene stores (Regulations Nos. 28 and 29.)—Definite requirements have been made for the provision of adequate and suitable dressing-room accommodation and for the provision of scene and property stores.

(vii) Cinematograph enclosure (Regulation No. 38).—A requirement has been inserted with regard to the construction and arrangement of the cinematograph enclosure and re-winding room.

(viii) Ventilation (Regulation No. 40).—This regulation provides that the premises shall be ventilated to the satisfaction of the Council.

(ix) Lighting and heating (Regulation No. 46).—The details with regard to gas lighting, which are included in the existing regulations, have been deleted. Electrical, lighting, gas and heating installations will be dealt with in a separate set of regulations, and regulation No. 46 requires that these installations shall be in accordance with such regulations.

(x) Sanitary accommodation (Regulation No. 41).—A new regulation has been inserted indicating the number of water closets and urinal stalls which are likely to be required in different classes of premises, according to the number of persons accommodated.

(xi) Natural lighting (Regulation No. 42).—A requirement has been made for the provision of natural lighting by means of windows and skylights to the auditorium and (where practicable) to all other parts of all premises.

With regard to ventilation we should mention that at present we have under consideration a draft set of regulations dealing with this subject. We have conferred thereon with various authorities and associations, and hope to be able shortly to submit proposals to the Council. We recommend :—

That the regulations made under section 12 of the Metropolis Management and Building Acts Amendment Act, 1878, on July 30, 1901 (p. 1117), and amended on February 4, 1902 (p. 135), November 13, 1906 (p. 1146), February 28, 1911 (p. 447), December 11, 1917 (p. 1101), and January 21, 1919 (p. 25), be repealed; that regulations, as follows, be made under section 12 of the Metropolis Management and Building Acts Amendment Act, 1878, with respect to the requirements for the protection from fire of theatres, houses, rooms, and other places of public resort within the Administrative County of London to be constructed or to be kept open for the public performance of stage-plays or for public dancing, music or other public entertainment of the like kind; and that the seal of the Council be attached to three copies of the regulations.

PERCY C. SIMMONS, Chairman.

The Assistants' Professional Union

Midland Counties Branch.

A general meeting of the Midland Counties Branch of the A.S.A.P.U. was held on Saturday, July 1, at The Market Hotel, Birmingham, on the occasion of the visit of Mr. J. Mitchell, General Secretary of the Union.

In an address dealing with some of the many vital questions with which the professions are faced to-day, Mr. Mitchell emphasized the severe overcrowding of the architectural and surveying professions at the present time. He intimated that shortly the Union would endeavour to bring into being District Committees, consisting of both practitioners and assistants, with a view to taking steps to regulate the number of entrants into the professions from time to time. Last year over two thousand students passed through the architectural schools, and many of these, finding that openings are not available, will be forced to begin once more to study in order to enter some other profession. The District Committees will deal with this obvious injustice by deciding each year on the number of students to be admitted to the ranks of the professions, and only that number would be trained by the schools.

In dealing with the subject of local propaganda, Mr. Mitchell urged upon the members present the necessity for putting in hand a social programme for the forthcoming winter session.

At the close of Mr. Mitchell's address a keen discussion took place, and arrangements were made for putting into operation some of his suggestions regarding the branch's social activities.

C. BERTRAM PARKES,
Hon. Sec., Branch No. 10, A.S.A.P.U.

Enquiries Answered

The Editors cordially invite enquiries from readers who require information on architectural, constructional, or legal matters. Answers to enquiries are in all cases the work of experts; and while every care is taken to make the replies thoroughly reliable, the Editors cannot hold themselves responsible for any inaccuracies that may inadvertently occur. Correspondents whose difficulties involve possible legal proceedings are strongly urged to consult their solicitors before taking action on any advice that may be given. Examination questions cannot be answered. It must be understood that, as a rule, both question and answer will be published in these columns. The name and address of the querist must always be given, not necessarily for publication. Correspondents are requested to be as brief as possible, and to write on one side of the paper only.

Tour in Cotswolds.

J. K. H. writes: "What is the best town to adopt as a centre for a tour through the Cotswold Hills with a view to seeing the type of stone house characteristic of the district? The town should be reasonably easy of access by railway from the North, and should have good hotel accommodation."

—Querist should try Chipping Campden (hotels: Lygon Arms and Noel Arms), from which, as well as the incomparable town itself, Broadway, Willersey, Weston-Subedge, Aston-Subedge, and Ebrington may be visited on foot; with a few days at Painswick or Cirencester, from which the southern villages are more readily reached. If a larger town is desired as a centre for motor trips, Cheltenham is excellent. See reports and itinerary of Architectural Association Annual Excursion 1909. G.

Cleaning Old Oak.

"Q" writes: "I am renovating and restoring an excellent sixteenth-century house in which there is a large quantity of oak, which was mostly covered with whitewash (about twenty coats) and plaster. The whole is in excellent preservation. Can you tell me: (1) How to remove the trace of all whitewash without damaging the oak, and (2) How to treat the oak so as to give it a good colour and not allow the whitewash 'stain' to return? It is important that the preparation recommended should not 'run,' as the remaining portions of the walls will be distempered. If linseed oil is used it is thought that the whitewash stain will return, and that the oil will also 'run' on to the distemper at the edges. A large portion of the oak is in the form of moulded beams, and it is important that the treatment should not spoil or disfigure them. (3) How should similar oakwork be treated which is external? There is no paint, etc., anywhere, only just the plain oak."

—(1) As much of the old whitewash and plaster as can be detached by flaking or tapping with a light hammer should first be thus removed. That which remains adherent should be scrubbed off with a stiff brush, using a solution—not over 10 per cent.—of hydrochloric acid in water. Care must be taken in handling this, as it is an irritant to the skin. Repeated applications will probably be necessary to remove the accumulations of lime. When all trace has apparently disappeared from the surface wash over the work with a strong alkaline solution, either sodium carbonate or ammonia, which will remove the bleached effect and leave the surface dark so long as it remains wet. When dry it will again appear somewhat bleached, but of not unpleasant texture, and many people will be satisfied with this effect. (2) If a darker tint is desired the tint of the wet oak may be restored by painting the surface with raw linseed oil. If this is carefully applied as to the edges (like paint) it should not run, as it is a drying oil. If a very dark colour is desired, staining with Brunswick black thinned to the desired tint with turps may do, but this seems vandalism. (3) A similar treatment for external oak should be effective, but if the oak on cleansing shows cavities these should be filled in with stained mastic, and a preservative coat of a creosote stain might be applied.

Demolition of Factory Chimney.

C. F. writes: "Would the demolition of a factory chimney, which it is not proposed to re-erect, constitute a claim for dilapidations on the part of the ground landlord at the expiration of the lease?"

—In the absence of the lease one can hardly reply definitely to this question, and it would be well for the enquirer to consult his solicitor. If the chimney is of any possible use to the premises in their present condition, or as they might be reconstructed, it is extremely probable that its demolition might be claimed as a "dilapidation," but if the term has still some years to run I should risk that eventuality. It cuts both ways. If the lease is shortly expiring, consult the ground landlord before doing anything. F.S.I.

Insulating an Ice House.

G. P. writes: "What is the latest method for insulating ice houses; i.e. houses erected for the storage of, say, 100 tons of ice? In designing ice houses must any special features be embodied?"

—One of the latest ice stores is that erected recently in a basement in London. The insulation was carried out by a Mr. William Taylor, of Tooting Junction Insulating Works, Tooting, and consisted of the following:—

Floor.—Two thicknesses of 3 in. slabs of cork, covered with a surface of 1 in. asphalt laid on site.

Partitions.—Formed of 9 in. studs (about 2 ft. apart), each side covered with 1 in. tongued and grooved boarding and one thickness of oiled paper, filled in with granulated cork up to about 2 ft. above the floor, and above that with slag wool. Not more than 16 lb. to the cubic foot.

Walls.—Similar to partitions.

Ceiling.—Similar to partitions, but all slag-wool filling; no granulated cork.

After completion the whole of the exposed woodwork received two coats of varnish. Another firm who carry out insulating works are Messrs. Wallington Johns & Co., of 13 Crutched Friars, E.C.

Soundproofing Floors.

"A" writes: "It is a common practice in Scotland to deafen floors by placing between the flooring boards and the plaster ceiling below, boarding supported by strips nailed to the sides of the joists, and on this boarding to put lime plaster and ashes. This appears to be an antiquated method, and in any case does not prevent the sound travelling through the solid portion of the floor, i.e. the joists. Would the placing of felt on the top of the joists and nailing the floorboards to the felt be an effective method of deadening sound, and what felt would be best for the purpose?"

—The method described is an old one, and is more effective in producing conditions favouring the development of dry rot than in stopping sound. Slag-wool filling in place of plaster is some improvement, but the passage of sound through the joists is, of course, not prevented. Strips of porous felt laid on the joists partially check this, but the nails of the flooring still convey sound freely. For best results, short of double flooring, the method common in America is most effective. On the joists a rough-boarded under-floor is laid, nailed in the usual way. When finishings are in hand this is covered with felt or Cabot's sheathing quilt, upon which a further layer of 1½ in. square battens is laid (but not nailed) one batten above each joist. The wrought upper floor is nailed to these battens with nails which do not penetrate into or through the quilt, so that the upper floor "floats" on the real structure. This is effective, but, of course, wastes about 2¼ in. in height. E.

British Market for Canadian Timber.

G. S. (Burnley): We learn that an inquiry is being conducted by the Imperial Institute Advisory Committee on Timbers into the possibility of extending the use in Great Britain of the timbers produced in the various countries of the overseas Empire. A report of the committee deals with timbers from British Columbia and the eastern provinces of Canada, and the attention of the Office of Works has been called to the value of British Columbian Douglas fir, spruce, and hemlock for constructional purposes. These woods are now included in their official specifications for Government buildings as alternatives to European woods.

Modern London Architecture

We are glad to note that the daily newspapers are devoting much more attention to architecture and building. Quite recently several of them have published contributions from architects dealing with matters of much importance to the profession. The latest instance is a series of articles in "The Morning Post" on Modern London Architecture, by Sir Reginald Blomfield, R.A. In his first article he deals with architecture as the Cinderella of the arts, and in the second urges that some general control should be exercised over the general treatment of new main thoroughfares.

Sir Reginald, in the course of his articles, says :

In the great days of the eighteenth century intelligent persons took an interest in architecture, and there existed a certain consensus of opinion by which it was possible for the layman to form some sort of judgment on the merits of a building. The result was that architecture at the worst did not sink below a certain level, because the public sense would not stand it.

This state of things no longer exists. Intelligent people take an interest in the art, but they have no accepted standard to refer to. The art critics give architecture a miss. Painting and sculpture are easier copy, and, as architecture is a technical art, there is the risk of getting out of one's depth. Moreover, architecture cannot really be exhibited except in buildings. The only place where an exhibition is attempted is in the architectural room at the Royal Academy, and even there the architects have sold their birthright for a mess of pottage by substituting for the illustration of architectural design water-colour pictures, seldom executed by the architect himself. In the descriptions of war memorials that appear in the papers the only person to whom no reference is made is, with a few favoured exceptions, the architect who designed the memorial. Architecture is out in the cold, the critics turn their backs on her, or, if they condescend to notice her, make her out to be so unattractive that they would have served her better by leaving her alone.

Architecture, if it is to be good, must be efficient for its purpose ; but efficiency for its purpose in architecture has a wider range than it has in engineering or in simple building, because in architecture the appeal to the æsthetic sense has to be taken into account, and if that appeal fails the architecture fails with it. A complicated piece of machinery may be extremely efficient, but it makes no æsthetic appeal, and nobody expects it to. But the Art of Architecture is on a different footing, and we get into dangerous depths if we treat it as a matter of mere construction and skeleton framework, and forget that it is the art of dealing with mass and plane, and that it is a plastic art on the greatest of all scales. Moreover, it is folly to turn one's back on the past and to attempt to throw overboard associations which resolutely refuse to leave a well-found ship.

Owing to financial conditions, domestic architecture, in which the pre-eminent skill of English architects is not seriously disputed, is temporarily out of action ; but in London and other great cities there is considerable activity in the building of large and costly business premises, shops, banks, insurance companies, and the like. There is no escaping these buildings in our daily walks, and the question arises, how far the façades of these buildings justify themselves architecturally.

The point is that it is the tradesman, not the designer, who is mainly at fault, and that if the tradesman had sense enough to realize the value of reticence and dignity in design as a business asset, he would not persist in his demand for these artistic iniquities. That the shrewder among them already realize this is evident from some of the most recent examples.

Some sort of control should be exercised over the general treatment of new main thoroughfares; and if a Commission of Fine Art is established, this might well be included within their terms of reference. As it is, the chief anxiety of the designers of our great business premises seems to be to go one better than the man next door. The inevitable result is that great opportunities are too often wasted, and, though an individual building may be fine itself, its want of relationship to adjacent buildings strikes a discordant note that upsets the whole architectural harmony. Boards of directors, often individually men of taste and refinement, seem in their collective capacity to forget that lavish display and audacious advertisement are not the best that architecture can do for them, and that in dealing with the great opportunities and resources under their control they have a certain responsibility to the public.

A vast apparatus of the Orders, even when correctly done, which is not always the case, is at its best an academical exercise of no interest to anyone but the mere technician, and even less attractive are the various versions of modern French design, which is now the prevailing mode of our great commercial buildings, a manner of design sadly inferior to the great French Classic of the eighteenth century. There is something unreal and inhuman about this borrowed garb.

It is a welcome sign that our best men move steadily towards greater simplicity and reserve in design, that whereas thirty years ago they were intent on the details of Neo-Classic, Neo-Gothic, and the like, they are now occupied with construction, proportion, mass and outline, planes and their relations, large planning in monumental work, effective and practical arrangement in domestic design.

Unification & Registration

The Council of the R.I.B.A. at their meeting on July 3 passed the following resolutions :—

1. That this Council considers the scheme of the Unification and Registration Committee is contrary to the best interests of the public, of architectural education and practice, and the Royal Institute of British Architects in particular, and is of the opinion that the Committee should be dissolved.

2. That each member of the Unification and Registration Committee be thanked for his services, and his appointment cancelled.

3. That a Committee be appointed of members of the R.I.B.A., with power to add to their number and to co-opt, if necessary, non-members of the R.I.B.A. and to obtain expert advice to draft a Registration Bill with a view to its being deposited in November 1922.

4. That a small Committee be formed to consider the revision of the Charter and By-laws, and to report to the Council at the earliest possible date. The Committee to have power to add to their number and to take expert advice. The new Charter to provide for equal voting powers for all corporate members, etc.,etc. A note to be inserted in the Journal asking members to send any suggestions to the Committee.

The Henry Jarvis Travelling Studentship

The Faculty of Architecture of the British School at Rome have decided that, subject to the approval of the Faculty, the Henry Jarvis student will be allowed to spend six months of his second year away from the school in any part of the Mediterranean Basin, it being understood that scholars are allowed under present conditions to travel, during the first and second year, for short periods in Italy and Greece.

University College School of Architecture

Following is a list of prize-winners for the session 1921–1922 :—

Donaldson Silver Medal.
F. Jenkins.

Hubert Batsford Prize.
Best First Year Student, Leonora Payne.

Andrew Taylor Prizes.
Second Year Construction, C. G. W. Eve.
Third Year Studio Work, F. E. Towndrow.

Ronald Jones Prizes.
Mediæval History, J. R. Alabaster.
Renaissance History, M. A. Sisson.

Lever Prizes in Architecture.
First Prize, M. C. Glover.
Second Prize, F. E. Towndrow.

Lever Prizes in Town Planning.
First Prize, K. A. A. Ansari.
Second Prize, R. N. Vanes.

"Architects' Journal" Essay Prize.
J. B. Wright.

The following students gained First Class Certificates in the session 1921–1922. (These certificates carry exemption from the R.I.B.A. Intermediate Examination) :—

Alabaster, J. R.
Armitage, H. M. A.
Burckgardt, E.
Cooper, J. B.
Dixon, B. E.
Eve, C. G. W.
Greenidge, J. T. W.
Hargroves, Amy.
Harriss, J. D.
Hawkins, J.
Hill, J. R.
Hobday, R.
Hope, A. F.
Jayasuriya, P. C. R.
Luke, R. L.
Mace, G. M.
Morgan, G. L. Ll.
Nicholson, G. T.
Pouschkine, Barbara.
Rea, H. F.
Short, C. H.
Sisson, M. A.
Stedman, L. R.
Stokes, L. G.
Studdy, Edith.
Sutcliffe, B. L.
Sykes, C. G.
Towndrow, F. E.
Unwin, E.
Wilson, Louise.
Wright, H.

The following students gained Town Planning Certificates, session 1921–1922 :—

Ansari, K. A. A.
Hudson, R. A.
Jayasuriya, P. C. R.

The Week's News

Housing at Leeds.

During the past twelve months 1,048 houses have been completed at Leeds.

The New County Hall.

The King opens the new County Hall on July 17.

Barking Town Hall.

Barking Town Hall, built in 1567 by Queen Elizabeth, is to be restored.

Lord Rosebery and Glasgow University.

Lord Rosebery has subscribed £5,000 towards the new schemes of Glasgow University.

New Church for Ventnor.

The old building of St. Alban's Church has been removed, and the erection of the new permanent church will commence forthwith.

New School for Berwickshire.

A new school is to be erected at Eyemouth, by the Berwickshire Education Authority, from plans by Mr. G. R. Black, architect, Edinburgh.

No more Houses for Chesterfield.

The Ministry of Health have declined to allow Chesterfield Town Council to erect fifty houses on the Highfield Hall estate.

Frescoes for Selfridge's.

We understand that Mr. Gordon Selfridge has commissioned Mr. Frank Brangwyn to paint frescoes in the dome of his new store.

Contractor's £580,000 Fortune.

Sir John Scott, Bart., of Darlington, Durham, who carried out big contracts in the construction of reservoirs and docks, has left a fortune of £582,165.

Town Planning at Llandaff and Dinas Powis.

Mr. F. M. Ellwood has been appointed expert adviser to the Llandaff and Dinas Powis Rural District Council with regard to the town-planning scheme.

Shortage of Houses at Middlesbrough.

During the discussion of proposals concerning provision of work for unemployed at a meeting of Middlesbrough Town Council, it was stated that Middlesbrough was 3,000 houses short of requirements.

White City for Sale.

The exhibition ground at Shepherd's Bush known to London as the White City, and famous throughout the world for the international displays that have been held there, is now for sale.

The British Empire Exhibition.

Great progress is being made with the erection of the British Empire Exhibition at Wembley Park. Messrs. John W. Simpson and Maxwell Ayrton, FF.R.I.B.A., are the architects.

More Houses for Bo'ness.

At Bo'ness thirty-two additional houses are to be built in connection with the housing scheme, and the average price works out at £620. These dwellings are three, four, and five apartments.

Estate Agent for Chesterfield.

Chesterfield Municipal Housing Committee have appointed Mr. W. Illingworth, of Bradford, as estate agent, at a salary of £300 per annum, to begin duty on August 1.

Manchester Operatives and the Wage Reductions.

Trade unionists recently met in Manchester and passed a resolution demanding that the executive members who agreed to the last wages reduction should resign immediately.

Housing at Northampton.

Northampton Town Council, having decided to build 100 houses without the Government subsidy, have accepted tenders for forty houses of the non-parlour two bedroom type, at prices ranging from £325 to £337.

Fort Pitt Hospital to be Closed.

Fort Pitt Military Hospital, Chatham, is to be closed down. The fort was originally built as part of a line of fortifications during the Napoleonic wars in preparation for a possible invasion, and later became a military hospital.

Electrifying the S.E. and C.R.

Shareholders of the South-Eastern and Chatham Railway Companies have approved the scheme for electrifying parts of the railway. The scheme, which aims at the electrification of 220 miles of line to a distance of sixteen miles out of London, will cost £6,500,000.

New Peterhead Academy.

Mr. J. A. Ogg Allan, F.R.I.B.A., is the architect for the New Peterhead Academy which is to replace the one destroyed early this year by fire. The new buildings, which are to be erected for the Aberdeenshire Education Authority, will cost about £27,000, excluding fittings and equipment.

"Statue of Liberty" for Portsmouth Harbour.

Portsmouth's war memorial is to be a stone monument 100 ft. high on Southsea Common, near the entrance to Portsmouth Harbour. At its base, looking north, south, east, and west, will be four lions. The names of all those whom the monument commemorates will be recorded upon bronze panels.

New Hotel for Lyons.

Another "Corner House" for London, almost facing the Marble Arch, is contemplated by Messrs. J. Lyons and Company, who have just secured the last three blocks of buildings in the important site in Oxford Street lying between Portman Street and Edgware Road. The total area of the three sites is 160,000 square feet, and the property comprises part of the Portman estate.

New Works for Messrs. J. S. Fry and Sons, Ltd.

Far-reaching extensions by Messrs. J. S. Fry and Sons, Ltd., of Bristol, are being carried out at Keynsham, a few miles from the city on the main Great Western line to London. On a stretch of about 300 acres, new factories are rising and roads, wharves, and railway sidings are taking shape. There are to be playing fields, bathing pools, and other amenities for the workers.

The "Old Stone Age."

The first volume of Mr. C. H. B. Quennell's "Everyday Life Series," dealing with the Old Stone Age, published by Messrs. Batsford last Christmas, has now been issued in America by Putnams. The different conditions of the transatlantic book market have enabled the American publishers to bring it out in a larger and ampler form at the price of $2.50.

£30,000 for Marlborough College.

At the Prize Day ceremony at Marlborough College the Master, Dr. Cyril Norwood, announced that Mr. Herbert Leaf proposed to present to the college the sum of £30,000 to pay the whole cost of installing electric light at the school, and it was his wish that the balance, which would be considerable, should be devoted to the purposes of a war memorial hall.

New Isolation Hospital for Swansea.

Swansea Health Committee have approved plans and drawings for the new isolation hospital which it is proposed to erect on the grounds of Hill House at an estimated cost of £118,252, with an additional £6,000 for furnishing. Accommodation is to be provided for 118 beds. The committee have applied to the Ministry of Health for sanction to borrow £124,250.

Higher Buildings.

Official notification has now been received by the Association of Retail Distributors that the L.C.C. have amended their building regulations in the following particulars: A general height of 80 ft. from the pavement level to the ceiling of the topmost floor is permitted in place of the old limit of 50 ft. A space limit of 500,000 cubic feet is permitted for the area of any one self-contained compartment, with a maximum floor area of 40,000 square feet.

The Late Mr. W. L. Bernard, F.R.I.B.A.

We regret to announce the death of Mr. William L. Bernard, F.R.I.B.A., at the age of seventy-eight. He was articled to the Bath City Architect, was appointed architect to the Bristol School Board in 1888 and had an extensive practice as a school architect. Among the big buildings for which he was architect was the Queen Victoria Jubilee Convalescent Home. He was a past president of the Bristol Society of Architects, a Fellow and member of the Council of the R.I.B.A.

Late Eighteenth-century Decoration and Furniture.

Miss Margaret Jourdain has prepared for early publication with Messrs. B. T. Batsford an important illustrated work on the Decoration and Furniture of the later Eighteenth Century. The volume will treat of the interior work of all the chief architects of the period—the Adam Brothers, Taylor, Dance, the Wyatt Brothers, Stuart, Leverton, Holland, and a number of brilliant decorative painters, native and foreign, Zucchi, Angelica Kauffmann, Rebecca, Pergolesi, Ibbetson, and others.

International Theatre Exhibition.

Queen Mary has paid a visit to the International Theatre Exhibition at the Victoria and Albert Museum. Among recent additions to the exhibition are two important models by Signor Mariano Fortuny. One of them is a very complete mechanical model of the canvas cupola invented by Fortuny for sky and lighting effects, and carried out by him in the Scala Theatre, Milan. The model shows how the canvas cupola can be folded up and moved to the back of the scene when other scenery is required in front. A second model, lighted by electricity, shows the effect of the cupola with a Venetian scene. Another addition is a large model of Drury Lane Theatre before the alterations made in 1921. This model, which was executed by Mr. J. H. Hollyman, is lent by Miss Renée Mayer.

New A.R.A.'s.

At a General Assembly of Academicians and Associates of the Royal Academy, Mr. Frederick Landseer Griggs and Mr. Henry Macbeth-Raeburn have been elected Associate Engravers. Mr. Griggs, who is a Fellow of the Royal Society of Painter Etchers and Engravers, has illustrated the collected works of William Morris, the "Life of G. F. Watts," "Memorials of Edward Burne-Jones," "Old Colleges of Oxford," "History of Eton College," "Highways and Byways in the Cotswolds," and many other topographical publications. He is a constant exhibitor at the Royal Academy, and his works have been purchased by the British Museum, South Kensington Museum, and other public museums and galleries at home and abroad. Mr. Raeburn, the son of Mr. Norman Macbeth, R.S.A., obtained his art training at the Royal Scottish Academy and at Julian's Studio in Paris. He started as a portrait painter in London in 1884, and became an engraver six years later. He has engraved plates after all the well-known masters, and has constantly shown at British and Continental exhibitions since 1884.

Conditions of Contract

The negotiations between the R.I.B.A., the Surveyors' Institution, the Society of Architects, the National Federation of Building Trades' Employers, and the Institute of Builders, which have been proceeding for some time with a view to the preparation of a Standard Form of Contract for building operations, have reached their final stage. A conference of representatives from the above bodies has appointed a Drafting Committee, which is already at work on the contract document. All matters on which the parties fail to reach an agreement will be referred to arbitration by a Tribunal of Appeal, consisting of one representative each of the builders and the architects, under the chairmanship of Sir William Mackenzie, K.C., President of the Industrial Court. Sir William is well known as an arbitrator in industrial disputes, and the acquisition of his services is of the greatest importance to the interests concerned. His appointment was made with the consent of the Ministry of Labour. The expenses of the preparation of the Standard Form of Contract will be borne jointly by the parties interested, and the Council of the R.I.B.A. have voted a sum of £200 for this purpose. It is hoped that the five spending departments of H.M. Government will accept the invitation extended to them to appoint representatives to assist the Drafting Committee.

Correspondence

Architect and Craftsman

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I entirely agree with the remarks of "Architectural Sculptor" in your last issue, but the Gothic architect is in a sorry plight unless he can find a Gothic sculptor.

If such sculptors as worked on Chartres or Wells existed to-day I, for one, would never have dreamed of making any drawings for the sculpture required for our buildings. C. F. A. VOYSEY.

Unification & Registration

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I have received a circular letter this morning (July 6) from the Council of the R.I.B.A. informing me that at their meeting on July 3 they passed the following resolutions :—

1. That this Council considers the scheme of the Unification and Registration Committee is contrary to the best interests of the public, of architectural education and practice, and the R.I.B.A. in particular, and is of opinion that the Committee should be dissolved.

2. That each member of the Unification and Registration Committee be thanked for his services, and his appointment cancelled.

In my view, resolution No. 1 is merely a pious expression of opinion by the Council of one of the constituent bodies composing the Unification and Registration Committee, which is premature in view of the fact that the Committee has not made its report. I consider it unfortunate that the Council of the R.I.B.A. should have issued this resolution without consulting the Committee.

I further consider that resolution No. 2 is "ultra vires," and I submit that the Council of the Institute has no power to cancel those appointments on the Committee made by other constituent bodies.

On the matter generally I submit with great respect that it is very unusual for a Committee to be discharged before it has made its report, and that if in the opinion of the Institute Council the Unification and Registration Committee should be discharged at this stage of the proceedings, the proper course is for the Committee to be called together to consider the views of the Council of the Institute on the subject.

If the Committee is eventually discharged with its knowledge and consent either before or after it has made its report to the councils of the constituent bodies, I submit that it would be more in accordance with the fitness of things and with precedent for the Council of the Institute to communicate the fact to the officials of the other constituent bodies rather than send an open unidentified circular letter to the individual members of the Committee purporting to cancel their appointment.

C. McARTHUR BUTLER,
Secretary of the Society of Architects.

Specifications Published.

181092.—Sanguinetti, D.—Coloured artificial asphaltum.

181098.—Rogers, R. H.—Beams, or like structural members, for use in reinforced concrete construction.

Abstract Published.

179204.—Artificial stone.—Lamarque, R., 106 Boulevard d'Armentières, Roubaix, France.—In the manufacture of artificial stone from natural stone fragments the latter are crushed and graded by sifting, and the graded material is further crushed and sifted alternately until a dust-free product of uniform fineness corresponding to the natural grain of the stone is obtained. If the stone is crushed wet the grading is effected by repeated washings. The crushed stone is agglomerated by means of a binding-agent capable of hardening in the air or by baking. Pure or mixed cement, coloured or otherwise, burnt of wet clay, or kaolin may be used as binders. The composition may be applied to a core of reinforced concrete. After treatment with acids to remove calcium salts from the surface, the stone may be polished in the known manner.

The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

List of Competitions Open

Date of Delivery.	COMPETITION.
July 15	Poster to be used at the R.I.B.A. for advertising the exhibitions of drawings which are held from time to time in the Galleries. Premium £5 5s. Assessors—Mr. Halsey Ricardo, F.R.I.B.A., Professor S. D. Adshead, M.A., F.R.I.B.A., and Mr. Alfred Cox, F.R.I.B.A. Apply Secretary, R.I.B.A., 9 Conduit St., W.1.
Nov. 1	New Town Hall and Municipal Offices in Victoria Park, Colombo. Cost not to exceed Rs. 1,000,000. Premiums Rs. 5,000, Rs. 3,500 and Rs. 2,000. A F.R.I.B.A. will act as assessor. Apply Secretary, Municipal Council, Colombo. Deposit Rs. 25.
No Date	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guiueas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.

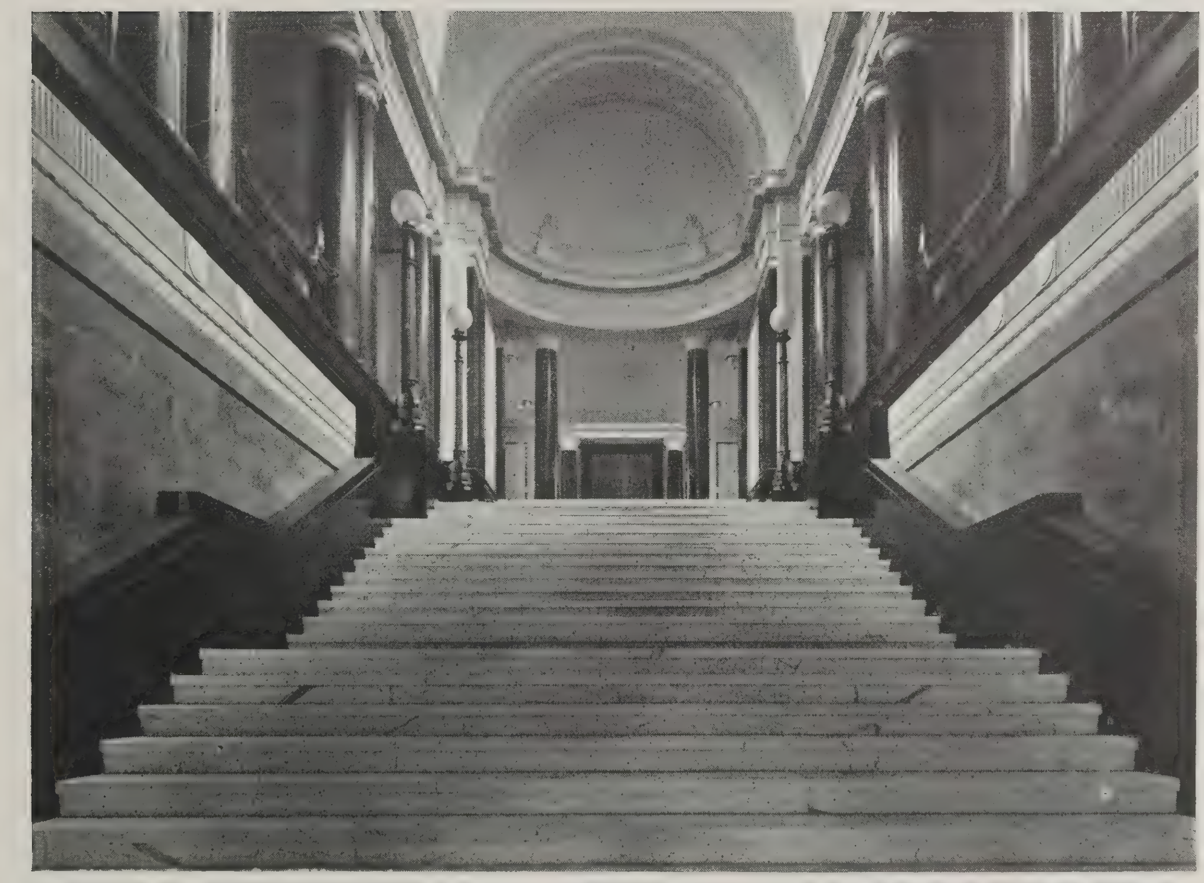
THE ARCHITECTS' JOURNAL & Architectural Engineer

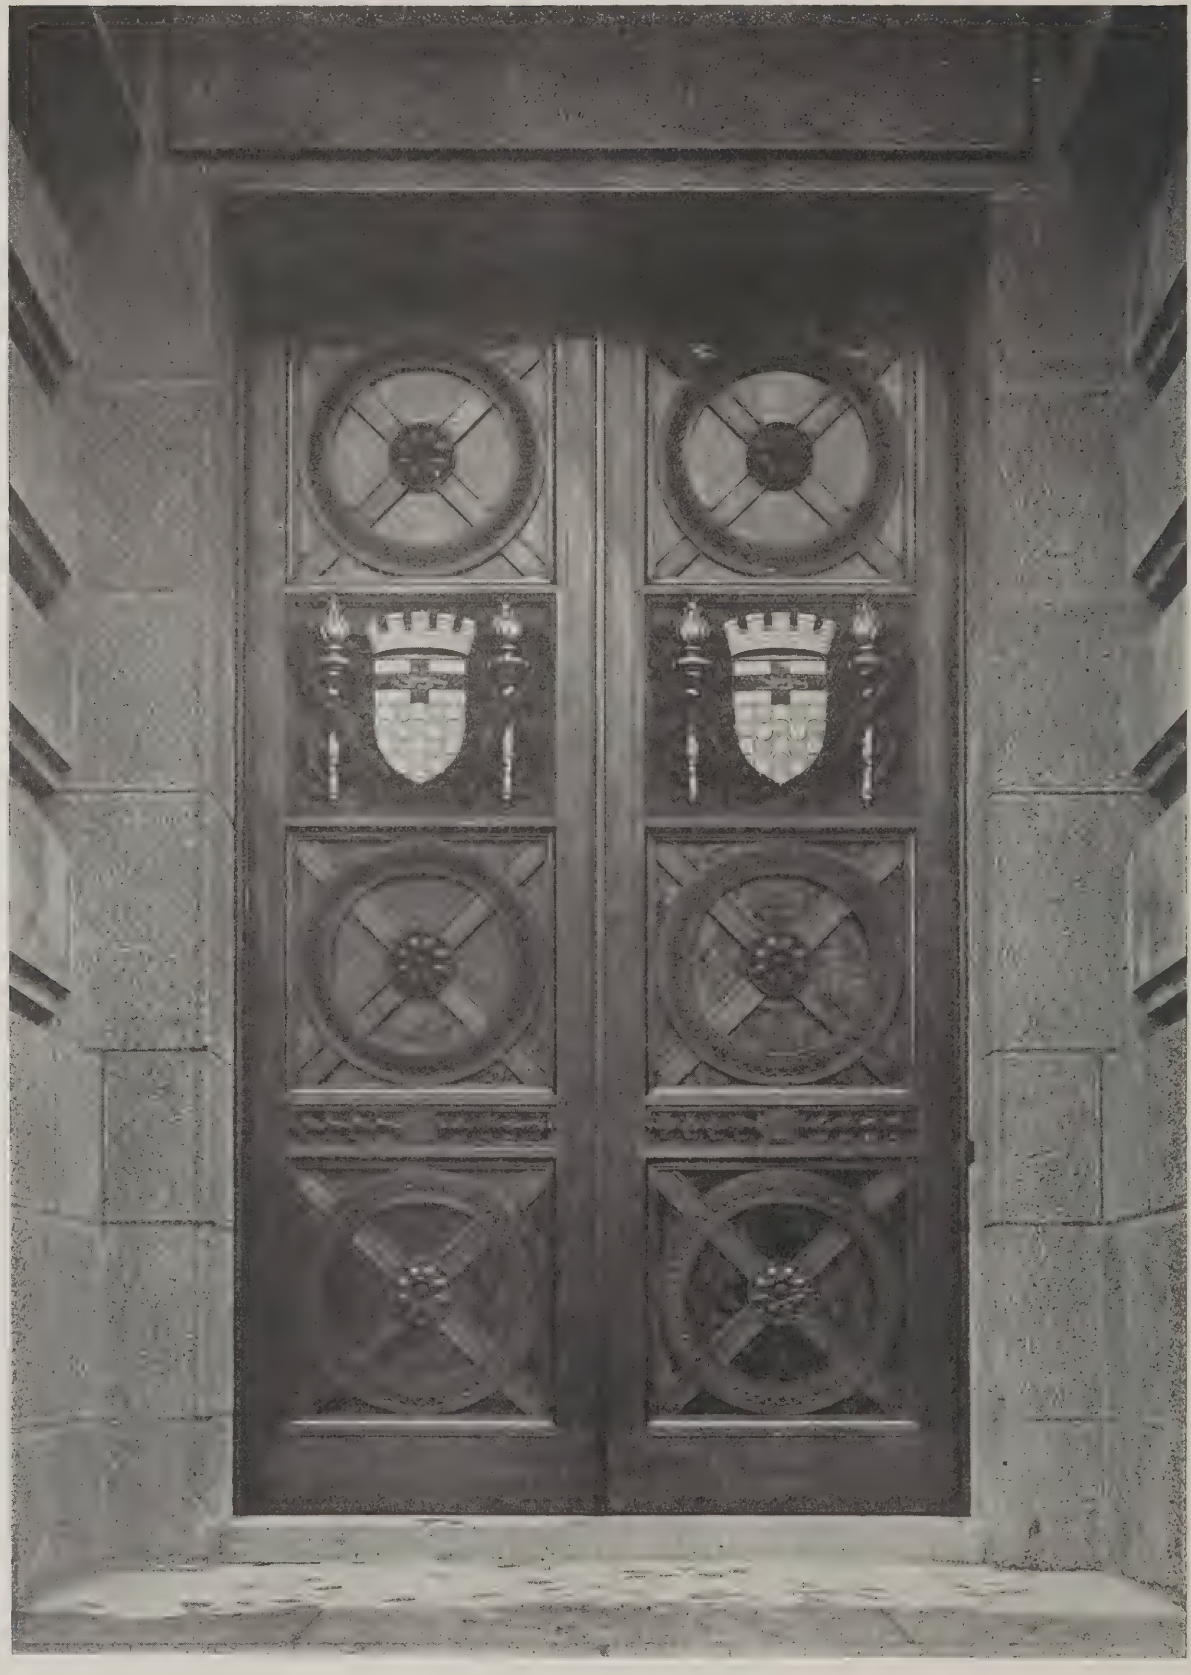
With which is incorporated "The Builders' Journal"



A VIEW OF THE CEREMONIAL STAIRCASE IN THE LONDON COUNTY HALL.

27-29 Tothill Street, Westminster, S.W.1.

Current Architecture. 158.—The London County Hall : Detail of Bronze Doors



The entrance on the Belvedere Road front is intended to be used primarily for ceremonial purposes, and special attention has been given to the design of the doors, which are excellent examples of modern craftsmanship in bronze. Two of the panels are occupied by the arms of the L.C.C. in heraldic colours. (See article in this issue).

THE
ARCHITECTS' JOURNAL
27-29 Tothill Street, Westminster, S.W.1.

Wednesday, July 19, 1922

Volume LVI. No. 1437

Does London Lack Civic Courage?

IF the alleged "Economists" were allowed to have everything their own way, they would leave the new London County Hall unfinished for ever and aye. They have already grumbled at the wanton extravagance of placing a marble veneer over walls that could have been distempered at much less expense. And queruously they ask: Why all those fancy fittings in the Council Chamber?

Considering that Londoners are spending some four millions sterling on their County Hall, the present moment is rather inopportune for urging them to spend freely on building nobly, or for charging them with any sort of meanness; and, moreover, right nobly have they come to the rescue of such architectural treasures as the ancient church of St. Bartholomew-the-Great, of the Abbey of St. Peter at Westminster, and now of the East Minster, more familiar as St. Paul's Cathedral, towards the preservation of which the sum of ten thousand pounds has been raised within a fortnight, and mainly in London. How unjust it would obviously be, then, to accuse Londoners either of meanness in money matters or of holding mean views of London and her public buildings!

It is not meanness, but modesty, that prevents the expansion of London through the enterprise of her own citizens, who too often leave it to the Colonies, and to American men of business, to put up colossal buildings in our midst, and to make strenuous attempts to overcome the native aversion to disproportionate height. Unfortunately this native modesty is commonly in excess. The Londoner is peculiarly liable—or his elected representatives are—to intermittent and alternating hot and cold fits, a spasm of lavishness being succeeded by a severe attack of griping Economy, disqualifying the patient from carrying out in a bold spirit his originally bold intentions. Tennyson must have had such instances in mind when he warned our race to "Pray Heaven our greatness may not fail through craven fear of being great."

The national tendency that has passed into a proverb about "spoiling the ship for the sake of a ha'porth of tar" should find no illustration in the case of the new London County Hall. To a public groaning grievously under abnormally heavy burdens of rating and taxation, it would seem almost cruel to suggest that the equipment and adornment of the County Hall should be forthwith completed with a lavish hand. Yet innumerable examples of the dangers of postponement should counsel a more courageous course. St. Paul's Cathedral, as a notorious instance, has remained for centuries inadequately decorated, and to that extent unfinished; while the Parthenon-like fragment on Calton Hill has excited two or three generations of derisive comment, as "Edinburgh's folly," "Scotland's disgrace," "Athens abridged," and so forth.

There is nothing that provokes more ridicule and contempt than an abortive scheme; and if it should chance by ill-hap that London's County Hall falls into the too-familiar category of "white elephant," the gibe should be incapable of literal interpretation as to the colour of the animal. The County Hall should show colour—warm and smiling—within and without.

To some extent it is already invested with that gracious feature, its interior marble decorations redeeming the promise of its red-tiled roofs; concerning which latter, by the way, certain newspaper writers have made haste to be hypercritical. In condemning the "flaring," or "staring," or "glaring," or "daring" red of these tiles, the critics seem to overlook the mellowing influence of age, on which the architect has naturally counted. He may have heard also a rumour concerning the "saddening" effect of London smoke—"saddening" in the dyer's sense as well as in the emotional effect on the observer. Soot and the weather may be depended upon to subdue any tendency of the tiles to be unduly gay to the scandal of the Puritanical Londoner. Let it be duly appreciated at home and abroad that there are certainly Londoners who have civic pride and who must be credited with clearness of vision. It is to such as these that we owe the very inception of the County Hall; and they carried the project through in defiance of the taunts of "Little Londoners," who could not or would not understand that the object was not "self-glorification," as they fatuously called it, but a clearer recognition than their own of what was due to the greatness of London. The worthier view has to a great extent prevailed, and London's County Hall is much more than a commodious building into which the scattered departmental clerks could be collected from the various outlying buildings where they were only accessible after consulting the telephone book and the Post Office Directory. And it is also much more than a place in which County Councillors can wrangle in comfort over some vital question of reducing (or increasing) the rates by a farthing in the pound.

The London County Hall has much higher functions to fulfil—functions that are not merely administrative, palpable, practical. Its projectors meant it to be also significant, symbolical of the greatness of the capital of a great Empire. It is, if you will have it so, a monument to London's civic pride, which, as all enlightened psychologists know, is not a vice to be condemned, but a virtue to be visualized and encouraged; for London Pride will make this stately civic palace an incentive to noble building in the immediate future, and especially in the immediate district.

London's County Hall, being fit for a king to open, is not unfit to be a near neighbour to Barry's magnificent pile on the opposite bank of the river—that river which flows between as "liquid history," or is thus construed by that great Londoner and erstwhile eminent County Councillor, John Burns.

To Lord Rosebery (the Council's first chairman), to John Burns, and to all other Great Londoners who have worked hard for London's aggrandizement, or for her redemption from sordidness, all honour and praise in this their hour of triumph and rejoicing over the partial fulfilment of their dreams and hopes. Sir John Benn, and many another stalwart friend of London, would have rejoiced to see the opening by His Majesty the King of London's civic Parliament. For London's new County Hall shall stand as a perpetual and not ignoble memorial to the awakening of London's civic consciousness and as an enduring testimony that London does *not* lack civic courage.

Notes and Comments

Higher Buildings Risks

STRONG objections against increasing the permissible heights for London buildings continue to be urged. One of the strongest recently advanced is "the serious aggravation of the traffic problem which must result if the available 'floor-space' in the central portion of this great city is increased beyond what is attainable under existing regulations." Already the means of transit to and from town are, at certain hours, tremendously overworked, and to board 'bus, train, or tram at such times is an exciting adventure in which lives and limbs and pockets are alike unsafe; but if the competitors for places were multiplied a hundredfold, as they would be if "skyscrapers" suddenly became numerous, the struggles at the termini would become as terrific as they are in New York or Chicago. And inconvenience is by no means the greatest of the ills of this congestion. A gentleman signing himself (in a letter to "The Times") "Winchester House," does not greatly, if at all, exaggerate the case in declaring that "to those who travel to and from the outer fringe of London the aggregate of hours given to standing or being stifled comprises a mild form of purgatory, and a positive injury to health." There is no room for doubt about the standing and the stifling—no room for anything, in fact, inside or outside; and the "positive injury to health" that must accrue from the close packing of persons, of whom a percentage may be only too safely assumed to be suffering from some form of transmissible and perhaps deadly disease, is a risk that should in no avoidable circumstances be increased. There is no necessity to increase it by exaggerating the height of London buildings and hence multiplying indefinitely the number of persons occupying a given area.

Inefficient Cottage Ranges

Something should be done about the cottage range. Indeed, something has been done about it. An investigation into the subject has been conducted by Mr. A. H. Barker at the request of the Fuel Research Board. Mr. Barker finds, in effect, that the cottage range suffers in efficiency from having, as it were, too many irons in the fire—is, it would seem, a Jack-of-all-trades and master of none. It is called upon to perform half a dozen functions, and is remarkably inefficient in them all, mainly because it is asked to do several different things simultaneously. All that is really necessary to it may be just a hot plate, but commonly "the hot plate cannot be heated without simultaneously heating the oven and the hot-water supply," great extravagance in fuel being thus involved. Whereas in an apparatus of special design an efficiency of 30 per cent. was easily obtained, the highest percentage obtained with common types was about 11 per cent., the average being about 7 per cent. The test for efficiency in hot-water supply showed an average of 11 to 12 per cent. against an efficiency of 45 in a range designed by the investigator, who recommends that, in the interests of economy, each portion of the plant should be designed for maximum efficiency separately. In an ordinary coal-fed range, wasteful in its fundamental principle of design, this segregation of functions is difficult to secure, but is common enough in the gas-heater or cooker; which also meets—or, rather, has anticipated—the investigator's recommendation of a communal or central heating system. As yet it is not possible to install central systems everywhere, nor is gas available in all the remote districts in which there are cottages. Consequently there must be many persons in the predicament of the gentleman who, writing to the Press, states that while wishing to abolish one of the ranges that the report condemns, he is at a loss to know what to put in its stead. "Cooking," he says, "can obviously be done by gas, but the question to which we all want an answer is: 'What is the best type of heating apparatus for supplying hot water in a small house?'" Many manufacturers are no doubt prepared to take up the challenge with confidence. The question of design should not be entirely forgotten. It is one that should be submitted to the architect more often than it is; although there are certainly a few manufacturers who are well aware of the value of architectural advice in such matters.

House, Road, and Motor

While much attention is being given to the effect of heavy traffic on the roads, there is, as Mr. Futvoye Francis, F.S.I., has said, an aspect of the subject that is unduly neglected. Roadside houses are being shaken to pieces by the rolling loads that are so destructive to the roads themselves. Bricks and mortar, Mr. Francis remarks, cannot stand the strain, but he does not suggest an alternative mode of construction; nor does he mention the havoc wrought on plaster ceilings, which are easily shaken down by the lumbering lorry-loads, omnibuses, charabancs, that rumble past with the effect of earthquake shocks. Reinforced concrete structures would no doubt offer more resistance to vibration than those of ordinary brickwork, which naturally "spring at the joints" when severely shaken; and boarding of one kind or another, plain or composition, gets rid of the inherent weakness of lath-and-plaster. On such matters the designers of houses, of roads, and of motors, should meet in consultation, with the object of solving a very serious problem of rather violently clashing interests. Sir H. R. Fairfax-Lucy, of Charlecote (how delightfully redolent these names of the escapades of the youthful Shakespeare!) supports Sir Walter de Frece's plea for taking in hand at once and "on a large scale the whole question of scientific and up-to-date road reconstruction to carry the enormous amount of modern traffic." Sir H. R. Fairfax-Lucy recalls that when he was a member of the Departmental Committee of the Ministry of Transport he pressed for a complete revolution in the methods of road-making. This opinion he now reiterates, adding that the alternative to this revolution is that this heavy motor traffic must pay proportionately to the damage that it does, "in which case it would probably be driven off the roads." Apparently he is among those who would not greatly regret this contingency, seeing that these heavy vehicles "are making the roads impossible for light motor traffic, unsafe for all other kinds of traffic, and are throwing an unbearable burden upon the ratepayers." A heavy indictment; and to it is to be added, as we saw above, the further charge that it shakes to pieces the wayside houses.

Co-operation with and among Architects

The British pavilion at the Brazilian Centenary Exhibition, Rio de Janeiro, is a notable example of happy co-operation between artists of various denomination. Messrs. John W. Simpson and Maxwell Ayrton, who designed the pavilion, had the enthusiastic help of Mr. Charles Sims, R.A., Keeper of the Royal Academy; of Mr. Anning Bell, R.A.; and of Mr. Reginald Bell, the artist in stained glass. Here is the interesting point that arises: these are all artists of marked individuality of style and temperament, and yet they have worked together in closest and most cordial sympathy and unity with most harmonious æsthetic effects. This result is of happy augury for the artistic success of the British Empire Exhibition, concerning which, by the way, it was stated officially in the House of Commons, on the occasion of the third reading of the Amending Bill for its sanction, that the formal opening of the Stadium is to take place next April. It is believed that the next Football Cup Tie match will be played there, where 125,000 spectators may assemble round a playing pitch of three acres.

The Rome Scholarship in Architecture, 1922

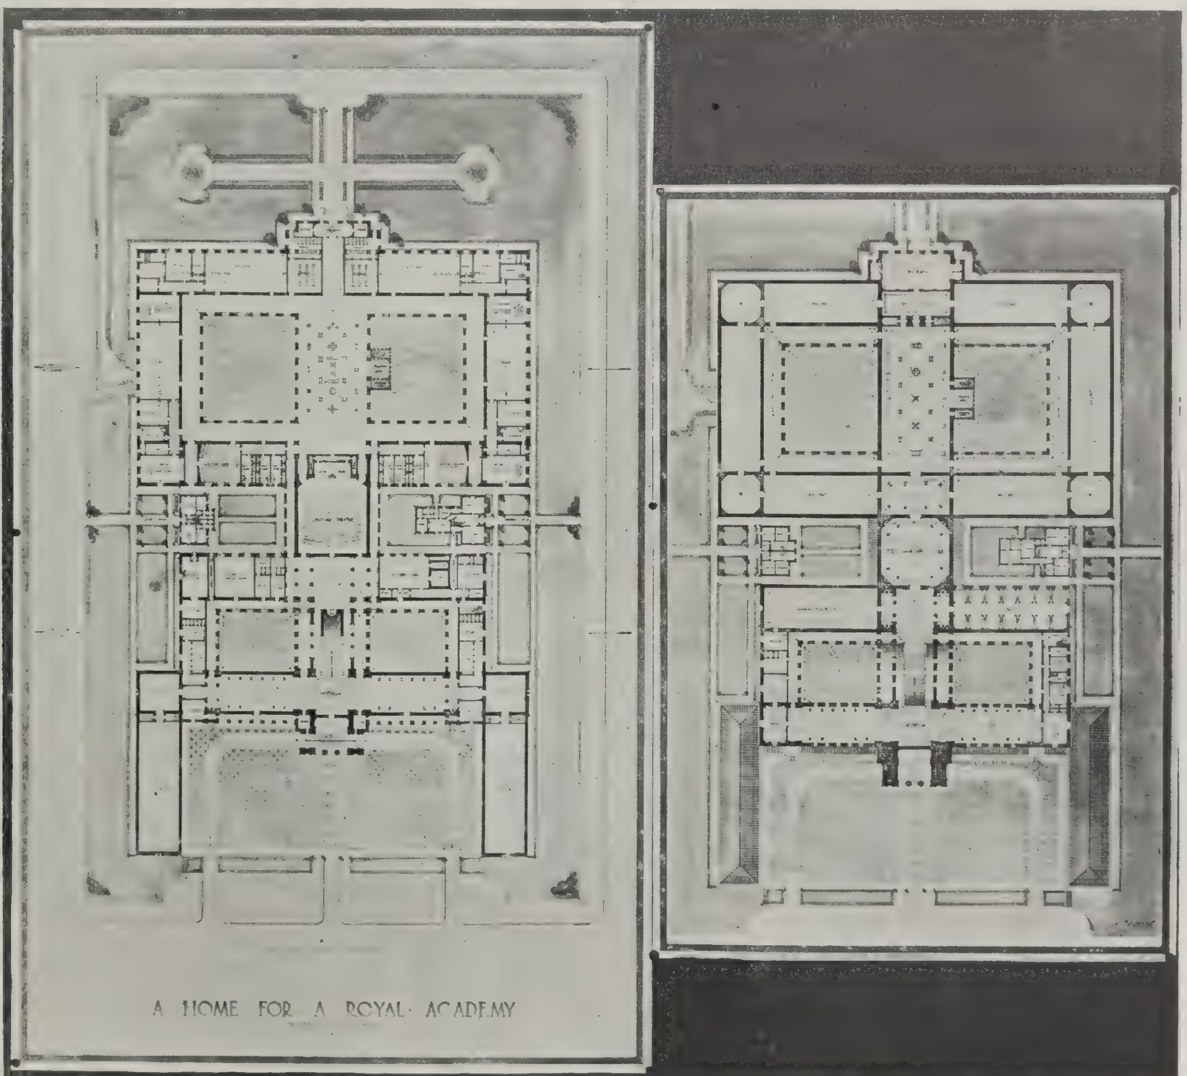
A Criticism of the Designs

THE drawings submitted in the Final Competition for the Rome Scholarship in Architecture, 1922, are now on view at the Galleries of the Royal Institute of British Architects.

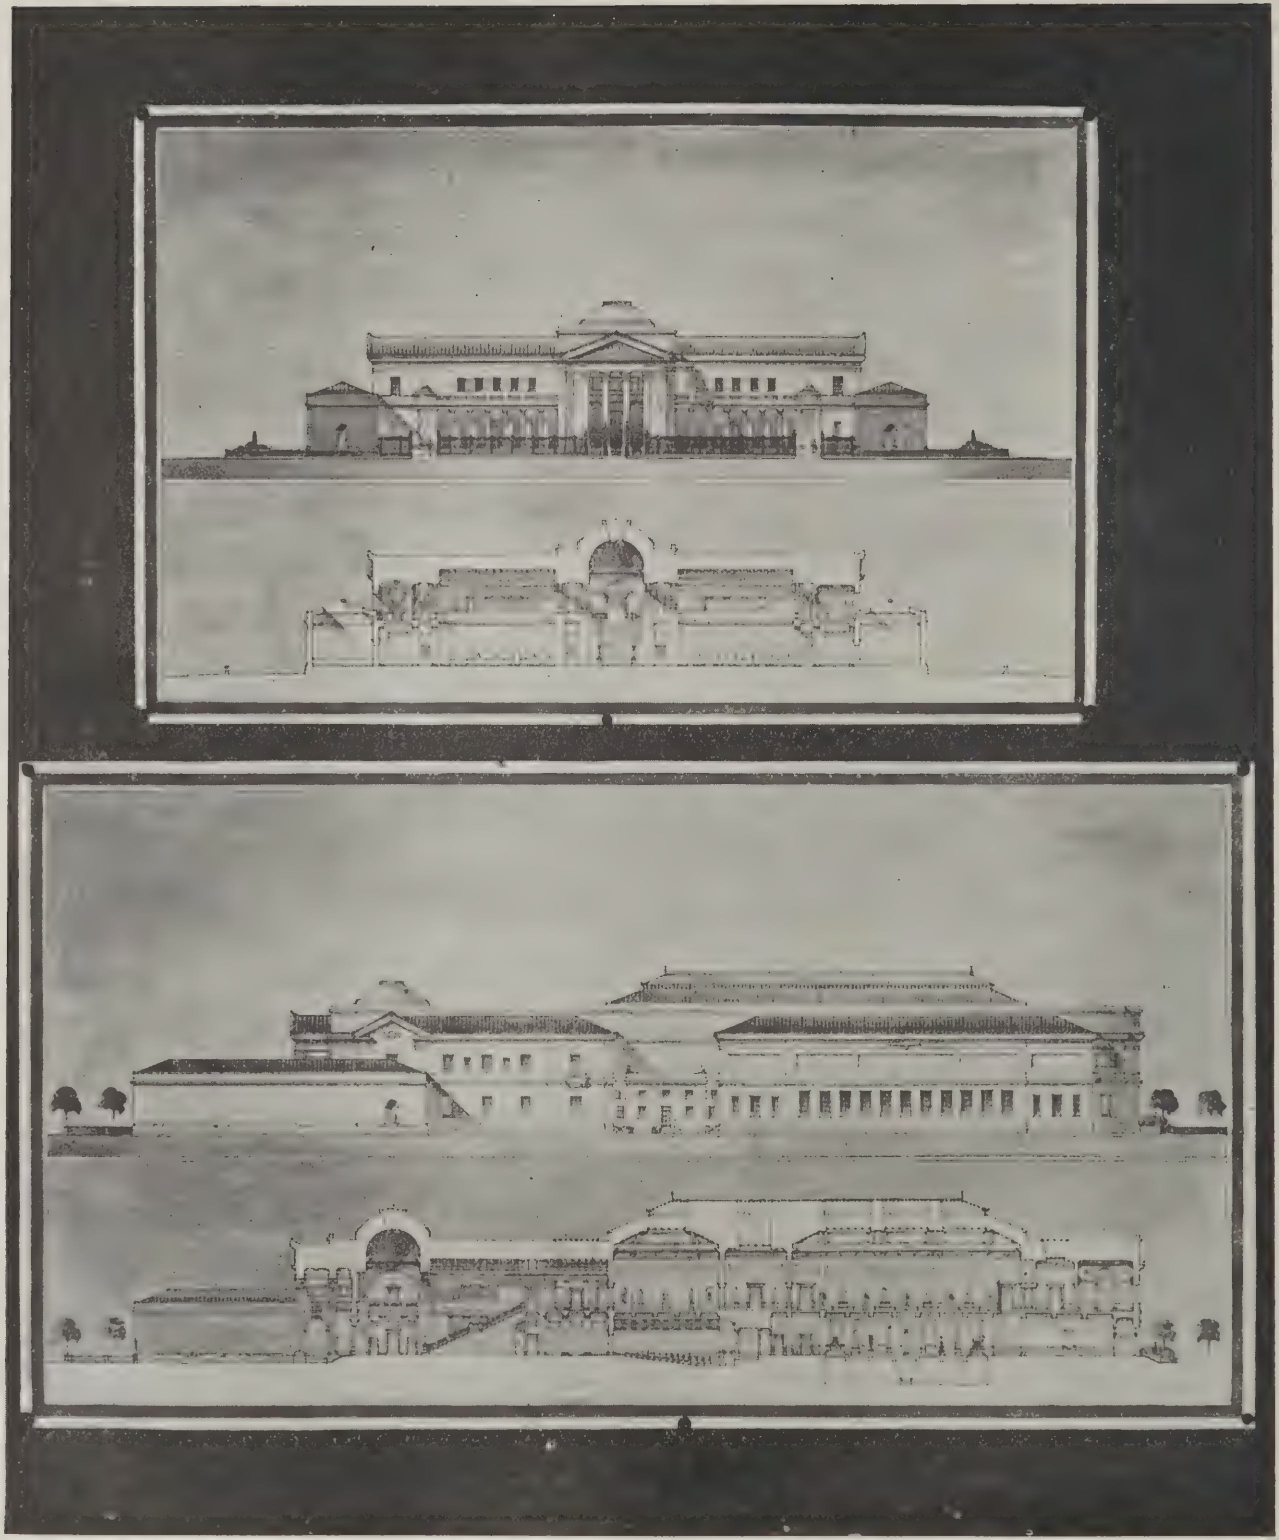
The subject set was "A Home for a Royal Academy Fronting a Public Square, forming the Centre of a Capital City." The buildings were to be on an island site 650 ft. by 40 ft., with wide roads all round, and a main thoroughfare 160 ft. wide on the central axis. The accommodation is generally divisible under two sections—administrative and educational—the administrative part to include a court of honour, large entrance vestibule, registrar's offices, and grand staircase leading on the first floor to galleries, library, banqueting hall, council room, etc.; the educational division with a separate entrance to consist of schools of painting, sculpture, architecture, and engraving, two lecture-rooms to seat 100, and one large lecture theatre —accessible from the public side of the building—to seat 300. The programme is very clearly drawn up with divisions and sub-divisions so as to leave no room for ambiguity.

In the nine designs submitted there is a general agreement in the disposition of departments. There is also a markedly uniform level of excellence reached by all competitors, so that it would be impossible on a merely superficial survey to decide on their varying merits. All have adhered closely enough to their sketches done during the first thirty-six hours. With regard to the sketch itself there seems some slight doubt as to what is required. Some merely indicate the general intention of the competitor, others are so finished as to allow little opportunity for modification of the design. These sketches on the whole lack conviction, and in some cases the finished design shows little or no improvement on the first idea. A certain inability to develop the "esquisse" characterizes most of the work.

There is no display of conspicuous draughtsmanship in the exhibition. The presentation generally is sober and sufficient, the prevailing monotone being noticeable. The drawings show timidity in shading and in the relative treatment of planes. In rendering plans some competitors omit detail, while others, obviously influenced by Beaux-Arts methods, have laboriously covered floor and courts with elaborate mosaic patterns, thus conclusively demonstrating their limited understanding of these methods. All designs naturally show such minor faults as are common



"A HOME FOR A ROYAL ACADEMY.'
THE WINNING DESIGN BY STEPHEN WELSH, A.R.I.B.A. (LIVERPOOL UNIVERSITY)



"A HOME FOR A ROYAL ACADEMY."

THE WINNING ROME SCHOLARSHIP DESIGN BY STEPHEN WELSH, A.R.I.B.A. (LIVERPOOL UNIVERSITY).

not only in students' drawings, but in all competitive work executed in haste under high pressure.

There is no reason for disappointment in the work shown. Twenty years ago no student would have been capable of producing such drawings single-handed in the ten weeks allotted. All the nine competitors are to be congratulated on their work.

The design placed first and awarded the Rome Scholarship is that of "Avon." It shows restraint and scholarship, and the subject is handled with skill and confidence. The plan, however, is not a very simple solution of the problem. In addition to a forecourt there are four internal courts and two open on one side, all of which are naturally small owing to the limitations of the site. The main front is hardly appropriate to the purpose of the building. The large portico seems to have little justification for its existence except to provide a box for the porters in the thickness of its walls. The dome over the vestibule is also too high to be effective internally. The grand staircase is a fine feature. It rises easily and directly to an ample space in front of the reception-room. The planning of this staircase should be the central motive of the whole design, and "Avon" and one other are the only competitors who have realized this and given it the necessary importance. The development of vestibule, grand staircase, and reception galleries on the main axis of the building is well conceived and entirely successful.

"Timgad," who is placed second and is awarded the Jarvis Studentship, has a simpler plan with four courts. It is, however, in detail inferior to Avon's. The grand staircase is involved and troublesome. It projects far into the vestibule, divides left and right, and finishes on the threshold of the gallery. By this arrangement of his vestibule and staircase he interrupts communication along the front of the building on the first floor. His elevations show ability, and some will probably prefer them to those of the winner. His sense of composition is, however, weak, and his work suffers from over-emphasis of subordinate features. The design, while displaying a lack of experience, is full of promise.

Of the other designs that by "Ono" deserves attention. His drawings are complete and carefully presented. The plan shows a sense of economy, and the accommodation is arranged round two courts. But this solution involves two corridors with borrowed light on the ground floor. He is the only man beside the winner who has a ceremonial staircase which is direct and well designed. The elevations have the "reticence" suggested in the conditions, and are well composed and chaste in detail.

"Belghian" goes rather far—too far, we are inclined to think—in his sketch. His plan is faulty in detail—the keeper's house impossible. (These quarters seem to have been a stumbling-block to most of the competitors.) Here is a design in which the author would have been better employed in solving the many difficulties of his plan rather than in covering the ground with elaborate patterns. The staircase is reminiscent of the Bordeaux Theatre, and the elevations betray an affection for the style of the Petit Palais, Paris.

"Tony" wasted time in inking in his sketch. That as a design it needed further consideration is proved by the fact that he was eventually obliged to depart from it to an extent which might have disqualified him. The single court is practically filled by a central block, and the double staircase of the sketch has been abandoned for another, little better, which projects too far into the vestibule.

"Baldaruzzi's" cheap pseudonym is typical of his work. His work is full of slick draughtsmanship and the hectic piling-in of meretricious detail badly proportioned and in-

appropriate. The half-inch shows no understanding of relative scale. The plan is simple but hastily conceived. Time has been wasted on meaningless "mosaic," which far from emphasizing the composition and relative importance of the parts, completely confuses the whole plan. A single court broken into by a lecture-room block spoils his suggestion of a "cortile," and obscures the open loggia which runs round at the first-floor level.

The design of "Ictinus" is marred in the very centre of its plan by the staircase, which is cramped, has a small light-well over, and makes an obstacle in the middle of the vestibule. Dark corridors go left and right; in fact the greater part of the ground floor is badly lit, producing an exterior mass almost unbroken by windows and false in expression.

"Ted's" sketch is careful and closely followed. His plan is simple, marred in rendering by distracting shadows of lamps and trees. He has one large court in the centre of which is the lecture-halls block. The exterior shows ability to design. It is sympathetic, well composed, and delicately presented.

"Toledo" has the usual difficulty with his grand staircase. It occupies too much space in the vestibule, and the landing at the top is too small. The elevations incline to be amateurish, and the design shows an inadequate sense of composition.

The Young Architect's Future

MY Uncle Donne remarked to me the other evening while passing the port, "I am thinking of making Francis (his adopted boy, now at a Public School) an architect. What do you think of the future for architects?" In an after-dinner mood I was inclined to be optimistic, but the importance of the whole position for the middle-aged of this generation, and for the youngster inclined to care for buildings, has given much food for thought. The resultant conclusions from much deliberation are put forward below. Let us start at the beginning.

Architecture as a separate profession, or art, if you prefer a more kindly label, is a comparatively modern production. To be a success an architect must have a wide vision, be capable of tremendous application, and with all respect to the believer in the principle that "genius will out," have a good slice of luck into the bargain. Very few opportunities are given to a real architect in the purely utilitarian or commercial side of his work. The factory and similar type of building is an engineering problem of a highly specialized nature, and a real architect has no concern with such. There is no scope.

The best opportunity for the architect who is an artist (and one need not consider seriously the other variety) lies in domestic work, church building, and occasional public, or semi-public, offices. This represents a small percentage of the total amount of labour which absorbs the building industry as a whole; probably, indeed, if one could arrive at reliable statistics, no more than 20 per cent. Pre-war conditions are assumed at the moment, as recently the whole position is so chaotic as to baffle any attempt at a coherent survey.

The real architect, therefore, has depended through the period up to the war on domestic and church work, etc., for his realization of ideals. How far he is likely to be offered a medium in which to express himself in the next few years is a matter for speculation. It is obvious that if civilization in Western Europe continues, a vast amount of commercial work must also continue, but with this the present writer is not really concerned. It is reasonable on the basis of the above argument to accept the fact that the architect has his opportunity in what may be called for the moment non-essential or luxury buildings. In accepting this fact one also accepts the principle that he comes into line with all his fellow artists—painters, sculptors, etc.

Now, what does the immediate future offer on these lines for the embryo architect? The political and economic situations of Western Europe are so obscure that a prophecy as to what the social system will have developed into by, say, 1935, would be undertaken only by the very rash or very ignorant. There are so many forces at work, and forces of a most violent nature, which pull in so many directions that it is impossible to foresee what the world will be like in twenty years' time. The surprising pact between Germany and Russia, to take one example, may well alter the whole position of England in Europe. The great industrial towns of the North may likely enough have reached their zenith, and it is quite reasonable to suppose that many of them will decline to a greater or lesser extent, and never again carry the big populations that they have in the past. If our export trade does not recover—and, moreover, recover fairly soon—it seems probable that the strain on the national resources will be too great, and the industrial machinery will break down. Indeed, in many ways it has broken down—labour and capital are at the moment glaring at one another over as wide a gap as they have ever had to face. The great mass of labour has become vocal, and not only vocal, but definitely articulate; and capital has got its back to the wall, an uncomfortable position which it has been forced into largely as a result of its inertia and lack of foresight in the past.

If this is true, and the country as a whole is indeed going to take a lower position in the world than previously, it is quite clear that the luxury building (as defined above) is going to be a matter of much smaller importance than it has been. The wonderful period of the eighteenth century, apart from the great mansions built by the landed gentry and nobility, was made possible only by the amazing increase in wealth of the merchant and middle class. If this is not understood, a study of the history of Bath, Dublin, or any other of the great eighteenth-century cities will be found convincing.

Now, England is either going to recover fairly rapidly or is going to settle down and stabilize on a lower plane; we all have our own views as to which is the probable course she will follow. To the ordinary man the latter seems overwhelmingly the more likely; if this is correct, it follows that the scope for the next generation of architects is going to be much more limited than it was in the period between, say, 1870 and 1914. The outlook, therefore, for the youngster is none too hopeful, and he is likely to go through his early days of practice without much opportunity of real architecture. That a certain number of architects will have plenty of work, and a large number a certain amount of work, is, of course, obvious; but the best opportunity for architecture is certainly going to be very limited. The advice that might be given to the boy thinking of starting architectural study is not to do so unless he has a real taste for the work, and, moreover, a sufficiency of this world's goods to make him independent of the more sordid side of his work. If these things are not his he is risking a life of disappointment, and of a disappointment keener and with less comfort than most other callings have to offer.

P. L. D.

The New Thames Bridge Site

In "The Times" of July 12 Lord Plymouth, as President of the London Society, Sir Aston Webb, P.R.A., as Chairman of its Council, and Sir Reginald Blomfield, as a member of Council, issued a powerful appeal regarding the choice of site for a new Thames bridge. They urged the Corporation of the City of London to postpone an impending decision to build the St. Paul's Bridge, and to give further consideration to the desirability of placing the bridge where, they submitted, the need for it is much greater. Instead of crossing the river between Southwark Bridge and Blackfriars, the new bridge should cross it between Waterloo and Westminster Bridges, in which position a bridge is very badly wanted. On the other hand, it is contended, the proposed St. Paul's Bridge is not really necessary. Whether it is wanted or not has been always a moot point. The plea for a bridge between Waterloo and Westminster is sufficiently practical. Waterloo Bridge is both awkwardly situated and grossly overworked. The ceaseless stream of traffic (increasing in consequence of the development of Waterloo Station) it pours across the Strand would be greatly reduced in volume by the relief that would be afforded by a bridge that might with great æsthetic as well as practical advantage take the place of the monstrous Charing Cross railway bridge. The signatories to the letter paid the Corporation a well-deserved compliment in recalling its splendid public action with respect to the Burnham Beeches, Epping Forest, and Shadwell Park, and besought them to act in this spirit with regard to the bridges. There is some hope that they may yet do this, for when the report of the Bridge House Estates Committee was presented at the meeting of the Corporation on Thursday last, the proposal for St. Paul's Bridge was referred back, largely in consequence of a powerful speech by Sir Banister Fletcher, F.R.I.B.A.

The London County Hall

Ralph Knott, F.R.I.B.A., Architect, in association with W. E. Riley, R.B.A., F.R.I.B.A., late Architect to the L.C.C.

THE opening of the London County Hall by His Majesty the King marks the completion of the first part of a great Metropolitan architectural undertaking that has been proceeding continuously over a period of fifteen years. A considerable section of the building on the northern flank still remains unbuilt, but this will probably have to be put in hand at no far-distant date to meet the ever-increasing demands of London's Government for headquarters accommodation.

Articles on the progress of the work have appeared in these pages at frequent intervals; but, apropos of the official opening, some of the main facts in connection with the building may be appropriately recapitulated.

Details of the earlier history of the New County Hall scheme are, perhaps, hardly necessary, but it may not be amiss to remind our readers that an international competition was held in two stages in the year 1907, to obtain designs for the building, and was settled early in 1908 in favour of Mr. Ralph Knott, who was then appointed architect for the new building in association with Mr. W. E. Riley, R.B.A., F.R.I.B.A., the then architect to the Council, in whom was vested discretionary power in all matters relating to internal economy, building construction, and stability.

The New County Hall when completed will be 750 ft. long by an average width of rather more than 300 ft. Its site is roughly 6½ acres in area, of which about 2½ acres represents reclaimed river foreshore.

The style of the building may be described as of the severe phase of English Renaissance, interpreted in a modern spirit, with a considerable measure of originality and freedom from the more arbitrary restrictions of architectural orthodoxy.

The plan that we see to-day differs materially from that submitted in the competition. It embodies various features that were subsequently considered desirable to produce a satisfactory arrangement of plan, including the straightening up of the old irregular Belvedere Road frontage to a new improvement line. As now planned the council chamber forms the centre of the building, being placed at the intersection of the longitudinal and two transverse axes, the latter being at right angles to the river and Belvedere Road fronts respectively. The cross blocks are placed at right angles to the longitudinal axis, which, as it happens, is practically due north and south, and in all blocks direct natural lighting is provided to both the rooms and corridors. The members' courtyard, with entrance drive from Westminster Bridge approach, is an interesting feature of the plan. By its means members of the Council are brought in direct touch with their own apartments in the building, centring around the council chamber.

Another means of access to the members' portion of the building, intended primarily for ceremonial purposes, is from the large entrance hall (85 ft. by 32 ft.) in the centre of the Belvedere Road front, at the ground-floor level, from which a straight staircase leads up to the eastern lobby of the chamber. This stair is 15 ft. in width, and its side walls, which are lined with marble, support a colonnade carrying the barrel-vaulted ceiling of the staircase intersected by the groins of the semicircular windows which light it. The walls of the corridor and lobbies surrounding the council chamber, with their cross arches, are lined with white marble—a considerable amount of which is Pentelic, from the old Athenian quarry—relieved by panel bands of Sienna or Cipollino. The columns which are freely used in the decorative treatment of this portion of the building are of black Belgian, Bleu de Savoie, or Ashburton marble. The finish of the marble generally is that known as "egg-shell" polish. The square voting lobbies, which occur north and south of the chamber, are top lighted, and are lined with Indian laurel wood panelling up to the column screens. The principal floor corridor is vaulted in plaster, and lined below with oak panelling. It is 10 ft. in width, and on office floors above is 7 ft. 6 in.

With regard to the chamber itself, the plan is approximately octagonal, with three entrance doors and one private door for the chairman, and lighted by four long-shaped windows, above the high dado, in the shorter sides. Above the entrance doors occur spacious galleries (seating about fifty persons each), which overlap the lobbies outside, on the level of the chamber floor. Three galleries are for the public and one for use of the Press. The height of the chamber is 55 ft., and its area about 3,500 sq. ft. The walls are lined with a high marble dado up to the gallery level—the plinth and capping are of black Belgian and the filling between them of Greek Cipollino, from the Island of Euboea, the quarry of which up to twenty years ago had not been worked since the time of Justinian. Above this the walls will have a plaster finish, the ceiling being of decorative plaster.

The very beautiful columns supporting the lintols of gallery openings are monoliths of rare Veine Dorée marble, quarried over 5,000 ft. above sea level in the Italian Alps. The seating is arranged on the usual horseshoe plan, stepped up from the central "well" of the floor, and the joinery is carried out in oak. It is proposed to cover the chairmen's seats on the dais with a veneer of very old oak taken some years ago from a London excavation.

The architectural settings to the doorways of the chamber, with their canopies, are of black Belgian marble. Near by in the northern cross block is situated the largest of the many committee-rooms, intended primarily for education purposes, and having accommodation for the public and the Press. By means of sliding screens it is divisible into three, as occasion may require. The large central division of this room has a barrel-shaped ceiling, intersected by the groins of the round-arched window heads and the gallery openings. As with most of the rooms on the members' floor, it will be lined with oak panelling, treated in a broad and simple way. The wood carving generally is by Mr. George Alexander, of Chelsea. The flooring throughout the building, apart from the two basement floors, is of English oak blocks. Windows are fitted with steel casements.

The crescent of the river front is probably the most striking architectural feature of the building, with its large Ionic order embracing four stories, columns over forty feet in height, and bold, sweeping, horizontal lines. The connecting chord across its terminating pavilions encloses the members' terrace, raised well above and disconnected from the new embankment road passing in front of it, and a few feet lower than the principal or members' floor itself. At or adjacent to the northern end of the crescent are the members' refreshment-rooms—at its southern end the reading-room and library, with access from and to the terrace in both cases. Within the curve of the crescent block are contained the private rooms of the chairman and vice- and deputy-chairmen of the Council, and the party whips, conveniently near to the council chamber.

We have before referred to the members' rectangular courtyard and its approach from Westminster Bridge. The heavily treated, stone-vaulted carriage-way, with its granite base, is a most interesting and impressive feature of the building. Entering it from the public roadway the vista terminates in the members' entrance doorway, finished with a semicircular arched head, and flanked on either side by pedestals designed to receive bronze

(*Continued on page* 88.)

RALPH KNOTT, F.R.I.B.A., ARCHITECT, IN ASSOCIATION WITH W. E. RILEY, R.B.A., F.R.I.B.A.

lamps. The façades of the four blocks of building giving on to the courtyard are treated similarly to the external fronts—Portland stone facings on a granite substructure and a steep-pitched roof with two stages of dormer windows.

The height of the main cornice of the building is, roughly, 90 ft. above the foundation, the ridge of roof 130 ft., and the top of the flèche 190 ft. The structure embraces nine stories, the two lowermost being the basement and sub-basement, devoted more particularly to storage purposes. Exclusive of these, and with the further exception of the first floor allotted to members and heads of departments, practically the whole of the building will be required for the accommodation of the Council's office staff. The rooms intended for the latter are treated in a severely simple way, and, indeed, extraneous or unnecessary ornament is generally avoided in the treatment of the building.

The medical officer's department includes laboratories for various uses, and rooms for the medical examination of school children. Luncheon-rooms for the Council's staff are provided for on the sixth floor of the crescent block, with provision for the catering service and its staff above, and lift connections with the members' floor, basement larders and stores, and with the goods delivery road. At the extreme north end of the building, when it is eventually extended and completed, will be a roadway connecting Belvedere Road with the embankment, thus securing, moreover, a lighting area for the northern front. Off this roadway will be formed the goods delivery and service cartway leading into the internal area of the building adjacent to the boiler house (beneath the large committee-room), by which means coal and other fuel will be delivered and the general supply of material and stores maintained.

The figure sculpture in Portland stone and bronze, above the heads of the pavilion windows of the principal floor, is the work of Mr. Ernest Cole, and Mr. C. H. Mabey, of Vauxhall, is responsible for architectural carving in stone.

The heating of the building is effected generally by means of a low-pressure hot-water system, the water being heated in four boilers of the marine type, and circulated by a central pumping plant. Two boilers of a similar type are used to provide steam to the cooking apparatus, to calorifiers for the hot-water services, and to the various air-heating batteries. The council chamber and the education committee room are heated and ventilated by a system combining direct radiation with a supply of warmed, humidified, and washed air.

The ventilation of the smaller committee-rooms and offices generally is by means of extraction fans connected with ducts over the corridors, to which vitiated air is drawn through gratings in the upper part of each room. The entering air passes through specially controlled inlet gratings behind those radiators which occur on external walls.

The sub-basement is considerably below the ground level, and a positive supply of warmed air is forced in to ensure that this part of the building is maintained in a satisfactory condition.

Floors and flat roofs generally are of the usual steel joist and concrete construction. The structural work includes built-up steel stanchions where required by the planning of the building; and the steel framing for the roof, which includes two floors of offices, has required special treatment, owing to its somewhat unusual form and the heavy loads to be carried.

Mr. Knott's consultant engineers for structural steelwork were Messrs. Whitaker, Hall, and Owen, of 1 Gresham Buildings. The general contractors were Messrs. Holland and Hannen and Cubitts, Ltd., of Gray's Inn Road, W.C. The whole job was under the supervision of Mr. E. C. Hannen, assisted by Mr. C. R. Waters, chief surveyor of the company, Mr. I. Stone, the manager on the works, and Mr. Sweett, who was responsible for the whole of the joinery work. The clerk of works was Mr. W. H. Hookham. Sub-contract work has been done by the following firms: Henry Hope and Sons (steel casements); Doulton & Co. (sanitary work); F. Braby & Co., Ltd. (copper flèche on roof and copper finishings to windows); J. Whitehead and Sons, Ltd. (marble work); Waygood-Otis, Ltd. (lifts); Bromsgrove Guild (bronze and wrought-iron work); Vertigan & Co. (wood block flooring and floor polishing); Heffer and Scott (painting (Keystona)), British Luxfer Prism Syndicate (lantern lights); J. W. Singer and Sons (bronze panels); Express Lift Company (lift); London Brick Co., Ltd. ("Phorpres" bricks); Sneyd Collieries (glazed bricks); Crittall Manufacturing Company (bronze and wrought ironwork); Strode & Co. (bronze and wrought ironwork); Benham and Sons (cooking apparatus); Newton-Witter Engineering Co., Ltd. (sprinklers); F. and C. Osler, Ltd. (ornamental fittings).

LATE ARCHITECT TO THE L.C.C.

The Design of Monolithic Reinforced Concrete Structures

By R. J. HARRINGTON HUDSON, B.Eng.,A.M.I.C.E.,A.M.I.Mech.E.,M.C.I.,M.Am.C.I.

IT will be convenient to divide structures into two broad classes :—

(1) Structures in which the connections between the individual members are of a yielding nature. When a member of such a structure is stressed its connections offer little or no restraint to the free bending and deflection of the member, and the bending stresses cannot be transmitted through the connections to other adjoining members of the structure.

(2) Structures of a monolithic nature in which there is a continuity of material and in which the connections between individual members are unyielding. When a member of such a structure is stressed the bending and deflection of the member are restrained by other adjoining members through the rigid connections between the members and, by offering this restraint, stresses are developed in the adjoining members of the structure. Many steel structures, particularly those known in America as "pin-jointed," come under class (1). Reinforced concrete structures come under class (2).

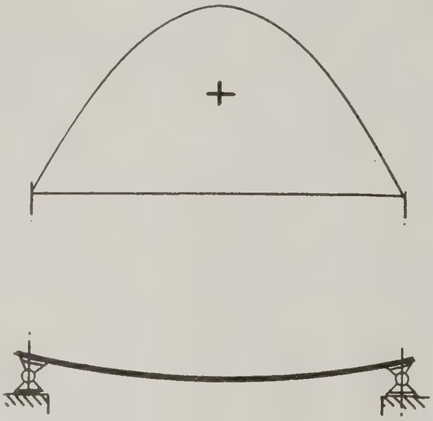
In structures of class (1) the members are often designed independently. Structures of class (2) should be treated as a whole and designed as a whole as one member affects another, and it is not possible to design any one member independently without reference to other members of the structure.

As a simple illustration of each class of structure consider a beam of single span. The ends of the beam may be simply supported on rocker bearings, Fig. 1. In this case the supports offer no restraint to the free bending and deflection of the beam and the bending moment diagram is positive throughout the length of the span. This simple structure comes under class (1). Now suppose that the ends of the beam are fixed in a horizontal direction, Fig. 2. In this case the supports restrain the ends of the beam, and the bending moment diagram is negative at the supports and positive towards the centre of the span. This structure would come under class (2). Simply supported beams are common in many types of structures. Beams with the ends rigidly fixed in a horizontal direction are very rare.

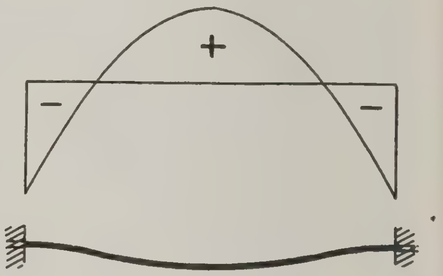
We might design two monolithic reinforced concrete structures consisting of a beam rigidly connected to two pillars to approach very nearly to the two extreme cases mentioned above, *i.e.*, a beam simply supported and a beam with its ends fixed horizontally.

Consider the first case; if a beam of single span is to be simply supported on pillars to which it is rigidly connected, then the pillars must offer the least possible restraint to the bending of the beam, *i.e.*, the pillars must be either as light and flexible as possible, Fig. 3, or the pillars must be as long as possible, Fig. 4. In either case the restraint offered by the pillars will be very slight and the bending moment diagram will approximate to that of a simply supported beam.

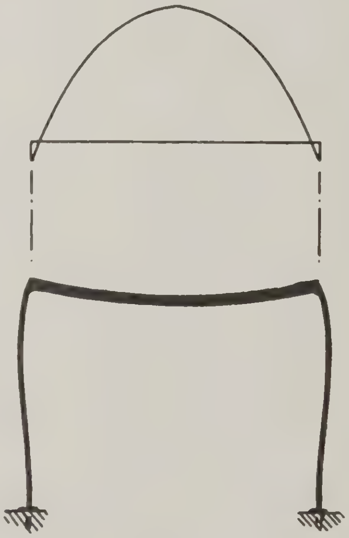
Consider the second case; to design such a structure to approximate to a beam with ends fixed horizontally it is necessary that the pillars should be either as rigid or stiff as possible, Fig. 5, or that the pillars should be as short as possible, Fig. 6. In either case the pillars will offer the maximum restraint at the ends of the beam, *i.e.*, tend to fix the ends horizontally, and the bending moment diagram will approach that of a fixed beam.



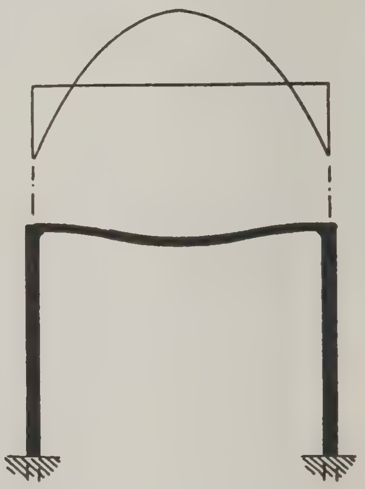
1.



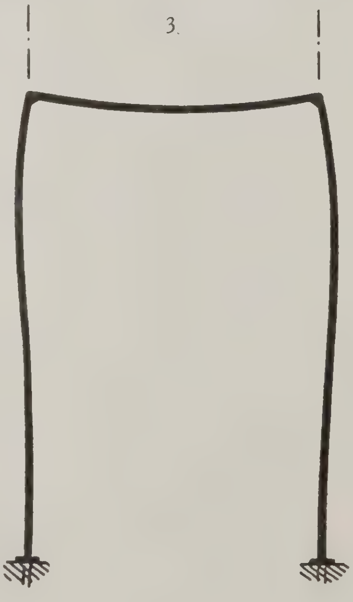
2.



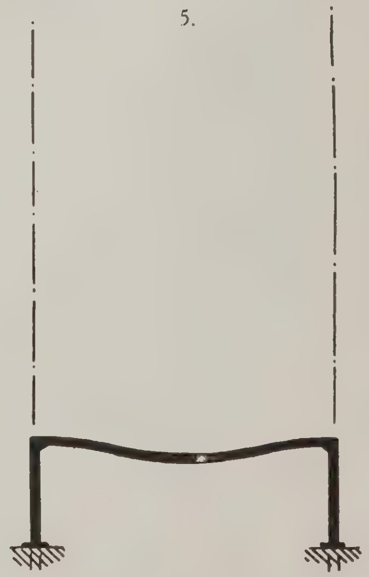
3.



5.



4.



6

In practice we have monolithic reinforced concrete structures of normal proportions which lie between the above extreme cases, and in each case it is necessary to examine the effect of the pillars upon the bending moments in the beam or, a matter of even greater importance, the effect of the stressed beam upon the pillars.

Experiments on large reinforced concrete frames have shown that there is every reason to have confidence in the rigidity of the connections when the structure is properly designed, and that the bending moments are transmitted from member to member by the connections. The negative bending moment at the end of a beam monolithic with a pillar is therefore transmitted to the end of the pillar to which the beam is connected, and the value of this bending moment at the end of the pillar is the same as the value of the negative bending moment at the end of the beam. We have seen that this negative bending moment may approach zero when the dimensions of the structure correspond to those shown in Figs. 3 or 4, and may approach a maximum (equal to the negative moment at the end of a similar fixed beam) when the dimensions of the structure correspond to those shown in Figs. 5 or 6.

The stiffness of a member depends upon the inertia moment of its cross-section. The two properties, (1) inertia moment, and (2) length, may, therefore, be used to determine the influence which one member of a monolithic structure exerts upon other adjoining members, just as the flexible pillars of low inertia moment, Fig. 3, or the pillars of great length, Fig. 4, will simply support the ends of the beam without restraint, whereas the stiff pillars of high inertia moment, Fig. 5, or the short pillars, Fig. 6, will restrain the ends of the beam and tend to fix them in a horizontal direction.

Inertia moments are measured in units of area multiplied by lineal units raised to the second power. If the inch is the unit selected then inertia moments are expressed in (sq. in × in.^{2}). Lengths are measured in any convenient lineal units. The properties, (1) inertia moment and (2) length of one member A of a monolithic structure, may be compared with those of another member B by the two *pure* ratios.

$$\textit{Ratio of inertia moments } (ri) = \frac{\text{inertia moment of A}}{\text{inertia moment of B}}$$

$$\textit{Ratio of lengths } (rl) \ldots\ldots\ldots = \frac{\text{length of A}}{\text{length of B}}$$

Any convenient units may be selected for measuring inertia moments and lengths when *pure* ratios are used, as the value of a pure ratio is not altered by a change of unit. The above pure ratios are also particularly convenient in the final forms of the equations, and lend themselves to easy manipulation. For example, by using these pure ratios simple alignment charts can be constructed to be used as time-saving devices.

When one member is a beam and the other a pillar of a monolithic structure, then, using standard notation,

Ib = *inertia* moment of *beam*.
l = *length* of beam
Ip = *inertia* moment of *pillar*
h = *height* of pillar,

and the ratios of inertia moment and of length are:

$ri = Ib/Ip$
$rl = l/h$

Consider again the simple structure consisting of a beam of single span monolithic with pillars the bases of which are fixed. We have seen that the negative bending moment is a maximum at the ends of the beam and in the pillars to which it is connected when the pillars are very stiff or very short, i.e., when the ratio $ri = Ib/Ip$ is very small or the ratio $rl = l/h$ is very great. Ultimately, when the ratio $ri = Ib/Ip$ is infinitely small or the ratio $rl = l/h$ is infinitely great, this negative bending moment at the ends of the beam and in the pillars becomes equal to the negative bending moment at the ends of a similar fixed beam. For the purpose of our investigations it is necessary to determine the values of this negative bending moment at the ends of a fixed beam. For ready reference several of the more common distributions of weight on a beam are shown in Table I, together with the corresponding values of the negative bending moments at the ends of the beam. These negative bending moments are to be used as *qualifiers* to denote the distribution of weight on the beam, and we shall symbolize them, Qa, Qb, . . . according to the end of the beam or the point of support a, b, . . . to which they refer.

We will now examine the bending moments at the ends of the beam and in the pillars, but before doing so it will be well to consider the degree of fixity of the bases of the pillars. Here again we have two extreme cases: (1) the bases freely

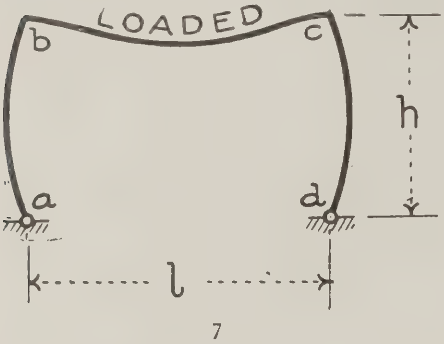
UNSYMMETRICAL.			
 5.	5. Weight concentrated at any point.	$W \cdot x^2 \cdot x'/l^2$	$W \cdot x \cdot x'^2/l^2$
 6.	6. Triangular distribution of weight from a maximum at a to zero at b.	$W \cdot l/10$	$W \cdot l/15$

Note.—When the weight is distributed symmetrically $Qa = Qb = Q$.

hinged, and (2) the bases fixed. It is necessary to examine each of these extreme cases in order to obtain the formulæ we require, but in practice the bases of the pillars are usually monolithic with reinforced concrete footings, and are much more nearly fixed than free. It has been the present writer's practice to assume that the bases of pillars in a monolithic reinforced concrete structure are fixed except in very special cases. A large proportion of monolithic reinforced concrete structures would seem to justify this assumption, and when the fixity of the bases of the pillars is doubtful the assumption errs on the side of safety.

Consider a beam *b*—*c* monolithic with pillars *a*—*b* and *d*—*c*, the bases of which are free to rotate (see Fig. 7). The beam is loaded with any distribution of weight.



7

Using the following standard notation,

Bb = *bending* moment at *b*
Bc = *bending* moment at *c*
Ib = *inertia* moment of *beam*
Ip = *inertia* moment of *pillars*
l = *length* of beam
h = *height* of pillars
ri = *ratio* of *inertia* moments = Ib/Ip
rl = *ratio* of *lengths* = l/h
Qb = *qualifier* for the end *b* of the beam (see Table I)
Qc = *qualifier* for the end *c* of the beam (see Table I)

and applying the familiar theorem of Three Moments, we can obtain expressions for the bending moments at *b* and *c*,

$$Bb = -\left[\frac{3}{2\,(ri/rl) + 3}\right] Qb \ldots\ldots\ldots\ldots\ (1)$$

$$Bc = -\left[\frac{3}{2\,(ri/rl) + 3}\right] Qc \ldots\ldots\ldots\ldots\ (2)$$

The expressions within square brackets in formulæ (1) and (2) are identical; they represent the *factor* by which the *qualifiers* Qb and Qc must be multiplied to determine the bending moments Bb and Bc respectively; in other words, the fraction of the negative bending moments at the ends of a similar fixed beam. This *factor* may be represented by the symbol F, and formulæ (1) and (2) may then be written in the simple form :

$$Bb = -F{\cdot}Qb \ldots\ldots\ldots\ldots (1a)$$

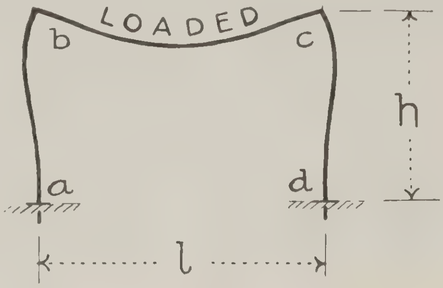
$$Bc = -F{\cdot}Qc \ldots\ldots\ldots\ldots (2a)$$

It will be observed that the above formulæ consist of two quite independent expressions; a *factor* F, the value of which depends solely upon the form and dimensions of the structure and the manner in which the bases of the pillars are fixed, and a *qualifier* Qb or Qc, which represents the negative moment at the ends of a similar fixed beam, and therefore depends solely upon the distribution of weight on the beam.

In a similar manner, when the bases of the pillars are *fixed* (see Fig. 8) the bending moments at *b* and *c* are :

$$Bb = -\left[\frac{2}{(ri/rl) + 2}\right] Qb \ldots\ldots\ldots\ldots\ldots\ (3)$$

$$Bc = -\left[\frac{2}{(ri/rl) + 2}\right] Qc \ldots\ldots\ldots\ldots\ldots\ (4)$$



8.

The *factor* within square brackets in formulæ (3) and (4) may be represented by the symbol F*a*, and the formulæ may then be written in the simple form,

$$Bb = -Fa{\cdot}Qb \ldots\ldots\ldots\ldots (3a)$$

$$Bc = -Fa{\cdot}Qc \ldots\ldots\ldots\ldots (4a)$$

When the weight on the beam is distributed symmetrically (see Table I), $Qb = Qc = Q$, $Bb = Bc$, and formulæ (1) to (4) may be written in the following forms :—

Bases of pillars *free :*

$$Bb = Bc = -\left[\frac{3}{2\,(ri/rl) + 3}\right] Q \ldots\ldots\ldots (5)$$

$$Bb = Bc = -\ F{\cdot}Q \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ (5a)$$

Bases of pillars *fixed :*

$$Bb = Bc = -\left[\frac{2}{(ri/rl) + 2}\right] Q \ldots\ldots\ldots\ (6)$$

$$Bb = Bc = -\ Fa{\cdot}Q \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ (6a)$$

By the aid of formulæ (1) to (6*a*) the bending moment at any point of a pillar monolithic with a beam of single span may be ascertained. The only variables in the expression represented by F*a* are ratio of inertia moments *ri* and ratio of lengths *rl*. A convenient Alignment Chart may therefore be constructed from which the value of the factor F*a* may be readily ascertained for any ordinary values of *ri* and *rl* (see Chart I).

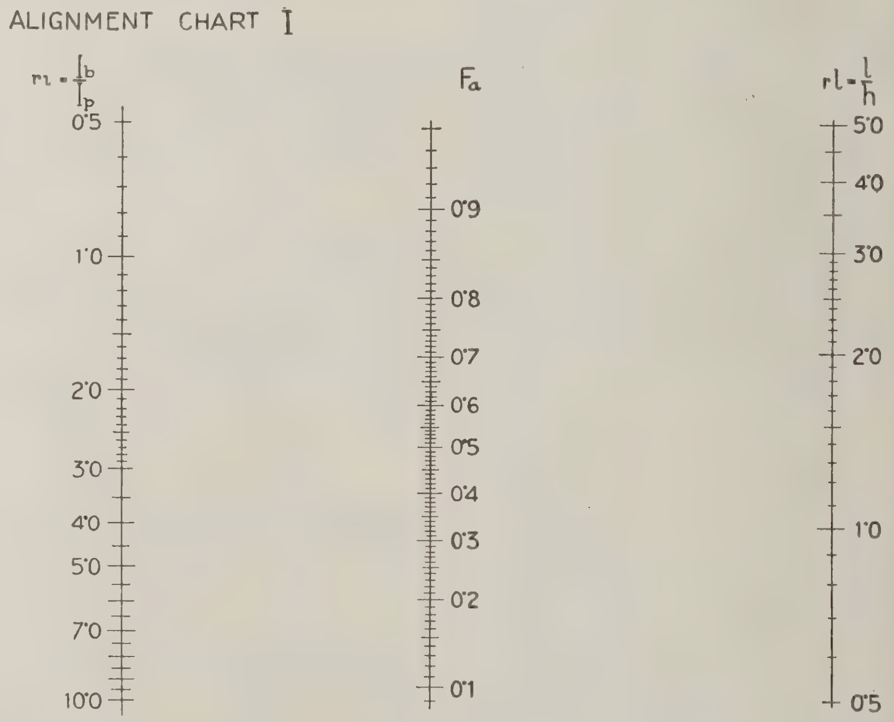
CHART I.

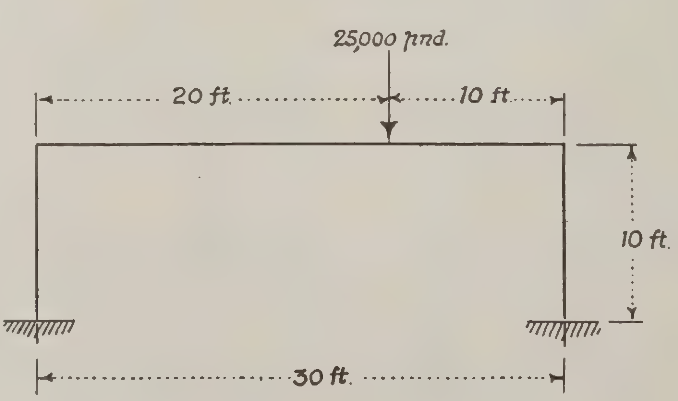
A simple example will best illustrate the use of this chart. A beam monolithic with pillars carries a weight W concentrated at any point on the span. The bases of the pillars are fixed (see Fig. 9).

Let $l = 30$ ft.
$h = 10$ ft.
$x = 20$ ft.
$Ib = 16{,}000$ sq. in. × in.^{2}
$Ip = 8{,}000$ sq. in. × in.^{2}
$W = 25{,}000$ pnd.

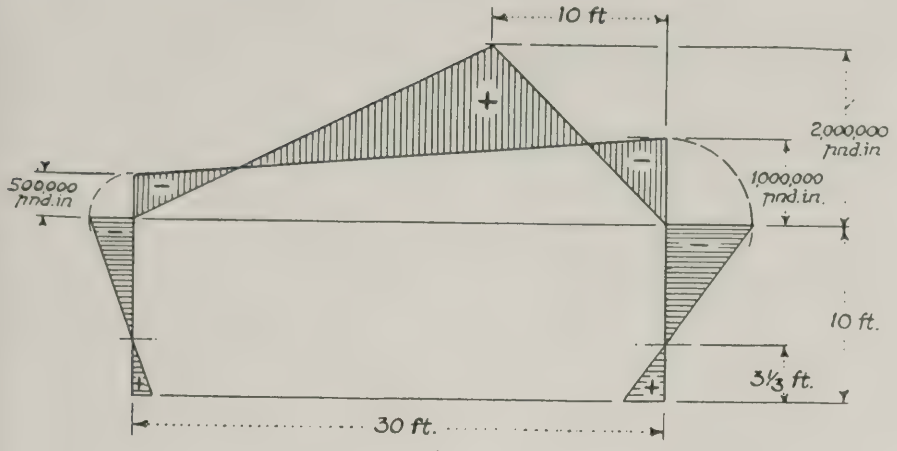
First calculate the values of *Qb* and *Qc* from data given in Table I.

$$Qb = \frac{W{\cdot}x{\cdot}x'^2}{l^2} = \frac{25{,}000\ \text{pnd.} \times 20\ \text{ft.} \times (10\ \text{ft.})^2}{(30\ \text{ft.})^2}$$
$$= 55{,}555\ \text{pnd. ft.}$$
$$= 666{,}667\ \text{pnd. in.}$$





9.



10.

$$Qc = \frac{W \cdot x' \cdot x^2}{l^2} = \frac{25{,}000 \text{ pnd} \times 10 \text{ ft.} \times (20 \text{ ft.})^2}{(30 \text{ ft.})^2}$$
$$= 111{,}111 \text{ pnd. ft.}$$
$$= 1{,}333{,}333 \text{ pnd. in.}$$

The value of the factor F*a* may be found from Chart I.

$$ri = Ib/Ip = \frac{16{,}000 \text{ sq. in.} \times \text{in.}^2}{8{,}000 \text{ sq. in.} \times \text{in.}^2} = 2 \cdot 00$$

$$rl = l/h = \frac{30 \text{ ft.}}{10 \text{ ft.}} = 3 \cdot 00$$

Lay a straight-edge across the Alignment Chart from 2·00 on the *ri* scale to 3·00 on the *rl* scale, and read off the point at which the straight-edge cuts the F*a* scale. This reading gives the value of the factor,

$$Fa = 0 \cdot 75$$

Using formula (3*a*),

$$Bb = -Fa \cdot Qb = -0 \cdot 75 \times 666{,}667 \text{ pnd. in.}$$
$$= -500{,}000 \text{ pnd. in.}$$

Using formula (4*a*),

$$Bc = -Fa \cdot Qc = -0 \cdot 75 \times 1{,}333{,}333 \text{ pnd. in.}$$
$$= -1{,}000{,}000 \text{ pnd. in.}$$

The bending moment at the point on the beam where the weight W is concentrated when the beam is simply supported, is given by the familiar formula,

$$B = \frac{W \cdot x \cdot x'}{l} = \frac{25{,}000 \text{ pnd.} \times 20 \text{ ft.} \times 10 \text{ ft.}}{30 \text{ ft.}}$$
$$= 166{,}667 \text{ pnd. ft.}$$
$$= 2{,}000{,}000 \text{ pnd. in.}$$

With these values of B*b*, B*c*, and B, we can construct the complete bending moment diagrams for the beam and pillars, remembering that the points of contraflexure in the pillars lie at a height of one-third the height of the pillars measured from the bases. These bending moment diagrams are shown in Fig. 10.

When the pillars rise through more than one story we may use the same formulæ (1) to (6*a*), but it is necessary to determine the points of contraflexure in the pillars above first-floor level. At a point of contraflexure the bending moment is zero, and the pillar may be assumed to be hinged. When the point of contraflexure is found, formulæ (1), (2), or (5) for bases of pillars *free* may then be applied to determine the bending moments.

Consider a structure consisting of two beams of single span monolithic with pillars rising to two stories of equal height *h*, the bases of the pillars being fixed (Fig. 11).

A weight W is distributed symmetrically over each beam, the negative bending moments at the ends of similar fixed beams may there be represented by the qualifier Q (see Table I).

Using standard notation as before :

I*b* = *inertia* moment of each *beam*.
I*p* = *inertia* moment of each *pillar*.
l = *length* of each beam.
h = *height* of each pillar between lateral supports, i.e. height of each story.

Let N = a fractional *number* such that the height of the point of contraflexure above the first-floor level is

$$y = N \cdot h$$
$$\text{or } N = y/h$$

Let R = the *ratio* of the ratios *ri* and *rl* = *ri*/*rl*.

The structure is symmetrical about the centre, i.e. about the vertical passing through the centre points of the spans, so the bending moments in one pillar only (pillar *a*—*d*) will be considered (see Fig. 12).

$$Ba = -\tfrac{1}{2}Bb \ldots\ldots\ldots\ldots\ldots\ldots (7)$$

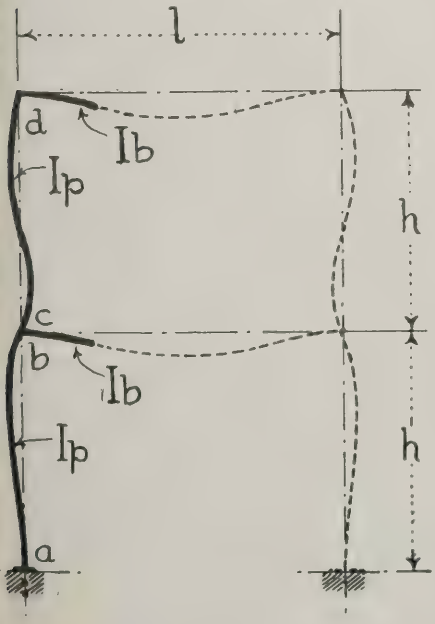
$$Bb = -Bc = -\left[\frac{3 + 4N}{4R \cdot N + 8N + 6}\right] Q \ldots (8)$$

$$Bd = -\left[\frac{3}{2R - 2R \cdot N + 3}\right] Q \ldots (9)$$

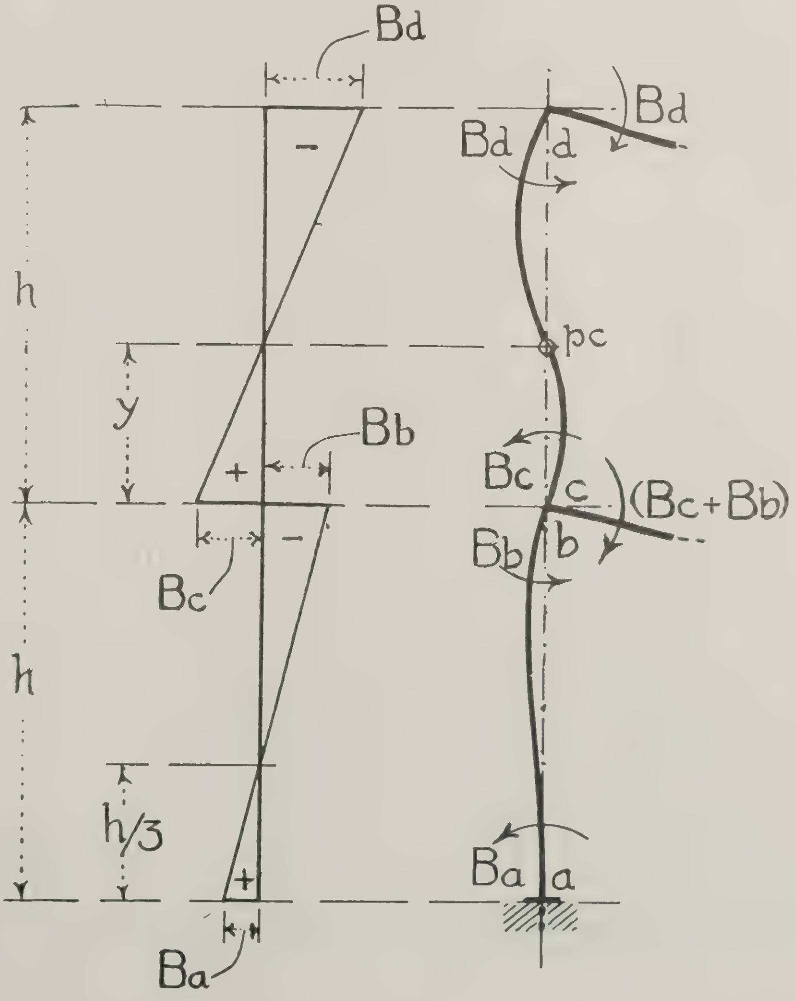
As in the previous case, equations (8) and (9) may be written in the simple forms :

$$Bb = -Bc = -Fb \cdot Q \ldots\ldots\ldots\ldots (8a)$$
$$Bd = -Fc \cdot Q \ldots\ldots\ldots\ldots (9a)$$

in which the factors F*b* and F*c* represent the expressions within square brackets in equations (8) and (9) respectively.



11.



12.

The value of N is found from the following equation :

$$8R{\cdot}N^3-(22R+36)N^2-(4R+15)N+(6R+9)=0\ \ldots\ldots\ldots(10)$$

The values of factors F*b* and F*c* may be read from Chart II for any ordinary values of the ratios *ri* and *rl*.

For example, with values of I*b*, I*p*, *l* and *h* the same as in the previous example,

$$ri = 2{\cdot}00$$
$$rl = 3{\cdot}00$$

Lay a straight-edge across Chart II from 2·00 on the *ri* scale to 3·00 on the *rl* scale. The values of factors F*b* and F*c* are read where the straight-edge crosses the F*b* and F*c* scales, i.e.

$$Fb = 0{\cdot}45$$
$$Fc = 0{\cdot}78$$

To ascertain the values of these factors by calculation without using Chart II it is necessary to solve equation (10) and then substitute the value found for N together with the known value of R, in equations (8) and (9), as shown below.

The *ratio of ratios* $R = ri/rl = 2/3 = 0{\cdot}667$. Substitute this value of R in equation (10),

$$(8\times0{\cdot}667)N^3-(22\times0{\cdot}667+36)N^2-(4\times0{\cdot}667+15)N+(6\times0{\cdot}667+9)=0,$$

from which

$$N = 0{\cdot}37.$$

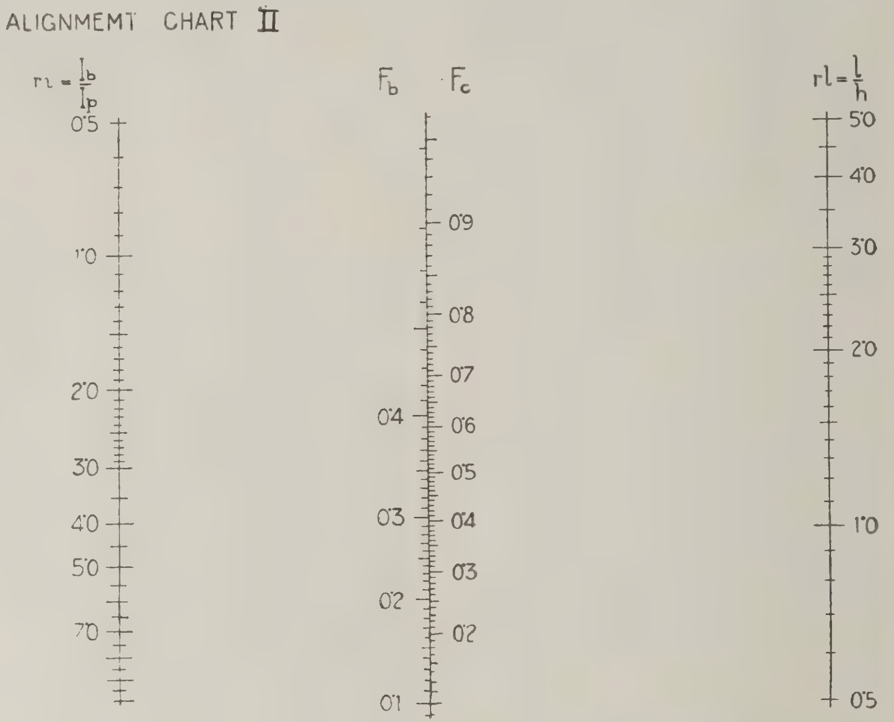
The values of R and N found above are now substituted in equations (8) and (9).

$$Bb = -\,Bc = -\left[\frac{3+1{\cdot}48}{0{\cdot}99+2{\cdot}96+6}\right]Q$$
$$= -\,0{\cdot}45\ Q$$

$$Bd = -\left[\frac{3}{1{\cdot}33-0{\cdot}49+3}\right]Q$$
$$= -\,0{\cdot}78\ Q$$

The qualifier Q depends upon the distribution of weight on the beams, and its value is given in Table I.

Beams of single span only, monolithic with pillars, have been considered in this article. Clapeyron's Theorem of Three Moments lends itself equally well to the treatment of monolithic structures in which the beams are of more than one span, but space does not admit of further discussion or of proofs of the formulæ and equations given in this article. These will be found in "Reinforced Concrete, A Practical Handbook," by Harrington Hudson (Chapman and Hall).



Magazines of the Month*

A Literary and Pictorial Digest

THE Contessina Lisa Scopoli has written an article for the July ARCHITECTURAL REVIEW on "A Pope's Peace Memorial," which, though projected, has not yet been carried out. Three years ago, says the writer, the late Pope Benedict XV entrusted the architect Armando Brasini with the preparing of a scheme for a great basilica as a thanksgiving for the re-establishment of peace. A large piece of ground was offered in the new quarter of the Parioli, in Rome, and the Pope selected Brasini to prepare designs. Brasini is an artist who, "through a curious and interesting psychological peculiarity, seems to perpetuate in himself the artistic vision and temperament of the sixteenth and seventeenth centuries." He is a man under forty who "has worked his way up through personal experience and practical craftsmanship, as artists used to do in the golden times of Italian art," and his passion is the baroque of Bernini, Rossi, Fuga, and Longhena. The building, as the illustrations show, is in this manner, and yet personal to Brasini himself. His plan is exceptionally interesting. It owes its inspiration to Bramante's design for St. Peter's, but he has turned the Greek cross so as to set the façade of the building between two of its arms, instead of at the end of one of them. It has a central altar under the dome, and four chapels at the corners, and the priests' dwellings are connected to the church.

The same issue contains articles on King's Lynn by Professor A. E. Richardson, on the War Memorial at Ely Cathedral by Guy Dawber, on the Architectural Courts at the Crystal Palace, and on the Secretariats or Government Offices at New Delhi—Herbert Baker's great buildings—which are not yet completed. The Secretariats are built in two blocks overlooking Delhi. The Processional Way rises between them and goes on to Government House, which is in the centre of the platform beyond. The stone used generally is a red and white sandstone, the great wall and the basement being red, and the superstructure white. Immense quantities of this sandstone are found on the hills beyond the city; and it is an interesting fact that Delhi has probably been chosen as a capital from time immemorial because of the position of this quartzite outcrop, which is the only stone outcrop on the upper regions of the plains of India. The work is being carried out by the engineering department of the Government of India. Under the engineers are half a dozen English foremen specialists. All the rest of the labour is Indian.

In its section on Architecture, the July LONDON MERCURY deals with the architectural exhibits at the Royal Academy. Messrs. H. Percy Adams and Charles Holden, Sir John Burnet and Partners, Gilbert Scott, and H. S. Goodhart-Rendel are picked out for special mention, but the general opinion of the critic is that "the variety of ideal shows a marked lack of anything approaching a national conviction in this art."

THE CONNOISSEUR for July contains an article on the "Old House" at Sandwich, one of the most perfect Tudor houses that we have left to us in England. The "Old House" is half-timbered. It has a fine entrance hall, and a drawing-room—the old living-room of the Tudor house—panelled in oak wainscot, and with a magnificent carved oaken chimneypiece from floor to ceiling. "The Queen's Bedchamber" is another delightful room, and has a most elaborate ceiling. The "Queen" was Elizabeth.

* All the magazines here mentioned may be seen in the Reading Room at 29 Tothill Street Westminster.

LA CONSTRUCTION MODERNE has an interesting leader on the Palace of Government of Rio Grande do Sul. "The State of Rio Grande do Sul," says the writer, "is one of the most prosperous in Brazil. The town of Porto Alegre, the capital, had, even before the war, a population of nearly 150,000, and is increasing in importance daily. The Palace of Government was in 1909 not erected, and there was in the country no architect capable of undertaking the work; it was therefore necessary to approach a foreign architect. The Government wished to employ a French architect who would be able not only to furnish designs and plans, but also sacrifice the necessary time for the actual superintendence of the work while it was in progress. So the Government, through the consular service, invited M. Maurice Gras, a Paris architect, to make the journey out in order to study the site. Thus M. Gras arrived in Brazil in 1909, and was entrusted with the commission by the Government of Rio Grande. Enormous difficulties arose, however. Almost all materials had to be obtained from France. Even the stone came from Lorraine, each piece hewn and ready to be placed in position. The steel framework, the staircases, the steel floors, the covering, the decorative features—were all ordered in France, executed in Paris, and sent out to Brazil. The erection of the Palace thus went on without a hitch or untoward incident, despite the difficulties attendant on carrying out work so far away. Supported by the President and the Minister of Public Works, M. Gras was able to place nearly all the contracts, amounting to several million, with French firms. Thus at the same time he swept away the German competition, and, at Government expense, imported French workmen and foremen who established themselves in the country. When in 1914 war broke out, the Palace was not entirely finished, although the main part of the work was completed. Part of the interior decoration, however, remained to be executed, also the outlying buildings and terraced gardens, for which plans and designs had been supplied to the Government. But in 1919, as soon as circumstances allowed, the Government decided to have the scheme finished from Paris. So M. Gras, who was just demobilized, took up the work where he had left off, and superintended the erection of the Palace, which is now almost finished, although temporary difficulties have obliged the Government to postpone till later the completion of the interiors. In acknowledgment of his work, M. Maurice Gras has been presented with a gold medal by the Salon of French Artists."

THE PALACE OF GOVERNMENT, RIO GRANDE DO SUL.
(*From "La Construction Moderne."*)

WENDINGEN is a monthly magazine published in Amsterdam. It is unique because it is published in three different languages—Dutch, German, and English. Each issue is devoted to one subject, and the cottage design illustrated on page 96 is taken from an issue on Dutch Architecture. This remarkable issue contains, besides illustrations, only one page of letterpress—a sort of Editorial at the beginning, which is headed "Representative Members of 'Architectura et Amicitia.'" And since it is extremely interesting to English architects it is here reprinted practically in full.

The two existing federations of architects in the Netherlands: The Bond of Netherlands Architects (B.N.A.) and Architectura et Amicitia (A. et A.), make no distinction between graduates of Technical High School (Architectural Engineers) and other architects on the admittance of members. Both submit the formulated condition of bona-fide professional practice; but while the B.N.A. demands from its members successful results of at least three years'

THE SECRETARIATS, NEW DELHI. HERBERT BAKER, F.R.I.B.A., ARCHITECT
(*From "The Architectural Review."*)

practice, A. et A. unites, besides the architects, their assistants and professionals of arts akin to architecture.

As a result of their composition, the sphere of activity of the two federations differs. The B.N.A. is the Trade Union which acts in the interests of the architects and determines and maintains the good principles of the profession. The Society A. et A. is, according to its Articles of Association, the federation which takes upon itself the care of architecture. But at the time of its reorganization in 1916, the federation had to admit that a number of its members could not be considered to be in possession of sufficient insight to enable them to take part effectively in that care for architecture, and it decided to institute a separate category of members who, as Representative Members, were especially commissioned with the protection of architectural interests. In the Articles of Association the following clauses were inserted concerning Representative Members :—

1. The following can be admitted as Representative Members of the Society. Ordinary Members who have attained the age of twenty-three whose technical and æsthetic efficiency shall have been approved by the Committee of Investigation mentioned hereinafter and who place themselves at the disposal of the Society for the fulfilment of a function to which the members' meeting may nominate them, such as Committee or Editorial Member, Member of a Jury, or as Committee Member of every Committee whose activities extend to the province of architecture or nearly-related arts.

2. For this, the candidates must address an application in writing to the Managing Committee, in which the necessary particulars with regard to previous life and study must be mentioned and in which reference must be made to work performed, or original designs must be submitted—all accomplished within the last five years.

A COUNTRY HOUSE AT HULSHORST, HOLLAND.
P. VORKINK, ARCHITECT.

(*From "Wendingen."*)

3. These documents will be judged by the Committee of Investigation to be nominated. As a basis for judgment for this Committee, the following shall apply : That sufficient professional knowledge is apparent from the work submitted and that plastic ability is present to such an extent that the designer's intended expression has become apparent in the work as a whole and in detail.

4. Should the Committee recommend the admittance of the candidate, membership can be granted by the member's meeting.

7. Representative members are exclusively eligible to one of the functions mentioned in clause 1 in this article.

8. A representative member who is found no longer to fulfil the conditions which led to his nomination, can be declared to have been deprived of his membership by the Committee of Management after the Committee of Investigation has been heard. Appeal can be made at the members' meeting.

5. Representative members are bound to exhibit annually and are not subjected to the judgment of a jury for admittance.

CONSTRUCTION, Toronto, illustrates a series of Branch Banks erected recently in Toronto. The bank shown opposite is in College Street, and is from the designs of John M. Lyle.

MODERNE BAUFORMEN contains an illustrated article upon the Rosenthal house in Berlin-Dahlem, an interior view of which appears here. Professor Breslauer, the architect, has been said to have adapted Spanish motifs to the requirements of the colder climate of Northern Germany. As can be seen on the plan, the house has a cortile, and the general design is strongly reminiscent of many American houses in California, where the Spanish influence is strong. At the same time, however, it has all the coarse and primitive German character.

The June ARCHITECTURAL FORUM of Boston is largely devoted to "Garden Design." It is the quality of life and growth which distinguishes the garden

(*From "Construction."*)

from the static work of art, says the writer, E. C. Whiting. "The ultimate forms, the textures, the colours, and the infinite details and subtle harmonies of the garden pictures are made of *living* materials, and it is in the happy balance and pleasing contrasts of these free-growing elements with the rigid elements imposed by man's control that the most satisfying beauty in garden design is attained. . . . Living materials, such as flowers, shrubs, and trees are the chief mediums of the designer's work—and these are changing from hour to hour, from day to day, from year to year. The garden designer must understand these living qualities of his materials, and he must appreciate the influence of those larger and, perhaps, more dominating elements of site and environment over which he has comparatively little control, for it is in both these sorts of conditions that are found the peculiar opportunities of the art." The influence of environment may be divided into two fields—the architectural or stylistic influence, usually established by the house, and the influences emanating from the conditions of the site. "If the garden is close to the house, if it is definitely and organically and visibly related to the house, there should be an evident harmony between the two—a harmony of line, form, material, and colour," but the less pronounced the style of the house, the smaller will be its influence upon the style of the garden. Usually, however, the most dominating influence in garden design is that of the site. The site provides at once a limitation and an opportunity. The garden illustrated here is a ravine garden, and its design is influenced more by the site than by the house. "The site was a narrow gulch in the edge of the woods and extended from the lawn at the upper end to a terraced vegetable garden at the lower. The straightness of the ravine, a distant glimpse it provided across the city, and the fact that it was

A GARDEN AT CLEVELAND. OLMSTED BROTHERS, LANDSCAPE ARCHITECTS

(From "The Architectural Forum.")

n a sense a 'way' from one part of the grounds to another, suggested a defined ıxial treatment. The garden is essenially an elaboration of the axis, and needs no other control to give it unity. t melts gradually into the informality of he wooded banks that frame the picture. Vater, sunlight, and the ever-changing hadows from overhanging trees give it ife and atmosphere." It is safe to say, concludes the writer, that the garden vhich shows no recognition of its environnent lacks harmony and fitness.

Other articles in the same issue deal with "Planting for Architectural Effect," "An Italian Garden," and the Hartford Fire Insurance Building, Hartford, Conn., of which a view in the Rotunda is shown opposite. The charm of this building is explained by its simplicity.

The June ARCHITECTURAL RECORD of New York contains the last of a series of articles by C. V. Solon on "Architectural Polychromy," an article on "The Ancient Spanish Granary," some notes upon the early Architecture of Pennsylvania, with some interesting photographs of colonial steeples, and illustrations of the Seaboard National Bank in New York. Its Portfolio of Current Architecture also includes a rather interesting cottage at Broadway, Worcestershire, by E. S. Carpenter.

THE AMERICAN ARCHITECT of June 21 contains an article on Stained Glass, and illustrations of apartment houses in New York, of which the entrance to No. 630 Park Avenue is shown on page 97.

PENCIL POINTS contains articles on "Motion Picture Theatre Data," "The Making of Linoleum Prints," and "Architectural Detail."

Enquiries Answered

Buildings to Measure

Forest Hill.

M. L. writes: "Kindly let me know vhether there are any suitable buildings o measure near Forest Hill."

–Near Dartford there is the church at Stone (*c.* 1251–74), which is an admirable rchitectural subject for study and neasurement. Many drawings have been nade of the wall arcade in the chancel. Another suitable building is the Royal Palace at Eltham, which dates from the fteenth century.

Berwick-on-Tweed.

G.F. writes: "Are there any buildings uitable to measure in or near Berwickn-Tweed? Can you give any facts with egard to the town hall and the parish hurch of Berwick?"

–Very little good work exists in the eighbourhood of Berwick-on-Tweed. The parish church of Holy Trinity, built n a debased Gothic style, was completed y Puritans in the time of the Commonvealth, 1652, when the spire and tower vere deemed unnecessary. It was reored and the chancel added in 1855. There may be a few features in it worth neasuring. In the High Street is the own hall, market-place, and gaol, built y Joseph Dodd, 1754–61. There is the uined castelet of the Carrington family t Cocklan.

Durham.

"Student" writes: "Please give me some nformation about buildings suitable to neasure in the county of Durham."

–The more important buildings are as ollows:—*Early English Work:* Chapel of he Nine Altars in Durham Cathedral; he churches of Sedgefield, St. Andrew's, ukland, and portions of the churches f Ryton, Medomsley, Easington, Chester-Street, Lanchester, and Boldon, and inchale Priory. *Decorated work:* Winows at Brancepeth, Houghton-le-Spring, arlington, and Easington, alterations t Tinchale Priory, the gateway of epyer Hospital, Durham, and windows the nave of Durham Cathedral. *erpendicualr work:* Altar screen and shop's throne at Durham Cathedral, arts of the Palace at Bishop Auckland, nd parts of the churches at Staindrop, hester-le-Street, Darlington, Houghton-Spring, Brancepeth, Sedgefield, Bilngham, Boldon, Easington, Hartlepool, ittington, Lanchester, Heighington, oniscliffe, Medowsley, Dalton-le-Dale, . Edmond's, Gateshead. There is some e Norman work in the cathedral and castle at Durham, and in the churches of Norton, Heighington, Pittington, and Lanchester. Saxon work will be found at the churches of Escombe, Norton, Monkwearmouth (A.D. 674), Jarrow (A.D. 685), and in the crosses to be seen at St. Andrew's, Aukland, Aycliffe, and in Durham Castle.

Great Bookham, Surrey.

Enquirer writes: "Please name buildings near Great Bookham suitable to measure."

—The Church of St. Nicholas, which is partly Norman (piers and arches), is situated at Great Bookham. Built in 1341 by Abbot Rutherwyke, of Chertsey, the church contains many fine monuments and brasses. At Little Bookham there is a small but interesting church, restored in good taste in 1864. Fetcham Church, in the Norman and Transitional Norman style, is also interesting. The church of Effingham is chiefly Early English. East Horsley Church is partly Early English, and was well restored in 1870. At East Horsley Towers, the residence of the Earl of Lovelace, there is much good Gothic work. Some Norman features and a Decorated barge-board, noted by Rickman, and regarded by him as unique, are to be seen at the little church of Merrow.

North Wales.

R.H. writes: "Can you give me a list of Gothic buildings suitable for measuring in North Wales?"

—St. Mary's, Shrewsbury; Abbey Church, Shrewsbury; Old St. Chad's; Wroxeter; Oswestry; Ruabon; Wrexham, tower and apse (Perpendicular); Guesford, tower (Perpendicular); Northop, tower and effigies; Mold; Cilcain, roof; Llanarmon, monuments and chandelier; Llanfwnog, arcades; Ruthin, roof; Llanrhaiadr, window; Efenechtyd, wooden font; Llanrwst, Gwydyr chapel, very fine Perpendicular rood-loft; Whitchurch (Perpendicular); Conway; Beddgelert, old Priory Church (Early English); Clynnog, roof, tower, St. Beuno's chapel; Beaumaris, carving; Llaniestyn, font (Early English); Llanvihangel, pulpit; Llanddyfnan, sculpture; Holyhead, sculpture; Llangadwaladr, windows; Llanaber (Early English); Llanasa, stained glass; Giulsfield, roof (restored); Newton, old screen in modern church; Llanidloes, roof; Pennant Melangell, screen; Llanmer, roof; St. John's, Chester, double row of triforium arches.

South Shields.

H. C. writes: "Is there anything to measure in the district of South Shields?"

—There is Boldon Church (St. Nicholas), crowning a hill midway between Jarrow and Hylton Castle. This was at one time a beautiful Early English church, and the peculiarly designed tower and spire are replete with interest. Although the church has been restored, the principal parts of the original building still remain. Much remains also of the original Church of St. Paul, at Jarrow, dating from the seventh century. At this church good Norman work is to be seen, and the N. and E. windows are of the Decorated style. Two elaborately carved bench-ends of fifteenth-century date are to be seen in the chancel. There is also a chair called "Bede's chair," said to have been used by the Venerable Bede, but it is difficult to imagine how it escaped destruction when the monastery, which once existed at Jarrow, was burnt by the Danes. At Bishopswearmouth some remains of St. Nicholas' Church, founded A.D. 930, still remain, as well as a thirteenth-century sedilia. At Tynemouth Priory some excellent work is also to be seen. At Newcastle-upon-Tyne are the magnificent Cathedral of St. Nicholas, the Keep, and two churches. The Keep contains some fine Norman work. St. John's and St. Andrew's churches contain good work of the Transitional Norman and Decorated periods and fifteenth-century font covers. At Monkwearmouth is the church of St. Peter, which is particularly interesting as being the earliest existing stone church in the country. It contains work of the seventh century.

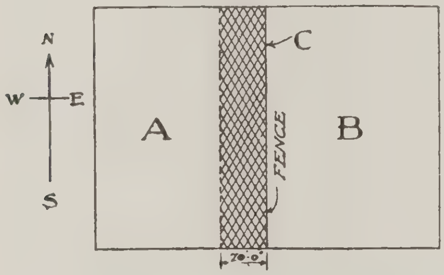
Shrewsbury.

T.C. writes: "What are the best buildings to measure in or about Shrewsbury? Are there any good small examples of half-timber work?"

—There are St. Mary's Church and the Abbey Church in Shrewsbury. Work of all dates from the twelfth to the fifteenth century and good mediæval glass are to be seen at St. Mary's Church. The Abbey Church is Norman, with later Perpendicular and some modern work. In Shrewsbury there are many half-timber houses, such as Ireland's Mansions and the Guildhall. A good detached Renaissance stone building is the market hall, and the old grammar school (now museum) belongs to the early part of the same period. Near Shrewsbury are Wroxeter Church (Transitional Norman and Early English, with later tower); Buildwas Abbey (Transitional Norman work); Much Wenlock Priory (Early English, with Norman chapter-house); Shawbury Church (Norman work and late tower); Haughmond Abbey (Transitional Norman work); and Acton Burnell Church. Buildwas, Much Wenlock, and Haughmond are ruins. In the district there are also many good halls or manor houses, such as Shipton Hall (seventeenth century), and Plaish Hall (*c.* 1533), near Church Stretton; Pitchford Hall (1500–1514), one of the finest half-timber houses in Shropshire; Condover Hall, a Renaissance stone building; Moreton Corbet manor house, Early Renaissance (in ruins), and Pink Hall, a fine half-timber house. There is also Ludlow, with its fine church (thirteenth, fourteenth, and fifteenth century) and castle. In Ludlow there are many good half-timber houses, including the Feathers Hotel and the Reader's House. Stokesay Castle is reached from Craven Arms Station. The gatehouse is a very good small example of half-timber work.

Boundary Fence.

H. S. writes : "A proposes to sell a strip of land shown on the diagram (reproduced below) by a dotted line and cross hatching. B claims the division fence marked C, and also 18 in. on A's land for brushing the fence. Is B right in his claim ? There is no ditch, and never has been. If B claims this right, can the purchaser claim a further 18 in. from A as a set-off against this 18 in. claim made by B ?"



—I am of opinion there is a mistake here, and should expect the boundary to be the "stake root" of the quick fence dividing the properties of A and B. Eighteen inches is neither one thing nor another, and I should imagine is an assumed figure; unless B can show documentary evidence in favour of it I should ignore the claim entirely. Had he claimed 3 ft. or 4 ft. there would be something worth investigating, as that would represent the width of a presumably formerly existing ditch (though the enquiry states this never existed). I can only suggest that A should ask B to show him his evidence—it might possibly be that B himself planted the quick inside his boundary deliberately, and that he is right in his contention. Can anything be deduced from the measurement of the frontage ? If A has contracted to sell a piece of land of so many feet frontage he must certainly deliver it or make good some other way. F. S. I.

"K" System of Drying Damp Walls.

T. A. writes : "Some years ago we had occasion to use what was known as the 'K' system of drying damp walls. It consists of a porous brick, weathered, and has to be inserted at intervals in the damp walls. As far as we recollect, the patent is Belgian or French. Can you give us the address of the British agents ?"

[We are unable to trace this system. If any reader should know of it we should be glad if he would forward information.—Eds. A.J.]

The New Thames Bridge

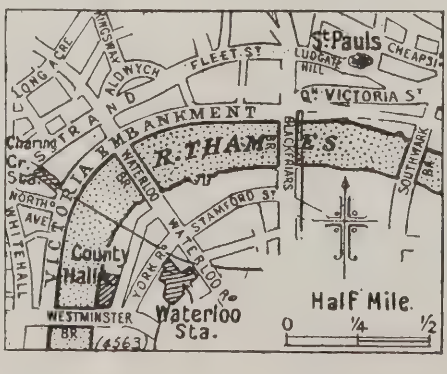
Lord Plymouth, President of the London Society, Sir Aston Webb and Sir Reginald Blomfield, chairman of Council and member of Council respectively of the London Society, have written to "The Times" with regard to the proposal to erect a new bridge, commonly known as St. Paul's bridge, over the Thames, between Blackfriars and Southwark Bridges. On Thursday last the City Corporation were asked to give final instructions to proceed at once with the erection and completion of the bridge.

In the course of their letter the writers observe : We venture to hope that some further time may be given for the consideration of this matter, and that if, as we think, it could be shown that a bridge across the Thames farther west would better meet the requirements of London as a whole, the Corporation would be magnanimous enough to agree to a change of site, even if the site were not within its own boundaries.

Our reasons for urging this are, first, that now London Bridge has been widened and Southwark Bridge rebuilt, a new bridge on the proposed site will not meet any public need commensurate with its cost; secondly, that the area on the south side in this quarter is already sufficiently served by the Southwark and Blackfriars Bridges, which are only a few hundred yards away from the proposed new bridge; and, thirdly, that from the architectural point of view the bridge and its roadway, passing to the east of the Cathedral instead of being axial to it, would be a very serious mistake in civic architecture, the effect of which would never be satisfactory.

The essential point is, we submit, that the proposed St. Paul's Bridge is not really wanted, whereas a great new road bridge crossing the river between Waterloo and Westminster Bridges is very badly wanted.

The congestion of traffic over Waterloo Bridge and its extreme inconvenience to traffic going east and west has been familiar to Londoners for years. The great terminus at Waterloo will increase it, and now, with the opening of the County Hall, the development of the south side of the river with all its possibilities comes within the range of practical politics, with the inevitable corollary of the construction in the near future of a bridge on the largest scale on the Charing Cross site. A glance at the map will show the immense benefit such a bridge would be to the traffic from the south side to the north-west area of London.



The Corporation of the City of London has, on more than one occasion, shown a most generous public spirit in undertaking, for the public good, great enterprises outside the City boundaries, such as Epping Forest, Burnham Beeches, and Shadwell Park. Here is another occasion for civic patriotism, and at the eleventh hour we venture to appeal to the Corporation to reconsider the whole question with a view to substituting a bridge at Charing Cross for the proposed bridge at St. Paul's, and once again to devote, *urbi et orbi*, the great resources at their command.

(At the meeting of the Corporation the St. Paul's Bridge proposal was referred back.)

The British Academy

At the annual general meeting of the British Academy, held under the presidency of the Earl of Balfour, the following were elected Fellows of the Academy : T. W. Allen, A. L. Bowley, O. M. Dalton, W. S. Holdsworth, H. H. Joachim, A. G. Little, R. A. Nicholson, and A. W. Pollard. Lord Phillimore and Mr. Charles M. Doughty were elected as Honorary Fellows; and Signor Remigio Sabbadina as Corresponding Fellow.

On the motion of Lord Balfour it was resolved to send a message of cordial congratulation to the Asiatic Society of Paris, which was celebrating not only its own centenary, but also the centenary of Champollion, the discoverer of the key to the Egyptian hieroglyphs. By a happy coincidence his lordship welcomed Sir Arthur Evans, who had just returned from four months' renewed excavation at the palace site of Knossos, Crete.

Sir Arthur Evans said that amongst the new features brought to light was part of a grand staircase in the west wing of the building, fresh arrangements connected with the State entrance, and a great bastion on the north. The most surprising developments, however, occurred within and about the south-east angle, connected with a great earthquake to be dated about 1600 B.C. Early houses near the palace walls had been overwhelmed by these huge blocks and afterwards filled in, after an expiatory sacrifice of bulls, of which traces remained. A mass of interesting relics was found in the filling and beneath, including some of the finest polychrome vases yet brought to light, and a terra-cotta figurine of a youth of great artistic value. Beneath the palace angle itself, which had fallen in owing to the catastrophe, appeared an earlier rock-cut vault, and leading from it an artificial cave, with a kind of lair as if of some great beast.

The Architecture Club

We learn that a new club has been or is being formed, called "The Architecture Club," composed chiefly of architects and writers. Its activities will consist in arranging exhibitions of architecture, in inspecting and discussing modern works of architecture, and in fostering interest in and criticism of architecture in the Press. The prime mover of the scheme is the secretary, Mr. J. C. Squire, the editor of "The London Mercury."

Contemporary Art : Exhibitions at the Leicester and Goupil Galleries

With the summer months, art galleries —as distinct from museum galleries— re admittedly going through their annual ean period, because, modern town life eing what we know it to be, the leisurely nd moneyed classes are too busy winding p the season with Ascot, Ranelagh, ord's, and Goodwood, before the general catter to Cowes and the North. West nd galleries, therefore, choose this eriod to avail themselves of their less ensational material. You may have bserved that fashionable artists, those ery much in the public eye, seldom, if ver, exhibit in July or August. What he art critic of "The New Age" or of 'The Manchester Guardian" might say atters little, so long as Mayfair, Ken-ington, and St. John's Wood (the more enteel part of it, of course) know, nod, nd buy—and that never takes place ust now. But, somehow, these galleries ave to keep open with something or ther, and they do. The wonder is that hey still manage to show interesting ork; yet three excellent exhibitions are eing held now, for instance. That of 'Drawings, Old and New," at the eicester Galleries, is of much value, and ncludes examples by great artists. The election is varied, and covers some of the ost fruitful periods of Renaissance and odern Art: Peter Breughel, Guardi, embrandt, Gainsborough, Morland, iepolo (do not miss his "Death of leopatra" (31), or his "Design for a eiling Decoration" (39)), Cotman, and e Wint. And then, more modern artists ress on : Holman Hunt, Burne-Jones, ossetti, Ingres, Daumier, Alfred Stevens, nd Beardsley. But perhaps you dis-ke the Victorian period ? Well, you an then give your attention to Forain, alter Sickert, and Degas, and Strang, nd Augustus John. Really, here are ictures to satisfy all tastes. When I trolled in at a quiet hour of the day, an x-Prime Minister, looking *molto ricco*, as having such fun. Catalogue in and and pince-nez strongly poised, he eemed to relish the very-modern-but-ne: James McBey, Prof. H. Tonks, . Y. Cameron, and Weatley. Sir illiam Orpen's clever portrait of William icholson, 1909, also attracted him, but grieve to report that Messrs. Roberts, omberg, Wyndham Lewis, and Stanley pencer's work did not come in for much ttention. The Right Hon. gentleman referred to wait and see the old masters, r those modern ones whose reputation is ecurely entrenched.

The far room in the same galleries con-ains paintings of Tunisia by Baron odolphe d'Erlanger. Obviously an mateur, Baron d'Erlanger wields the rush with a good deal of ability. His rger canvases are, to my mind, a mis-ake. Much nicer, much more valuable, re his small oil annotations. "Street in airo" (2), the "Door of a Zaonia" (31), r "Cairo, Twilight" (35) are charming ttle sketches. The picturesque "bit" ttracts him, and it is in the treatment of ese that he shows to greatest advantage.

The Goupil Gallery holds three exhibi-ons. The "Summer Exhibition" con-ains some good examples of modern works. For those "who know what they like" I commend Elizabeth Drury's "In the Luxembourg Gardens" (4), a well-balanced study of an underwood, of exceedingly fresh greens. This gifted lady surely enjoyed doing it. Rather similar in technique and manner is William Nicholson's "Aux Champs Elysées." It is what is known as able and accomplished. Wilson Steer dominates the room with his "Harbour Entrance" (18), an oil of tremendous vigour. A direct and simple "Cottage Girl" (19), by George Clausen, R.A., and a fine study of "Fruit" (20), by Mark Gertler, are alone worth a visit. Upstairs one comes up against an illuminating contrast between old-fashioned paintings and sketches on the one hand, and modern fashionable sculpture on the other. Never excessively thrilled by stodgy and laboured canvases, I yet much prefer those of Johann and Oswald Sickert to the contemporary bronzes and marbles of Eleuterio Riccardi. In connection with this, a little honest aside will not be amiss. Now, Signor Riccardi is an able modeller, but his artistry is wretched, and were it not for the two bronzes of "Lord Buckmaster" and "Frederick Delius, Esq.," which are rather nice and straightforward, such a show should be ignored. To worry out, as commissions, portraits of Eminent Statesmen and Society and Elegant Ladies is one thing; to do so with a total disregard of artistic honesty and then foist them upon an unsuspecting public quite another. Such things as the gilded terra-cotta bust of "Countess Raben," or the kiss-mummy called "Maternity," are amazing essays in vapidity. If those insipid, facile, and mawkish little statues called "Bacchante," "Tête d'Ange," and "Nymphe," are made such a fuss of by our Fashionable Public, then it is time that the kind of sarcasm which, perchance, might sting them should be dealt out, because to encourage stuff of this calibre is well-nigh disastrous. Painstaking as they are, it is a relief almost to fall back on the sketches of the Sickerts, because we face, at any rate, honesty. These two artists, father and grandfather of Walter Sickert, our Post-Impressionist painter, are dull on a whole, but theirs is sincere and ably painted work. The water-colours and pastels of Oswald (1828–1885) are most likely to appeal to a modern public on account of their resiliency and freshness, but the oils should not be dismissed too quickly. "Mr. Robert Sickert as a Child" (26) has great merit; in it strong influences of Rubens are clearly discernible, and the "Early Portrait of the Artist" (17) is also very good; painted when hardly sixteen, it speaks well for the thorough training which those quiet Danish painters underwent with such will and sincerity.

G. HOLT.

The Rio Pavilion : A Correction

We regret to say that owing to a misunderstanding the dome for the Rio Pavilion was attributed, in last week's issue of the JOURNAL, to Mr. Anning Bell, A.R.A., whereas the whole of the stained-glass dome is, in fact, the work of Mr. Reginald Bell, of Messrs. Clayton and Bell. Some of Mr. Reginald Bell's brilliant cartoons will be illustrated in next week's issue.

Victoria University of Manchester

Following are the awards for the session 1920–21 of the Victoria University of Manchester School of Architecture :—

B.A. DEGREE HONOURS ARCHITECTURE. FINAL EXAMINATION.

First Class.

R. A. Cordingly. Elsie Rogers.
J. P. Nunn.

Second Class, First Division.

W. R. Briggs. W. H. Norbury.
P. G. Fairhurst. R. J. Willis.

Second Class, Second Division.

G. H. Gatley.

The Manchester Institute of Builders Travelling Scholarships of £120 and £60 were awarded to Mr. R. A. Cordingly and Miss Elsie Rogers respectively, and a graduate prize of £5 was awarded to each of these students.

The Jarvis Travelling Scholarship of £50 was awarded to Mr. J. P. Nunn.

The A.S.A.P.U. and Overcrowding

Following are the results, (which were announced at a meeting of the new Council), of the elections of the officers and Executive Council of the Architects' and Surveyors' Assistants' Professional Union for the ensuing year : President, A. J. Penty, Lic.R.I.B.A.; Vice-President, J. M. D. Henderson, M.S.A., A.R.I.B.A. (Ayr); Hon. General Treasurer, R. G. Strachan, P.A.S.I.; Director of Employment, T. Bilbow, M.S.A.; Executive Council : Chas. MacLachlan, A.R.I.B.A. (Chairman), H. D. Funnell, F.S.I. (Vice-Chairman), T. Braddock, D. Cameron, C. R. Cathrow, R. F. Curling, L.R.I.B.A., W. S. Dalton, H. J. Davies, M.S.A., G. F. Fox, J. A. Gould, G. N. Hannam, P.A.S.I., W. H. Jackson, A. M. Laurie, A. Mather, M.S.A.; Advisory Member of Council, P. W. Farmer.

In accordance with the instruction from the National Convention of Delegates, 1922, the following resolution was passed for communication to the press, and for presentation to the Headmasters' Association, to serve as a warning to all interested in the recruitment and training of persons entering the professions :—

"The Executive Council of the A.S.A.P.U. desires to draw attention to the severely overcrowded state of the architectural and surveying professions at the present time, and warns students, parents, guardians, and schoolmasters, also such students who contemplate leaving at the end of the present school year to take up architecture or surveying as a profession.

"Owing to the scarcity of money for capital work, which must continue for a long time yet, the amount of building work in hand and under consideration is very small. Well-known practitioners have very little work in their offices; many small offices have none at all; Government and municipal staffs are being drastically reduced; and hundreds of assistants, most of whom are fully qualified men, are without employment.

"Those who enter the professions can only come in to share the present distress, and the Executive feels that this should be very plainly put before them."

News Items

Woking Hospital.

£7,733 has been obtained towards Woking's hospital extension scheme.

Rebuilding at Harrogate.

Harrogate proposes to rebuild the Spa Rooms attached to the Royal Hall, at an estimated cost of £29,000.

Reconstruction of Buxton Natural Baths.

A beginning is to be made with the reconstruction of the Buxton Natural Baths at an estimated cost of £20,000.

The International Theatre Exhibition.

The International Theatre Exhibition at the Victoria and Albert Museum will remain open till July 31.

Promenade, etc., for South Shields.

With a view to providing work for the unemployed during the coming winter, the South Shields Town Council have adopted an extensive scheme of improvements at the seaside.

Exhibition of "Problems in Design."

The Problems in Design submitted by candidates for the R.I.B.A. Final and Special War Examinations are on exhibition in the Galleries of the R.I.B.A. until Friday, July 21, between the hours of 10 a.m. and 5 p.m.

Proposed Bridge Reconstruction at Shrewsbury.

It is proposed to reconstruct and double the width of the fine eighteenth-century English bridge that crosses the Severn—one of the most beautiful bridges in the country, and the subject of a painting by Turner.

Bridge Built in Twenty-six Hours.

Sixty men, working at top speed, have dismantled a seventy-five ton bridge and erected a new one in the short space of twenty-six hours. The bridge spans the Midland and Great Northern joint line near Counter Drain Station, Lincolnshire.

Brighton Aquarium.

Although Brighton Town Council has definitely adopted a scheme to convert the Aquarium into a motor-coach station, strong efforts are being made to reverse that decision. A rival scheme to transform the buildings into a pleasure centre is said to have influential backing.

Bathing Pool at Hartlepool.

The open-air bathing pool, the plans of which the Hartlepool Town Council have just approved, is to be constructed at the South Cliff, and will be semicircular in shape, having a length on the land side of 250 ft. A concrete wall will enclose the pool on the seaward side; the depth will range from 2½ ft. at the shallow end to 6 ft. at the deep end.

Architects' Fees for Abandoned State-aided Housing.

For the guidance of members, the R.I.B.A. have worked out, in conjunction with the Ministry of Health, examples of the application of the revised scales of professional charges which have now been established for abandoned housing schemes. Copies of these examples, showing the manner in which the fees are calculated, also the average cost of houses in the months subsequent to July 1921, will be supplied on application to the R.I.B.A.

Exhibition of American Architecture.

An exhibition of American Architecture is being held under the auspices of the Liverpool Architectural Society (Incorporated) at the Walker Art Gallery, Liverpool, until July 22. The exhibition was opened by Mr. Gilbert W. Fraser, F.R.I.B.A., President of the Liverpool Society, and an address was delivered by Professor C. H. Reilly, O.B.E., F.R.I.B.A.

Famous House Burnt Down.

One of the most famous houses in England, at Redruth, Cornwall, has been burnt down. A granite tablet on the house reads as follows: "William Murdock lived in this house, 1782 to 1798; made the first locomotive here, and tested it, 1784; invented gas lighting, and used it in this house in 1782. Erected by Tangye Brothers, Birmingham."

International Meeting of Builders.

Members of the Superior Council of the International Federation of Building and Public Works are visiting London from July 17 to 21. Their headquarters are at the Hotel Victoria. There are delegates from France, Belgium, Holland, Italy, Switzerland, Poland, Szecho-Slovakia, and Great Britain. As the guests of the National Federation of Building Trades Employers of Great Britain and Ireland (an affiliated body), H.M. Office of Works, the Port of London Authority, and other bodies, the delegates will pay official visits to Westminster Hall, to inspect the roof, the London Docks, and the housing schemes being developed by the London County Council at Dagenham, the Borough of St. Pancras at Highgate, the Borough of Hampstead at South End Close, and the Government at Woolwich. There will also be visits to the Tower, Windsor Castle, and Hampton Court Palace, and various other social functions.

Royal Sanitary Institute Congress.

Up to the present some five hundred delegates have been appointed from British Dominion and foreign government departments and municipalities to attend the thirty-third Congress and Health Exhibition of the Royal Sanitary Institute, which opens at Bournemouth on July 24. In addition many members of the Institute, which total over five thousand, will attend. The Congress, to take place under the presidency of Major-General the Rt. Hon. J. E. B. Seely, P.C., C.B., C.M.G., D.S.O., M.P., will be divided into five sections. There will also be conferences of representatives of various professions, an exhibition of apparatus and appliances relating to health and domestic use, a number of popular lectures, and the social side has been well developed by the provision of facilities for interesting boat and motor trips, golf, etc. The president of the section devoted to engineering and architecture is Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A., the recording secretary is Mr. A. Saxon Snell, F.R.I.B.A., and the local secretaries are Messrs. F. P. Dolamore, F.S.I., and Samuel J. Newman, F.R.I.B.A. Full particulars of the congress, which closes on July 29, may be obtained from Mr. E. White Wallis, F.S.S., secretary to the Institute, 90 Buckingham Palace Road, London, S.W.1.

R.I.B.A. Visit to Greenwich Hospital and the Royal Naval College, Greenwich.

With the permission of the Director of Greenwich Hospital the Art Standing Committee of the R.I.B.A. have arranged a visit to the hospital on Saturday, July 22, 1922. Members and their friends who intend to take part should arrange to be at the tram stop, King William Street, Greenwich, at 3 p.m. on the date mentioned, where they will be met by Mr. T. C. Agutter, F.R.I.B.A., on behalf of the hospital authorities.

Those intending to take part should notify the Secretary, R.I.B.A., as soon as possible.

List of Competitions Open

Date of Delivery.	COMPETITION.
Aug. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Apply, by Aug. 1, to "Chicago Tribune," 5 Rue Lamartine, Paris.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8,000 francs.
Nov. 1	New Town Hall and Municipal Offices in Victoria Park, Colombo. Cost not to exceed Rs. 1,000,000. Premiums Rs. 5,000, Rs. 3,500 and Rs. 2,000. A F.R.I.B.A. will act as assessor. Apply Secretary, Municipal Council, Colombo. Deposit Rs. 25.
No Date	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
	Southend Proposed Secondary School. At the request of the Competitions Committee of the R.I.B.A., the drawings required in this Competition will be to a scale of 16 feet to the inch.

Competition News

Ipswich War Memorial.

The assessor's award in the above competition will be announced this week. An exhibition of designs, of which more than 180 have been sent in, will be opened on August 9.

Colombo Town Hall and Municipal Offices.

The secretary of the R.I.B.A. has cabled the promoters of the above competition pointing out the inadequacy of the time allowed to competitors in this country and urging that an extension of time should be granted.

"Chicago Tribune" Building.

Architects desiring complete information and applications for entry in this competition should write at once to Colonel R. R. McCormick and Captain Patterson, editors and publishers of "The Chicago Tribune," at the office of "The Chicago Tribune's European Edition," 5 rue Lamartine, Paris, France. Applications for entry must be filed before August 1. Drawings must be submitted between then and November 1, 1922.

Law Reports

Alleged Defective Drain: A Fine Point

Higgs v. The Corporation of Croydon.

King's Bench Division.
Before the Lord Chief Justice and Justices Lush and Bailhache

This was an appeal by the plaintiff, the owner of a house at Beulah Hill, Upper Norwood, against a decision of the Croydon justices, who had imposed penalties upon him for failing to obey a notice served upon him by the Croydon Corporation to repair a drain that ran from his house and other adjacent houses and which was out of repair. The proceedings were taken under the Croydon Corporation Act of 1905 and the Public Health Act, 1875 (section 41).

Mr. Schofield, K.C., for the appellant, explained that his client was called upon to repair a defective "single private drain" that ran from appellant's house and was connected with other houses in the street. He did not obey the notice, and was fined. The preliminary objection was made that no penalty was recoverable under the Act, while also it was argued that the line of pipes was a sewer because it was laid under the Public Health Act to the satisfaction of the Corporation. The main point was that the notice was bad because it called upon the appellant to repair a drain that ran through other people's property, which property he would have to disturb if he carried out the work.

Mr. Colam, K.C., for the Corporation, said the case was a test one to decide the question whether the Corporation should do the work as upon a sewer, or whether the house owners should do it as upon a drain.

Allowing the appeal with costs, the Lord Chief Justice said the preliminary objection to the notice should have succeeded before the justices. Although it was obviously reasonable that a man should be ordered to pay penalties if he refused to remedy a nuisance arising from his own drain upon his own property, it was unreasonable to call upon a man to repair a drain which he could not wholly repair because, if he carried out the work, he would have to trespass upon other people's property.

The Justices agreed.

Dilapidation Claim: Interesting Issue

Executors of J. C. Lovell v. Sexton.

King's Bench Division.
Before Mr. Justice Sankey.

In this case the plaintiffs sought to recover possession of 150-152 Church Street, Kensington, under a proviso for re-entry in the tenancy agreement granted to the defendant.

Mr. H. G. Robertson appeared for the plaintiffs, and Mr. S. A. Kyffin for the defendant.

Mr. Robertson said the breaches of contract complained of were dilapidations and underletting without consent. The tenancy agreement was made upon September 28, 1900, between the defendant and the predecessor in title of Mr. Lovell. No question arose about the title of the plaintiffs, and the yearly rent was £65. The agreement contained a repairing covenant and a proviso that the tenant would not assign or underlet. Then there was the proviso for re-entry. After Mr. Lovell's death in 1919, his executors instructed their surveyor, Mr. Joseph Hill, to inspect the premises, and he found them in a very dilapidated state, chiefly owing to no repairs having been done. Upon September 1, the usual notice was given under the Conveyancing Act, stating what was required to be done. Nothing was, however, done by October 18, and on October 20 the action was commenced.

The defendant, said counsel, denied the breaches alleged, and denied that a reasonable time for carrying out the plaintiffs' requirements had elapsed before the action was commenced. Defendant also denied that the sum of £156, which was a builder's estimate for the work, was a proper amount. With regard to the underletting, that appeared to be admitted, but the defendant pleaded it was done with the acquiescence of Mr. Lovell during his life. Defendant counterclaimed for relief under the Conveyancing Act. Of course, there was no relief obtainable in respect of the underletting. Mr. Thomas Sexton, husband of defendant, said they had spent £300 in repairing the property since 1900.

His Lordship said he proposed to say that the dilapidations should stand at £100, mesne profits at £65, and other sums amounting to £10 13s., or £175 13s. altogether. If by September 16 the defendant paid the sum and would allow the plaintiffs to go on the premises and repair them at reasonable times, then she would stay on. If she did not pay upon that date, she must go out upon September 29, and the plaintiffs would then have to do the best they could to get damages by such means as the law allowed. That meant judgment for the plaintiffs for £175 13s., upon the terms he had stated.

Question of Deduction for Repairs from Income Tax

The King v. Tax Inspector Parish of Kingsland, ex parte Pearson, Kingsland Estate.

King's Bench Division.
Before the Lord Chief Justice and Justices Lush and Bailhache.

This case raised an important point in regard to the question of deduction for repairs from income tax return.

The Attorney-General, Sir E. Pollock, K.C. (with him Mr. R. P. Hills), appeared to show cause against three rules for prohibition, certiorari, and mandamus obtained by the trustees of the Kingsland Estate in Kingsland and Shoreditch (London) directing the Commissioners of Inland Revenue and the local inspector of taxes to show cause why an additional assessment for income tax for the year 1920–21 under Schedule A should not be quashed. In addition it was sought to prohibit any further additional assessment, and the Court was asked for an order that such additional assessment by the inspector was null and void, being made without jurisdiction. He argued that the property owners had mistaken their remedy. They had the proper course of appeal laid down by the rules, with the result that the application to the Divisional Court was out of order. There was no question of law to be raised which could not be dealt with by the Income Tax Commissioners.

Mr. Montgomery, K.C. (for the Trustees of the Kingsland Estate), said the figures about which the appeal to the commissioners could be made had been agreed, and the point of law only remained. They came to the High Court straight away to avoid trouble and expense, and to save, perhaps, years of litigation. The trustees had entered an appeal to the proper tribunal which they were keeping alive pending the decision of their Lordships.

The Court discharged the rules with costs.

The Lord Chief Justice, in giving judgment, said Section 125 of the Act said that if the surveyor of taxes discovered that the person assessed has had any deduction not authorized by law, then he could make an additional first assessment, and that had been done in this case. That was subject to appeal, the procedure for which was definitely laid down. It had been conceded that the question whether the deduction could or could not properly be made came within the jurisdiction of the surveyor of taxes to decide. After that there was a clear right of appeal, and that appeal was at present lodged. He could not agree that the Legislature intended to enact anything so grotesque as that the surveyor was bound to allow deductions for every repair that the owner claimed to have made and to give a certificate for all such deductions. Again, against such a refusal by the surveyor there was a right of appeal in the proper channels. In the circumstances the Court was of opinion that the proper appeal was not to that Court by way of writs of prohibition, certiorari, or mandamus, but through the channels provided by the Act.

Mr. Justice Lush was of opinion that there was ample jurisdiction in the surveyor of taxes to amend the assessment if there had been an error, and his jurisdiction could not be challenged if he honestly made the assessment, even though it was erroneous.

Justice Bailhache concurred.

An Architect's Claim

At Newcastle Assizes, in the Civil Court, an action has been heard in which John Blackwell, architect, of West Hartlepool, sought to recover £340 5s. 6d. in connection with a housing scheme adopted by the Hartlepool Rural District Council in the latter part of 1919, for which the plaintiff had acted as architect. The plaintiff's charges were £402 8s. 3d., in respect of which the defendants had paid £62 2s. 9d. up to the commencement of the action and £140 since. Mr. Mundahl, for the plaintiff, said the action was due to the abandonment of the scheme by the Council. An agreement was arrived at between the parties, by which the plaintiff was to receive £212 17s. 3d. in addition to the £62. Judgment was entered for that amount.

A New Asbestos-Cement Tile

THE æsthetic shortcomings of ordinary asbestos-cement roofing tiles are due to three causes: their thinness, their colour, and the diagonal direction of their tail lines. And it is precisely on these accounts that their adoption by architects for buildings other than of the factory and inexpensive bungalow types has not become very general.

Regarding the first of these objections, it is at least arguable that because the necessity for a clay tile to be thick has established a tradition in our minds, it does not follow that we may not eventually accept as a standard a thinner tile made of a far denser and tougher material.

With respect to colour it must be admitted that the attempt hitherto to produce a satisfactory shade of red has not led to very happy results, while as to the diagonal lines presented by the tiles when laid, these are certainly far from pleasant to the artistic eye.

A frank recognition of these drawbacks has led Messrs. Bell's United Asbestos Co., Ltd., to devise a new tile capable of satisfying the artistic requirements of the architectural profession, while retaining the economical advantages which the material itself undoubtedly possesses.

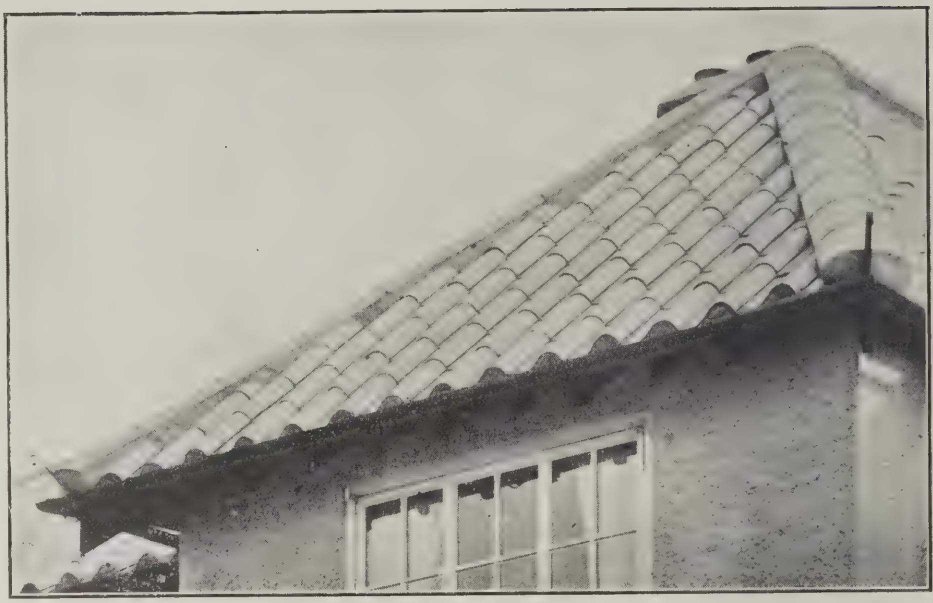
The result has been the production, after much experiment and scientific investigation, of the Poilite pantile, which is laid in horizontal lines like its clay prototype, and has the additional merit of closely resembling it in colour. This is of a deep russet brown shade, which not only varies as between one tile and another, but in different parts of the same tile. The colour, which is produced by a secret process, and has a tendency to deepen with age, is singularly pleasing, and marks an advance of a noteworthy character.

Poilite pantiles are manufactured in equal proportions of rough and smooth surfaces (which produce an improved texture effect), are holed to receive two nails, and are laid with a four-inch lap.

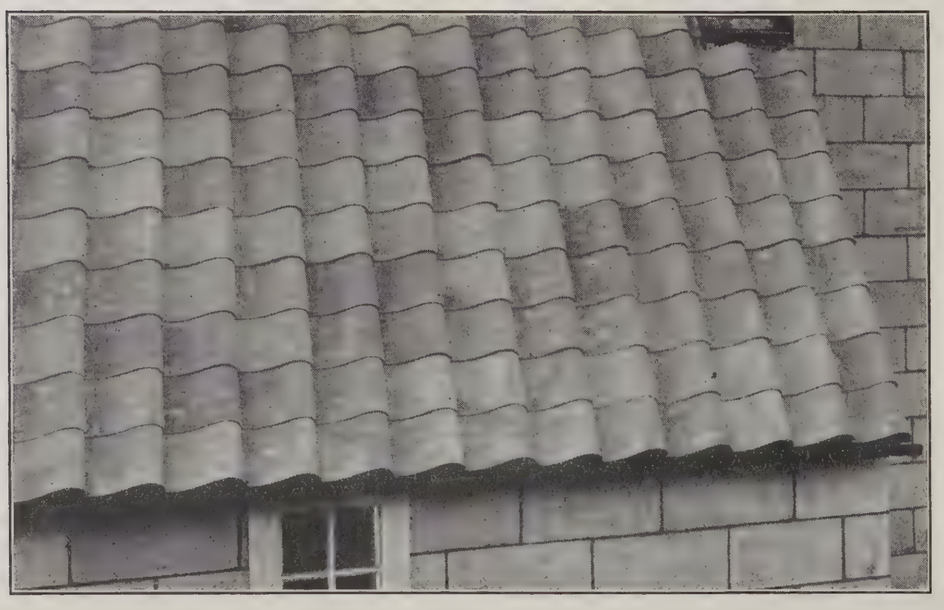
Although somewhat larger than earthenware pantiles, the fact that they weigh nearly 40 per cent. less results in an appreciable reduction in the scantling of the roof timbers, in addition to which these may be spaced farther apart.

The following table of relative sizes, weights, and numbers per square of Poilite pantiles and ordinary pantiles shows at a glance the essential differences between the two :—

——	Size.	Weight per 1000.	Weight per tile.	Weight per square.	Number per sqre.
	Inches.				
Poilite pantiles	15¾ × 13¼	29 cwts.	3¼ lbs.	3¼ cwts.	113
Ordinary pantiles	13½ × 9½	47 cwts.	5¼ lbs.	8 cwts.	180



ASBESTOS-CEMENT PANTILE ROOFING AS EMPLOYED FOR THE HAREFIELD HOUSING SCHEME.



ASBESTOS-CEMENT PANTILE ROOFING.

Housing and the Slums

Sir Alfred Mond, speaking at the dinner of the 1920 Club, said that the shortage of houses was a world-wide problem, and was more acute in other countries than this. No other Government, so far as he was aware, had endeavoured to tackle it at all. At the end of this year and the beginning of next 220,000 houses would have been provided. The capital outlay was enormous, and involved an annual cost to the taxpayer of over £9,500,000. Some of that money might have been saved earlier. Houses were erected at a cost of £1,300 each which to-day were costing something in the neighbourhood of £450. He did not pretend the housing problem was solved, and he did not know it was solved before the war. They had built a house of too elaborate a type, and he was prepared to go back to a simpler, cheaper type of building, that the working man could afford to pay for, and which would meet his requirements. It was a pity so much had been done at Whitehall, and that the local authorities had not been allowed to do more. He was a great supporter of garden cities, but when the problem was the rapid provision of houses at a cheap rate it was scarcely the time for trying new experiments in that direction. It was a counsel of perfection, and had resulted in the finances breaking down. The result was that, whereas they might have had 300,000 or 400,000 houses for their money, they had only about half that number.

Sir Alfred said the provision of new houses was in itself no cure for slums or overcrowding. So long as there were slums people would live in them, and not always those earning the smallest wages. The only way to deal with slums was to tackle the problem as a separate one, apart from other questions.

The Poor Policy of Poor Building

THE King's speech at the opening of the London County Hall could not possibly have been happier in theme or expression. It went straight to the heart of things, and was most emphatically a word in season, as every utterance of the King's is invariably. His Majesty summed up in a single pregnant sentence the full significance of the municipal building, and most dexterously implied the essential intimacy that exists between well-building and well-being: "It is necessary to appeal to the imagination—a public authority meanly housed may be meanly esteemed"; and, further, "this noble Hall, the seat of the government of the County of London, will be typical of the importance of their duties and responsibilities, and should stimulate the development of that sense of citizenship, so difficult and yet so imperative to cultivate."

Further, His Majesty was pleased to recognize the Hall as a proof of the energy of the citizens, and thought it a good augury of their success in the arts of peace.

There followed, further, a hint, as tactful as opportune, of the improvements of which the erection of the County Hall on the south side of the Thames must inevitably be the forerunner. It is an even greater portent of the replanning of South London than is the recently opened Waterloo Station, and between them these two buildings, with their argument for dignified development strongly reinforced by the grave dignity of the St. Thomas's Hospital blocks, will succeed, sooner or later, in persuading the Surrey side to lift up its head and look more like a part of London than a disreputable appendage to it, an outcast, poverty-stricken object, but not irreclaimable.

Pity it is that the London County Hall is not yet completely built, and that as yet, therefore, it does not stand out conspicuously as a finished exemplar of scale and dignity, an example to which a Londoner may point in proof that his civic patriotism is not dead, but only sleeping. If, however, "John Citizen" allows his County Hall to remain very long in its present unfinished state, it will rather come to be regarded as a monument to his meanness and vacillation than to his nobility of conception.

He should build courageously if he build at all, and it is his civic duty to build. It would be truly humiliating, not only to London, but to the Empire of which it is the capital, if the County Hall were to be left long in its present lopsided and undecorated condition.

London's County Hall should be always "a building to make Britons proud of London's civic dignity"—a phrase used by a leader-writer in a recent issue of "The Daily Mail." It will fall short of winning that tribute for as long as it lacks its north wing, and even for as long as it lacks the environment that all architects desire for it. Surely there is no rashness in suggesting a small adjacent park—perhaps no bigger than the pleasant patch of green adjoining the Houses of Parliament, that in which the Rodin replica finds place; but any hint of the kind made at the present moment of inflated rates and taxes is scouted as a symptom of megalomania; while advice to "carry on" with the south-side embankment would be regarded as sheer lunacy.

In "The Daily Mail" leader from which the above-quoted passage was taken, there is a clear indication of the nervous debility, not to say prostration, to which the community has been reduced by excessive taxation, undue interference by Government with the normal course of business enterprise, and by several other discouraging features of the times, including a general very serious misconception of the meaning of "Economy."

Against wise economy there is, of course, never a word to be said. Economy, the prudent conduct of affairs, is not for an age, but for all time. It is not a nauseating dose of physic to be taken in spasmodic gulps and with a wry face when the body politic happens to have got below par. It is a tonic beverage to be used constantly, regularly, naturally, and with a cheerful countenance, for the preservation of health—to be taken, not to cure a malady, but to keep fit. True, the malady is upon us, but it must on no account be allowed to get on our nerves. Our contemporary has unwittingly said a word that is only too likely to increase the civic timidity that should by all means be resolutely shaken off.

Let it be cordially acknowledged that on many occasions "The Daily Mail" has brought its vast influence to bear effectually and beneficially on much national wastefulness and on much wanton and reckless public extravagance. These are abuses which it does well to discourage; but in its able and interesting article, to which we have already referred, it offers quite reactionary counsel. The title of the article—"Architecture and Citizenship"—covers some excellent moral sentiments—followed by some very mischievous and impolitic advice. "Fine architecture," it acknowledges, "has its own powerful influence," and "such a building as the new Council Hall should make Britons proud of London's civic dignity, of which it is an outstanding symbol. It should, as the King said, 'stimulate the development of that [sense of] citizenship [that is] so difficult and yet so imperative to cultivate.'"

Our contemporary then goes entirely astray, by adding the unfortunate remark that "The erection of such buildings [as the new County Hall], valuable as they are, must be the task of prosperous times, and this age cannot expect to see others of this description taken in hand. The country is too poor to afford them at present." Surely a "most lame and impotent conclusion!" to the excellent moral sentiments it immediately follows. It misapprehends the nature of true Economy.

That our contemporary has lifted up its powerful voice to deprecate building by public authorities is bad enough. Public opinion needs no prompting to build meanly, or, rather, to restrain its representatives from building otherwise or at all, and our contemporary's advice is entirely out of harmony with what it quotes with loyal approval from the speech by the King, who, as we have seen, showed a firm grasp of the psychology of the matter in noting that "a public authority meanly housed may be meanly esteemed."

So, indeed, may a nation, and it is such truths as these that should be kept constantly before the public mind. They are truths that it is difficult to apprehend, and we should have welcomed the powerful support of so influential a journal as "The Daily Mail" in the task of helping the public to the larger vision of which building bravely, and with civic patriotism, is the logical outcome. A town is judged by its buildings, and a nation is judged by its towns. Our contemporary, in urging that "the country is too poor to afford" noble buildings at present, provokes the swift and just retort that the country is too poor to do otherwise. Poor as it is, it must strive to keep up appearances before the world. Mean building implies bad trade, and bad trade brings worse trade.

The average trader knows all this very well, and it is a great pity that his faith in good building, in its power and influence for the promotion of prosperity, should be shaken by the discouragement implicit in the advice in "The Daily Mail" on the country's being too poor to build courageously. We repeat, it is too poor to do otherwise.

Notes and Comments

The Ordnance Survey

It is pleasant to note that the Ordnance Survey still survives. That, at least, is a fair inference from the announcement that although Colonel Sir Charles Close, K.B.E., etc., who has occupied the post of Director-General of the Ordnance Survey since 1911, will retire from the Service on August 11 next, he is to have a successor. Colonel E. M. Jack, C.M.G., is to take his place, the Minister of Agriculture and Fisheries having made the appointment with the approval of the Army Council. "Ordnance" connotes the titles of army officers, and it was a general—General Roy—who in 1783 began the Survey of England, which was continued by Colonel Colby and completed by Colonel Sir Henry James in 1856. It was another colonel—Colonel Mudge—who began, in 1819, the publication of the famous maps, without which the architect and surveyor would find it much less easy "to make sure of his ground," even with the aid of "Ordnance Datum" to give the levels.

Premature "Tearing Down"

That indefatigable writer of letters to the newspapers, Mr. J. Landfear Lucas, has not failed to provide them with an opportune note on property law. He suggests that "the Government authorities chiefly responsible for the management of London property should grant a temporary extension of leases for ten or twenty years, at the option of the lessee, rather than tear down existing property with no guarantee of its replacement." Mr. Lucas doubtless has in mind such notorious precedents as the London County Council's "island site" at Kingsway, which was so long left derelict that prolific crops of interesting flora sprang up there, and the sites of buildings since put up were the haunts of fauna not often seen in London. To all but the botanist and the naturalist it was pitiful to see such large tracts of valuable building land thus running to waste, and such uneconomic precedents should not now be followed. Yet what is the alternative? In such cases the authority often makes haste to clear the site—whether in the interests of the botanist or with the object of making a little ready-money from the sale of old materials or from letting the hoardings to enterprising advertisement contractors, who shall say?—and then becomes as torpid as the seven sleepers. As the building and the lease seldom fall in quite simultaneously, Mr. Lucas's idea is quite practicable. It is difficult to see why Government, or the L.C.C., or other authority, should ever be in a hurry to "tear down" buildings of which the lease has expired. Could they not allow the leaseholders to remain as tenants on sufferance, provided they would allow notice-boards to be shown announcing that the site would be cleared when required? Occupancy need not postpone re-letting or other means of disposal, and would not delay rebuilding for longer than it takes to clear the site. But besides the practical aspect of the matter, there is the architectural point of view. Can nothing be done to prevent the "tearing down," premature or otherwise, of buildings of great architectural value?

The Penalty of Procrastination

When the terms of contract include penalties for delay, the builder knows exactly what will be the pecuniary consequences to himself of avoidable failure to complete within a specified time. The penalties incurred by the public when their elected representatives, municipal or imperial, are negligent and dilatory in the matter of public building may be enormous, and are seldom easy to ascertain quite definitely. That trenchant *causeur* "Alpha of the Plough," who writes so engagingly in "The Star," permits himself to grow very indignant about the heavy penalty for delay—or, rather, for procrastination—that the ratepayer has had to pay in the case of the new County Hall. Here is a part of his indictment of the false economists. When the site for the Hall was purchased, "What, a Palace for London? said the Little Londoners. Down with the Wastrels! Down with the spendthrifts! It is *your* money they want. . . They left the site idle for five years. Then they began the building grudgingly and sluggishly. With every year's delay the cost of the enterprise increased, and when . . . more than fifteen years after [the site was bought], the building was opened, it had cost four millions sterling instead of the million and three-quarters it would have cost" if the work had been started promptly. Two millions and a quarter," "Alpha" contends, has been wasted through procrastination.

London University Site Again.

The ghost of London University (for that institution can hardly be said to have corporeal existence as yet, despite "the Bartlett" and one or two other adjuncts to the University proper—e.g., the Institute of Historical Research)—the ghost, then, still haunts us. There is still indecision about the site, to which the London County Council seems disposed to apply the same tactics of procrastination that it employed so profitably (?) in the notorious instance of the site for its own County Hall. Its Education Committee "asks for further consideration of the choice of a site for the University of London." The reason for all this dalliance is undisguised. "The Government is now forced towards rigid economy"; and "the London County Council is unwilling to spend the ratepayers' money on a scheme which it thinks unsatisfactory." It would think unsatisfactory any scheme on which money is to be spent, and this uncourageous attitude suggests the suspicion that its Holland Park proposal is merely tactical.

On Going Forward

A Conversation on Architectural Education

By JAMES BURFORD

"'All men,' says Cicero, 'have a sort of tacit sense of what is right or wrong in arts and sciences, even without the help of arts.' This surely it is in the power of art very greatly to improve. That most men, therefore, proceed no farther . . . is owing either to the want of any, or (which is perhaps yet worse) to an improper education."—FIELDING.

"WE have to separate the permanent from the transient features of education, to discover which is the suggestive idea and which is not." These thoughts and others of the kind have been running through my head as a legacy of a visit I made, a while back, to an old friend in the Provinces. He and I had entered on our articles to the late Mr. ——, the architect, in the year 189–. Though my friend holds lightly his gain by that adventure, I must record it to the honour of our old master that he made it a matter of conscience to put apart some time in every working day for the instruction of his pupils. It was his aim to give us his enthusiasm for the works of Ancient Rome and of the Renaissance, and his pleasure to lend us the use of his copious and venerable library. He set before us a severely classical ideal, was strict on the five orders, and if his outlook on matters architectural was not liberal, as I have since thought, he possessed, in a limited sense, and as it was understood at that day, the sovereign blessing of good taste. My fellow pupil's novitiate was big with the promise of success—my own work was of the slow and plodding order—but I had noticed that his progress was marked by a growing dissatisfaction with his acquirements, and I was not much taken aback—about the second year of our studies—when he abruptly gave his decision to go from us. For a time I maintained with my young friend a correspondence which gradually became desultory, then intermittent, and finally ceased altogether. Of his subsequent history I knew no more than what I gathered from reports or notices of him, in this or that regard, and of late years in connection with a new school of architecture—that is, an education establishment, of growing reputation, near one of our larger provincial towns. A chance meeting, a few months ago, gave me an opportunity to renew the friendship so early formed; the usual civilities passed between us, and the upshot of our talk was an invitation to visit his school when a fitting occasion should occur. It was on the 27th of May last that I landed at the town of ——, with a free day before me, and a speculative interest in what it would bring forth. My friend met me at the station and, thinking perhaps that there is no time like the present, began at once to unburden himself of his architectural ideals and his educational ideas.

"The fault of much of our so-called modernism (he said) is that it is no more than a definite attempt to be different for the sake of being so. Architecture must make its contribution to progress, it must hold an expression of our civilization, must be something more than an imitation—and an imitation never has the vitality of the original, and if we would achieve these ideals we have to discover the extent of our resources, to determine the conditions which control their use, and to decide in what way a knowledge of the past will best profit us to-day." I agreed. Something of this sort I had heard before; indeed, it has been the cry for many years. "I admit," he went on, "that it all sounds simple enough, and it is (he added), when you know how to do it. The problem before us is how to train the students of to-day—our architects of to-morrow—in such a way that they will not only work with some such ideal as I have described to you, but that they will be backed up by the power and knowledge to carry it through in reality. We have to separate the permanent from the transient features of education, to discover which is the suggestive idea and which is not. We have to train men to their most useful pitch of energy, to search out the extent of their power, and the method of unlocking it. But we must not forget that the student has his own problems to work out; it is not the business of the educator to impose ideas, the most we can do is to guide his energies in the right direction—to say to him, in the words of Bunyan's book, 'I will go with thee a little way, and set thee in the right path, that thou mayest continue in it without guidance.' It has often been a matter of concern to me, in what I may claim as a fairly wide experience, that so many students come to our schools like empty bottles—if I may use the simile—expecting the good wine of architecture to be poured in by an obliging staff, to be filled without effort on their part at all. Education, as the word implies, can do no more than draw out whatever latent possibilities exist, and with architecture, as with all forms of art, education is not so much a matter of imparting information as of developing appreciation." "These ideas, no doubt, are excellent," said I, "but have you (I asked) sufficient time to put them into practice?" "As for time," he replied, "we have no difficulty on that score. It has always seemed to me a weakness, in so many of our schools, that they compress their curriculum into short terms divided by long vacations, while at the same time their terms are too long for the normal growth and relaxation of the mind—you remember my remark on the development of appreciation. Here we have only two official 'terms' in the year, but we contrive to have six breaks in all—their length varying with the season. I believe we are not the only school working on some such line as this. The old system of long continuous work results in what I might term 'mental indigestion' for the student and vitiation of energy for the staff." "And so I suppose you encourage outdoor games," I said. "By all means," he returned, "so long as the game is the servant of some worthier purpose. I have always been suprised that some young men are so foolish that they think their work an excuse for their existence and games the object of it. I am never happy myself unless I see my students working hard, but hard work is not overwork, and education has no place for tests of mere endurance." He paused. "But I think you will understand my ideas better when you see them in use," he continued. "I might go on talking of education from now to the crack of doom and perhaps you would be no further with me in the end—but here is the school." We turned in between two stone gate-piers, crossed the lawn, and entered the building. I need say no more of it than that it seemed eminently fitted for its purpose.

We rested for a while in the entrance hall, and my friend took the opportunity to outline the method of education he used in his school. "I think you will agree with me," he said, "that before we can go far in any form of art, and if we are to obtain a broad view of it, we must understand the general principles to which all art conforms. When we have once laid a sure foundation in this way, we are in a position to study that particular manifestation of art for which our capacities have best fitted us. My method of training architectural students here is to begin with a study of these general æsthetic principles, and when these are appreciated to present architecture to them, at first in its simplest elements, and then, by combining these elements, to go on to more complex problems, gradually increasing the details until they are in a position to handle the problems of to-day. And if we must not forget that the student is the heir of all the ages, we must also remember that he is a factor in determining the future." I told him that I had nothing to say against his theories, that he certainly aroused my interest, but that I could better form an opinion of his methods when I had seen them in operation. Our tour of inspection began at once, I eager to learn, he anxious to explain.

"By beginning at the beginning and ending at the end I think you will form an idea of the continuity and progressiveness of my programme," said my guide as we entered the studio given over to the first part of his course. Being a Saturday, the room, to my regret, was almost empty of students. "I have long been convinced," my friend continued, "of the futility of proceeding from the definite to the indefinite in architectural training. To expect the student to appreciate complete and perfected forms, to understand the refinement of a result which was only arrived at after centuries of experiment, before the simplest elements of art have been grasped, is one of the worst cases I have met of putting the cart before the horse—it is surprising that we have worn the harness that way for so long." "And so what is your way of setting out?" I asked. "Why," said he, "I simply reverse the process. I go from the indefinite to the definite. It can be confidently stated that composition is the basis of all art. The first thing, then, that my students study here is composition, not in direct connection with architecture, but in the simplest problems of cutting or filling spaces in the most satisfying and harmonious way. We begin with the composition of a few lines and the easiest relation of masses, and by building one thing on another the student gradually develops an appreciation of what composition and proportion really mean. Here," he said, taking a sheet from a portfolio, "you see the earliest exercise done in this class." To me it seemed a series of designs for textiles—for plaids, perhaps. My friend must have caught my questioning look, for he smiled and said, "The extreme indefiniteness of these early efforts need be no cause for concern or reason for ignoring them; the question is not whether the student is producing good drawings, but whether he is developing his faculties. Here is another study, which shows a simple arrangement of dark and light masses in a given area. Quite a number of sketches are made for the design; the best is selected and compared with what has been done, on similar lines, by masters of the art. Constant selection of the best and rejection of the rest is necessary for the forming of a critical judgment. After these preliminary exercises have been mastered some natural object can be selected and treated in the same way. Composition, harmonious arrangement, is the constant aim. I make it a rule that all imitative drawings shall be used as material for composition. Of course, sheer representation has its use and place, but for an art training, for beginners, it has little value when compared with composition as a factor in developing appreciation. Nature will not teach composition; a study of nature will give us material to work with, but not the power—the art—to use it. The composition of a few lines, or the artistic arrangement of a few masses of light and dark, may seem a simple enough matter to you; but it is not difficult to go astray, and in the mastery of these elementary problems the beauty of such buildings as the Parthenon or the Pandolfini Palace has its origin." He showed me many drawings, taking them in the order in which they had been made, and I could see how the solution of a problem, once grasped, inevitably led on to the next step. "We take each element in composition in turn," my friend continued, "symmetry, repetition, and so forth, treating them first as line arrangements, then as harmonies in mass, and when sufficient skill in their handling has been achieved we use them in combination, two, three, or more principles being involved. Finally we have line, dark and light and colour combined in designs which call for a skilful use of all the principles and means of composition." No materials seemed to come amiss. There were designs for textiles, pottery, tiles, patterns geometric and patterns of leaves or flowers, in line, in black and white, in gradation of tone or gradation of colour, birds and fishes, rugs or shawls, no matter what, if it formed the subject of composition. I could see from the drawings before me that there was a definite and organized series of exercises, each calling for a more cultivated judgment, a finer appreciation of the relation of parts to the whole. The increase of power seemed to be called up by the very solving of the problem in hand, and, as my friend remarked, by proceeding gradually from the mastery of one difficulty to the tackling of another, by making each triumph a stepping stone to the next, the student was in the line of a normal development. There appeared to be no end to the variation of the work, until it seemed to me that there could be no problem in composition which the student was not qualified to solve. "For what length of time (I inquired) do your students hold by this part of your course?" "On an average, about eighteen months," he replied. "It is, perhaps, a misfortune that any scheme of education which includes the advantage of emulative and co-operative effort implies some form of class or grade. Students can join us here with equal facilities at the beginning of either of our half-yearly terms, and we try to mitigate the disadvantages of a class by making their progress from this grade to the next not a question of time, but a matter of development." "And could you obtain these results with any students?" I asked. "That is rather a broad question," he replied, "I am not working here with selected students, I take them much as they come to me, but I must, of course, have some basis to start on, and most men are not devoid of some little taste. Given that, and by beginning in the simplest way, original and progressive effort, and the stimulus of good examples, will do the rest. I am inclined to think that poor taste, a lack of discernment in fine relations, is largely due to the thoughtless imitation of works done when original effort had ceased, works which are themselves no more than imitations of the products of vitality."

I had formed a premature opinion, on examining the earliest drawings, that my friend's method of education was too elementary, indeed I had thought it more suited to the Kindergarten; but now that I had seen the results of his system and realized the broad power and discrimination which his method gave, I held back my criticism and congratulated him on the success of his work. He thanked me, "But you have seen little of it yet," he said. "I can take but small credit to myself for my manner of teaching composition; I owe much to the American artist, Mr. A. W. Dow. Of course, I have adapted his methods for my own purposes, but in general I can do little to improve on them. Although I regard composition, in its broad sense, as by far the most important of the first steps in architectural education, there must be time for some other matters which have their use and purposes. A study of lettering is a useful exercise in composition, the principles of shadow projection can be brought in as part of it, and these things become an added interest and incentive by giving a fresh application of the powers already gained. A stepping stone to architecture proper is found in simple mechanics and solid geometry, applied in a way that calls for no definite architectural knowledge. You see my method is one of advancing step by step, there are no missing rungs in my ladder of progress. . . . But I must not press such continuity on your inspection of the studios; with your leave I would suggest an adjournment for lunch." I held with him there, and we passed downstairs.

(*To be concluded.*)

A House at West Horsley, Surrey

By H. S. GOODHART-RENDEL

THIS little house is to be the first of a number of similar houses built upon a newly developed estate in Surrey. Its chief characteristic is its simplicity. Everything has been done for the sake of economy, and though the house has not yet been finished it is believed that the final cost will be rather astonishing. Inside there is practically no decoration of any sort. The joists of the ceilings are left exposed, and no extra expense is incurred by any kind of ornamental detail.

The plan and section are intended to contain the least possible amount of waste space. The accommodation, it will be observed, differs from that in most houses of the kind in that a servants' sitting room has been provided in place of a scullery. All the washing up is done in the sink in the kitchen, and what would otherwise have been a scullery is turned into a very comfortable sitting-room. Mr. Goodhart-Rendel considers this servants' sitting-room a feature that should not be left out of any modern house. It means that the servants are comfortable and that they will wish to remain. It is the one way to keep them.

The very sympathetic drawing by F. L. Griggs on page 113 shows the garden front, and the windows of the drawing-room, dining-room, servants' sitting-room, and of three bedrooms. The greatest possible space has been allowed for the drawing-room, in order that there shall be one really large room in the house. There are five bedrooms.

The walls of the house are faced with purple-grey stocks dressed with red bricks, and the roof is covered with red pantiles.

Walter J. Fryer, C.B.E., Architect

The architect's chief problem in designing this shop front was the presence at first-floor level of heavy steel joists. These have been effectively masked by the intermediate frieze with the Greek Fret shown in the above illustration. The doorway is the essence of simplicity.

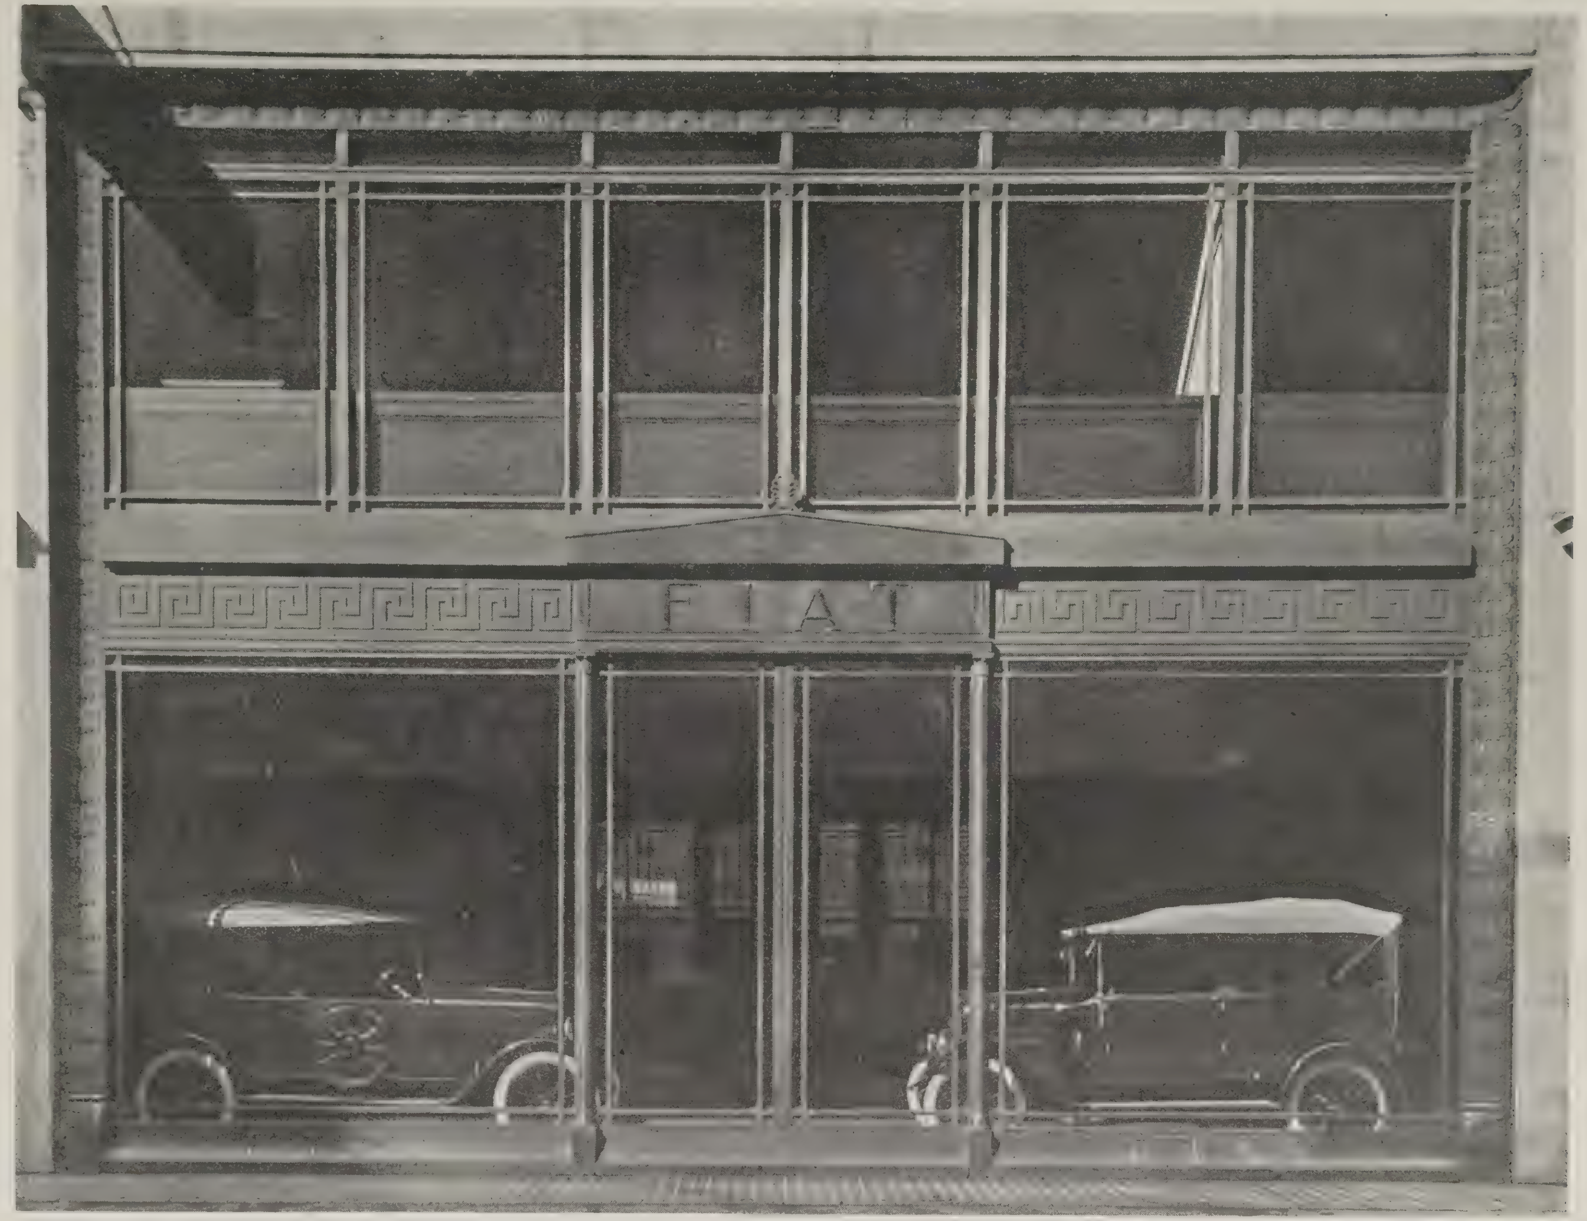
Shop Fronts. 8.—The Fiat Showroom, 43–44 Albemarle Street, London

Walter J. Fryer, C.B.E., Architect



The fine architrave of acanthus leaves surrounding the shop performs the double function of binding the whole design together, and of acting as frame for the picture of the cars displayed in the window. Without this architrave there would be some danger of the heavy Greek fret and frieze splitting the two stories into two designs. As it is, the result is extremely satisfactory. This front is probably one of the best show-cases in London from both a business and an architectural point of view. The metalwork is of bronze, and has been carried out by Messrs. Haskins of Walthamstow.

The Architecture Club

THE formal alliance of Architecture with the Press was celebrated at the inaugural dinner of the Architecture Club at the Hotel Cecil last Thursday. The president, Mr. Thomas Hardy, was unable to attend, and Mr. J. C. Squire, the Editor of "The London Mercury," was in the chair. Amongst the literary people present were Mr. G. K. Chesterton, Mr. J. St. Loe Strachey, and Mr. E. V. Lucas.

Mr. Squire sketched the origin of the Club. It began, he said, like the human race, in a garden, where he and an eminent architect had a conversation. He had accused modern architects of lack of contact with other artists and with the intelligent public. There were plenty of good young architects about, but nobody knew their names. Sir Edwin Lutyens was the only living architect whose name came fluently to a journalist's pen, and that was only on the strength of the Cenotaph; and even then the public would probably soon forget Sir Edwin Lutyens. The Club, in which every precaution had been taken to prevent architects from getting a majority, was determined to rectify that, to promote the intelligent criticism of architects and architecture, and to stimulate both architects and other artists by bringing them in personal relation with each other.

It must be obvious to everybody that the Club is going to serve an important purpose, and that its inauguration is what would be called in press circles an "epoch-making event." What influence it will have upon the profession and upon modern architecture is at present hypothetical, but we believe the future will show that the profession in general owes a debt of gratitude to Mr. Squire and to the anonymous "eminent architect," which might be gracefully acknowledged by the erection in the fateful garden where the idea was first conceived of an imposing memorial structure from the designs—possibly—of Sir Edwin Lutyens.

The first rule of the Club is that its purpose "is to enlarge public appreciation of good architecture and the allied arts, and especially of the best work of to-day"; and the second rule is that members shall be either (*a*) architects or (*b*) writers, or (*c*) persons interested in furthering good building; and membership shall be divided as near as may be equally among these three classes. The Club is to consist of not more than 150 members during the year 1922, but may be increased as from January 1923 by not more than twelve members every month until a total of 300 shall be reached; thereafter new members may be added only in the place of those who have ceased to be members.

The affairs of the Club are to be conducted by an Executive Committee consisting of ten members, five of whom are to be practising architects. The members of the Committee for 1922 are Oswald Barron, F.S.A.; James Bone; A. Clutton-Brock; E. Vincent Harris, F.R.I.B.A.; Ralph Knott, F.R.I.B.A.; Oswald P. Milne, F.R.I.B.A.; Giles Gilbert Scott, R.A., F.R.I.B.A.; J. C. Squire; and Sir Lawrence Weaver, K.B.E., F.S.A. The Hon. Treasurer for the year is H. Austen Hall, F.R.I.B.A.; and the joint Hon. Secretaries J. C. Squire and Miss Grace Chapman.

Rule XI states that the Executive Committee may further the purpose of the Club in such ways as—

(*a*) by arranging or aiding in the arrangement of exhibitions of architecture and the allied arts.

(*b*) By holding four dinners a year, at which members will each be entitled to bring one guest, and each member shall pay his shot.

(*c*) By arranging meetings and excursions for the inspection and discussion of modern works of architecture.

(*d*) By promoting the description and criticism of architecture in the press.

All communications on the subject of the Club should be sent to Mr. J. C. Squire, "London Mercury," Castle Court, Poppins Court, E.C.

Queen Mary's Maternity Hospital, Hampstead

IN the entrance hall of this Home is a tablet on which the following record is inscribed :—

"This Maternity Home was founded in October 1919 by Her Majesty Queen Mary out of surplus moneys placed at Her Majesty's disposal by the Governing Bodies of 'Queen Mary's Needlework Guild,' 'H.M. the Queen's Gift Fund for Troops at the Front,' and 'H.R.H. the Princess Mary's Sailors' and Soldiers' Christmas Fund,' associations inaugurated for the purpose of sending comforts and gifts to our combatants in the Great War 1914–1919. The existing building was, with Her Majesty's approval, erected under the advice and superintendence of the Ministry of Health in order that it might serve as a Model Maternity Home, the site having been presented to Her Majesty by the Lord Leverhulme."

The result is a quiet brick building of Queen Anne character, designed to bear as homely an atmosphere as is consistent with the most modern ideas of hospital construction and sanitation.

Situated, thanks to the generosity of Lord Leverhulme, in an open and sunny position on the highest part of Hampstead, it commands extensive views over London.

The building has been designed to meet the requirements of the Ministry of Health.

All the wards and patients' rooms face south, as well as the sitting-rooms for the staff, which open on to a broad paved terrace.

The building will accommodate fifteen patients in wards containing beds for four, three, and one patient, and in addition to this there are nurseries for eight older infants of mothers who are in the Home. The staff accommodation is for twelve nurses and probationers and six maids, with accommodation for three laundry-maids in the laundry block.

The principal aim has been to secure lightness and cheerfulness and as much quiet as possible, which is effected by the use of linoleum throughout wards and corridors, laid direct on concrete. One feature of the Home is the flush hospital doors specially designed for the purpose and made by Messrs. Ripper, stained grey and polished.

The whole Home is entirely self-contained, and includes a modern detached laundry, built on the site of the old stable, and fitted with electrically driven machinery.

The work was carried out under the supervision of Mr. Danby Smith, F.R.I.B.A., from sketch plans prepared by the Ministry of Health under the superintendence of Mr. Brook Kitchin, F.R.I.B.A., the Ministry's chief architect.

The marblework round the sanitary fittings was carried out in "Marbliola" by Messrs. W. G. Crotch and Son. Messrs. George Parker and Sons, Ltd., were the general contractors, sub-contractors including: William Morris & Co. (metal and lead glazing); Kleine Patent Flooring Syndicate (fireproof floors); Edward Evans and Son (Terralith floors and asphalt); Rippers, Ltd. (hospital doors); Redpath, Brown & Co. (steelwork); Comyn, Ching & Co. (electric lighting); W. G. Crotch and Son (marblework); Morrison, Ingram & Co. (sanitary fittings); Z. D. Berry and Sons (heating and hot water); Yannedis & Co. (door furniture); Thos. Lawrence and Sons (tiles and bricks).

THE LONDON GAS EXHIBIT AT THE WOMAN'S EXHIBITION, OLYMPIA
DESIGNED BY H. AUSTEN HALL, F.R.I.B.A.

The Exhibition Stand: An Architectural Treatment

EXHIBITION stands are so seldom of architectural interest that the discovery of one so attractive as that of the London Gas Companies at the Woman's Exhibition, Olympia, comes as a distinctly pleasant surprise. The companies concerned are to be congratulated on their wisdom in engaging the services of a distinguished architect to design the setting of their exhibit. The example is one that we hope will be widely followed in the future.

Designed and planned by Mr. H. Austen Hall, F.R.I.B.A., the exhibit comprises sections of a day nursery, a night nursery, a bathroom, two different types of kitchen, and a boudoir.

A specially interesting feature of the stand is the arrangement, in the day nursery, of a tip-up bath and a cooker and sink behind cupboard doors. With these doors closed, no one would dream of the utilitarian contrivances that stand behind ready for service.

The various rooms are delightfully furnished and decorated by Messrs. Heal and Son, and are fitted with every imaginable gas convenience down to a heated towel-rail in the magnificent black and gold bathroom fitted up by Messrs. Davis, Bennett & Co. The lighting is noticeably soft, and the excellent heating, cooking, hot-water supply, washing, ironing, bread-making, and jam-making appliances were selected and installed by a committee representing the eight principal London gas companies.

Correspondence

University Degrees in Architecture

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Your leading article headed "University Degrees in Architecture" in your issue of July 12 seems to infer that the foundation at Cambridge of a B.A. in which architectural studies play a leading part is a new departure in British universities. We are all glad to welcome the late arrival of a School of Architecture at Cambridge, and to hear that that university is now brave enough to make architectural studies a part of a B.A. course, though it has not yet promoted them to the status of a tripos or honours degree. As a Cambridge graduate I can rejoice at this awakening of my old university to the value to our civilization of the academic study of architecture, even if Cambridge has only discovered architecture as a liberal study some thirty years after she has swallowed mechanical engineering, or, as some would say, with a third of the university devoted to that subject, has been swallowed by it.

Your article seems to forget what has happened in other universities, such as London, Manchester, and Liverpool. All these, at one time or other, have gone, or are going, through the stage of giving a B.A. after a three years' course in which architecture plays the leading part. Liverpool, however, determined some years before the war that this was not enough, and felt the time had come for the study of architecture to be placed on the same basis as that of law, medicine, and engineering—that is to say, with its own special degrees and forms of training. These latter included office work, corresponding to the work done in office, hospital, and workshop in the other schools.

The degree given was a Bachelor of Architecture, B.Arch., after a five years' course, in which the latter two years were spent mostly in office work. At the end of the war, however, the university determined to strengthen still further its course for the B.Arch., and to do so required that in the fourth and fifth years the students should return to the School of Architecture for six months' solid work, the remainder of those two years still being spent in offices. This is the scheme under which we are now working; a scheme recognized by the R.I.B.A. by its grant of its Final Examination to those who complete it. Of course this was a very safe thing for the Institute to do, for a B.Arch. degree at Liverpool, even without honours in either design or construction, means that the candidate has not only taken a five years' course, but has been through at least two tests, his fourth and fifth years' examinations, at a considerably higher level than the Institute Final. That is quite as it should be, for all connected with the Liverpool School want the Liverpool Degree, or its corresponding Diploma to those who have not matriculated, to be a real and lasting distinction. This year nine students have just passed out of the University with the B.Arch. degree, five of whom were in the final of the Prix de Rome, and one of whom obtained the Rome Scholarship and another the Jarvis. I admit that this year has been an *annus mirabilis* in the history of the school; but we do not mean to lower the standard of our degree in other years, rather the reverse. Only the best students will ever get it. For the rest there are certificates and lesser distinctions.

Although the B.Arch Degree has been established at Liverpool for so long a time, it is not till now that we have considered the establishment of any higher degrees in architecture. Having, however, now made sure of the standard of the B.Arch., a proposal is before the university for a Master's Degree, or M.Arch. This proposal is of a very interesting kind, and, I think, indicates more than anything else the practical ideas underlying the Liverpool degrees in architecture. We have frankly gone out for technical degrees showing technical ability in a practical art. No other sort of ability is recognized. You cannot get a B.Arch. at Liverpool from written papers or memory tests or anything of that sort. You have to prove your practical ability in design and working drawings. So it is to be in the M.Arch., if it is established. In this case, however, the ability has to be shown in actual building. The proposal before the University is that candidates may present themselves for an M.Arch. not earlier than ten years after taking their B.Arch., and must then submit to the University photographs of a building of distinguished merit erected under their own names. This is the proposal. I should much like the views of the profession upon before it becomes law. It means that only the best educated men can ever attain it, because to get it they will have to have passed through the portal of the B.Arch., but it means more than that. It means that only those who have justified their training in after life in a very special way will be eligible. My ambition is that the M.Arch. of Liverpool should be a very real distinction to be held only by proved artists.

From all this it is evident that Liverpool University long ago found no dilemma or difficulty in giving degrees in a practical art, and is now proposing to continue the process still further.

C. H. REILLY.

School of Architecture,
Liverpool.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—The ancient Universities are themselves unconscious witnesses to the influence of architecture upon culture. The recognition of this influence and its cultivation have now attracted attention.

Architecture has so many connections with the schools of classical, historical, and scientific studies that the specialisation of departments of these studies, by schedules and examinations, for the purpose of professional architectural students became the first step at Cambridge.

The second step was that of establishing courses of study in drawing and design together with lectures upon architecture. The further step has now been attained by the recognition of a complete course of three years study, with annual examinations for the B.A. degree.

It will be apparent that the advent of the University in the sphere of architectural education is certain to exercise an important influence. The attainment of a merely professional qualification cannot be its ideal; the possibilities of study and practice will be explored, stimulus to a wider education will be provided, and the reflex influence upon university life of the presence of architectural students among its members may be counted upon as a valuable ally.

The Board of Architectural Studies may be congratulated upon having secured, as the Master of the Architecture School, the distinguished student and architect, Mr. Theodore Fyfe, who will take up his duties at the commencement of the Michaelmas Term. The staff of the school includes Prof. E. S. Prior, the Slade Professor of Fine Art, Mr. T. H. Lyon, of Corpus Christi College as Director of Design, and Mr. H. C. Hughes, of Peterhouse, as Instructor and Librarian.

BERESFORD PITE.

Royal College of Art,
South Kensington.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Your leading article on University Degrees raises points of great interest to architects.

University Degrees have an obvious and material value to the holders, giving as they do a sort of hall-mark which is fairly widely understood. In this connection it may be said, as I do not think the fact is realized to an adequate extent, that the award of degrees in architecture is the most practical step towards Registration which has yet been taken.

As is usually the case, however, the less obvious and more subtle advantages are the more important.

Architectural education gains from its association with the universities mainly because, broadly speaking, the latter possess what Kipling would call "the essential guts" of higher education.

The objection that the introduction of architecture may tend in any way to degrade a university is really comic. The result must surely be the reverse; the introduction of this living art into any higher seat of learning should have a beneficial effect.

The most striking defect in the various types of general education in this country is surely to be found in the partial or complete ignoring of the great arts of Painting, Sculpture, and Architecture, which have played and are still playing such a great part in life. Of these arts it may well be urged that architecture—in addition to its strong claim to be "the Mistress Art"—is the most suitable for presentation in courses of study forming part of a general education.

With a School of Architecture in a higher seat of learning, it becomes possible to provide for non-architect students a short course of study forming part of, say, the Arts Degree Course, dealing with architecture in a manner which will add considerably to the value of other studies in classics and history. It would also seem clear that students of geography and economics would gain by contact with a department dealing with regional surveys, town planning, housing, and the like.

It should also be said that the large amount of creative work done in the Schools of Architecture may well influence for good other schools in a university which in some cases do not err on the side of excess in this direction. Lectures on architecture have for a long time played an important part in university extension work, but normally such lectures have dealt mainly with the archæological side. With the linking up of Schools of Architecture with Universities, this defect should be remedied and architecture be increasingly put before the public as an art which is influencing life for good here and now.

The award of degrees in architecture should thus lead not only to direct advantages to architects and to university education, but also to increased appreciation of our art among our futures public men, teachers, and the general public.

May I throw out for further discussion a suggested Art Faculty for a university, which with a "unified command" would deal with town planning, architecture, sculpture, painting, furniture design, and other kindred subjects—in fact, with all those various requirements of a community which, with the help of the artist, can be made more fitting and pleasing ?

W. S. PURCHON.
Head of the Department of Architecture and Civic Design, Cardiff.

Some Pricing Puzzles

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—The tenders mentioned by "F. S. I." in your issue for July 5 were separate ones for a number of different schools. The tender of £119 was accepted for the painting of the exterior of Spon Street Council School, and that of £639 17s. was accepted for painting the interior of Broad Street Council School.

Although the actual tenders received for the different works did show great variation, I do not think it was much greater than has been usually the case before the war.

FREDK. HORNER.
Secretary to the Coventry Education Committee.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—With regard to the discrepancies in the prices of tenders for redecoration of Guildhall, I am entirely unable to account for these, as very carefully prepared specifications and detailed quantities were supplied.

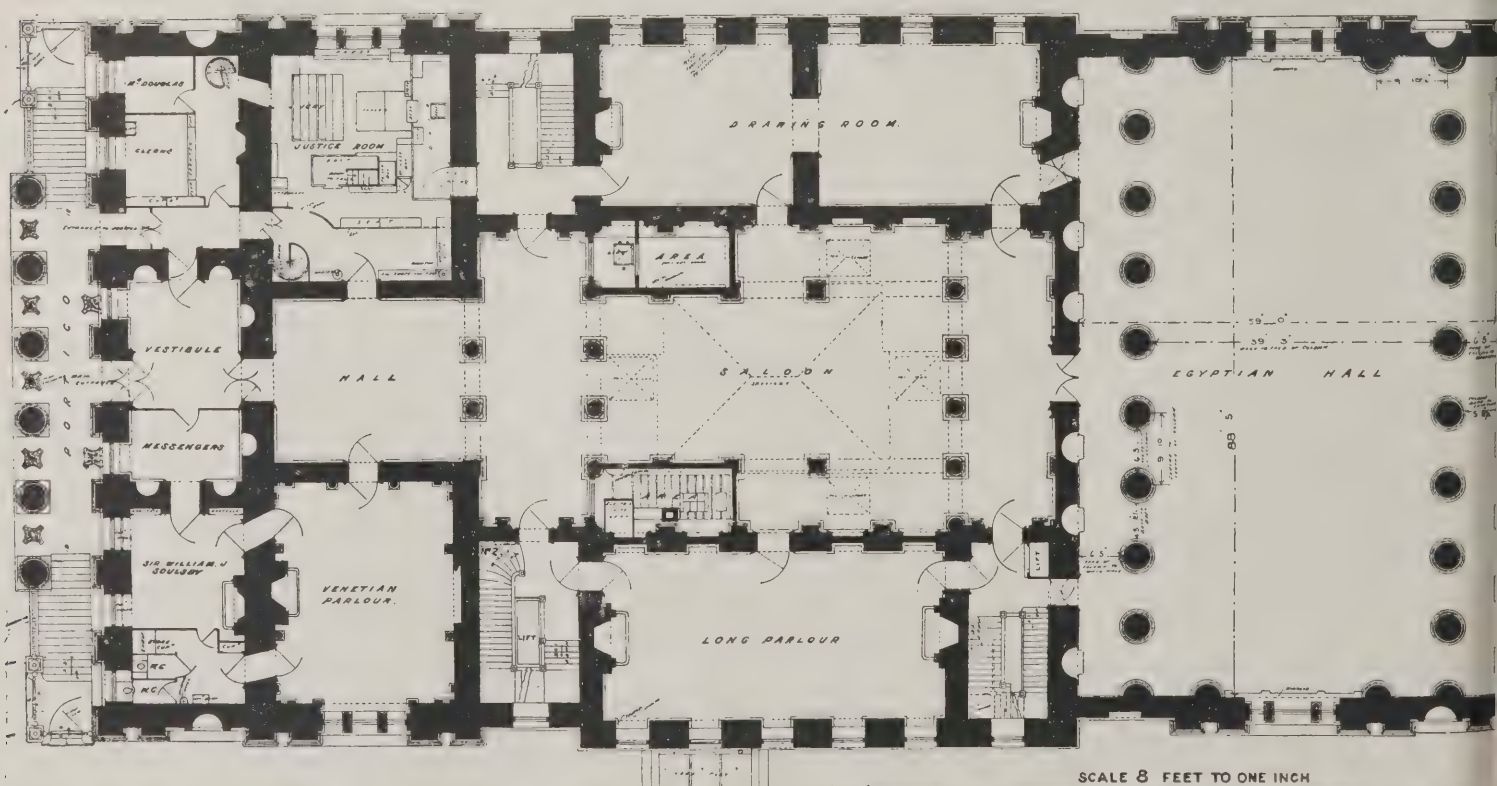
E. W. A. CARTER.
City Surveyor and Waterworks Engineer.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—With regard to the disparity in the tenders which I received for the erection of a block of thirty-six flats at Walker, I am unable to offer any better explanation than that suggested by your correspondent, "F.S.I.," viz., that pricing is not as closely studied by builders as the subject warrants.

I may say that in this case, whilst my own preliminary estimate was based on a price of 9½d. per foot cube, which gave a total of £10,360, the lowest tender gives a foot cube price of 8¼d. No quantities were issued to builders, but each builder was supplied with a carefully written specification and a blue print of the working drawings. The builders tendering, almost without exception, were well accustomed to housing work.

R. G. ROBERTS,
Housing Architect
of Newcastle-upon-Tyne.



FIRST FLOOR PLAN

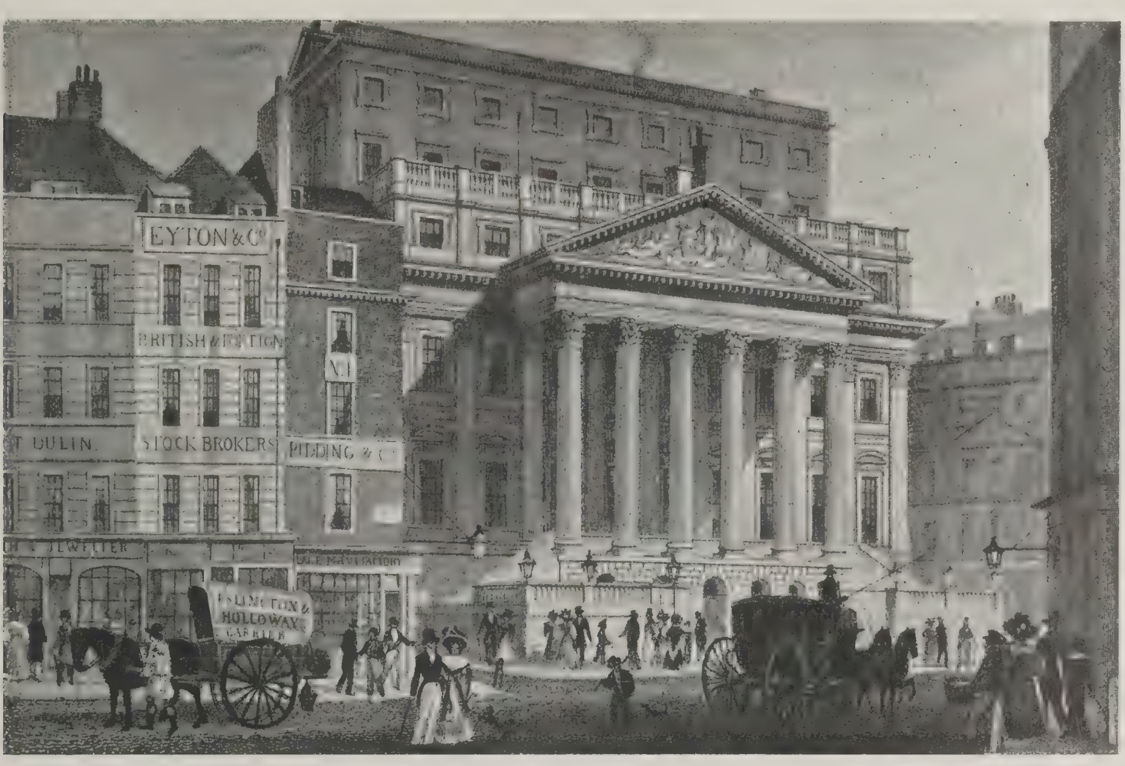
FIRST FLOOR PLAN OF THE MANSION HOUSE AS IT IS TO-DAY.

From "The History of the Mansion House" by Sydney Perks, F.S.A., F.S.I., F.R.I.B.A.

Book Reviews

A Monograph on the Mansion House

Mr. Sydney Perks was predestined to ecome the historian of the Mansion Iouse. He has all the qualifications and very facility for the task. The idea of ome day taking it up had been simmering n his mind for many years when the reat War broke out, robbing him of is customary holiday in France and taly, but giving him the opportunity o prosecute, in London, Oxford, and lsewhere, research work relevant to his bject, and thus bringing the matter to definite issue.



THE MANSION HOUSE FROM THE BANK, 1830, SHOWING THE "MAYOR'S NEST."
DRAWN BY T. H. SHEPHERD, ENGRAVED BY W. WALLIS

Those who are acquainted with Mr. ydney Perks—and what architect is ot ?—need not be told that he has performed the work with the greatest possible care and thoroughness; inasmuch s architects will probably think that he s too meticulously historical, while the verage citizen will probably grudge the mount of attention he has given to natters that are "merely architectural." His justification is that in both respects is book assumes rank as a final authority, nd that he has given his book a double nterest rather than a half-and-half interest, and that in either aspect the monograph will amply repay intensive reading.

In a sense, the book is, of course, ntirely historical; but much of what it hronicles belongs to the environment of he building, to the happenings in and bout it, to the civic and social atmophere surrounding it, and from which it nay be said to have materialized, rather han to that more limited, more physical istory that relates directly to the fabric itself, to its immediate projectors, its architect, its builders, its authors and finishers inside and out, the materials of which it is constructed, whence they came, what they measure, and what they cost. To get these matters into proper perspective, and even to provide a firm evolutionary basis for them, it was desirable to delve down some considerable depth into ancient annals. The pavement level of Roman London is mentioned; and the author very wisely refrains from dogmatizing as to why the Roman causeway mentioned in Wren's "Parentalia" as being used in the foundation for Bow Church in Cheapside was 18 ft. below the modern surface, or why the fine mosaic pavement uncovered at the north-east end of Queen Victoria Street, and preserved in the Guildhall Museum, was found at a depth of 19 ft., or why the remains of a macadamized road in Bucklersbury should have reached a depth of about 25 ft.

Much that is curious and interesting is recorded in the account of the Stocks Market; Mr. Perks's account of it beginning with the period between 675 and 685, and carrying on with glimpses of the laws of Ina, of Athelstan, Edgar, Canute, William the Conqueror. Letters patent of Edward I licensing the mayor to build are quoted as sanctioning the building of the Stocks Market, which may be said to have stood, in 1283, on or near the site now occupied by the Mansion House; in coming to which we have overleapt, but by no means overlooked, many quaint annals which the author has brought together as the result of diligent research and judicious selection. Then follow chapters on St. Mary Woolchurch Haw, and St. Stephen's, Walbrook, the surveys after the fire, and other matters, until at length we come to "Chapter X: The Plans for the Mansion House."

Of interest to the antiquary, but of very little value to the architect, is the reproduction from an old MS. book in the Guildhall Library of a list of all the mayors of London from 1343 onward; their chief point of relevancy being that these mayors had their mansions in the City, and, their addresses being given, it is easy to see where, at any given date, any forerunner of the Mansion House happened to be situated. For where the Mayor lived, there was the Mansion House. As the mayoral functions grew steadily more complicated, it became necessary to provide him with a fixed municipal abode, and Mr. Perks finds that as early as November 15, 1670, a Mansion House was contemplated. Grocers' Hall was first suggested, but in 1728 it was decided to choose a site and procure plans for a new building; yet it was not until 1734–5 that a Mansion House Committee was appointed. That committee chose the Stocks Market site, and Mr. Gibbs, Mr. James, and Mr. Leoni were invited to take part in a limited competition. Their ideas, and those of Mr. Batty Langley, and of Dance, on how the Mansion Houses hould be designed, are given in detail by Mr. Perks. Both Batty Langley and Dance were invited to compete, the invitation being extended to the latter on July 17, 1735, at a committee meeting at which Langley had presented a plan. A plan volunteered by Captain de Berlain was summarily rejected. It was not until the five architects chosen had sent in plans for the Leadenhall Market site as well as for the Stocks Market site that the committee finally adopted the latter; this decision being made on March 28, 1736. Dance's estimate coincided with that of Leoni, at £26,000, Gibbs's with that of James at £30,000, and the committee recommended Dance's design.

Mr. Perks smashes the apocryphal story that a design by Palladio was rejected *nem. con.* "because he was a Papist." "How could Palladio, who died in 1580, have prepared a plan with prophetic instinct to comply with these conditions?" Besides, both Gibbs and Leoni were Roman Catholics, and their designs were not challenged on that account. Isaac Ware also volunteered (and published) a design, which Mr. Perks reproduces, as well as schemes by John James, James Gibbs, Batty Langley, and, of course, the drawings prepared by Dance. Leoni's plans cannot be found; plans of three floors by Gibbs the author had the good fortune to find in the Radcliffe Library. The Court of Common Council confirmed in May 1738 the selection of Dance's plans; and tenders having been obtained, the foundation stone of the Mansion House was laid on October 25, 1739. The position of that foundation-stone cannot now be traced! In September 1757 "all the work was finished except painting the Great Hall." Mr. Perks gives very full particulars of the procedure from start to finish; and he glances at wire-pulling by interested contractors, at spiteful attacks on the architect, at extravagant overcharges for work, and vexatious delays in it, as well as some deplorably shoddy workmanship that must have given Dance many anxious hours.

Mr. Perks considers that "a comparison of Dance's design with the others submitted will show that the Corporation were wise in their choice," and few who avail themselves of the means of making that comparison now put before us will venture to disagree with the opinion. In any case, every architect will feel grateful to Mr. Perks for his detailed analysis of an important building that, both historically and architecturally, amply repays the minute and scholarly investigation that the author has devoted to it. Such masterly monographs as this on the Mansion House are rare; and by quietly demonstrating rather than noisily proclaiming the architectural, historical, and archæological interests of that building Mr. Perks has invested it with distinctly higher claims to attention than it was previously thought to possess. Incidentally he will have increased the average citizen's esteem for architecture as a subject of interest. The many valuable illustrations with which the book is enriched include a hitherto unpublished portrait of George Dance the Elder, which Mr. Perks has been able to give by the kind permission of Miss Dance, of Bath.

"The History of the Mansion House." By Sydney Perks, F.S.A., F.S.I., F.R.I.B.A., City Surveyor to the Corporation of the City of London. With 33 Plates and 67 Plans. Cambridge: At the University Press. Price 35s. net.

French Cathedral Churches in the War

A summary has just been issued of the war collection of Barr Ferree, of America, of information with regard to "the Cathedral Churches of France in the War of 1914–18." The collection consists of books, scrap-books, newspapers, illustrations, prints and engravings, cartoons, posters and maps, etc.

The origin of the Barr Ferree collection far antedates the war of 1914–1918, as for many years the owner has been gathering books, papers, photographs, illustrations, and other material relating to the cathedral churches of France, aggregating more than 150 buildings. By 1914 it had reached several thousand titles, and was probably the largest single collection on this subject in America.

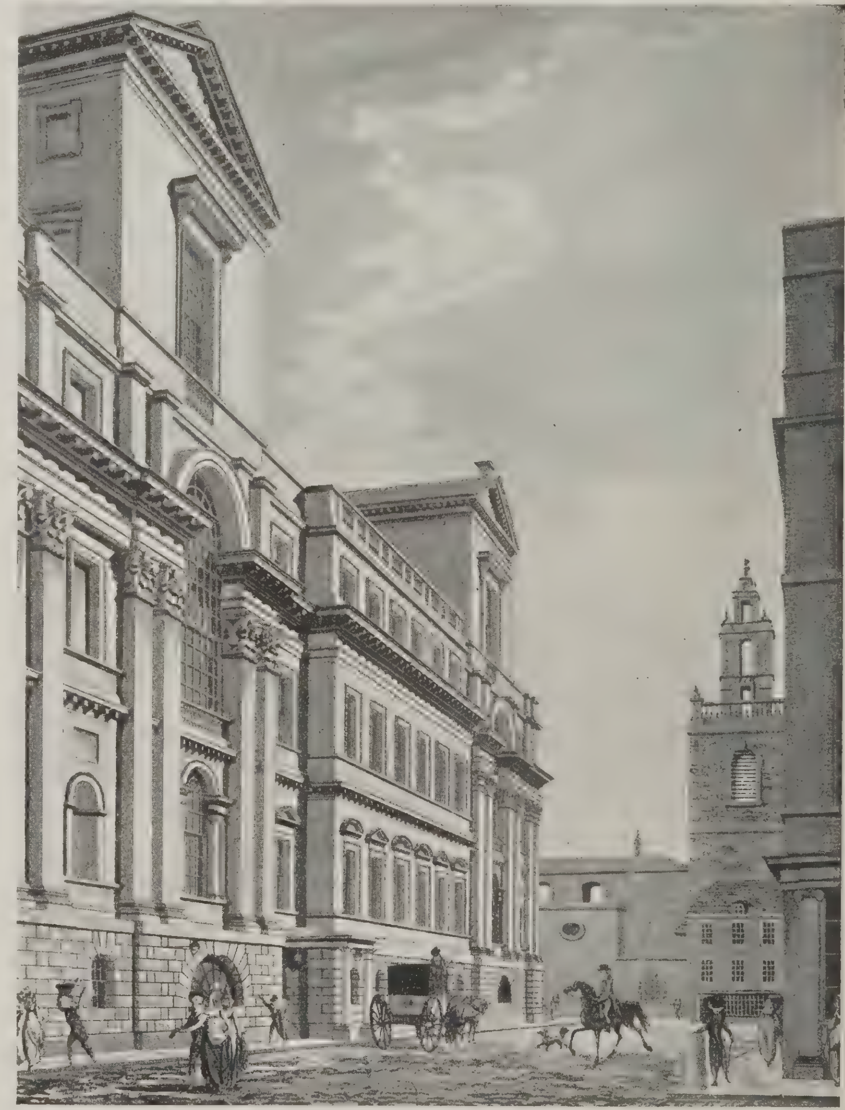
With the outbreak of the war it was greatly expanded. It was obviously no longer sufficient to collect strictly architectural material relating to the cathedrals, but everything concerning the cities and immediately surrounding area assumed new value. It did not suffice to keep a record of injuries to the cathedrals alone, but it became necessary to include everything possible on the military events connected with these cities, as explaining the origin of injuries to the churches and the circumstances under which they were damaged. Thus the collection became no longer strictly architectural, but somewhat general, and now includes many military books and papers. The cathedral cities directly affected by the war—that is, subjected to bombardment, or centres of military events—were Reims, Verdun, Laon, Arras, Senlis, Soissons, Cambrai, Nancy, Amiens, Noyon, Paris, Lille, St. Dié. Strasbourg and Metz are also in this group.

"The Cathedral Churches of France in the War of 1914–18." Summary of the War Collection of Barr Ferree. New York: 249 West 13th Street.

An Architect in Fiction

To the novel reader who is also a member of the architectural profession this is a book with a particular attraction. The principal character is an architect, and anyone who is tired of the astonishing eccentricities of the traditional architects of fiction should, for that reason alone, be interested in James Wedmore, who is portrayed as a normal human being. There are no villains in this story!

James Wedmore may perhaps be con-



THE WEST FRONT OF THE MANSION HOUSE, SHOWING PORTICO AT THE WEST DOOR, BUILT 1775 AND AFTERWARDS REMOVED.

(Published 1798 by T. Malton.)

idered somewhat fortunate in building ıp such a very prosperous practice during he short and extremely unsettled period hat has elapsed since the war, but a feat f this sort is, of course, more easily chieved in fiction than in fact. He is ortunate, too, in encountering such a harming young lady as Miss Woodruff n the environment of a fifteenth-century nanor-house. He is extraordinarily ortunate in ultimately obtaining both he hand of the lady and vacant possession f the house.

Nevertheless it would be niggardly on he part of anyone to begrudge success o James Wedmore, for he is the latest cquisition to that very small group of rchitects in fiction whose prototypes are t all likely to be encountered in real life.

It is, however, permissible to doubt hether the erection of a technical institute in a provincial city would prove a sufficient recommendation for the election of its architect to an Associateship of the Royal Academy. It is even more unlikely that any such recommendation would receive additional consideration when advanced by a vulgarian of the type of Sir John Pumphrey. In allowing his prospective father-in-law to engineer a surreptitious agitation in such a direction on his behalf, James Wedmore's attitude appears to be somewhat inconsistent with his ideals.

The book deals with the city and neighbourhood of Bristol under the thin disguise of Barstow, and contains a number of meditations on the effect of different types of building on the temperament of its chief character.

In travelling by rail through the outskirts of Barstow, for instance, James Wedmore is irritated by "the irrelevant inventions of brick and bargeboarding in a land where stone is plentiful," and retreats to the middle of the compartment in order to avoid the spectacle of these incongruities. Railway passengers, hardened by constant exposure to sights of like nature, may feel inclined to scoff at such sensitiveness. The fact remains that, in passing through certain modern residential districts, even the season-ticket holder is at times tempted to draw the blinds and crawl under the seat.

In any case, it is a whimsical thought of Wedmore's that railway trains jolt (even as high-spirited horses have been known to shy) on passing some particularly aggressive perpetration of the jerry-builder. This theory may explain the series of bumps which combine to form the methods of transit known as Suburban Railway Services.

F. R. JELLEY, A.R.I.B.A.

"An Order to View" By Charles Marriott. (Hutchinson & Co.)

The L.C.C. Theatre Regulations

We have received the following from a orrespondent :—

These regulations which supersede the gulations made in 1901 deal principally ith the protection of places of public ıtertainment from the risk from fire. is a matter for regret that the London ounty Council in revising their regulaons have not followed the practice of merican and French authorities and ealt with the various types of buildings classes. But for a clause towards e end there is nothing in the regulations indicate that except for theatres and usic halls they are not rigorously apied. It would be obviously unfair to pply the same standard to a hall atched to a suburban church as would be esirable for a West-end theatre. The ouncil in practice discriminates, and hen the regulations were under revision would have been an easy matter to dicate that the regulation, for instance, th regard to site is not enforced. This rticular regulation has been amplified d on the whole is an improvement. ackland sites will not in future be aporved. Waiting spaces are made comılsory in the case of cinematograph halls, d small ground-floor theatres will be cused a brick proscenium wall and fire rtain.

The regulations as to the construction the stage have been recast, and the ea of the lantern light has been ineased from one-tenth the area of the ge to one-sixth. The object of this gulation is to afford an outlet for flame d smoke in the event of the stage tching fire—serious fires have generally curred on the stage. The sashes of this ıtern are required to be glazed with in glass. We venture to suggest that e area is unnecessarily large, much in cess of that required in any similar gulation with which we are acquainted. our opinion it will make the stage bearably cold in winter. The sashes the lantern are required to be on a sible link. This is an improvement vocated first by the American engineer eeman. But instead of a glazed sash he advocates a shutter or series of shutters which will be released when the link fuses, and this, we think, is a better method of dealing with the problem, which we commend to the favourable consideration of the London County Council. We are also strong advocates of the all metal stage, which was introduced into this country by the late Edwin O. Sachs. Its installation will reduce materially the amount of combustible material on the stage, and effect a substantial reduction in the wages bill, as fewer men will be needed to work the scenes.

The regulation requiring adequate dressing-rooms is one which should be applied to the provinces, where the need is generally greatest. Further regulations are promised on ventilation, heating, and lighting. If gas lighting still exists in any London theatre it should certainly be abolished.

Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

Unemployment Insurance.

In the House of Commons last week Major Barnes asked the Minister of Labour whether his attention had been called to the case of Mr. William S. G. Wear, a naval architect, of Walkerville, Newcastle-on-Tyne, who, holding an exemption certificate under the National Health Insurance Act, was compelled to pay contributions under the Unemployment Insurance Act whilst holding a temporary appointment extending over a period of four months from October 1, 1921, to February 11, 1922, and was subsequently granted an unemployment exemption card; whether he was aware that repeated applications to his department for a refund of those contributions, amounting to 13s., had been refused; and whether, in view of the fact that Mr. Wear had been unemployed for a considerable period and it was extremely unlikely that he could ever benefit by the provisions of the Act, and that the small sum in question was one of substantial importance to him, he would give instructions that the contributions deducted from Mr. Wear's wages during the temporary appointment in question be returned to him. Dr. Macnamara said that he understood that the contributions which Mr. Wear claimed should be repaid to him were paid prior to the date on which he obtained exemption from Unemployment Insurance. He already held an exemption certificate under the National Health Insurance Acts, but this did not exempt him from the payment of Unemployment Insurance contributions. If an employed person holding such a certificate desired to obtain exemption from Unemployment Insurance, he must make a definite application that the certificate granted to him under the National Health Insurance Acts should be applied to Unemployment Insurance. The contributions paid by Mr. Wear before he was granted exemption from Unemployment Insurance were properly payable, and he had no power to authorize a refund of these contributions.

Building Trade Unemployment Figures.

Dr. Macnamara, Minister of Labour, informed Mr. T. Thomson that on May 22 last, the latest date for which figures were available, the numbers and percentages of unemployed in the building trade were as follows :—

	Number Unemployed.	Percentage Unemployed.
Carpenters	11,562	8.7
Bricklayers ..	6,334	10.2
Masons	2,421	10.2
Slaters	546	10.1
Plasterers	676	3.9
Painters	10,648	9.2
Plumbers	3,539	9.9
Other skilled workers	5,824	21.9
Labourers	74,462	
Total building trades	116,012	15.3

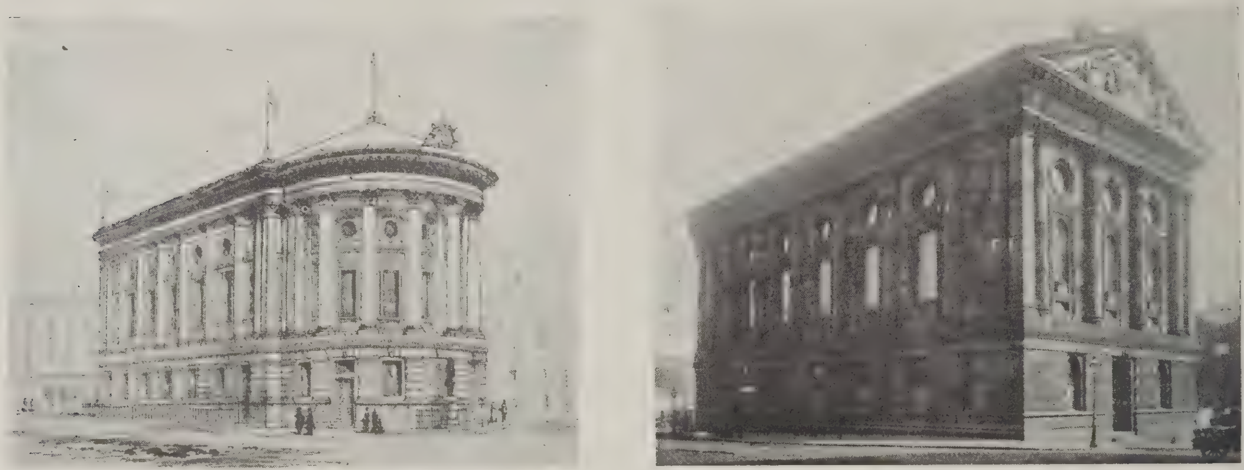
Rent Restriction Act.

Replying to Sir Walter de Frece, Sir A. Mond said that the composition of the committee of inquiry into the Rent Restrictions Act was not yet complete, but he hoped to make an announcement at a very early date.

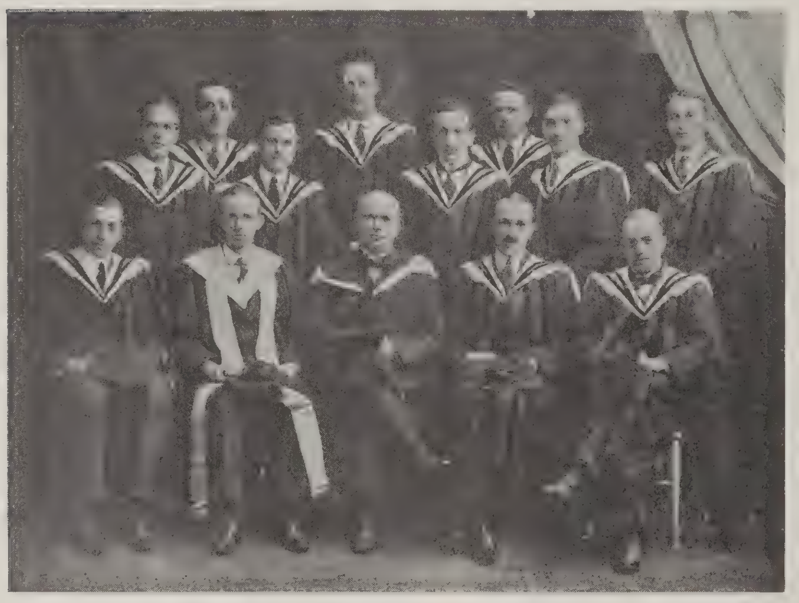
A Pictorial Review

Illustrations of Topical, Practical, or Curious Interest

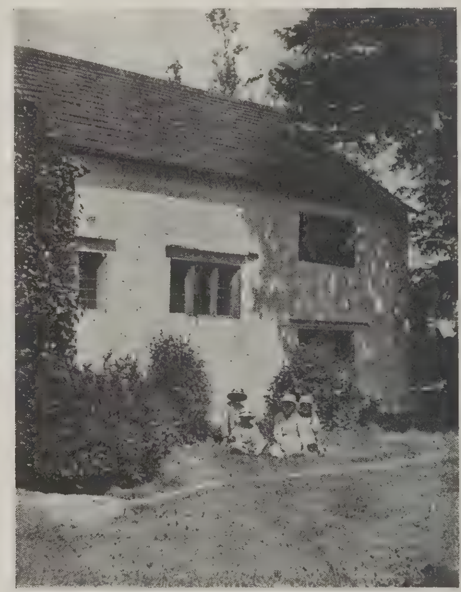
Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.



The Town Hall at Todmorden was built by John Gibson "of Westminster" in 1870. The design is remarkably consistent, the end bays on the flanks being well managed as foils to those between. Gibson is best known in connection with the head office of the National Provincial Bank of England in Threadneedle Street and its branches throughout the kingdom. John Gibson became a pupil of Sir Charles Barry in 1835, hence his predilection for Italian detail, which in process of time experience enabled him to modify to accord with the style made familiar by the genius of Cockerell. The illustrations show the hall as designed and as carried out.—ANON.



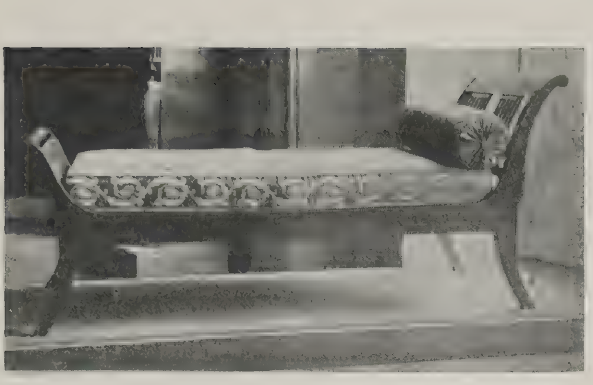
Apropos of the discussion, now proceeding in our columns, on university degrees in architecture, the above photograph is of interest. It shows the students (with their leading teachers) who obtained the Liverpool B.Arch. this month. The B.Arch. hood is a white silk hood like the Cambridge M.A., but lined with a narrow black velvet line to suggest the architect's drawn ink line. This narrow velvet line appears, too, on the stole of the gown. The hood, like all Bachelors' hoods, is edged with fur, the removal of which would convert it into a Master's hood should an M.Arch. be founded. Reading from left to right the names are as follows: Top row—A. C. Holliday, E. R. Arthur, E. W. Martin, W. Dougill, P. B. Haswell, G. Checkley (Jarvis Scholar), J. S. Allen, H. Forshaw. Bottom Row—S. Welsh (Rome Scholar), L. B. Budden, Professor C. H. Reilly, E. R. F. Cole, J. E. Marshall.



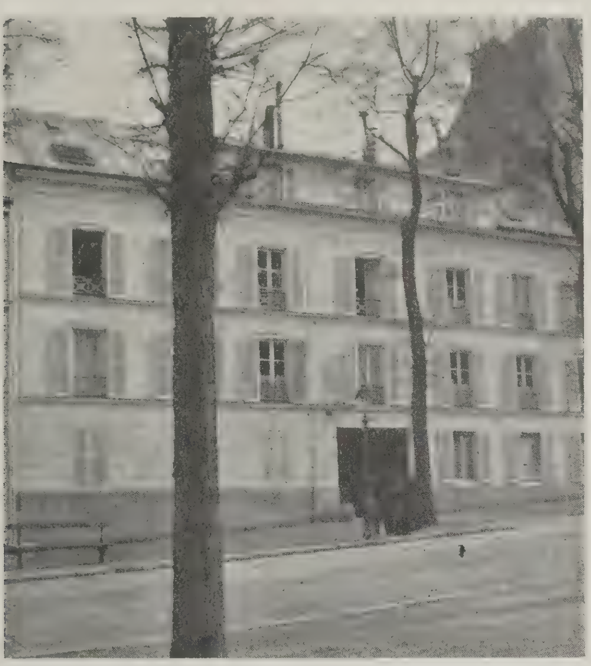
The Friends' Meeting House at Brigg Flatts, near Sedbergh, Yorks, which is said to be, with one exception, the oldest Quaker establishment in England, was built in 1675. George Fox, the founder of Quakerism, had visited the neighbourhood long ere this, but about the year in question a large public gathering, numbering some hundreds, assembled to hear him preach, and this interesting little fabric was the outcome of their espousal of the new creed.

JOHN A. METCALFE.

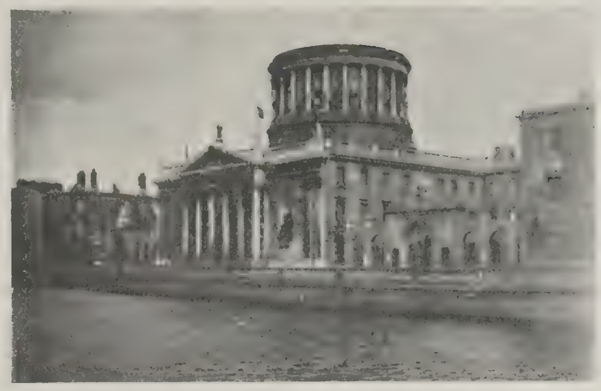
A consignment of over a quarter of a million Fletton bricks in fifty-ton wagons leaving a London brick company's works for King's Cross. The bricks, which were used in the construction of the London County Hall, represent only a portion of the daily output.



This "chaise longue," or sofa, an excellent specimen of furniture of the First Empire period, is now on exhibition in the Louvre. It is notable for the general simplicity of its character, the grace and distinction of its lines, and the absence of ornamentation. The modern furniture-maker might well take cognizance of pieces of this type.

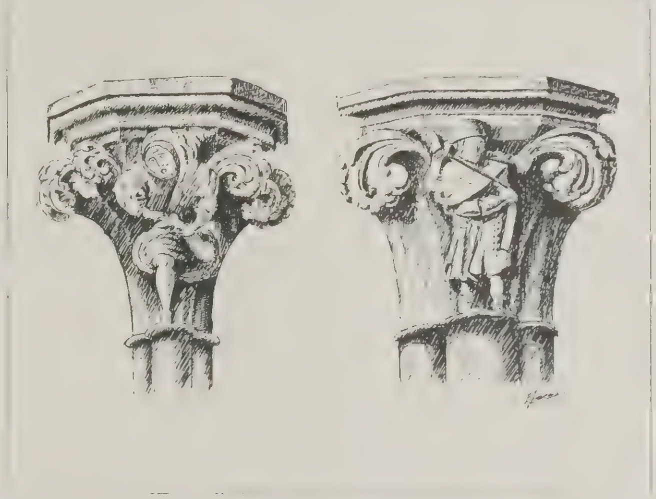


This illustration shows a beautiful French house of the period of the transition, Louis Seize to Empire. The delicacy of the mouldings, the adjustment of the slight attic story, the sound proportion, and, moreover, the colour of the wall surface, reveal that rich simplicity which is the best evidence of good taste.—ANON.



I send you a snapshot of the "Four Courts," Dublin, after bombardment, fire, and internal explosions. The copper dome is gone, and the peristyle drum is much more shattered than appears. The artillery breach to right of portico is into one of the courts, which were disposed radially on the diagonals of the square around the central hall under the dome. The centre of the front is merely a frontispiece, but the central portico, with its recessed alcove of segmental plan, is excellent, and the stone screens to the courtyards are very pleasing.

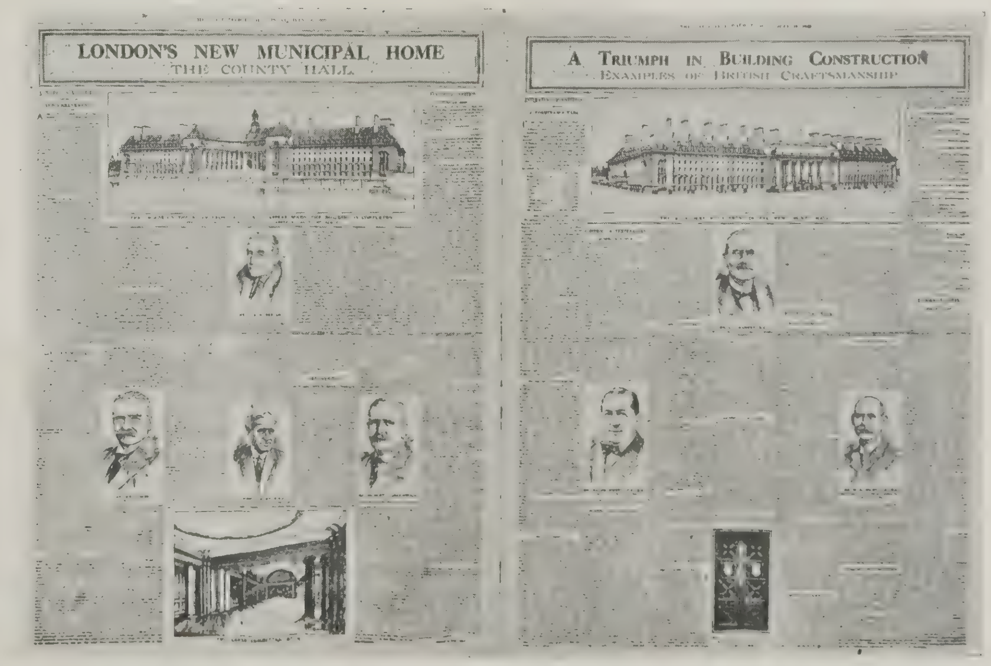
H. G. LEASK.



These capitals from Wells Cathedral reveal in a very amusing way the essentially human quality of Gothic art. One represents an old woman extracting a thorn from her foot, and the other a woodman. May I suggest that modern architecture would be better for a few touches of everyday human life? A direct and vigorous expression of life would make a far more intimate appeal to people. Very few have the time or the inclination to unravel the meaning of dull symbolic groups of sculpture.

E. L.

A portrait of Mr. George Checkley, who recently won the Jarvis Scholarship. Mr. Checkley is a student of Liverpool University, which he entered with a N.Z. Government Scholarship, after serving three and a half years with the N.Z. Expeditionary Force.



LONDON'S NEW MUNICIPAL HOME
THE COUNTY HALL

A TRIUMPH IN BUILDING CONSTRUCTION
EXAMPLES OF BRITISH CRAFTSMANSHIP

It is very gratifying to note the increased interest which is being taken in architecture by the general Press. During the past week many excellent illustrated descriptions of the new London County Hall have appeared in London and Provincial newspapers, "The Daily Telegraph" devoting two full pages to the building. These are reproduced above as a memento of a remarkable event.

Abandoned State-Aided Housing : Fees Payable to Architects

The following statement has been issued by the R.I.B.A. :—

It will be recollected that on the issue by the Ministry of Health of General Housing Memoranda 51 and 52, the profession generally felt that the extent of the services rendered by them to their clients—and through their clients to the State—had not been fully understood or appreciated, and the scale of payment therein set forth was considered to be inadequate. The members of the R.I.B.A. thereupon elected representatives to reopen negotiations with the Ministry for the purpose of revising the terms of these Memoranda; giving to its representatives full powers to conclude an agreement on their behalf.

Prolonged negotiations between the Ministry of Health and the members of the R.I.B.A. revealed difficulties on both sides, but have resulted in an agreement being reached on the question of payment to architects for work upon schemes which have been wholly or partially abandoned.

In their consideration of the many cases of hardship submitted to them the representatives of the R.I.B.A. were impressed by the unequal application of any flat-rate scale of payment to partially and wholly abandoned schemes and to large and small schemes.

In the revised terms effect has been given by the Ministry to the claim that the fees for partially abandoned schemes should be more equitably apportioned in relation to the amount of the scheme which has been carried out, a more generous proportion being paid to those who have had very little work executed. Also a new scale of payment has been adopted giving still more favourable consideration to those architects whose schemes have been entirely abandoned as compared with those who have carried into execution a fair proportion of the work originally placed in their hands.

These terms and conditions are set out in a new memorandum to be issued by the Ministry known as General Housing Memorandum No. 61.

The main points in which this memorandum differs from or supplements G.H.M. No. 52 may be briefly summarized as follows :—

A.—Whereas G.H.M. No. 52 only provided for charging to the Housing Assisted Scheme Account fees for schemes which were approved by the Minister, in G.H.M. No. 61 provision is made for the consideration of schemes not so approved.

B.—In regard to work on roads and sewers the fees have been more accurately apportioned to the stages which the work had reached when it was abandoned.

C.—Average prices per house have been agreed as the basis on which fees for abandoned work should be calculated in respect of plans which were prepared before July 1921 and subsequently.

D.—In partially abandoned schemes instead of half the fees for totally abandoned work being paid in all cases, the fraction payable is related to the proportion of the scheme carried out.

E.—A more generous scale of payment has been adopted where the whole of an architect's work has been abandoned, and it has been provided that the R.I.B.A. will act as a Board of Reference in deciding certain points in this connection.

F.—It is provided that the local authority shall be satisfied as to the respective stages of the work carried out, and the appropriate fees.

G.—The settlement does not supersede cases where an agreement providing specifically for abandoned work has been made between the architects and the local authority, their clients, or where a final settlement has already been arrived at.

H.—The term "scheme" used in G.H.M. No. 52 has been more favourably interpreted in relation to abandoned work in G.H.M. No. 61.

I.—Travelling expenses have been provided for in G.H.M. No. 61 on a more reasonable scale.

K.—Under G.H.M. No. 61 payment may be made in certain cases for the preparation of additional copies of drawings and specifications.

L.—The Ministry are requesting local authorities to expedite the settlement of accounts with architects.

It is satisfactory to note that by the reopening of negotiations terms have been agreed which will result in a greater appreciation of the services rendered by the profession, and a scale of remuneration more in accordance with its labours.

It is desired to place on record appreciation of the manner in which our deputation was received by the Ministry and the sympathetic consideration given by the Ministry to the case presented by the deputation.

The Institute are not inclined to think that the association of architects and local authorities in connection with municipal housing schemes is at an end. They believe that in many cases local authorities will proceed with their schemes on their own account, and that architects will resume their work on these schemes.

For the guidance of members examples of the application of the revised scales have been worked out in conjunction with the Ministry; copies of these examples showing the manner in which the fees are calculated, also the average cost of houses in the months subsequent to July 1921, will be supplied on application to the R.I.B.A.

Signed :

HERBERT T. BUCKLAND, F.R.I.B.A.
FRANCIS JONES, F.R.I.B.A.
HERBERT A. WELCH, A.R.I.B.A.

New Rate of Interest for Housing

A new Order named The Ministry of Health (Rates of Interest) Amendment Order, 1922, dated June 17, 1922, has been made by the Minister of Health, with the approval of the Treasury, under Section 5 of the Housing Act, 1921 (11 & 12 Geo. 5, c. 19). As from the date of this Order the Ministry of Health (Rates of Interest) Order, 1921, shall have effect as if the words "Six per cent." were substituted for the words "Six-and-a-half per cent." and the words "Five-and-a-half per cent." for the words "Six per cent." in the Schedule to the said Order. Provided that nothing in this Order shall affect the rate of interest on any advance made or any expenses incurred by a local authority before the date of this Order.

New Companies Registered

There has been an encouraging increase in the number of new private companies registered during the past half-year, compared with the corresponding period of 1921. According to a statistical report prepared by Messrs. Jordan and Sons, Ltd., of 116 and 118 Chancery Lane, W.C.2, company registration agents, the increase is rather more than 30 per cent., but the average capitalization of the private companies declined from £10,980 to £10,756. Taking the whole of the registrations, public and private, limited and unlimited, while the aggregate capital increased by nearly £13,000,000 the average declined from £16,719 to £16,114.

Appended are details, which have been extracted from a table embodied in the report, of company registrations of importance to the building industry :—

Classes.	Public Companies.		Companies other than Public.		Totals.	
	Number Registered.	Capital.	Number Registered.	Capital.	Number Registered.	Capital.
		£		£		£
Bricks	—	—	61	652,400	61	652,400
Builders	1	1,000,000	138	1,010,500	139	2,010,500
Electric, Gas, Water . .	11	6,698,500	82	291,418	93	6,989,918
Engineers	1	12,500	245	2,386,280	246	2,398,780
Furniture	—	—	66	332,410	66	332,410
Iron, Brass, etc. . .	3	725,100	171	1,560,260	174	2,285,360
Mines, Quarries, etc. . .	20	2,078,900	102	1,874,950	122	3,953,850
Oil	5	915,000	34	157,850	39	1,072,950
Timber	2	145,000	65	954,400	67	1,099,400

The totals of all the various companies, including the above, registered during the past half-year, were as follows, the figures for the corresponding period of 1921 being given in parentheses : Number of public companies registered, 190 (204); capital, £23,686,930 (£20,173,350); number of companies, other than public registered, 3,851 (2,921); capital, £41,401,386 (£32,073,808). Total number companies registered, 4,041 (3,125). Total capital, £65,088,316 (£52,247,158). Messrs. Jordan and Sons state : The continued heavy Capital Duty still tends to restrict enterprise, and despite the lower bank rate now prevailing we can scarcely hope for a notable improvement in the figures unless relief be given from the quadrupled burden imposed in April 1920.

The Rio Pavilion: Mr. Reginald Bell's Cartoons

We illustate on this page two of Mr. Reginald Bell's cartoons for figures in the stained-glass dome of the British Pavilion at the Rio de Janeiro Centenary Exhibition.

The dome, or arched lantern, is situated over a great square orifice in the ceiling of the central hall of the pavilion. Four curving sides taper upwards to a circle at the summit. In this a sun, with golden rays penetrating downwards into the dome, is set, and about it the stars of the Southern Cross, part of the Brazilian national emblem, are dotted. A tropical sky in exquisite blue glass occupies the upper portion of the sides and forms a background to four figures.

In two opposite quarters gorgeously robed female figures, each seated upon a terrestrial globe, symbolize the British Empire and the Eastern World, and Brazil and the Western World. Two other figures in bright garments occupy the other spaces. Their arms are stretched upwards as though supporting the centre of the dome.

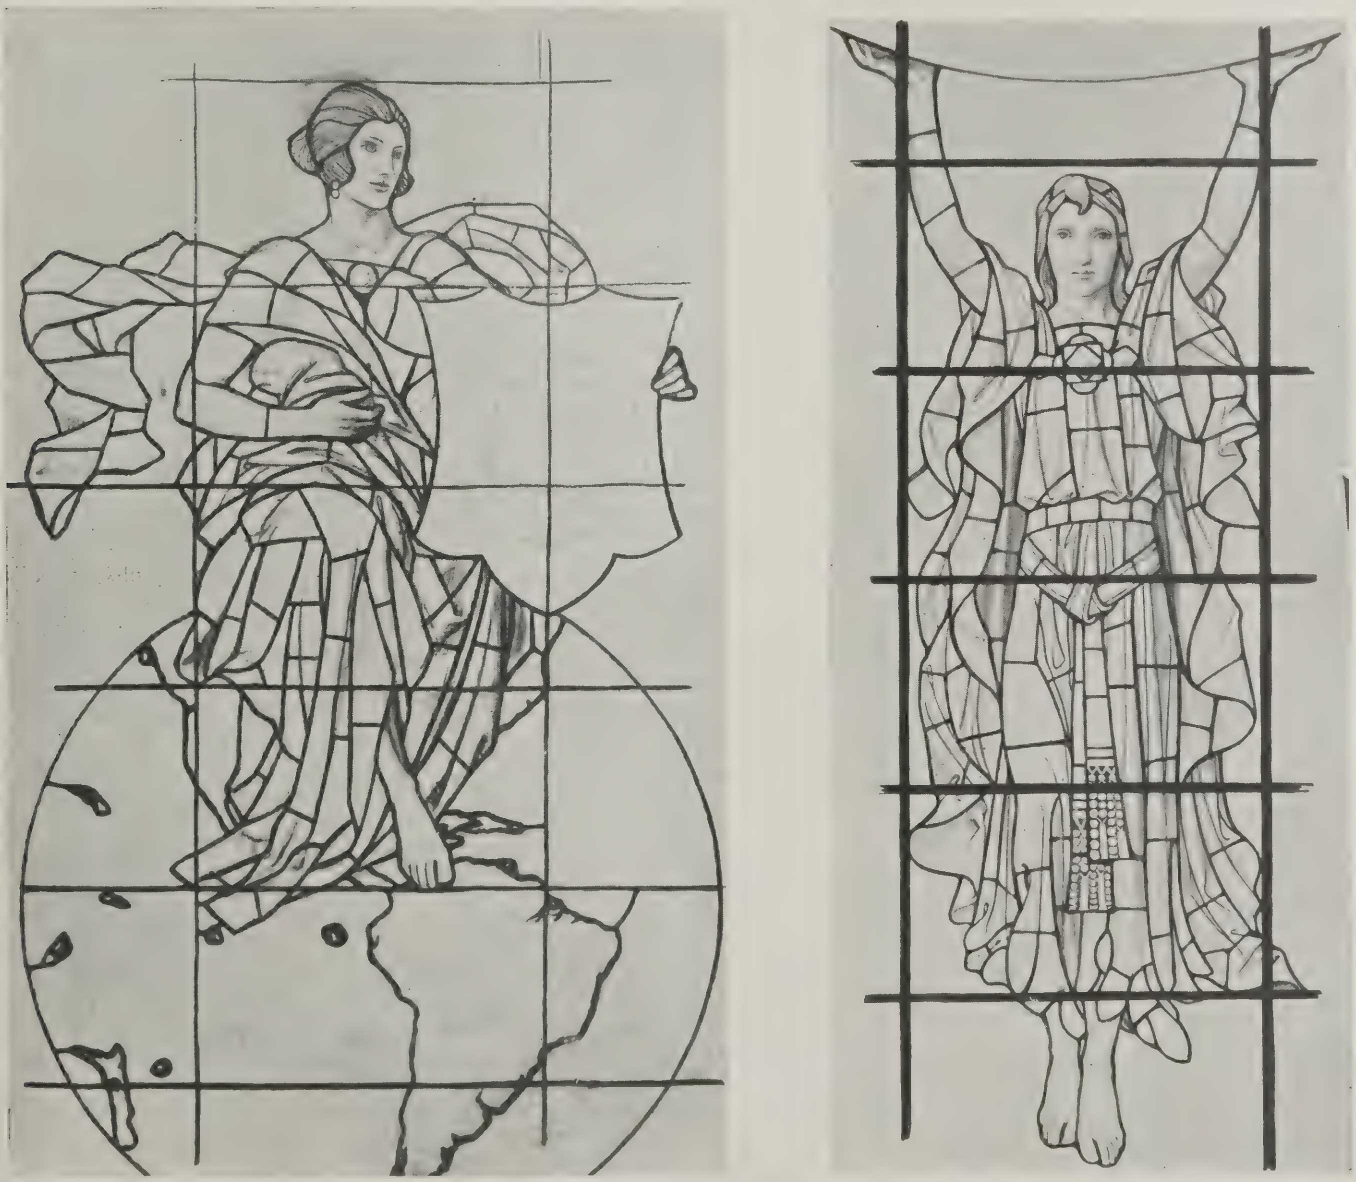
Beneath the feet of the figure runs a narrow strip of coast line, on one side the chalk cliffs of Dover, on the other the low-lying dark line of distant Brazil, and in front of these the sea, reflecting the blue light of the sky. An effect of great distance and glorious colour is obtained. The dome will be illuminated from the outside at night.

Mr. Bell is of the third generation of a family of stained-glass designers and craftsmen. Since 1856, the partnership of which he is a member (Clayton and Bell) have produced windows that have been installed all over the world.

Glasgow Housing Exhibition

Glasgow Corporation will hold their fourth Housing and Health Exhibition in Kelvin Hall during the three weeks commencing October 2. The Council have been the foremost of all Corporations in the endeavour to encourage the display of the latest in the building of and the internal arrangements of the home under up-to-date methods. So successful have been the recent enterprises of the Glasgow Corporation in such exhibitions that they have arranged to make the forthcoming one quite outstanding, and additional features have been arranged which will make the show the most attractive they have yet held. The classification of exhibits has been extended so as to include building materials of all classes—reinforced concrete brickwork, concrete slabs and blocks, asphalts, asbestos, slabs, tiles, marbles and mosaics, casements, cements, chimney-pots, cowls, etc., roofing materials, doors, door fitting and window fittings, flooring, glazing, timber, art metal work, mouldings, plaster, chimney-pieces (metal and wooden), stone.

In furnishings, lighting, heating, labour-saving and cleansing appliances the exhibits will include furniture of every description, electric and hand sweepers, electric and gas irons, gas and electric cookers, heaters, boilers, and geysers, gas and electric radiators and fires, electric and gas fittings, globes and shades, and gas mantles. Sanitary appliances will include baths and bath fittings, sanitary pipes and drainage fittings, and sanitary specialities of every description. The decoration section comprises paints, oils, varnishes, distempers, wall-papers, enamels and wall-hangings.



TWO OF MR. REGINALD BELL'S CARTOONS FOR THE STAINED-GLASS DOME OF THE BRITISH PAVILION AT THE RIO DE JANEIRO EXHIBITION.

The Week's News

Additions to Guy's Hospital.

New anatomical and biological departments are to be constructed at Guy's Hospital, at an estimated cost of £45,000.

Fish Market, Looe.

Looe Harbour Commissioners have decided to erect a covered market for fish buyers.

Improving Scarborough.

Important alterations to the Scarborough Spa have been sanctioned at a cost of over £13,000.

Keighley War Memorial.

Keighley Town Council are considering the erection of a war memorial, and it is likely that competitive designs will shortly be invited.

Bank of England Rebuilding.

We understand that the Bank of England is to be reconstructed from designs by Messrs. Herbert Baker and F. W. Troup, FF.R.I.B.A.

Oxford Public Baths.

The Corporation have invited tenders for the erection of a building and fitting it up as public baths at the rear of Grey Friars' House, Paradise Street.

Clock Tower for Golders Green.

As the result of a referendum the war memorial for Golders Green is to be a tower with a four-faced clock at the cross roads near the tube station.

Malvern War Memorial.

Part of this memorial is to consist of a library to be built at a cost of £12,000, to the designs of Mr. Maurice E. Webb, F.R.I.B.A.

Seaham Harbour War Memorial Fund.

The memorial, which is to be erected in the centre of the Terrace Green, is to be a Celtic cross, 20 ft. high. The cost will be about £1,200.

Sir Charles Ruthen to Stand for Parliament.

Sir Charles Ruthen has been chosen as a candidate for South Hackney in view of the expected expulsion from Parliament of Mr. Bottomley.

Shelters for Cinema Queues.

It is recommended by the Building Acts Committee of the London County Council that cinema halls be put on the same footing as theatres and music halls as regards shelters over the public way.

New School for Barnsley.

The Barnsley Education Committee has approved of recommendations to erect a permanent building for the long-proposed Central School, to accommodate 400 children up to fourteen years of age.

Change of Address.

Mr. C. L. J. Doman, who is executing the sculpture work on the new Port of London Authority building, has moved to 9 Spencer Hill Road, Wimbledon. 'Phone 332.

Improving Weymouth.

Improvement schemes involving an expenditure of £63,000 have been adopted in principle by Weymouth Town Council. The schemes include esplanade widening, enlarging bowling greens and tennis courts, and erecting sea-front bungalows.

The International Theatre Exhibition.

In view of the continued large attendance at the International Theatre Exhibition, and in response to many requests, the authorities of the Victoria and Albert Museum have decided that this exhibition shall remain open till July 31.

A.A. Prize Distribution, &c.

The distribution of prizes at the A.A. will take place to-morrow at 3 p.m. The address to students will be by Sir Reginald Blomfield, R.A. An exhibition of students' work will be held from July 27 to August 27.

Dewsbury War Memorial.

The Dewsbury War Memorial Committee have decided that the borough's war memorial should be erected in Crow Nest Park. Professor Reilly is to be asked to give an opinion upon the question of site, the type of the memorial, and the cost.

Vacancies for Architects in the U.S.A.

Mr. Edward B. Lee, President of the Pittsburgh Chapter of the American Institute of Architects, has written to notify the editor of the R.I.B.A. Journal that there are vacancies for British architects, assistants, draughtsmen, and apprentices in that city.

Hathersage Memorial Hall.

At a meeting of the Hathersage War Memorial Committee it was reported that the fund has reached close on £2,000, and when negotiations for the parish land are completed building operations will be commenced in the centre of the village, where a memorial hall will be erected.

New Partnership.

Mr. Eugene C. Beaumont, M.S.A., has taken into partnership his son, Mr. E. Edward Beaumont, A.R.I.B.A. The practice will continue to be carried on at 134 Fleet Street, London, under the title of Eugene C. Beaumont and Son, architects and surveyors.

Bedford War Memorial.

Bedford War Memorial, unveiled last Thursday, takes the form of a statue of Justice, the work of Mr. C. S. Jagger. The lay-out and architectural details were designed by Mr. George P. Allen, F.R.I.B.A., consulting architect to the War Memorial Committee.

Harefield Light Railway.

At the Ministry of Transport inquiry into a proposal to construct a light railway between Harefield and Uxbridge, the Metropolitan Railway are submitting an amending scheme for connecting the proposed new line with their Uxbridge and Harrow branch near Ickenham.

New Washhouses, Manchester.

Manchester Baths and Washhouses Committee are considering the establishment of six new washhouses in and around the city. The sites which are under consideration are in Moss Side, the Hulme Barracks site, Chancery Lane, Mayfield (conversion of the women's bath), New Islington, and Moston.

Ken Wood.

A contract has been entered into between the Preservation Council and the Earl of Mansfield for the purchase of a considerable portion of the estate at the reduced price of £1,350 per acre, and a deposit of £10,000 has been paid. The area to be secured for the public amounts to something between 90 and 100 acres.

The Wren Centenary.

Mr. Andrew T. Taylor has been recommended as the London County Council representative on the committee of the R.I.B.A. to arrange the proceedings for the commemoration in February next of the bicentenary of the death of Sir Christopher Wren. Mr. Josiah Gunton, Chief Commoner of the Corporation of London, has been appointed by that body to represent it on the same committee.

R.I.B.A. Special War Examination.

The Special War Examination will be held for the last time from December 11 to 15, 1922, inclusive. Applications, accompanied by the necessary Testimonies of Study and entrance fees, must be submitted by November 4, 1922. Candidates who fail to satisfy the examiners in this examination will be required to take the ordinary examinations of the Institute if they desire to qualify as candidates for the Associateship.

Rebuilding Moscow.

Colonel the Hon. F. H. Cripps, son of Lord Parmoor, has returned from Moscow, where he has been organizing a rebuilding scheme under special charter of the Soviet Government. One building has already been completed, and contracts have been arranged for three others, the total estimated cost being £50,000. The enterprise represents a capital of £100,000 at present, but an expansion of this sum is expected to be forthcoming in the city.

Foreign Contractors' Visit to London.

The International Congress of Building Traders and Public Works Contractors, which assembled in London last week, is the outcome of a conference held in Brussels last year, when it was suggested that it would be interesting to inspect our public buildings and see the results of British effort to meet the housing problem; 120 foreign delegates, including representatives of France, Italy, Switzerland, Belgium, Holland, and Czecho-Slovakia, attended the Congress.

Mr. Justice Darling's Bon Mot.

A bon mot of Mr. Justice Darling's during the week escaped notice. The case was a libel suit between the council of a local authority and an architect, in which questions of tenders for building houses were under discussion. One of the counsel found it difficult to discover the right word to use regarding a building contract, and sometimes spoke of it as "a contract," "a tender," "a proposal," and "an engagement." Mr. Justice Darling leant forward and asked: "Why not call it a tender proposal?"—"Daily Mirror."

News (*continued.*)

British Industries Fair Catalogue.

In connection with the British Industries Fair, recently held at the White City, London, a catalogue was issued embracing not only a list of the manufacturers exhibiting, but also comprehensive particulars of the various goods manufactured by them. In view of the detailed nature of the information given it is thought that the catalogue should prove of use as a book of reference to firms requiring information as to where to place orders or make enquiries regarding any special class of goods. Copies are still available and may be obtained, price 2s. 6d., from the Department of Overseas Trade, 35 Old Queen Street, S.W.1.

Leplay House Tours.

Arrangements have been completed for the holiday course in the Austrian Tirol which is being organized by the directors of the Leplay House Tours. The party will leave London on August 4, and will spend four weeks in the Tirol, making their centre at Achensee, and returning to London on September 3 or 4. The eaders include Mr. Alexander Farquharson, Mr. Harold Peake, Mr. Christopher Dawson, and Dr. Marcel Hardy. Anyone wishing to join the party, either for the whole period or for two weeks, should apply immediately to Miss Margaret Tatton, Leplay House, 65 Belgrave Road, Westminster, S.W.1.

Japanese Lacquer at the V. and A. Museum.

The Victoria and Albert Museum has eceived another valuable gift of Japanese acquer, Mr. R. A. Pfungst having presented to the nation the whole of the collection of medicine cases (Inrō) which have been exhibited on loan for the last ive years. This series consists of 286 inrō, most of which are complete with their netsuke and ojime. It ranges in date rom the seventeenth to the nineteenth century, and, in conjunction with the earlier examples which the museum owes to the generosity of the late Mr. George Salting, the late Mr. Alexander, and Mrs. Sage, now places this section of the museum collections in a very strong position.

R.A.M.C. Memorial.

The Duke of Connaught, in unveiling a memorial in Westminster Abbey to the officers and other ranks of the Royal Army Medical Corps who fell in the Great War, announced that £10,000 of the fund aised by the corps for the memorial had been assigned to the Dean and Chapter or the restoration and maintenance of he structure of the Abbey. The memoial takes the form of a simple white marble tablet placed on a wall about ten yards from the stone covering the grave of the Unknown Warrior. The tablet bears an inscription that it was erected o the memory of 743 officers and 6,130 other ranks of the R.A.M.C. who fell in he war, 1914–1919.

Rust and Corrosion : A New Society.

In view of Sir Robert Hadfield's recent stimate that the ravages of rust and orrosion represent an annual wastage of more than £500,000,000, an Association of Manufacturers of Non-corrodible and Anti-corrosive Products is being ormed to create new and increased demands for the products and processes of its members. Several firms have already intimated that they are in accord with the formation of such an association. A meeting will be called as soon as all members of the trade have been approached with a view to being associated as founders of the movement. Manufacturers interested should communicate with Mr. W. R. Douglas Shaw, the Royal Society of Arts, 18 John Street, Adelphi, London.

French Duties on Cast Iron.

Tariff increases on imports of cast iron are recommended to the French Government by the committee appointed to consider the imposition of "co-efficients of increase" (states the Paris branch of the Anglo-South American Bank). These involve the raising of the *ad valorem* tariff on cast iron from 6 to 12 per cent.; the application of a 2.5 co-efficient to the protective duties on cast hematite and cast spiegel, and of a 1.8 co-efficient to all other classes of castings in place of the co-efficient of two now applied to all castings. It is considered that cast hematite of British origin may find difficulty in competing in the French market, should the recommendation be accepted.

Prize-giving on the "Arethusa."

The annual distribution of prizes took place last Wednesday on board the "Arethusa" at Greenhithe, which is under the command of Commander F. G. C. Coates, D.S.O., R.N. A large company was present, including Sir James H. Brooks, K.C.B., and Lady Brooks, who very kindly distributed the prizes, and the chairman, Mr. Howson F. Devitt, presided. Some 200 lads in training presented a smart appearance, and the report on their work during the past year does great credit not only to the boys, but to all those who give so much time to the institution. Full particulars may be had of the institution from the Secretaries of the Shaftesbury Homes and "Arethusa" Training Ship, 164 Shaftesbury Avenue, W.C.2, to whom donations should be sent.

Bristol Architects Visit Oxford.

The Bristol Society of Architects have paid an enjoyable one-day visit to Oxford. Among those who accepted the invitation of the Society to join the party were the Sheriff (Mr. F. N. Cowlin) and Mr. E. F. Fabian (hon. Associates of the Society), Messrs. C. Hayes (President of the Master Builders' Federation), Mr. Lessel S. McKenzie (City Engineer), and Mr. F. J. Williams (Building Surveyor). The party journeyed by charabanc, and a halt was made at Cirencester, where the church and other interesting buildings were inspected. On arrival at Oxford luncheon was served in the Hall of Magdalen College, where the party was welcomed by Sir Herbert Warren, the President, who is also President of Clifton College, and who extolled the architectural and other beauties of Bristol and Clifton. After an interesting detailed account of Magdalen by Mr. Edward P. Warren, F.S.A., F.R.I.B.A., a tour of the Colleges was made under the able guidance of Mr. Harold S. Rogers, M.A., the President of the Oxford Society of Architects. The return journey was made via Malmesbury, where the Abbey provided the final item in the architectural itinerary.

Royal Engineers Memorial at Chatham.

This memorial, which was unveiled last Wednesday, is an obelisk with a spreading base set on a paved platform. The base is subdivided into four stages, the lowest of which has, on each of the four sides, dies carved with festoons, symbolizing the four corners of the world from which the Royal Engineers were recruited. The next stage comprises the stone on which is the dedication inscription, and above are groups of symbolical sculpture. The work has been carried out to the designs of Messrs. Hutton and Taylor, FF.R.I.B.A., architects, Glasgow, and the sculptured panels are the work of Mr. Alexander Proudfoot, A.R.S.A., Glasgow.

10,000 *Houses for Miners.*

A scheme to provide 10,000 cheap houses for miners at the rate of 2,000 a year has been put into operation by colliery owners. Thirty large colliery companies have formed what is in effect a co-operative society for housing. For this purpose a company has been registered as "The Industrial Housing Association," with a starting capital of £1,000,000. No profit will be aimed at, but each housing scheme undertaken by the association will simply be required to pay its own way upon the actual expenditure incurred. Substantially built houses, playing fields, open spaces, institutes, and other amenities will be provided for the tenants. A beginning has been made in several areas. Sir Tudor Walters, M.P., is the chairman of the building committee which will supervise the building and planning of the villages.

List of Competitions Open

Date of Delivery.	COMPETITION.
Aug. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Apply, by Aug. 1, to "Chicago Tribune," 5 Rue Lamartine, Paris.
Aug. 11— Jan. 31, 1923	Labour-Saving Flats, Hampstead Garden Suburb. Premiums £500, £300, and £200. Assessors: L. Rome Guthrie, F.R.I.B.A., J. C. S. Soutar, Lic.R.I.B.A., and E. J. Cooper, Secretary, Second Hampstead Tenants Ltd., to whom, at Temple Fortune House, Hampstead Way, N.W.11, applications must be made by August 11.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8.000 francs.
Nov. 1	New Town Hall and Municipal Offices in Victoria Park, Colombo. Cost not to exceed Rs. 1,000,000. Premiums Rs. 5,000, Rs. 3,500 and Rs. 2.000. A F.R.I.B.A. will act as assessor. Apply Secretary, Municipal Council, Colombo. Deposit Rs. 25.
No Date	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
	Southend Proposed Secondary School. At the request of the Competitions Committee of the R.I.B.A., the drawings required in this Competition will be to a scale of 16 feet to the inch.

Labour-Saving Flats, Hampstead.

The attention of readers is directed to the above new competition, full particulars of which are given in the small advertisements on page xxiv.

New Inventions

Latest Patent Applications.

18730.—Black, R. A.—Lavatory seats. July 7.

18371.—Dudley, J. G.—Building. July 4.

Specifications Published.

181389.—Bell, F. J. T., Hague, J. M., and Entwistle, E.—Means for suspending cradles or the like used by workmen in repairing or analogous operations on the outside of buildings.

181930.—Walker, J. H.—Concrete structures.

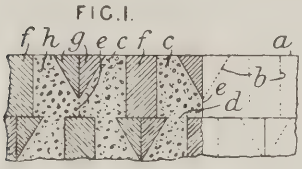
182016.—Hartmann, J.—Construction of ceilings.

176778.—Soc. Industrielle de Matériel d'Entreprise et de Construction.—Apparatus for constructing concrete piles or the like.

Abstract Published.

180222.—Wall slabs.—Richardson, O. C., 93 Queen's Road, Finsbury Park, London, and Meredith, E., The Rosary, Northolt Junction, Middlesex.—Concrete wall slabs *a* are formed with internal passages *b* which extend downwardly and laterally from the top *c* of the slab and open both at the bottom *d* and sides *e* forming in each slab a parallel-sided central web *f* and triangular corner webs *g*. When built up to form a wall and arranged to break joint, the slabs are positioned as shown, and cement grouting *h* poured into the passages effectively keys the whole together.

FIG. I.



The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

Trade and Craft

The New County Hall.

The whole of the decorative marblework at the County Hall was executed by Messrs. Farmer and Brindley, Ltd., and we regret that their name was inadvertently omitted from our description of the building last week.

We are informed that the large bowl pendants in the Council Chamber of the County Hall, the massive six-branched electroliers in the Education Committee's room, as well as a number of dish pendants and wall brackets for various positions of lesser importance, were made by Messrs. Faraday and Son, Ltd., of Wardour Street, W.

Messrs. Rippers Hospital Doors.

Messrs. Rippers, Ltd., joinery manufacturers, of Castle Hedingham, Essex, are exhibiting a full range of hospital doors at the Royal Sanitary Institute Exhibition at Bournemouth, which is being held in the Drill Hall, Holdenhurst Road, from July 25 to July 29 inclusive. Architects, physicians, and all interested in modern sanitation are cordially invited to visit Stand No. 30.

Law Item

Decay of Woodwork. Liability to Paint

Broadbent v. Smith.

July 14. Official Referees' Court.
Before Sir Edward Pollock.

Sir Edward Pollock gave judgment in London in an action heard at Leicester, in which a claim of £145 was made for dilapidations of a house, 107 Hinckley Road, Leicester, occupied by Dr. David James Smith, who was defendant. The plaintiffs were Mrs. Susan Broadbent, widow of the late Dr. Broadbent, by whom the house was let to Dr. Smith, Mr. Reginald Broadbent, and Mary Broadbent, who claimed as executors under the will of Dr. Broadbent.

Sir Edward, in the course of his judgment, said there was no doubt the defendant under the agreement of tenancy was bound to keep the premises in reasonable repair, but only such repair as would make them fit for the occupation of a tenant of the class likely to occupy them. They were now occupied by the plaintiffs, and the question arose as to the condition of the house when Dr. Smith entered into possession. The evidence left that in a very vague state, and he was unable to say from the evidence what rooms were in a bad state and what were not. Plaintiffs had claimed for the painting of every room in the house, but there was nothing to show that any of the woodwork was likely to suffer from decay consequent upon neglect to paint. There were other repairs claimed for which he thought unnecessary, and the result was that he had cut down the claim to £30, and for that amount there would be judgment for the plaintiffs.

Judgment was accordingly entered for the plaintiffs for £30.

ARCHITECTS' JOURNAL

27-29 Tothill Street, Westminster, S.W.1.

Wednesday, August 2, 1922

Volume LVI. No. 1439

Architecture, the Public, and the Architecture Club

THAT public interest in and knowledge of modern architecture at the present time are at a low ebb needs little demonstration. How fully is it recognised that architecture of any age is the reflection of the mind and aims of the people themselves? We get the kind of building that we as a community demand and deserve. If we care little for such things, or are content with a low standard, our building will be poor in conception and mean in execution; if we like vulgar or dreary streets we shall have them. It is only as the general public demands fine buildings that we shall get dignified and worthy towns.

Architecture, the greatest art, indeed the art to which all other plastic arts minister, has in these latter days, when perhaps our standard of values in all artistic matters is not very high, become the most neglected of them all. It is not written about or criticised with any intelligence in the public press. The names of our architects are unknown to the general public. The daily press when it does take note of, say, the opening ceremony of a new building or the unveiling of a monument will tell us about the cost and who unlocks the door or pulls away the veiling. We shall know who presents the bouquets, but as a rule we shall not be told even the name of the designer; and as to any intelligent description or praise or blame of the value of the work we shall hear nothing. We need not stress the poverty of idea in the mass of our modern-day building; we can illustrate it by taking the case of shops alone. The shop in its modern guise is a product of to-day. How often do we find it finely treated—a building of artistic merit? In the suburbs the shopping street is usually synonymous of all that is bad in architecture. We can think of plenty of vulgar rows of shops, but around London only one fine block rises to our mind (of course there are others)—a block in the Finchley Road in the Hampstead Garden Suburb.

In London itself the examples of shops of fine architectural quality are equally rare. Fine ones there certainly are, such as the Selfridge building in Oxford Street, by Mr. Frank Atkinson; the Wolseley building in Piccadilly, by Mr. Curtis Green; Messrs. Heal's shop, by Messrs. Smith and Brewer; and a small motor showroom in King Street, by Mr. Vincent Harris, all of which have real quality; but they are distressingly few among a mass of mediocre buildings. It is the same with every class of structure, whether public buildings, business premises, or domestic houses. It is not for lack of architects capable of doing the fine thing that our building generally is of so poor a character; they are to be found, as our sprinkling of worthy buildings shows; it is rather that we should educate the public or the private owners or public bodies who control and commission building to have the strong desire for and the knowledge of how to judge the best thing.

And so it is that the formation of the Architecture Club, to which we referred in our last issue, may well be one of the most significant events in the history of modern architecture. It perhaps is, as "The Observer" remarked in its leader of July 23rd, "a grim commentary on the artistic condition of our age" that such a Club should be necessary, but it may be the beginning of a recognition by people in general that architecture is the most intimate of the arts and touches the lives of all in the community very closely, both in their homes and in their towns and countryside.

The Club, which is wholly unconcerned with professional politics, has set out with a great object; in the words of its rules, "To enlarge the public appreciation of good architecture and the allied arts, and especially the best work of to-day." It aims at creating a public opinion about architecture—an architectural atmosphere—by promoting the description and criticism of architecture in the press and by holding exhibitions of modern work, the first of which is promised for the spring of next year.

It has taken on a difficult task, and if it achieves its object even in limited measure it will be doing a great work.

Its formation appears to be on the right lines; it has recognised that architecture is not only the concern of practising architects. The membership, though strictly limited, comprises, as well as architects, writers and laymen—all people who are interested in furthering good modern building—and the architects are in the minority.

Thomas Hardy, O.M., now one of our most distinguished men of letters, who started life as an architect, is the Hon. President. The membership seems to cover a wide field when we find upon its roll, to mention only a few, such names as Viscount Lascelles, Lord Plymouth, Lord Lee of Fareham, Lord Leverhulme, Mr. A. C. Benson, Mr. Granville Barker, Mr. Gordon Selfridge, Mr. G. K. Chesterton, Mr. J. C. Squire, Mr. E. V. Lucas, Sir Lawrence Weaver, Lord Riddell, Mr. Clutton Brock, Mr. D. S. MacColl, and Sir Frederick Radcliffe. Among the architects we find Sir John Burnet, R.A., Sir Edwin Lutyens, R.A., Mr. G. C. Scott, R.A., Sir Robert Lorimer, A.R.A., Mr. Herbert Baker, Mr. Ralph Knott, and Mr. Percy Worthington, as well as many other distinguished names.

The Club seems to have found its beginnings in a conversation that took place little over a year ago between Mr. J. C. Squire, the distinguished writer and editor of "The London Mercury," and Mr. Oswald P. Milne. The man of letters, being deeply interested in architecture, expressed the view that architects lived in a world of their own, nobody knew their names even, and if architecture was to take its right place of importance in the modern world they must tell people what they were doing and thinking both in the press and elsewhere. The architect, on his side, said that architects were on the whole practical if inarticulate people, but were ready to do anything to get the public interested in fine building. Meetings of architects and writers ensued, and soon it appeared that there was latent plenty of living interest in architecture among laymen, and that something in the nature of the Club which grew out of these meetings was "in the air" and merely needed a touch to bring it into being.

The architects who, with their fellows in the art of letters, were the prime movers in the formation of the Club belong to the younger generation. The outlook of the Club is broad, and is not concerned with any particular school or phase of architecture; the encouragement of really good work is its aim. It will not encroach upon work of the professional societies and bodies, but clearly will supplement the work that they are doing, and can do much that an official organisation cannot attempt. The Club will be doing in its own way what has been done by the Architectural League in New York. There the annual exhibition is a function that is not ignored by society or the public; every intelligent citizen knows the names of the architects and what buildings they have designed. Architecture is a common topic of conversation, and the commercial magnates have realized that fine architecture is a commercial asset.

We wish the Club every success on the road upon which it has successfully embarked.

The Potency of Bank Buildings

To rebuild the Bank of England is to create no small stir and no small precedent. The enlargement of its premises in Threadneedle Street appeals to the imagination as an outward and visible sign of the expansion of the Empire, and an augury of restored national prosperity.

If the "Man in the Street" is still unaware of the names of the four architects who successively had a hand in building the Bank, it is not the fault of the daily newspapers. They have familiarized him with the names of George Sampson, Sir Robert Taylor, Soane, and Cockerell, and have told him that the architects (whether consultative or executant, he cares not) for the extensions are Mr. Paul Waterhouse, P.R.I.B.A., Mr. Herbert Baker, and Mr. F. W. Troup; the two latter, of course, being the authors of the new designs; while to Mr. Waterhouse the Bank Directors are no doubt indebted for the best possible advice as to the general principles on which the rebuilding should proceed. The "general reader" will have learnt, too, if he had not divined it from his own knowledge and observation, that many features of the old Bank have been thought worth preserving, and are to be preserved, thanks to the wisdom and prudence of the Governors in seeking and accepting sound architectural advice.

Said Mr. Herbert Baker, as reported in "The Times": "The banking halls designed by Sir John Soane for this building seem to give an exceptional sense of dignity and fitness of expression to a bank, and honour can, therefore, best be paid to his memory, not only by the preservation of these halls, but by the acceptance, after the test of a century, of his invention as the motive idea for the natural aftergrowth of his building." The familiar outside blank wall is not to be destroyed, nor are the rooms that Soane put behind it.

Similar tenderness is to be shown towards Taylor's old Court-room, which looks out upon the pleasant Garden Court which was once the churchyard of St. Christopher-le-Stocks. There, right in the midst of the roar and bustle and clatter of the busiest part of the busiest city in the world, silence reigns save for the twittering of the sparrows. It is one of the marvels of London that it contains so many harbours of refuge from the tumult. Drapers' Gardens is one of those that, being not far from the garden with which Sir Robert Taylor, with the architect's true instinct and foresight, provided the Bank, were no doubt directly inspired by it. Pity it is that the Rotunda must go; but, sympathetically though its retention was considered, it could not be preserved.

Taylor's work, which was done between 1694 and 1734, found little reverential regard in Sir John Soane, who seems to have got rid of as much of it as he dared; whereas the present architects are preserving as much of it, as well as of Soane's work, as circumstances will permit.

It is pleasant, however, to see in the Bank such strong reflections of the classical taste affected by Soane as the imitation, in the corner towards Lothbury, of the Temple of the Sibyl at Tivoli, as the Constantine arch leading to the Bullion Yard, and as the Roman baths motif in one of the Stock offices.

A World-wide Influence

Excellent! Such scholarly amenities redeem a bank from the sordidness commonly but quite erroneously assumed to be inherent in lucre. Sampson, Taylor, Soane, and Cockerell, each in his day, and, of course, Soane most of all, helped to establish for all time the classical type of bank-buildings; and, on the whole, an excellent type it is, introducing classic dignity and serenity to many a mean town, and thereby setting an example and radiating an influence that, especially since the passing of Sir Robert Peel's Joint-Stock Banking Act in 1844, has pervaded every town in the kingdom, and far beyond it. The gracious influence has indeed spread overseas, and is no doubt obvious in the designs of the Commonwealth Bank at Melbourne, of which the foundation stones were laid by the Australian Prime Minister and Sir Denison Miller on July 26. Did Sampson, Taylor, Soane, and Cockerell dare to dream that their influence would be so prepotent and so widespread? Taylor and Soane must surely have had an intuition that banks would at no distant day become ubiquitous. Cockerell knew it from actual observation, because he did not succeed Soane as architect to the Bank until 1833, and lived until 1863; while in 1836 "the rage for bank-building," says the annalist, "was at its height."

Mr. Herbert Baker and Mr. F. W. Troup are obviously handicapped by the peculiar conditions. They have not to plan a grand new building, but to enlarge an old one designed by acknowledged masters. It was a problem to solve in fear and trembling, lest one should fall under condemnation of the saying about new wine and old bottles.

But the rearing of this great new Bank in times like the present is a testimony to the wisdom, energy, and enterprise of the Directors, and a powerful incentive to the business community to build boldly and well in spite of those who croak about "unpropitious times."

The Growth of Interest in Architecture

In the House of Commons on July 22 there was a pleasing incident that ought to be less startling for its rarity. A member—Mr. Hogge—who is not remarkable for tenderness towards Ministers, actually rose in his place to express his thanks to one of them. Mr. Hogge thanked Lieut.-Col. Gilmour, as representative of the First Commissioner of Works, for the opportunity he had afforded members to inspect the work of restoration of the roof of Westminster Hall. Mr. Hogge said he understood that the work would probably be completed by the end of March next, and that the cost would amount to £100,000. Lieut.-Col. Gilmour was responsive in a like vein, and this little interchange of courtesies became the more pleasant for eliciting the statement that the Office of Works is considering the question of publishing, for sale to the public, drawings or photographs of the work of restoration. It is in the public interest that it should do so, if there were no other object or effect in view than the stimulation of the public interest in architecture and building; but such publications are of practical value also, and we trust that the Office of Works will not be checked in its enlightened policy. An official description of the work from start to finish would be of great interest as a souvenir of a most interesting piece of restoration.

On Going Forward

A Conversation on Architectural Education

By JAMES BURFORD

(Concluded from last week's Issue)

"I AM opposed," said my friend, as we sat in the veranda after lunch, over coffee and cigars, "I am opposed to the time-honoured type of academic lecture. I do not doubt it has a use and place, but it is not best suited to my purpose here. I have emphasized the importance of appreciation over information; but information, in some degree, we must have, as material to work with; and the surer the judgment the more room there is for facts. But we strive to make our lectures here anything but a one-man show.

"It would seem hard to include the benefits of co-operative and emulative effort in a method of lecturing, but by encouraging our students to take an active part in lectures, by questions and discussion, and by requiring that, in the place of notes, a précis of the matter should be written afterwards, and by a public criticism of these papers, we obtain a deal of the emulative spirit in what, too often, was a tedious performance."

"But surely," I said, "some men have instilled a great enthusiasm by what you term 'the old type of academic lecture'?"

"I will not deny it," he admitted, "but such a man is the rarity rather than the rule, and such enthusiasm evanescent in its quality. You may think my methods elementary, but they can scarcely be disparaged; they stimulate an interest and a mental activity, and, by exercising the memory, they ensure that the knowledge gained is not easily forgotten."

"And so you take every precaution to keep interest afoot," I said. "By all means," he replied; "indeed, it is one of the fundamentals of my creed. When interest flags, true education ceases. The discipline of the mind is one of the aims we have before us, but it must be a discipline maintained by interest, not by coercion.

"Little is gained when the difficult task is regarded as an unpleasant imposition; we must endeavour to cultivate that attitude of mind which attacks difficulties for the power their conquest brings. It is in this spirit we approach architecture here. If you will come with me I will explain the workings of my course.

"I maintain," my friend continued when we had entered another of the studios, "that the student should receive his introduction to architecture proper by way of a sound understanding of the essential needs of building—of the problems of construction and the principles of their solution. He should discover how these difficulties have been overcome in past times, and, what I regard as of great importance, realize that the various appearances these solutions have presented—what are commonly known as 'styles'—are the inevitable outcome of certain conditions, social, geographical, ethical, and political, exerting their influence on problems which are fundamentally the same.

"By acquiring a habit of mind which regards architectural form as the result of factors broadly conceived, he will recognize the necessity for understanding our own times and of approaching modern problems in the same spirit of reasonable deduction."

"Your theory sounds well enough," I said, "as you put it to me, but I should be interested to learn how you carry it out in reality."

"It is in this way," he explained; "we study first what I might term the 'elements' of building—walls and openings in them, lintels and arches, the problem of covering a space, roofs, and all the requirements general to buildings of all periods. To take a wall for example; it does not call for a deal of mechanical demonstration to show why a wall stands up or why it does not, and I encourage my students to find out the principles of construction for themselves, experimentally.

"When these principles have been grasped, in this way, we discover, with the help of books, photographs, and drawings, the various treatments these elements have received, at different times and by different peoples. We take them in an historical sequence to maintain the idea of continuity—confining ourselves to Pre-Renaissance work as being best suited for our purpose. That the reason for the differences of treatment should be understood, our lectures, of the informal kind I have described to you, set forth the life, customs, and resources, in short the history, in its broad sense, of the peoples whose work is under review.

"There is a great interest in beginning a study of architecture in this way. Education should not be like a journey through darkness to some bright land beyond, but rather a progress up some pleasant slope, from which we can see farther as we go higher, and gather flowers all the way."

After so poetical an outburst I felt there was something of bathos in my asking him what part constructional details played in this part of his course. I was mistaken, for he seemed to regard poetry and construction as of equal importance—to be, in fact, as I thought later, very intimately related.

"I fear," he said, "that I have not made my ideas clear to you. It is impossible to study by the methods I practise here without realizing the part that construction plays in architecture. By following a system which gives at once an idea of development and of the causes which controlled it, the student discovers that nothing has been or can be built until the constructional problem is solved, and, on the other hand, that, as new requirements arise, the resources of construction must be extended to meet them. In short, construction is the limit of design, design is the stimulus to construction.

I should think it detrimental to a proper appreciation of architecture and a sound policy of education to introduce the smaller details of construction at this early stage of the student's career. If the broad principles of construction are understood, in a comprehensive way, they provide of themselves an incentive to discover that more exact knowledge which will permit a wider use of the powers already gained. You see, I am true to my conviction that to go from the indefinite to the definite is the proper course to follow."

I had been looking with a growing interest at some of the drawings and papers before me; the written papers sufficiently explained the wide scope of the lectures, a number of sketches showed a searching about for solutions of the problems, while from other drawings I learnt how complete had been the inquiry into the treatment of the same problems in the past.

I remarked on the excellence of proportion the forms displayed; but, as my friend said, there could be little difficulty in achieving a good proportion after the earlier study of composition, "And whenever some power has been acquired," he added, "I make a point of keeping it in active operation.

"But I must not detain you with this elementary work—there is still much to see. Although to me these primary studies have an importance at least equal to the more advanced work—regarding them, that is, from the educational standpoint—I have no doubt the later studies will be, to you, more generally attractive." I was hastily disclaiming any lack of interest in what I had been seeing and hearing as my guide led the way to the next room.

"By the time the student reaches this stage in my course," he continued, "he has sufficient understanding of the 'elements' of building to use them in combination. Our method of study is the same, and we still confine ourselves to the Pre-Renaissance work. We find out how these 'elements' have been combined in the past, and we consider the conditions which controlled their use.

"At first I choose buildings which show these combinations in their simplest forms; and an historical sequence, if properly handled, gives a natural progress to more complex arrangements—we are studying in miniature, as it were, the development which took centuries to evolve. Our lectures deal more closely with the details of construction and design. It would, of course, be a waste of energy to acquire an exact knowledge of the building trade as it stood in any historical period, but a general understanding of the evolution of constructional resources is essential to a proper appreciation of the architecture of the past; a report explaining these matters accompanies each design."

"I suppose it is about here that you make room for a study of the Orders?" I asked.

"Oh, the Orders," he said, smiling; "we take them in, certainly. But we find that they have to be divested of a good deal of the pre-eminence and pride they once enjoyed. We consider them as parts of an organic whole, subject to change and growth, not as separate entities of isolated perfection."

"And what importance do you give to the reconstruction of historical buildings?" I enquired.

"It is my opinion," he answered, "that reconstruction of the kind you mention has little educational value. A critical and comprehensive study of such buildings is necessary in any system of architectural education; but we must search for the spirit, and not content ourselves with the letter. It is, for example, of more use to design an Imperial Thermæ for the Roman people than to reconstruct the Baths of Caracalla."

The drawings he showed me indicated the results of his teaching and impressed me with the power and freedom of the draughtsmanship. There was no attempt to make for prettiness, but the drawings very adequately expressed the designs as buildings. Laboriousness, unnecessary finish, and irrelevant additions, were alike absent—in short, the work was eminently workmanlike. My friend was at pains to show me how the problems were approached by determining the essentials of construction, and what surety the earlier training in composition gave to the handling of the forms.

"And in planning," he went on, "we have the same powers at work. If we have a sufficient knowledge of conditions to put the various units in the right relation to each other, our appreciation of constructional possibilities and the requirements of composition will enable us to combine them in a plan of architectural worth."

"I suppose you have some periodic test of the student's progress?" I said. "What examinations do you hold?"

"If you mean examinations in the generally accepted sense, we have none," he replied. Seeing my puzzled air, he continued: "To the student, an annual inquiry into his attainments—superficial and limited as it necessarily is—gives a poor indication of his progress; he should be constantly aware of the extent of his powers, for a self-knowledge assists his development. But with the system we have here, the papers which follow the lectures, the reports which go with the designs, and the frequent criticisms of his studies and drawings, give an indication of his advancement sufficient for him and more than enough for the needs of the staff."

"And added to those advantages," I said, more than partly convinced by his argument, "you avoid the cramming which annual examinations inevitably excite, and banish for ever that incubus of possible disaster which made my work of more pain than pleasure."

"And which robbed your work," he added, "of much of the educational value it might have had."

We continued our tour to the next studio.

"It is here," he continued, "that we study architecture from the beginning of the Renaissance to the time when eclecticism took the place of traditional development. By grouping this period as a field of study we can recapitulate the knowledge already gained and re-use our resources as fresh conditions and new means of construction dictate or permit. By discovering how new influences will give fresh life to old familiar things—how new vitality can spring up, phœnix-like, from out the past—we receive a suggestion of a way of approaching our problems of to-day.

"Many of the constructional details encountered at this stage have so close a bearing on modern work that an exact study may be made of them, but those of more recent invention are reserved for their proper place and time, when their use and purpose can be better understood. You can see," he went on, turning over a number of drawings and sketches for my inspection, "that the student is reaping a yet richer harvest from his previous acquirements—from his early appreciation of composition, his understanding of the 'elements' of building, and his study of Pre-Renaissance architecture. From beginning to end my students have two and a half years with this historical study; their next step is to apply their gain of knowledge and abilities."

I could think of no very apposite remark for the occasion, my friend seemed anxious to explain the remainder of his course, and after the usual migration attendant on the introduction of a fresh phase I was ready to witness the results of what I had already seen.

"But do you never find," I asked, "that some students have a marked predilection for the work of some particular period?" With that he came back on me with, "Such a discovery would announce the complete failure of my whole educational system. You see," he continued more quietly, "my students have not only discovered what buildings were like or how they were constructed, they have also inquired into the reasons for the forms they took or the methods employed.

"Such a system of education encourages a type of mind which seeks for reason in all it does, which is not afraid to let its conclusions be guided by conditions nor to seek for help in the storehouse of the past. A mind so trained will reject instantly the idea that the manner of a bygone day is wholly suitable for modern usages.

"Of course, a study of the past, however properly made, is not alone sufficient to ensure a reasonable advance. Our work, at this period, includes a study of the broad aspects of the social and political questions of the present day. It may seem strange to you, perhaps, to find lectures and essays on such subjects as 'Individualism and Co-operation in Industry,' 'The Organization of Peace,' or 'The Future of the Empire' taking place in a school of architecture; yet such matters must play their part if architecture is to have a vital meaning in the civilization of the future. Our inquiry into the means of construction embraces all modern resources—you will notice that they are not introduced until their need is felt and their purpose appreciated.

"We have passed from the indefinite to the definite—from the abstract to the concrete—and we can build up on what has gone before; the details are quickly acquired when the principles are understood. In a time which is short when compared with that taken under the old method of putting the details first, we are calculating the stresses and strains of a steel-framed building or following the intricacies of ferro-concrete."

A brief inspection of the drawing convinced me of the continuity of his system. The first design—the student's earliest attempt to help the progress of architecture, as my friend remarked—was for a small building, governed by the simplest conditions and calling for few constructional details, but those very fully understood. The next was more complex, but came into line with the student's growing attainments. Each step led to the handling of more complicated problems, to designs governed by an increasing exactness of conditions. Though the preliminary studies were rendered, with the shadows properly projected, the final designs were presented as working drawings. Some of the later problems equalled any to be met in actual practice.

I spoke of the rapid development apparent in the work before me, and my friend replied: "The student is now in a position to make a quick advance. He has an ample stock of resources to draw upon, he is backed by his appreciation of composition, his understanding of the fundamental principles of construction keeps his work in the line of probability, he can apply the whole range of his study of the elements of design, he has gained a knowledge of the past and the habit of using his knowledge in a critical spirit, and he has formed that attitude of mind which recognizes that architecture is controlled by causes and conditions."

I felt there could be no doubt of the thoroughness of his equipment. "And what time do your students give here to this modern design?" I asked.

"About two years," he said, "and that brings my course to a length of six years or thereabouts. I have taken you through it in less than a day, and I think we are both in need of a little relaxation."

* * * * * *

"There seems to me to be one particular objection to the system you use here," I said, when tea and toast had warmed me to criticism. "If a student found himself unable to take more than, say, the first four years of your course, through lack of funds perhaps, however far he would have advanced in an appreciation of architecture, he would stand poorly equipped for the necessity of earning his living."

"He certainly would," my friend replied, "but there is little danger of his finding himself in that predicament. It has begun to be realized that a proper study of architecture is a liberal education; for that reason some part of the time and money formerly spent on a general education may be laid out on a special education with as much immediate profit to the mind and, from its closer application, with more ultimate gain to the work of life. In a school such as this, students can begin their special training younger, and keep to it longer, than was once the case."

Our conversation turned to the subject of his staff. "Any system of education is worthless unless used with skill," he said. "When I began my work here I had great difficulty in finding the right men to help me; it was that that brought about my course for the training of instructors. A knowledge of architecture, however extensive, or abilities in it, however brilliant, do not necessarily imply a capacity for educational work."

"I suppose not," said I; "architectural education has become a complicated matter since the days when we were simply apprenticed to the trade, so to speak."

"Not complicated, but different," he replied, "and on the whole, I think, simpler. If you would understand the system of education I use here, ask yourself two questions The first: How and why has architecture developed from its origin to the present day? The second: How does the mind develop from a state, architecturally speaking, of knowing nothing, to that attitude of thought which will make men an influence in the progress of civilization in the years to be? It is on the answer to these questions that I have built up the whole structure of my policy."

* * * * * *

It was a regret to me that our conversation should be interrupted at this point by the necessity of my catching the return train to town. I arrived at the station with a bare minute to spare, and as I settled myself in the corner of my compartment I laid aside the book I had brought with me to while away the journey. If there were some things in my friend's ideas with which I did not agree, there was that in them had given me "much food for meditation."

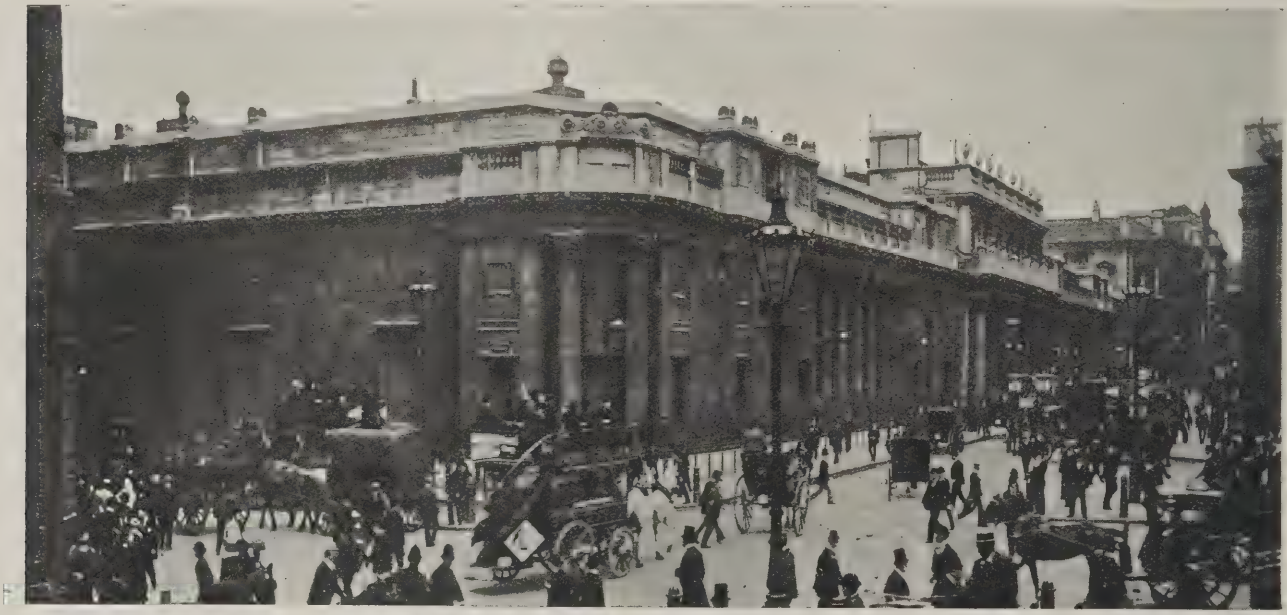
Acoustics and the Architect

IN the Council Chamber of the new London County Hall the speakers are heard with difficulty. It is, unfortunately, not an uncommon defect in a new building; nor, indeed, in an old one, as witness the notorious case of St. Paul's Cathedral; and many writers in the Press have asserted, rather ignorantly, that insufficient attention has been given by architects to the science of acoustics; the fact being that, in designing any building in which speaking or singing is to be heard, the architect always gives the most anxious consideration to this matter, and we do not for a moment doubt that Mr. Ralph Knott made full use of all the available data before proceeding with his design. Those data are admittedly very scanty, and many an architect has had to deplore the fact that the science of acoustics as applied to buildings is largely, if not entirely, empirical. From patient and protracted experiments the late Mr. W. C. Sabine, who was then Professor of Physical Science at Harvard, deduced many important facts. Nevertheless, as Sir W. J. Pope, of the University of Cambridge, has said in a letter to "The Times," "So far, no attempt has been made to ascertain the factors which determine acoustical efficiency in an auditorium." He adds: "It is, however, certain that a quite small expenditure of time, money, and intelligence, would suffice to provide architects with knowledge which would enable them to render every hall acoustically perfect." Sir Joseph Larmor, another distinguished Cambridge Professor, is much less positive if not less sanguine than Sir William. To his interesting letter on the subject he appends a very useful moral: "Until the principles governing a phenomenon have been elucidated as a matter of pure science, it may be of little use groping by experiments of trial and error after tentative modes of improvement. In architecture as in other practical arts, much may be gained by traning in a university atmosphere." From all this it follows that the newspaper and other critics who have made haste to blame the architect for the alleged "defective acoustics" of the London County Hall Chamber do not in the least know what they are talking about. We shall return to this important subject in a later issue. In the meantime we are impelled to protest against the gross and grotesque unfairness of blaming an architect for not having mastered a science that has not yet been formulated.

The Rebuilding of the Bank of England

THE question of rebuilding the Bank of England has for some time been engaging the attention of the Court of Directors, in order to provide on the existing site accommodation for the whole staff, of which the greater part is now working in various buildings in other parts of the City.

For this purpose an entire reconstruction of the interior will be necessary. But in order to preserve as far as possible the style and character of the existing building it is proposed to keep the present outside walls with as many of the old rooms behind them as possible; to continue a similar series of top-lighted offices round the site, and, inside the enceinte thus formed, to raise the building to the height of four or five floors. In the course of the consideration of these preliminaries, the Bank consulted on the general question the President of the Royal Institute of British Architects, Mr. Paul Waterhouse, who was unhesitating in his reply that the only possible way of harmonizing the artistic claims of the Bank with its present duties lay in the direction of building a central structure of the necessary height surrounded by a girdle of lower buildings composed in fact of the existing external walls —unaltered and without any avoidable superstructure.



THE BANK AS IT IS.

The Bank furthermore have been in consultation with Mr. Herbert Baker, F.R.I.B.A., and Mr. F. W. Troup, F.R.I.B.A., and we publish some sketches which, with the following notes, have been prepared by Mr. Baker :—

"Long and sympathetic study has been given to the determination of the extent to which the more valuable portions of the old building of the Bank of England could be retained consistently with the creation of a new structure worthy of the Bank, and sufficient for its needs.

"The facts of the site in relation to its light and the surrounding streets and buildings, together with the practical and sentimental values of silence, security, and seclusion which the present blank external wall affords, all seem to point favourably to the policy which it is proposed to adopt and to a solution of the problem on the lines of Sir John Soane's own design of top-lighted halls screened from the street by his great blank wall.

"In an architectural appreciation of this building, Sir John Soane's life work and masterpiece, it may be recognized by those who have given most study to it that his genius is more specially distinguished by the powers of invention which he shows in the varied and ingenious treatment of domical-vaulted and top-lighted spaces. His banking halls seem to give an exceptional sense of dignity and fitness of expression to a Bank, and honour can therefore be best paid to his memory not only by the preservation of these halls, but by the acceptance, after the test of a century, of his invention as the motive idea for the natural aftergrowth of his building.

"The proposal under consideration by the Directors includes the retention in its entirety of the outside blank wall with such of Soane's rooms as lie behind it, and the construction of a sequence of similar rooms behind the old wall right round the perimeter of the site.

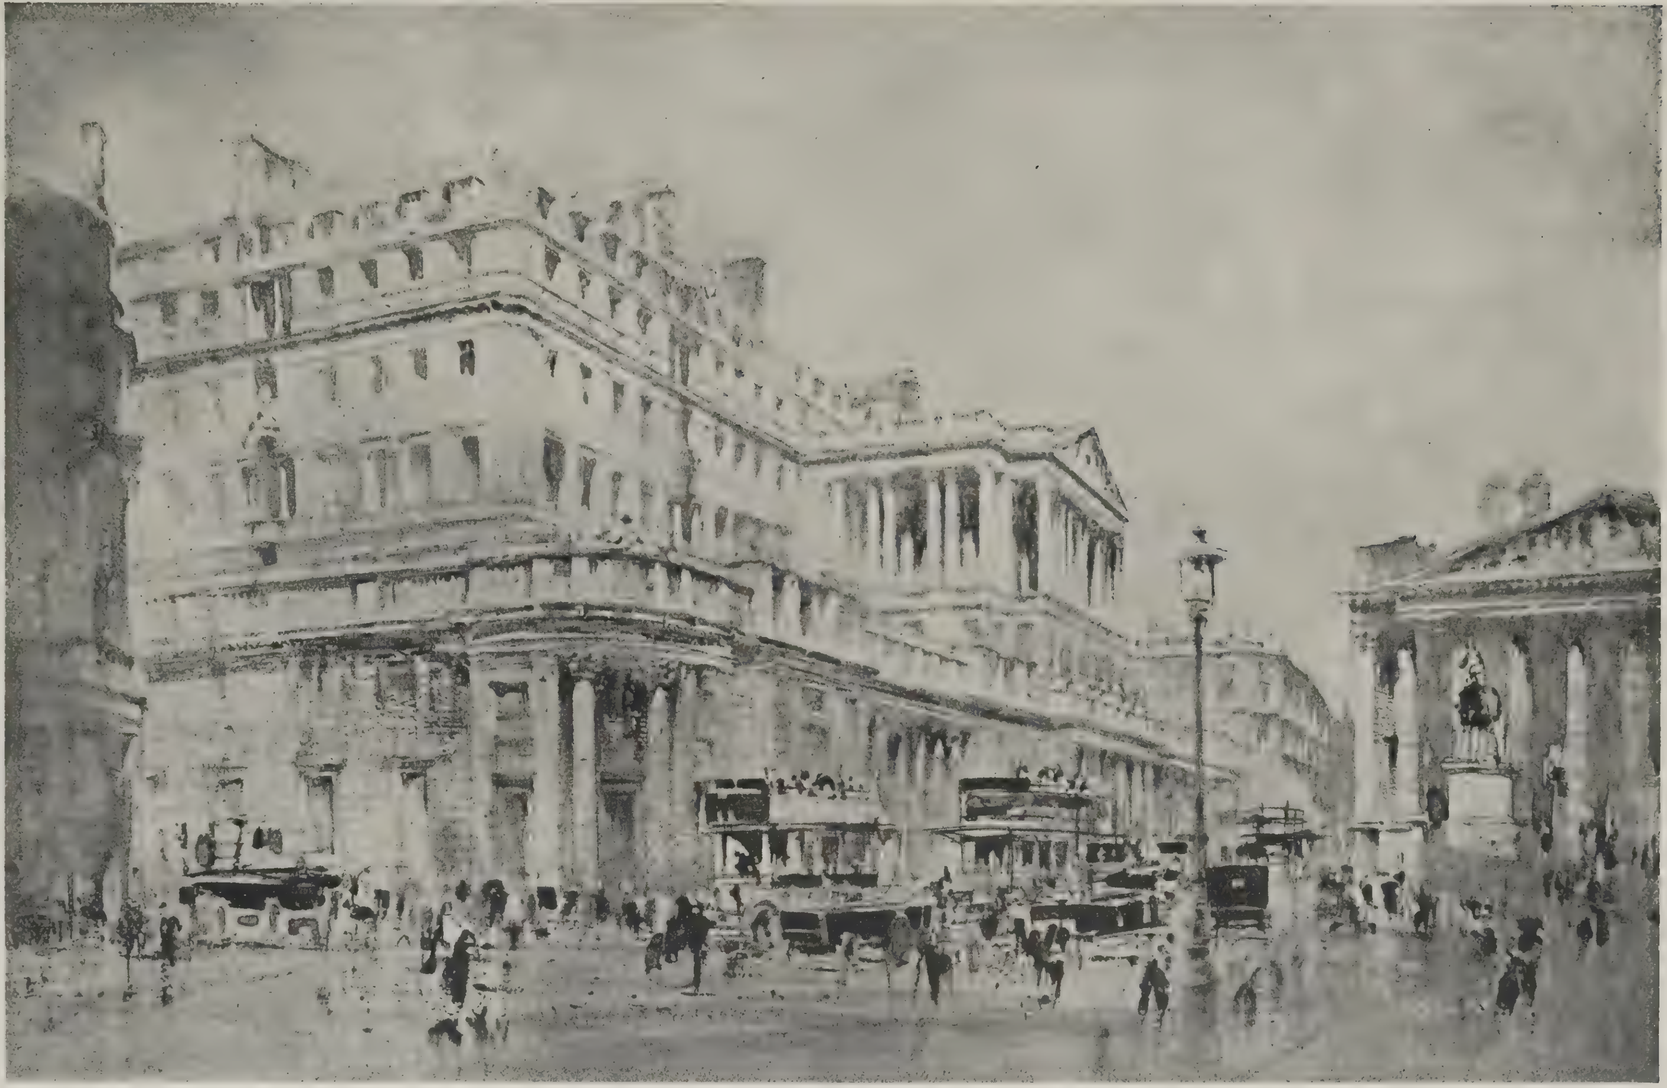
"A feature of characteristic beauty in the Bank is the open Garden Court on the site of the old churchyard with its venerable tree and Taylor's old Court Room looking out upon it. This small court, however, if the walls round it are raised, would lose its light, its tree, and its charm. It is therefore proposed to build a larger open court in the centre of the site where it will best fit the organism of the building, and to reconstruct on the north side of it, with the same southern aspect as of old, Taylor's old Court Room with its attendant Committee Room and as many of the attractive little ante-rooms as may be possible.

"It will be between this inner court and the outside sequence of Soane's banking halls that it is proposed to rear the new inner building to the fullest height which may be held to be legitimate and advisable for the architectural harmony of the building as a whole, and for the light and health of the surrounding narrow streets and buildings. It has been considered that such a plan, while retaining what is of the greatest value in the old building, will give at least as much accommodation on the ground floor as would be possible in any scheme of reconstruction, and on the upper and basement floors sufficient well lit and ventilated office space for the future needs of the Bank.

"Most sympathetic consideration has been given to the retention of the Rotunda, but it has been considered that the retention of its great masses would involve too serious

Current Architecture. 162.—Proposed Rebuilding of the Bank of England

Herbert Baker and F. W. Troup, FF.R.I.B.A., Architects



In this suggested rebuilding it is proposed to retain the outside blank wall in its entirety, with such of Soane's rooms as lie behind it. Between a new central court and surrounding halls will be reared a new inner building four or five stories high. A notable feature of the reconstruction is a projecting portico on the front towards the Royal Exchange.

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

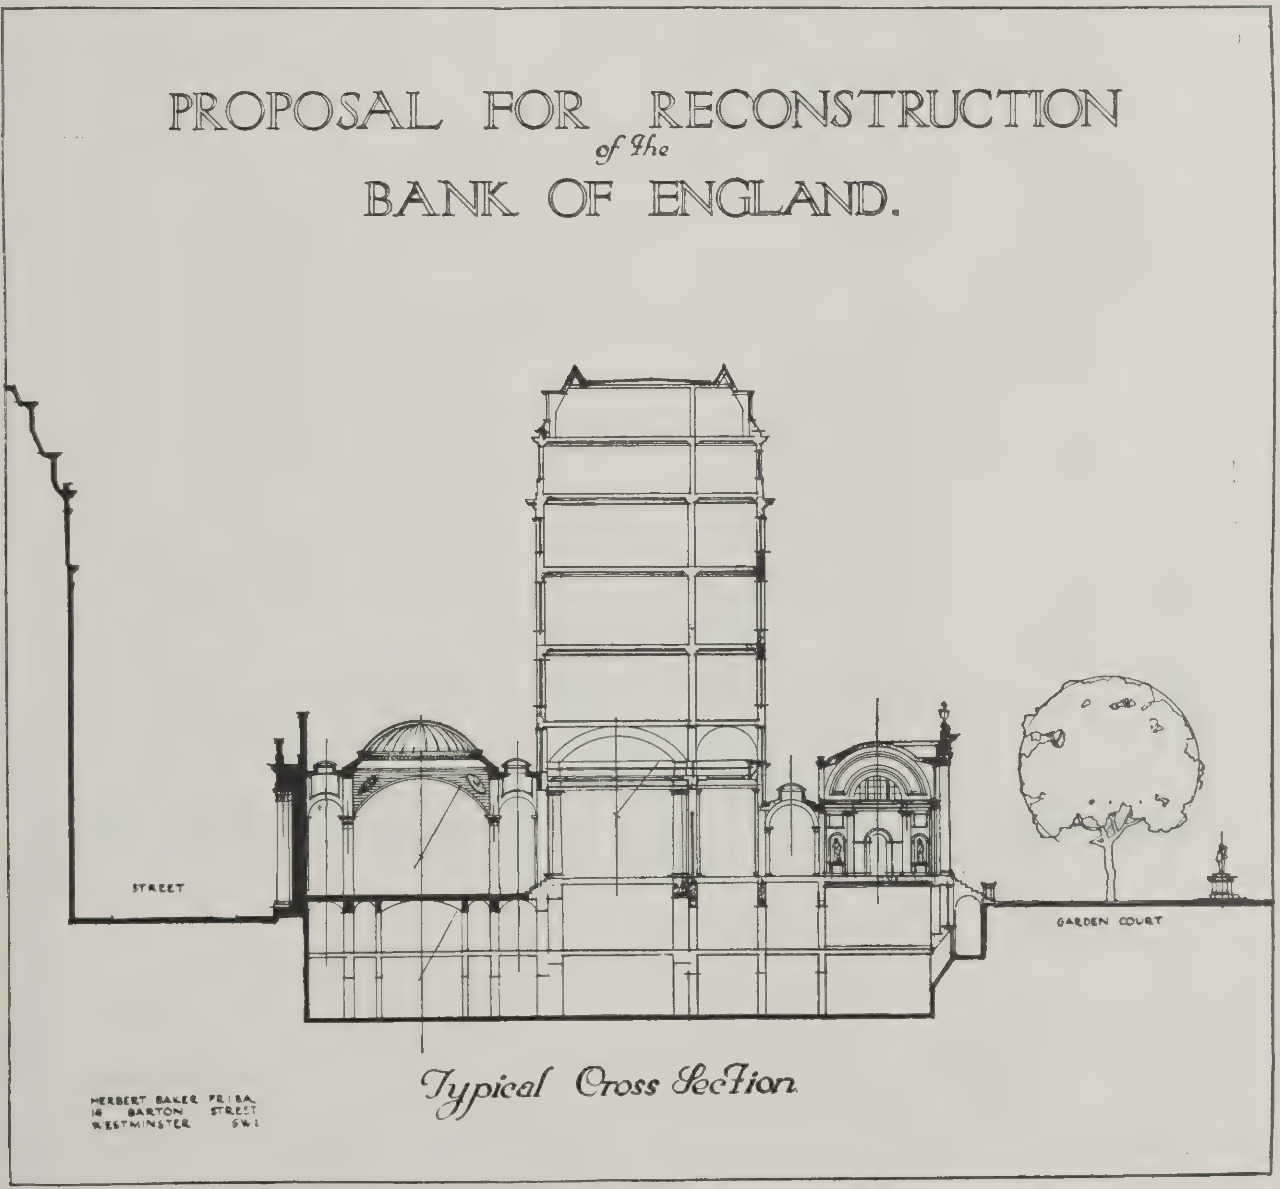
a sacrifice of space and efficiency. But there are throughout the building many ingeniously vaulted rooms and corridors, and it is hoped that after more prolonged study of these and of the requirements of the new building, it may be found possible to set in the new building some more gems of the art of Soane, or of Taylor, or even of Sampson.

"It must be understood that the drawings now published in no way represent any final solution, and have been prepared only as illustrations of the very complex problems involved in the rebuilding scheme. The plan illustrates the three main features herein described, the outer sequence of top-lighted rooms, the new inner court, and the high building between them. The section is intended to illustrate a possible method of lighting through the great width of continuous offices. The perspective illustrates the general appearance of such a building, and presents only a possible solution of the problem of connecting the old low and new high building in some way that will give visible architectural expression to the unity of the building and the sense of the continuity of the life of the Bank."

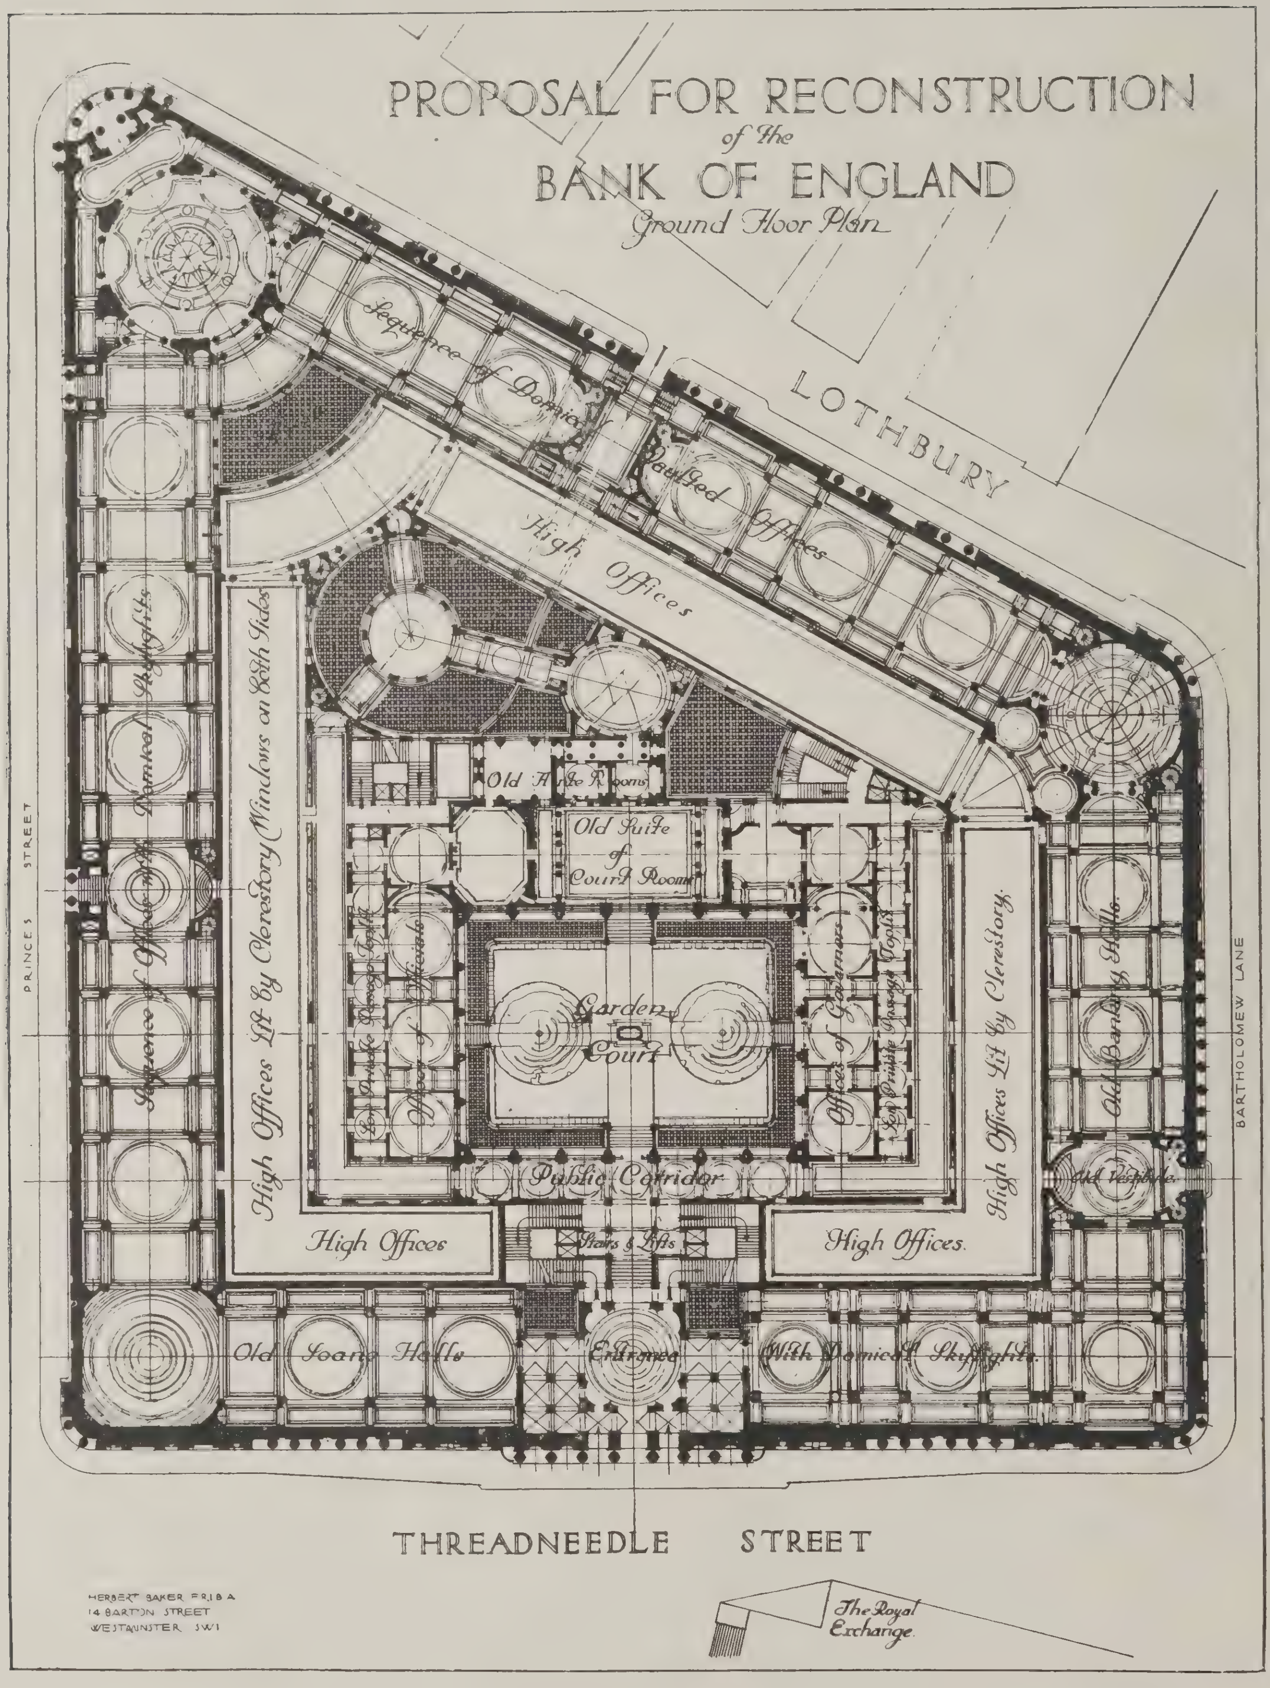
In some quarters the proposed rebuilding has not been favourably received. We quote the following from "The Westminster Gazette":—

"It may be admitted at once that, according to the architects' drawing, much skill has been devoted to the task of finding a way to enlarge the Bank of England without destroying the architectural features of the present building. The picture which has been prepared is that of a handsome and imposing structure; but architects' drawings are no more to be accepted at their face value than house-agents' advertisements, and in this case it is possible that the design may be carried out in all faithfulness and yet have a very different effect from that which the draughtsman suggests. The scheme proposes to leave the outer rectangle of Sir John Soane's building, with the 'practical and sentimental values of silence, security, and seclusion which the present blank external wall affords,' and to erect within it a structure more than three times its own height—to 'the fullest height,' the architects tell us, 'which may be held to be legitimate and advisable for the architectural harmony of the building as a whole.' The result would, undoubtedly, be a very fine building; but in 'architectural harmony' it would be altogether lacking. The present long, low walls will lose all the value of their proportions and their design if they are made to serve merely as the pedestal of a miniature sky-scraper. If the Bank is to be rebuilt at all, it should be rebuilt entirely, for there is enough unfortunate patchwork in the architecture of London already."

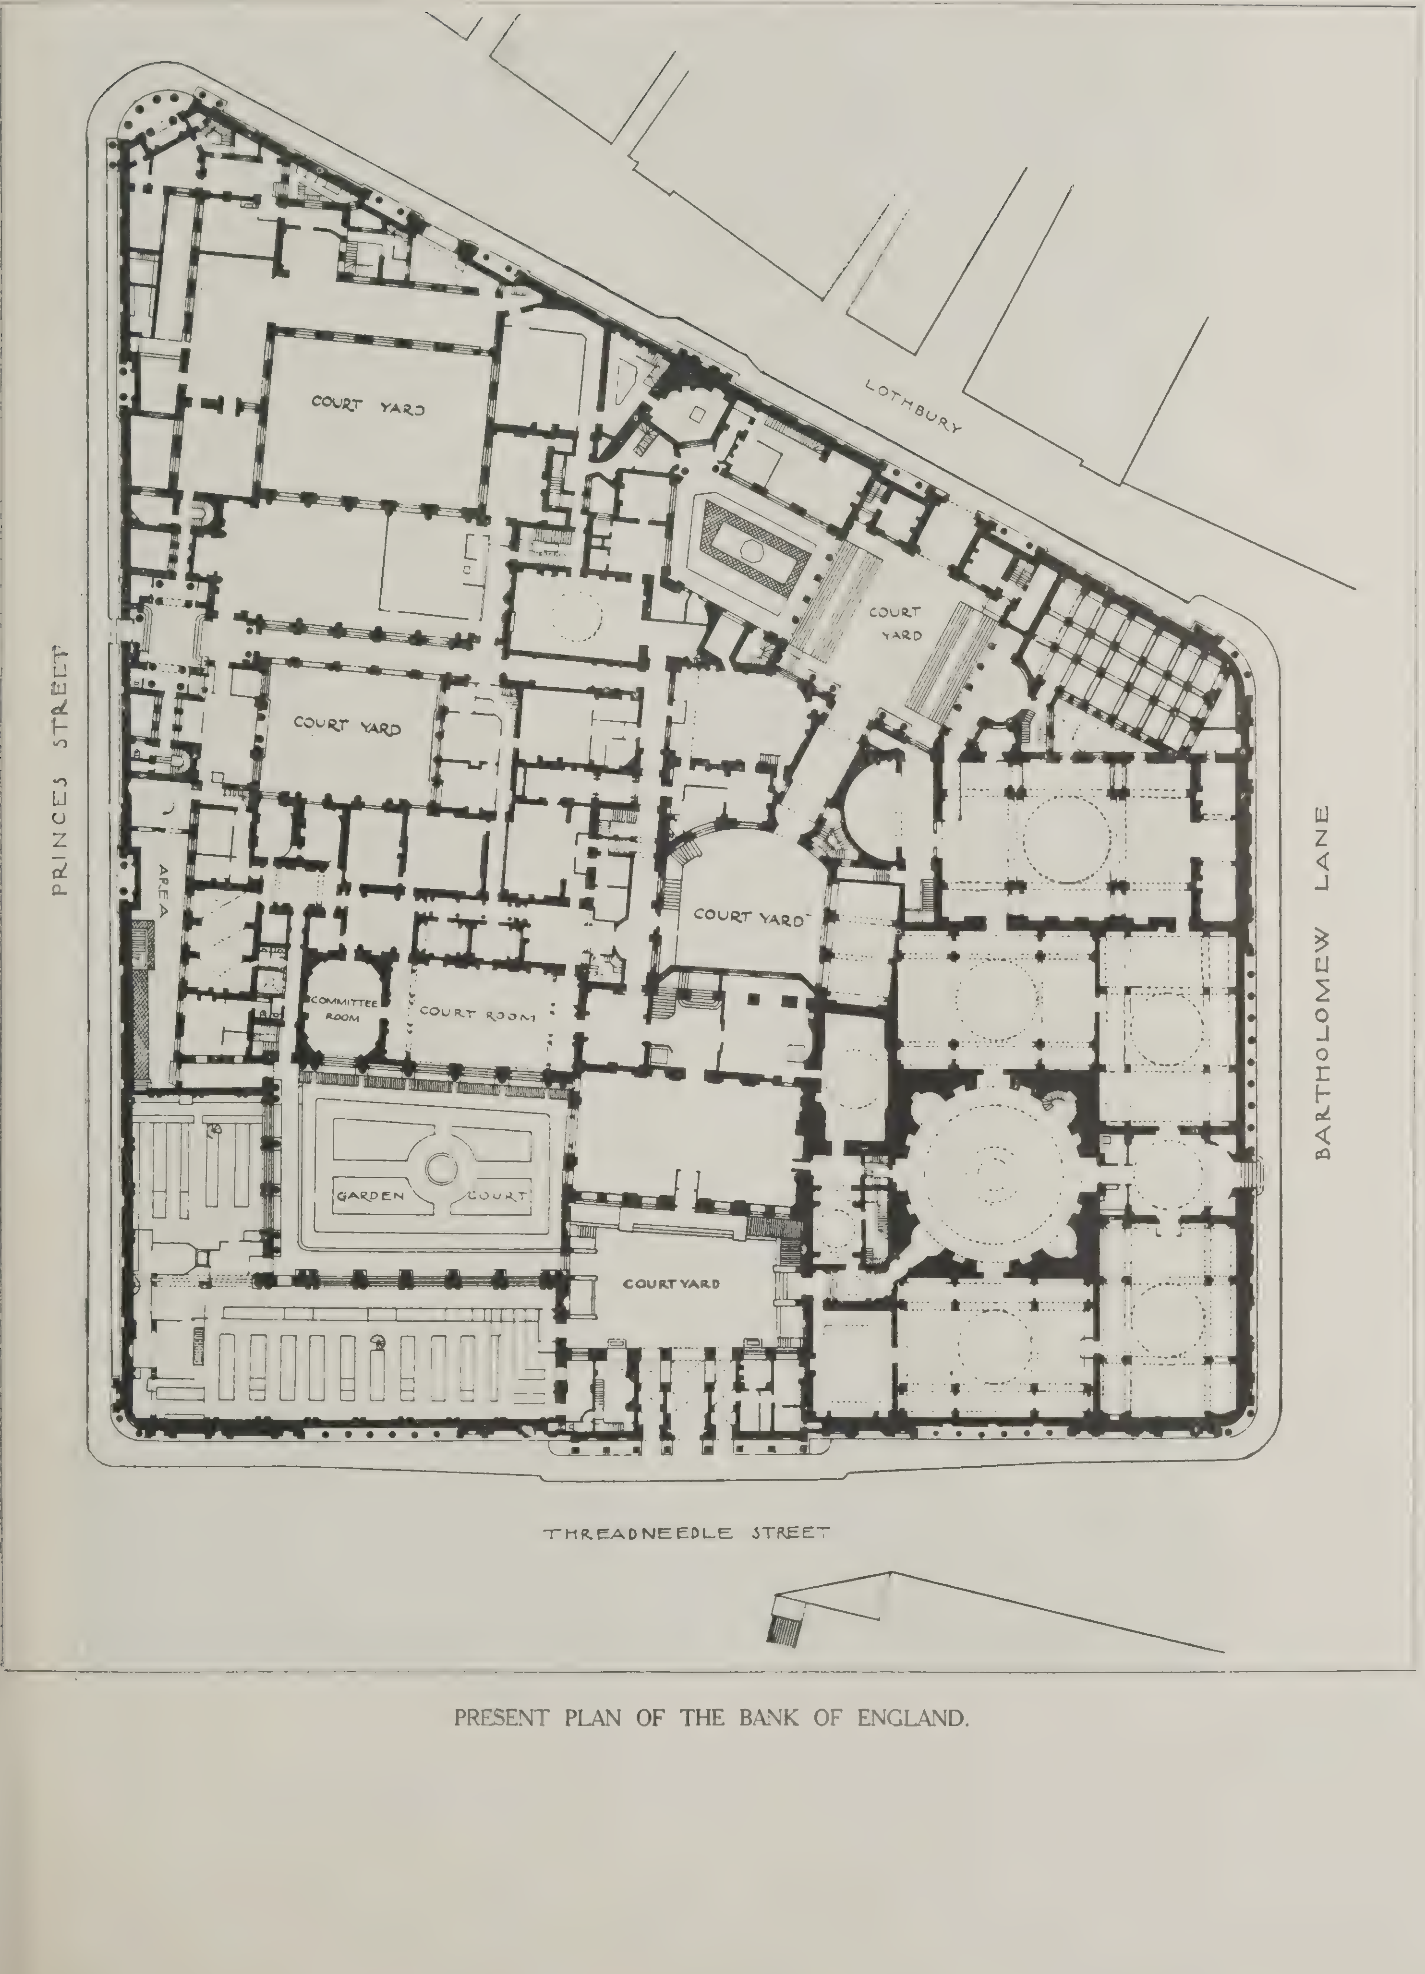
[That the architects themselves anticipated this objection is certain. In any case, they are to be congratulated upon a solution which, though a compromise, is an extremely clever one. We should welcome the opinion of our readers on the question of whether the Bank should be remodelled or entirely rebuilt.—Eds. A.J.]



HERBERT BAKER AND F. W. TROUP, FF.R.I.B.A., ARCHITECTS.



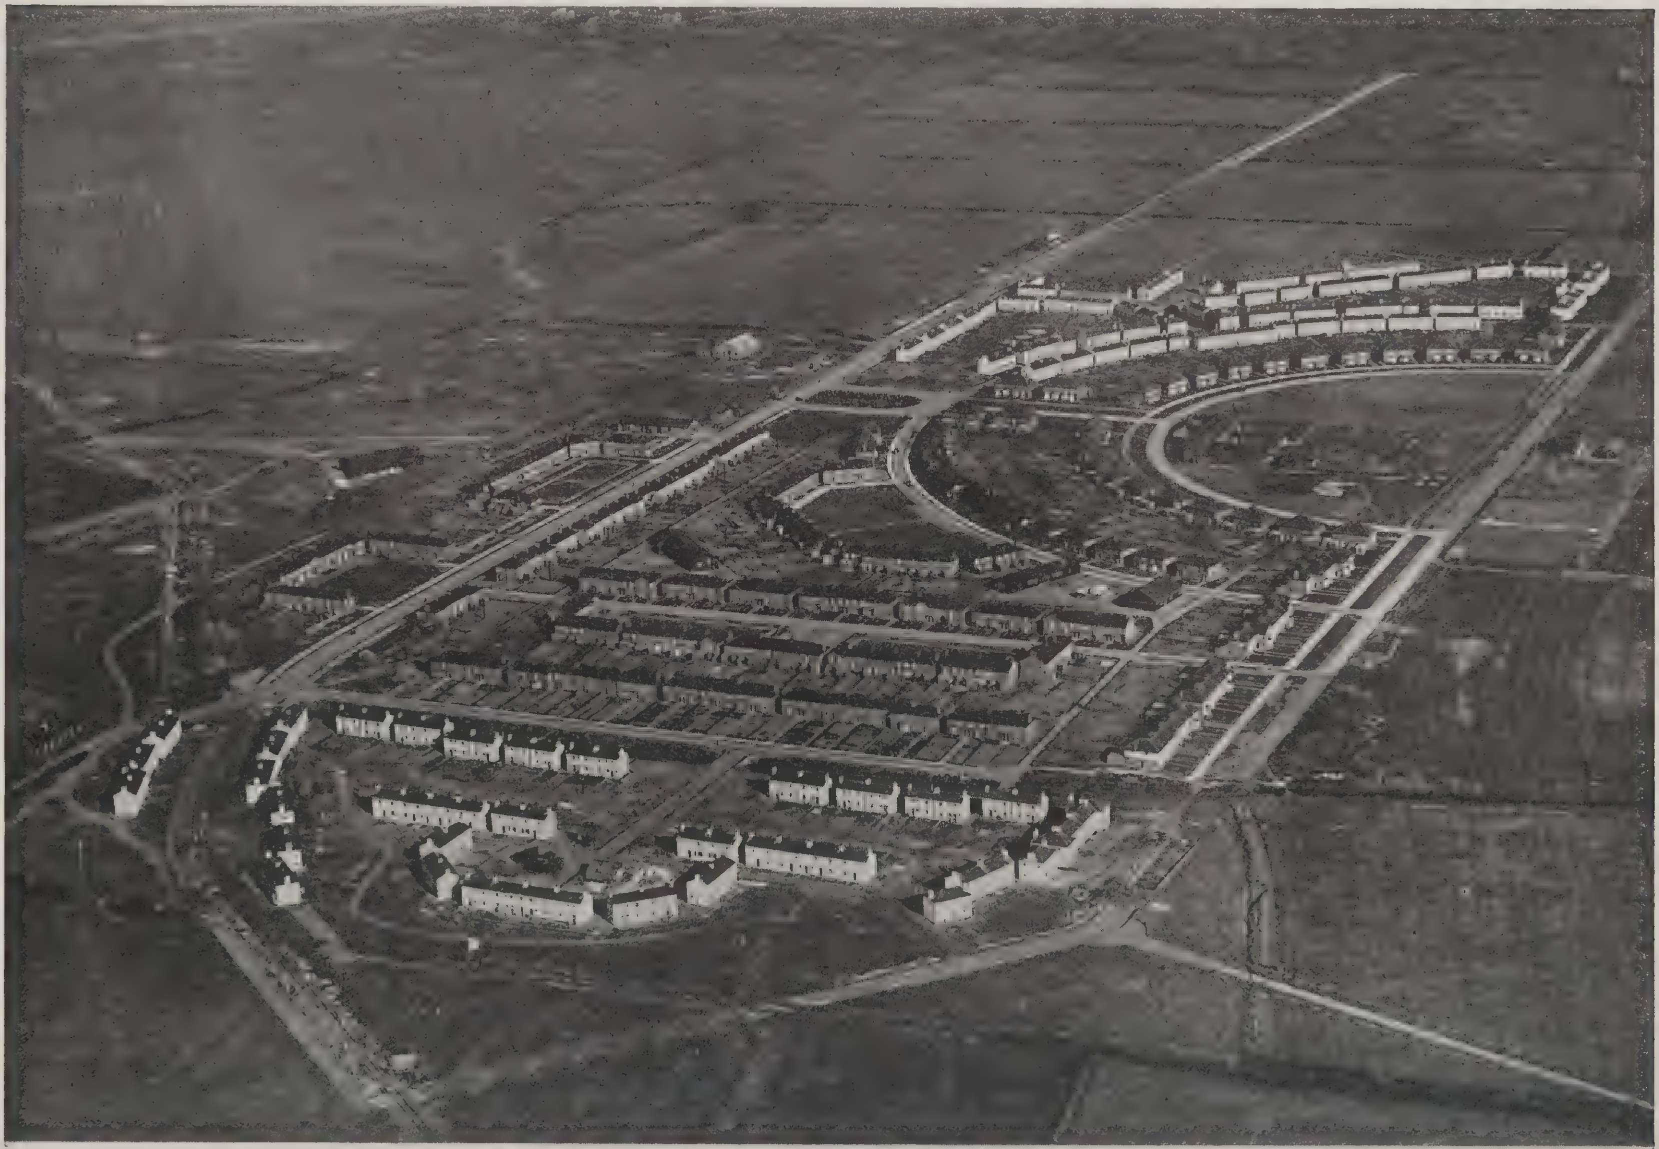
PROPOSED NEW PLAN.

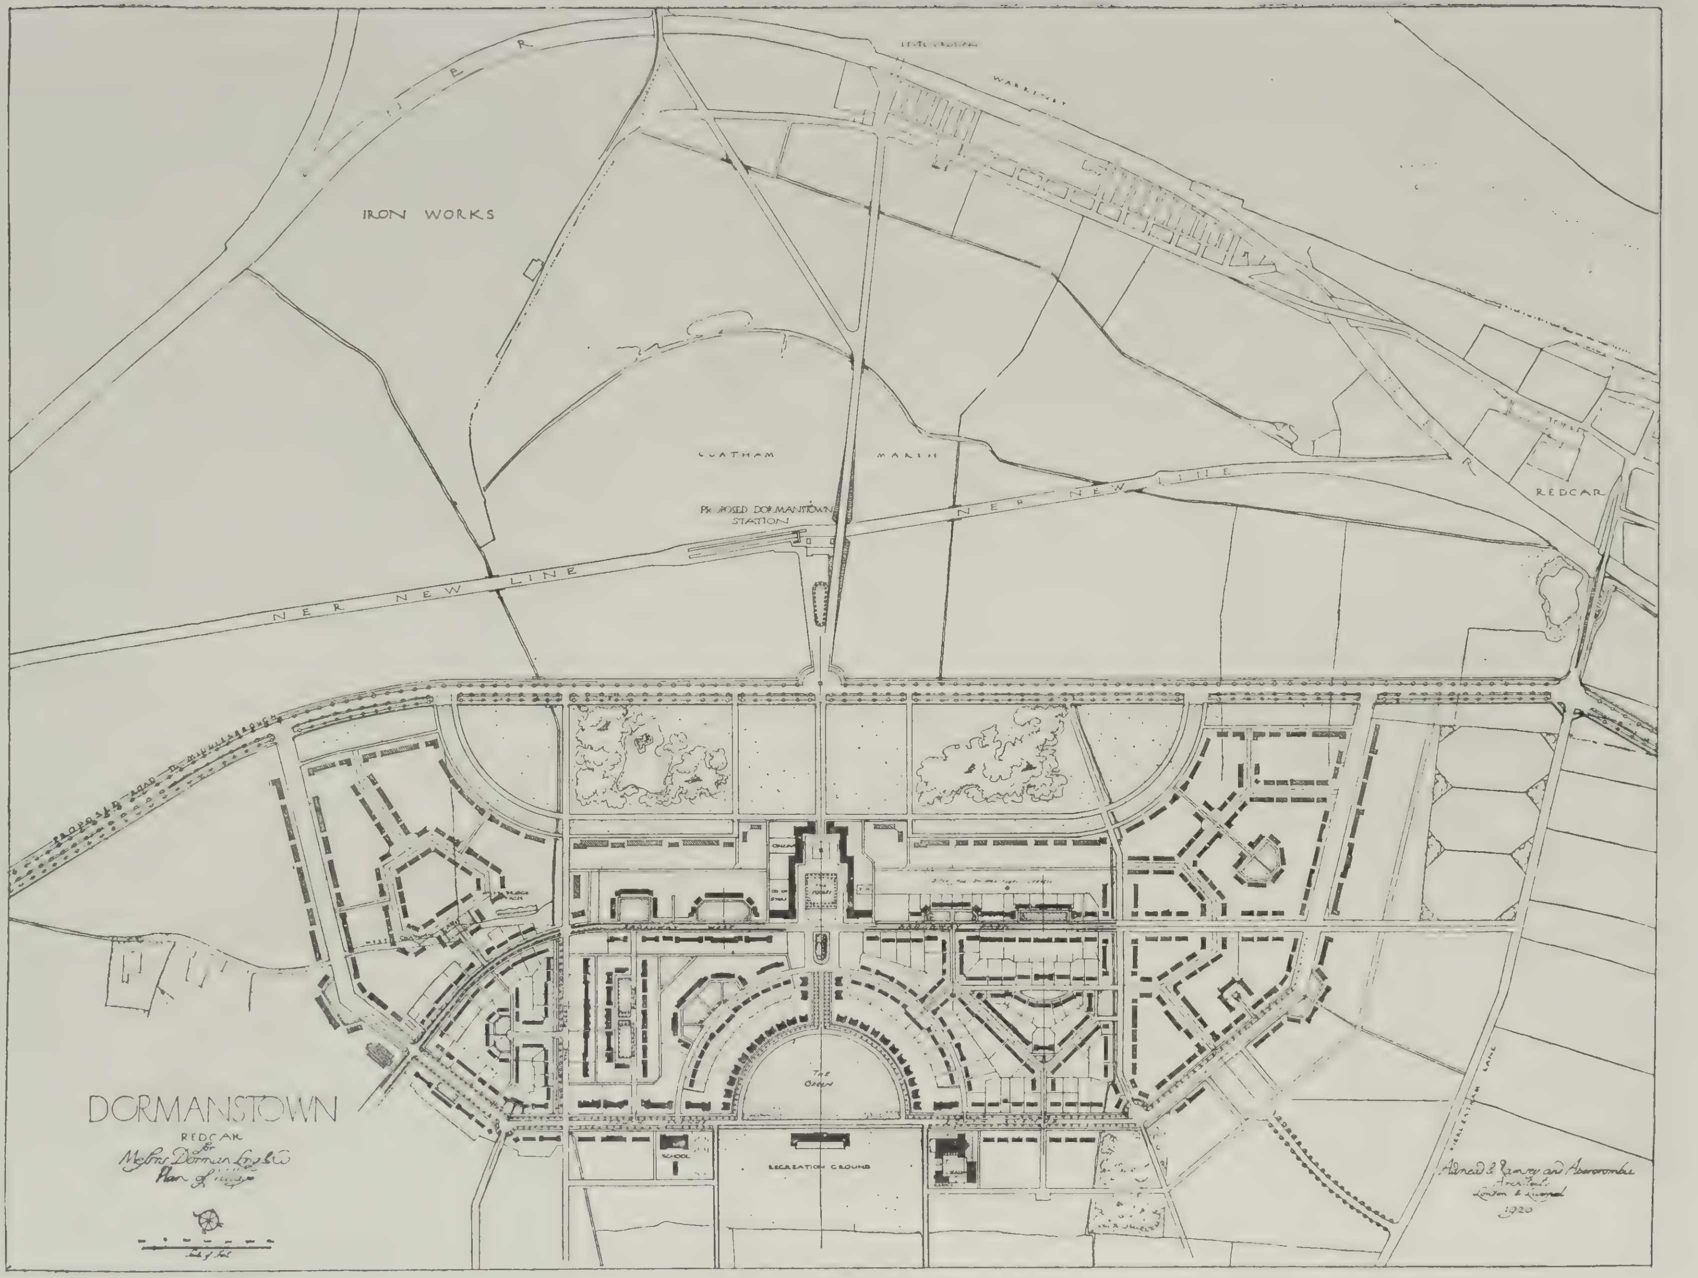


PRESENT PLAN OF THE BANK OF ENGLAND.

An Air View of the Industrial Village of Dormanstown, Redcar, Yorks

Adshead and Ramsey, with Patrick Abercrombie, Associated Architects





An illustrated description of Dormanstown was given in our issue for December 31, 1919. We now reproduce a remarkable air view of the scheme, together with the architects' plan, which affords an interesting comparison.

The Chiswick Works of the L.G.O.C.

THE depôt at Chiswick built for the overhaul and reconstruction of the London General Omnibus Company's motor-buses is, the company claims, the most modern in lay-out and progressive in system in the world. It is located in Gunnersbury, immediately facing the Chiswick High Road, and buildings and plant were erected by direct labour to plans prepared by the company's staff.

The works extend over 31 acres of ground, of which the buildings cover more than half. Thirteen acres are actually under cover, and the main building, which is of steel-frame construction, occupies an area of some 300,000 sq. ft.

In the works the motor-bus overhaul, formerly discharged in between thirty and forty different garages scattered all over London, is now concentrated and standardized in one establishment.

Before the works were in full swing, the average time taken for a complete motor-bus overhaul was sixteen days, but the Chiswick system will reduce this time to four, which means a saving of twelve clear working days per vehicle per annum.

Building was actually begun in September 1920. By the following March a certain amount of work was being turned out in the coach-building section. The engineering side did not actually begin operations until August, 1921. By September, 1921, the weekly output of completely overhauled vehicles had reached fifty. Within two months of starting, this figure had risen to seventy-five.

The works are laid to accommodate a weekly total of a hundred units nominally, but the system is elastic enough to enable the executive to handle, during short rush periods, 120 vehicles weekly.

When in full swing the works give employment to something like 2,000 people, the men being almost equally divided between the engineering and the coach-building sections.

The welfare of the staff has not been neglected, and in the works canteen, where 1,000 men can be served, meals are provided at cost price. A portion of the spare land has also been laid out as a sports ground for the use of the employees.

Motor-buses for overhaul are driven to Chiswick under their own power. Turning in at the entrance gates, they leave the main block of offices—which are detached from the works proper—on the left, and continue to the west side of the works where, actually entering the factory for the first time, they run, still under engine power, on to marked ways to the body-demounting shop.

The first operation is the removal of the bolts holding the coachwork to the chassis. A multiple hydraulic jack swings into position, and the coachwork is lifted clear, after which the chassis leaves the demounting shop and continues its journey right round the works to a second gate, located on the other side of the factory.

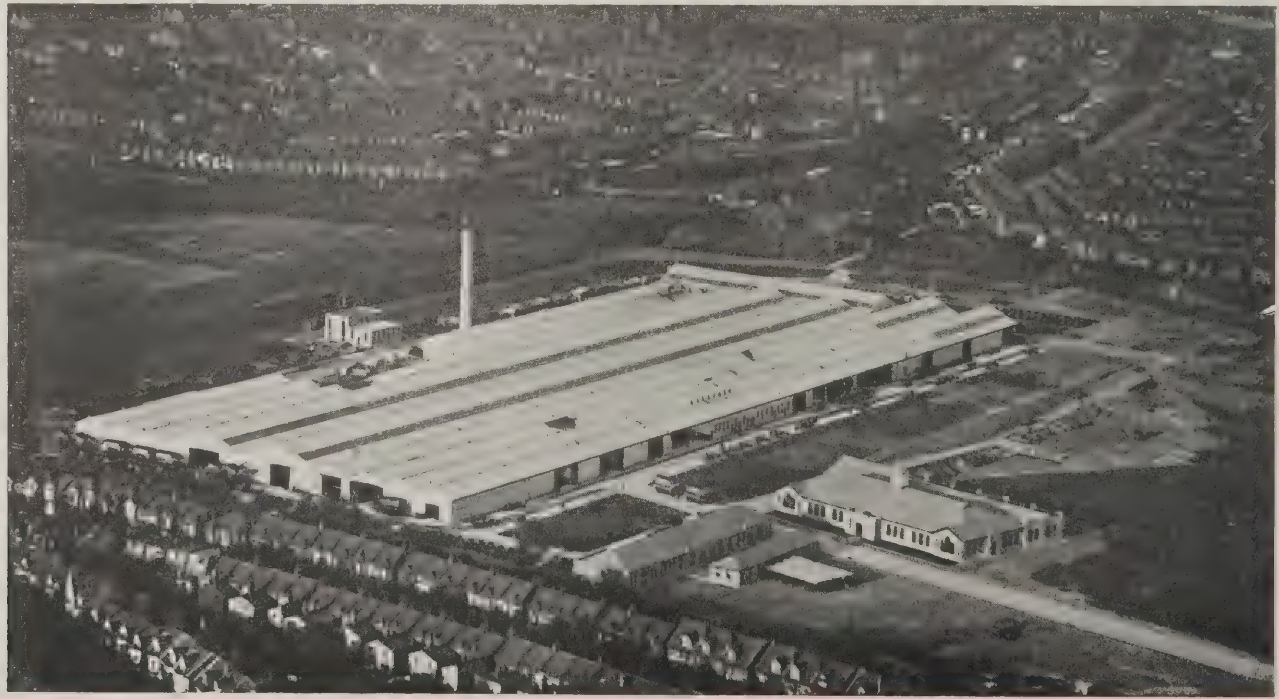
By this system each successive dismantling operation follows on in logical sequence, and the reconditioned coachwork reaches the mounting department as the completely overhauled chassis leaves the works for its road test. The two entirely different sections have worked inwards, and come together, in the end, at exactly the right moment.

When coachwork is detached from the chassis, an electric trolley carries the body into the factory proper, through a lower entrance gate. In this particular section of the works—the body shop—there is accommodation for 104 units. The lay-out is simple. On the left-hand side, looking towards the centre of the shop, are the timber stores. Alongside are other very completely equipped stores, containing all supplies which are in constant demand in the body-shop.

The whole of the supplies for these various stores are taken in by a central door on the south side of the factory. So that there may be no unnecessary movement in supplying any parts required at any stage of overhaul, the raw material, as it flows in at the south door, is distributed in due order over the whole range of stores. As these run the full length of the body-shop, whatever particular replacement part is needed is almost automatically to hand at any stage. This arrangement is common to both engineering and coachwork supplies.

The bodies are first completely stripped, and then reconditioned so far as their main components are concerned. Following these operations, they pass into the paint shop, where there is accommodation for fifty-seven units. The whole of the body-painting is done by hand, and the full time taken to paint and varnish a complete vehicle is five days. The painting completed, the body passes into the mounting and finishing shops, where it is fitted with cushions, aprons, boards, and advertisements, while the electricians complete the wiring and electric fitting. In the meantime a score of different jobs have been called for, necessitating the employment of smiths, tinsmiths, and other workers.

With regard to the chassis, immediately the engine is stopped, the petrol tank is emptied and the fuel drained, by an underground pipe, into the main storage tank. As each chassis part is taken out it is moved, by rollway or conveyor, according to its size, and completely dismantled. Each part is tested and inspected before it journeys down the line of workers and benches, and parts which have become worn are replaced.



AERIAL VIEW OF THE WORKS.

THE MESS-ROOM.

One of the greatest difficulties confronting the motor repair shop is that of obtaining perfect cleanliness in parts grimed and greased by a year's work. The special washing-machine, designed to overcome this trouble, takes the form of a big diameter tunnel, carrying, on its inner diameter, coiled piping perforated with many thousands of $\frac{1}{8}$ in. holes. A high-temperature caustic solution is forced through the perforations by means of a 6 in. pump, the result being that thousands of high-velocity jets play on every part, from every angle, as the component passes through the tunnel on an automatic conveyor. Three machines of this type are installed, and each is capable of accommodating five components, such as gearboxes, at one time.

As the chassis passes along the shop it is gradually stripped of engine, clutch, gearbox, brakes, back and front axles and steering gear, and all other fittings, down to the bare frame. The wheels go into their own special shop for retyring, the tyres themselves being taken from the store immediately adjoining. The millwright's, tool-room, and electrical departments are also located in this section of the works.

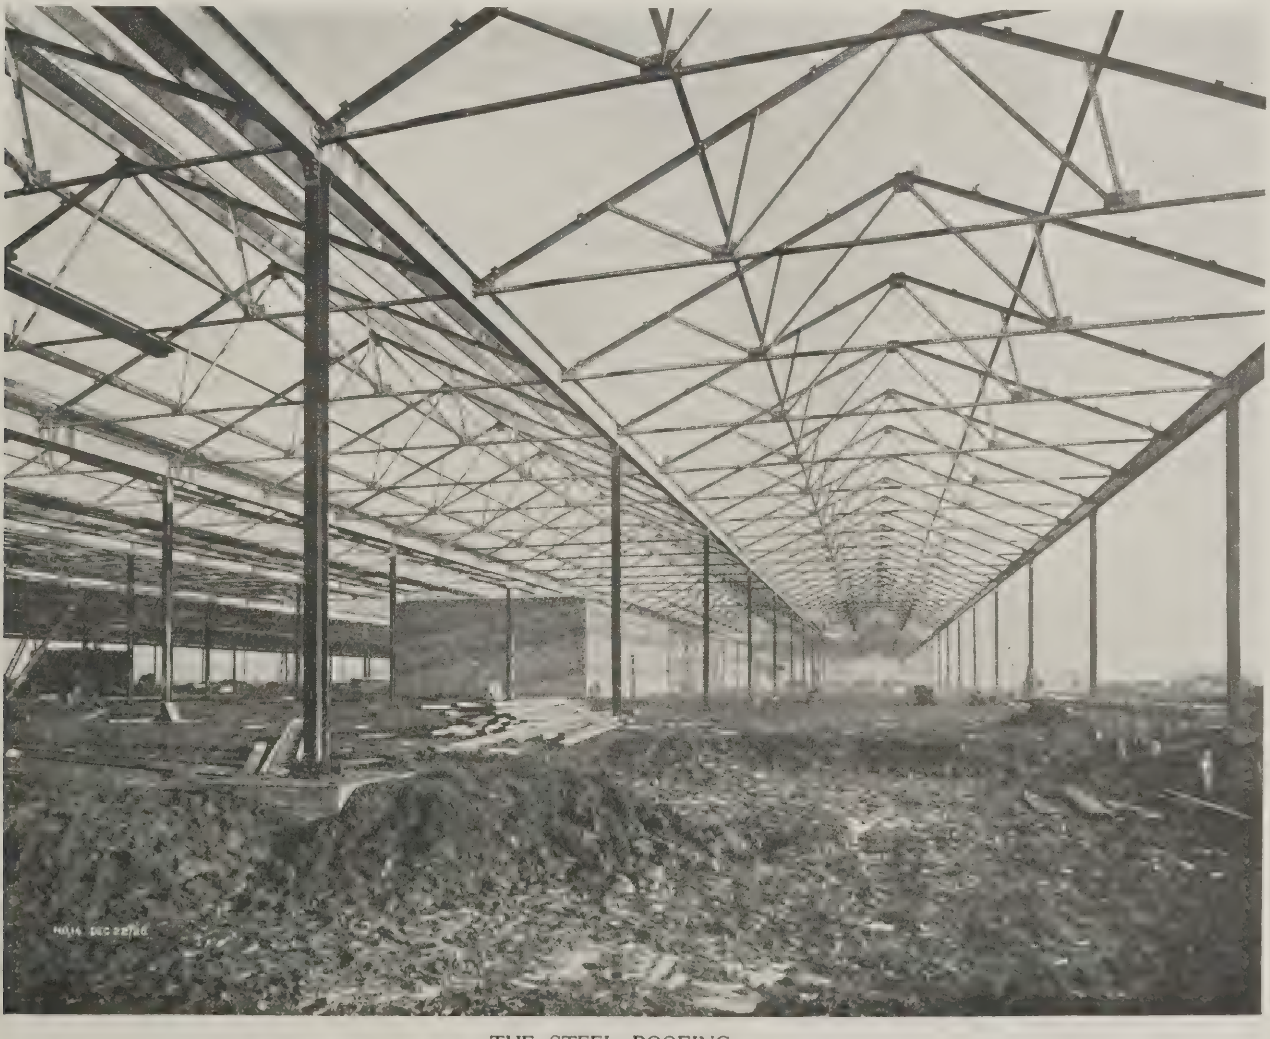
After the frames have been inspected, repaired, and passed as fit for further service, the retempered springs are mounted, and reassembling begins. As the frame passes along towards the main moving platform which runs practically the full width of the shop, front and rear axles are also being reassembled until, when they actually reach the main conveyor, they practically fall into position.

Once on the main platform, rebuilding is chiefly a matter of bolting the various units into position. The total length of the platform is 220 ft., and one may walk up the full distance and see, in the course of an hour or so, a chassis completely assembled.

As the frame and transmission nears the end of the platform the time arrives for the engine installation. A boring, reamering and running-in machine is installed centrally between the point where the engine is first taken from the chassis, and the point where, completely rebuilt, it joins up on the main moving platform. A noteworthy point about this machine is that it reduces what was formerly a two-day task for skilled fitters to a twenty-minute affair for a machinist.

In the meantime all other engine parts are being overhauled, all eventually being assembled on a moving platform. When the chassis has moved far enough up the main platform the engine, complete with all its auxiliary gear, leaves the moving conveyor ready to be dropped into place and bolted down.

Radiators, tanks, electric equipment,



THE STEEL ROOFING.

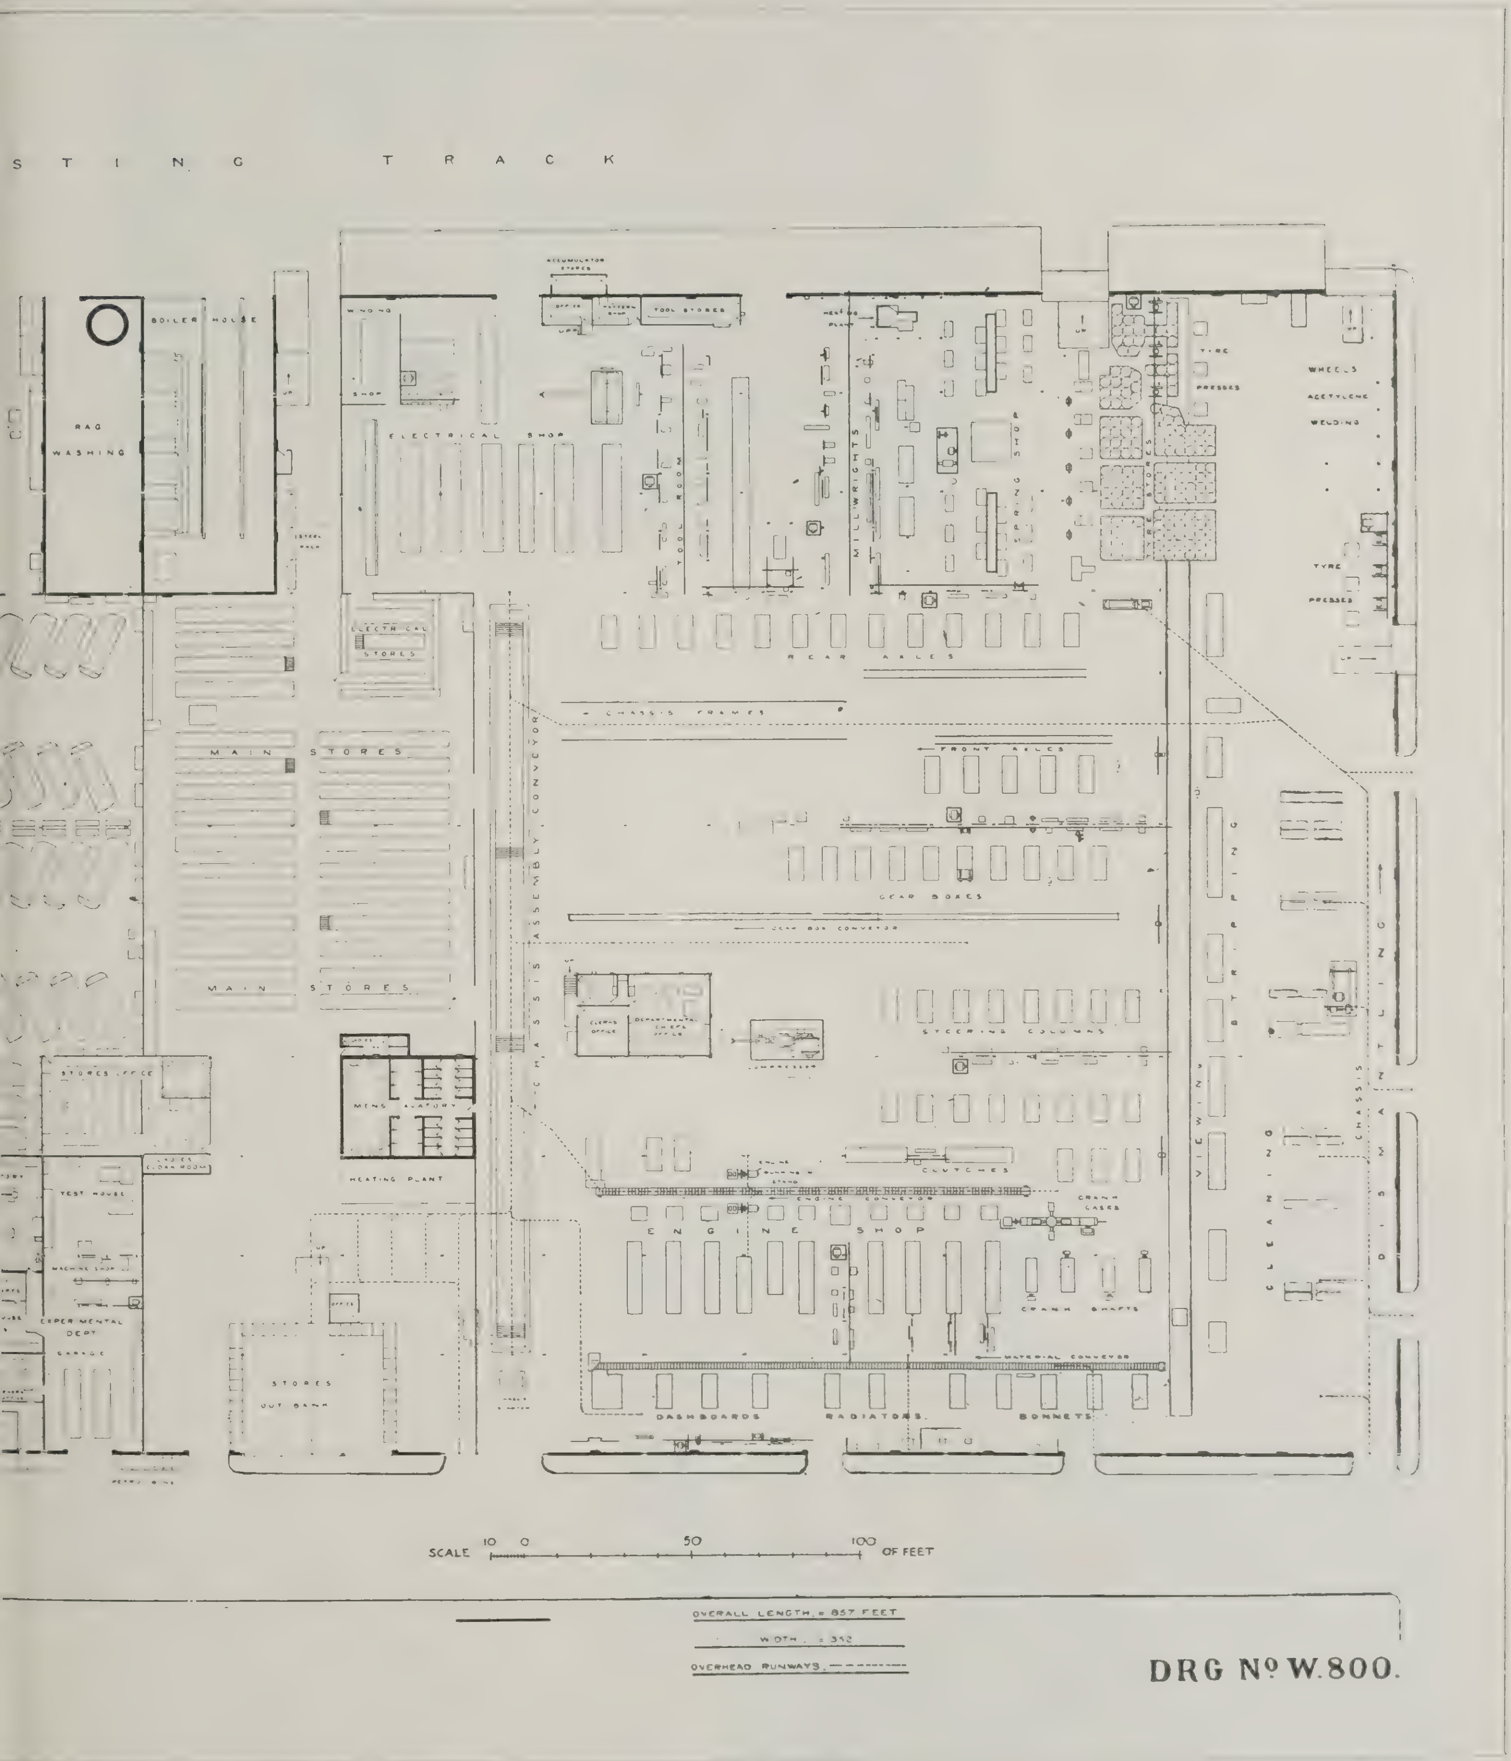
(See article be

on of Motor Omnibuses, Chiswick: General Lay-out



on *page* 154.)

and details by the score are fitted in due order, and the chassis is completely erected by the time it has reached the end of the platform. It then passes on to a further position, where the engine is started by a machine operating through the rear wheels, and the unit leaves the shop under its own power for the first test run.

Outside the works, testing roads have been built with a rough surface and a gradient of one to fifteen—approximately as severe a test of brakes and pulling power as the chassis is likely to experience in the course of ordinary service. This testing-place, constructed as a part of the general scheme, involved the making of 800 ft. of graded roadway with a double hill. From the excavations all the sand and ballast required for the buildings were obtained.

Having successfully passed the running test, the chassis runs on to its registered track; the coachwork has preceded it by electrical truck, and is held in position on multiple hydraulic jacks similar to those used for dismounting the body in the first place. The nuts are screwed home on the holding-down bolts, the battery terminals are coupled up for final test before being submitted to the police passing station, and the vehicle "passes out" fit for another 30,000 miles of running.

The whole arrangement is particularly well planned: there is no retracing of steps, and no overlapping. As every part of either coachwork or chassis is dismantled, it immediately begins a journey which brings it out, either repaired or replaced, at the exact moment and position where it is needed in the reassembling of the whole job.

Moving platforms and conveyors are utilized on a very large scale.

A modern experimental shop forms part of the scheme. In the laboratory raw materials, fuels, and lubricants are tested. There is a dark room for photography tests, and, lastly, there is the first-aid and rest-room, where accidents may be treated without delay.

BY OUR SPECIAL REPRESENTATIVE.

Housing in Scotland.

During discussion on the Scottish Estimates in the House of Commons last week, Mr. Munro, Secretary for Scotland, said that the Royal Commission on Housing stated that the pre-war needs of Scotland were 235,900 houses—undoubtedly a very high standard. To-day 25,550 houses had been built, were building, or planned, and if to that figure were added the houses built under the private builders' subsidy, estimated at 2,400, and 400 under the special crofters' scheme, they got a total of 28,350. At the end of December 1920, the houses completed numbered 927; at the end of December 1921, they numbered 5,287; at the end of June 1922, they numbered 10,253. Although the number of houses built could not be described as a large contribution to the housing needs of the country, he thought that, having regard to all the difficulties that prevailed, they might congratulate themselves upon the results achieved. Dealing with the clearance of slum areas, he said that the Scottish Board of Health had decided that after the schemes of the local authorities had been approved those authorities should have a free hand. The State contribution to the clearance of slum areas was £30,000 a year for Scotland.

The Rent Restriction Act.

Replying to Mr. Myers, who asked whether the committee to deal with questions arising under the Rent Restriction Acts had yet been constituted, and, if so, whether he would state the names of the members of the committee and the terms of reference, Sir A. Mond said that the committee will consist of: Sir H. Norman (Chairman), Lord E. Percy, Mr. A. Shaw, Lt.-Col. Watts-Morgan, Major Barnes, Sir Aubrey Symonds, K.C.B., Second Secretary, Ministry of Health, His Honour Judge Sir Edward Bray, Mr. A. S. D. Thomson, Sheriff Substitute for Lanarkshire, Mr. T. White, Chairman of the National Federation of Assessment Committees, Mr. B. P. Moodie, Assistant Secretary of the Scottish Office, and the President of the Surveyors' Institute had also been asked to nominate a surveyor to serve on the committee. The terms of reference were: "To consider the operation of the Increase of Rent and Mortgage Interest (Restrictions) Act, and to advise what steps should be taken to continue or amend that Act." The Secretary of the Committee would be Mr. H. H. George, of the Ministry of Health.

The Royal Sanitary Institute Congress at Bournemouth

The Congress of the Royal Sanitary Institute was held at Bournemouth from July 24 to 29. Below we give extracts from some of the more important papers in the Engineering and Architecture Section.

Presidential Address

BY SIR HENRY TANNER, C.B., I.S.O., F.R.I.B.A. (Vice-President).

THERE are several subjects to which I wish to draw attention. The first of these is Research. As you are no doubt aware, there has existed for rather over twenty years a committee termed the British Fire Prevention Committee which has done much useful work in testing on regular lines various materials both manufactured and otherwise, and the results obtained were regularly published. With the death of Mr. Sachs, this committee practically ceased to exist for various reasons, mainly for want of funds and a directing mind which could give continuous attention to business. The cessation of the activities of this committee is, I consider, a great misfortune.

This is one phase of research, but there are other, and continually recurring examples where it is required in connection with materials, construction, etc., needed for building and engineering. One would have thought that the Fire Insurance Committee would have supported such an institution as the British Fire Prevention Committee, but although the companies' surveyors and others frequently attended the testing, they gave no help. I understand, however, that the companies are meditating the establishment of a station in the neighbourhood of Manchester. The Government Research Department has acquired a site and provided a building with some appliances, but how far this will meet the requirements of the building profession it is impossible to say.

The Engineering Standardizing Committee has done much in some directions. What is wanted, however, is some central and independent institution not relying on casual subscribers, but to which manufacturers and others can submit their productions to test at reasonable charges, the results being published and easily obtainable at moderate cost.

All by-laws and building regulations become antiquated in course of time, and they should, therefore, be revised at intervals. The model by-laws issued from the Ministry of Health should be brought up to date at short intervals not exceeding ten years, and such modifications as may be introduced should be compulsorily adopted wherever the model by-laws are in operation, as some have been in use without change for perhaps fifty years. The same applies with greater force to the London Building Acts and the regulation made thereunder. Drastic changes have been made in the manufacture of cement, and yet the Act still contains the same requirements as was the case sixty years ago or more. Steel has become standardized, and can be thoroughly relied upon; and yet a safety factor of four is still demanded in building work. Surely something less than this would meet any reasonable contingencies. In these times of high costs, demands under Building Acts and by-laws should be relaxed so far as is reasonably safe, and they should be made with the belief that they will be acted upon and not ignored. If the latter is the thought underlying them the dishonest will still depart from them if possible, and the honest will be handicapped.

A short time ago the question of relaxing the by-laws under the London Building Acts relating to the height and capacity of buildings was brought before a general meeting of the R.I.B.A., and there was a large majority against change, but at the recent elections the mover of the rejection of any change has failed to gain re-election, while the supporters of the change have found seats. In these circumstances it would seem that the late council did not represent the general feeling.

There is, however, another aspect of the case. The by-laws limit the height of buildings for the sale, manufacture, and storage of non-inflammable goods to a height of 60 ft. to the level of the topmost floor (recently varied to 80 ft. to the underside of the ceiling of the topmost floor), and at the same time restrict the area of any floor to 20,000 sup. ft., increased, however, to 40,000 sup. ft., with a cube not exceeding 500,000 cu. ft. in any single compartment. At the same time it is insisted that the building shall be fire-resisting and furnished with all kinds of fire-fighting apparatus, which is not the case in ordinary buildings which are allowed to be carried up some 20 or 30 ft. higher. This does not seem a reasonable proposition, and, having regard to the superior character of such building from a fire-resisting point of view, the time has certainly arrived when there should be no differentiation in the different class of buildings; for if it is possible for the London Fire Brigade to deal with fires at the top of buildings of an office or other ordinary class there should not be any greater difficulty in the second class. Having regard to the concessions recently made, we still hope that this distinction as to height may be withdrawn.

Open Spaces in the Rear of Small Houses

BY MANNING ROBERTSON, F.R.A.S., A.R.I.B.A.

The Departmental Committee on Building By-laws, appointed by the President of the Local Government Board in 1914, has, in its 1918 report, given us a thorough summary of the position and of possible remedies; but in attempting to rectify numerous small defects and absurdities, which cause intermittent worry, we may overlook the fundamentals, and fail to concentrate sufficiently on the obvious fact that our by-laws, by omitting to deal with certain essentials, have failed to secure an adequate standard of housing. The competitive speculator is a past-master in the art of discovering loopholes, and we owe it to the community to see that such gaps are filled, especially when they are being utilized on a tremendous scale.

We are not here concerned with over-meticulous requirements as to house construction, but we cannot adequately deal with the effect of by-laws upon public health without reference to the width and construction of roads; and, above all, we must realize the disastrous results of our consistent refusal to recognize the importance of light.

In examining pre-war housing, leaving out of account the question of design (which is not without its bearing on the moral and physical welfare of the people), we find, almost universally, the following characteristic defects :—

1. The frontage is too narrow.
2. Light is obscured from the main back windows by an extension of the building at the rear.

These two faults are well known, but there is nothing to prevent them from being perpetuated in the future. Number two follows as a direct consequence of number one, as can be seen on Fig. A, a drawing that I prepared and which originally appeared in the Ministry of Health's short-lived journal, "Housing"; it illustrates the inevitable degradation of a sound plan when it is subjected to the squeezing process with which we are too familiar. The areas of the rooms are the same for the 15 ft. front as for the 21 ft. front, but when the frontage is reduced the lighting of the living-room is sacrificed, and the outlook becomes dreary and depressing in the extreme. I hesitate to insult my hearers by reminding them that on any ordnance sheet of any town in Great Britain a superabundance of such houses can be found, generally in terraces.

It is impossible to prevent the erection of these narrow-fronted houses by any stipulation as to a minimum frontage. I suggest that the problem can best be tackled in two ways simultaneously: first, by reducing compulsory development charges to a minimum; secondly, by getting power to secure adequate lighting, and in each of these directions Parliament should be asked to extend the requisite powers. The first remedy is persuasive, the second obligatory, but both would tend towards the discontinuance of the evils under consideration.

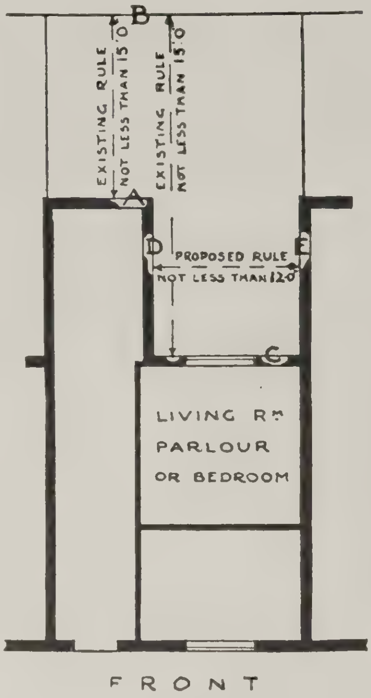
Let us now examine the position with respect to cramped frontage, in so far as this is unintentionally encouraged by the by-laws.

It may be contended that I exaggerate when I say that we have habitually overcrowded our houses in the past; I may be asked what evidence I can adduce to prove that they are overcrowded. In reply, I point to Fig. A, and ask whether 90 per cent. of small Victorian houses were not of the degraded shape shown on Plan 3. They are that shape because the frontage was cramped, and because it was therefore necessary to squirt the scullery and offices outside the main building into the back extension, and the frontage was cramped because too many houses were placed along a given length of road, and this means overcrowding. We have already noted the main objections to Plan 3, and it cannot be denied that by-laws that permitted the erection of such dwellings in hundreds of thousands have proved themselves inadequate to secure healthy and satisfactory conditions.

The limitation of the number of houses to the acre would get over the difficulty, and is a necessity in any town-planning scheme, but such a restriction could hardly come within the scope of the by-laws, and it is first in the direction of relaxing overstringent demands in road-making that we must look to them for help.

The question of the width and construction of streets and carriageways is exceedingly complex, and has been fully considered in Chapter 4 of the committee's report already referred to. A thorough revision of the existing system is here necessary, and to this end Parliament should be asked to extend adequate powers.

The Public Health Act of 1875, which gives power to secure "a free circulation of air," must be amended to include light, and I suggest that the attention of the Minister of Health be drawn to the urgency of obtaining such amendment. Under the law as it stands it is doubtful whether windows can be legally demanded at all, and whether holes in the wall or dark louvres would not meet all strictly legal requirements; but as we are here considering abuses that are in being, and not those that might legally arise, I shall confine myself to outlining two proposals, each of which presupposes that we are given powers to deal with light, and either of which should help to cure existing evils.



B
EXISTING RULE NOT LESS THAN 15'0"
EXISTING RULE NOT LESS THAN 15'0"
A
D
PROPOSED RULE NOT LESS THAN 12'0"
E
C
LIVING RM
PARLOUR
OR BEDROOM
FRONT

FIG. B.

The first possibility would be to include a proviso in the by-laws to the effect that no extension to the rear of any dwelling-house shall be so constructed as to interfere materially with the light entering any living room or bedroom. I am dubious about this proposal, because the word "materially" would be interpreted in different ways.

My proposal, which I think meets these difficulties, is as follows: Referring to Fig. B. It is now stipulated that the distances A—B and C—B must each be at least 15 ft. (although the distance C—B, for obvious reasons, is usually, and is here shown, a good deal more). I suggest that, in addition to the two requirements as to A—B and C—B, a third should be inserted, to the effect that, when the light to any ground floor, living room, or bedroom depends upon a window in the back wall C, the distance D—E shall not be less than 12 ft. I incorporate in this rule an exemption for walls projecting less than 4 ft., in order to allow every possible freedom in design. In appropriate language, I propose the following: Where any living room or bedroom, situated on the ground floor, depends for its light upon a window in any rear wall, the width of the open space adjoining such window, measured parallel to the window, from any wall rising above the level of the sill, and projecting more than 4 ft. from the plane of the face of the wall containing the window, to any other such wall, and to the boundary of any lands or premises adjoining the site, shall not be less in any part than 12 ft.

This rule precludes the back extension where it does harm, but legitimate use can still be made of this feature, because the ill-lighted back wall can be used for windows of minor importance. It will also be noted that when living rooms or bedrooms are adequately lighted from elsewhere, as in through rooms, there is no restriction as to extending the building to the rear.

Housing from the Technical Point of View

BY W. R. DAVIDGE, F.R.I.B.A. (late Housing Commissioner for the Southern Counties and London Areas.)

The Government Housing Scheme was brought into being by a national emergency, and like many emergency measures, has been much criticized owing to the inherent weakness of its finance, but

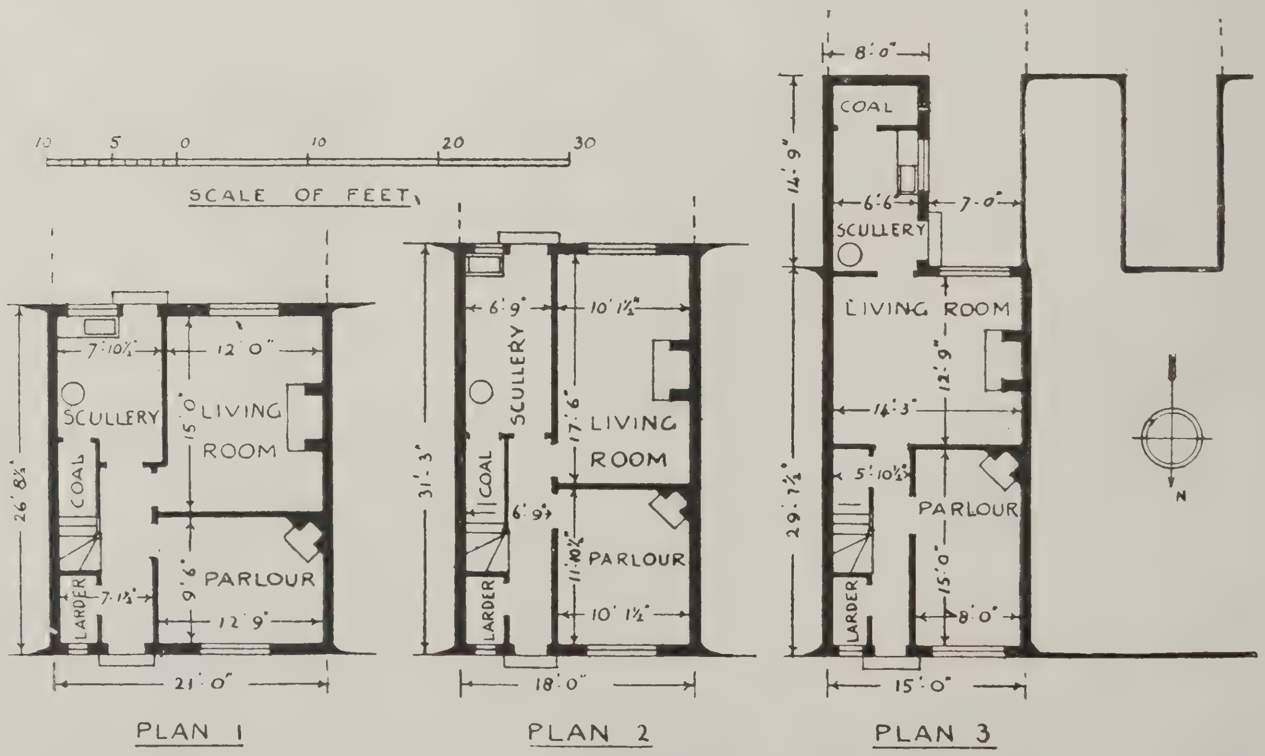


FIG. A.

the object lessons of good housing to be seen all over the country will be of incalculable value in the effort which will still have to be put forward to raise the general standard of housing.

It may be worth while to review the typical pre-war housing scheme of 1913 and see how it compares with its successor of the present day.

The Local Government Board only nine years ago, in their official publication, recommended cottages with narrow frontages of only 16 ft., and even showed back additions. Many cottages had only two bedrooms. Bathrooms were unrecognized, and even baths, when introduced, were almost invariably to be placed in the scullery, either under a side table, or in the floor, upright against the wall, or anywhere else so long as they were out of the way.

Lavatory basins and upstairs W.C.'s were alike unknown. The size of the rooms did not allow even for the proverbially necessary operation of swinging the domestic cat.

Then as to the style of architecture of those now remote days of 1913. Sound construction was important, but the employment of an architect in connection with a housing scheme was, except for the larger schemes, almost unknown.

Heavily paved by-law roads and sometimes narrow little paved forecourts and tar-paved or brick-paved yards completed the "tale of the bricks."

The prolonged and careful inquiry instituted during the war by the Departmental Committee on Building Construction under the chairmanship of Sir John Tudor Walters, reported in 1918 on Housing and House Construction in detail, and the report of the Committee* may be regarded almost as epoch marking, and in itself it was one of the greatest advances in housing ever made in this country. The Ministry of Reconstruction, it will be remembered, had also during the later stages of the war issued a number of suggestive reports, including reports by the Advisory Housing Panel on the Emergency Problem, The Women's Housing Sub-Committee, and the Housing (Financial Assistance) Committee.

The Local Government Board, now the Ministry of Health, in their "Manual on the Preparation of State-aided Schemes," published early in 1919, embodied all the important conclusions of the Tudor Walters Report, and officially set a new standard of housing for the whole country, to be modified, it is true, at a later date in actual practice so far as sizes of rooms are concerned, but otherwise substantially setting forth the standard which has now been put into practice.

The "Lay-out" and aspect of the house now for the first time received official consideration. It was recognized that the principal living-rooms should be arranged to get the maximum of sunlight possible, according to the time of day in which the room was likely to be used; that the larder should face north, or at any rate be protected from the direct rays of the sun; that the drainage of the house should be grouped, either in the front or the back of the house with a view to economy, and that every house should have a bath and, if possible, a bathroom.

"By-law" roads were to be no longer a necessity, and the width was to be in future regulated, not by a hard and fast by-law, but according to the traffic expected, and economy in road planning was strongly recommended.

A minimum of three bedrooms was regarded as essential.

The sizes of rooms officially recommended were as follows :—

	Square feet.
Living room	180
Parlour (when provided) ..	120
Scullery	80
Larder	12–16
Coal store (to hold at least one ton)	15
Bedroom	150
,, ...	100
,, .. (minimum)	65

Bath to be provided in separate chamber.

It will be seen at once how great an advance this standard was on the pre-war average of accommodation.

The Government have not yet announced what they propose to do when they have completed the whole of the 176,000 houses to which at present they have set their hand, but it is evident that some form of municipal housing will have to be continued, and so long as the Rent Restriction Acts are in force some form of assistance or contribution from national funds, either for the purchase of land or by other State grant, is almost essential if the housing is to be provided in the districts where it is most needed.

---

* Cd. 9191—(19:8).

Sanitary Annexes to Ward Blocks

BY A. SAXON SNELL, F.R.I.B.A.

Until recent years it was usual to place the sanitary conveniences in towers built out at the lower or open ends of the ward blocks, with disconnecting cross-ventilated lobbies. The disconnection was efficient if the windows of the lobbies were kept more or less open; but the position of the towers overshadowed beds at the end of the wards and shut out valuable light and air.

It is more usual now to have *one* tower only, and placed at the upper or closed end of the ward, and so arranged as to avoid overshadowing the separation wards and day rooms. It is thus under better control and supervision.

Even so it is still an excrescence, and comparatively costly to build; and some architects, therefore, have boldly eliminated it, by building the sanitary offices among the ward annexes (separation wards, scullery, etc.). An intervening lobby lighted and ventilated by a window is regarded as sufficient cut-off from the approach corridor to the wards. It is, however, open to doubt, because with a strong wind blowing against the window, air would probably pass through into the corridor, drawing with it the foul air from the w.c., etc.

It would seem better to provide means of *through* ventilation, either by opposite windows, or by a window at one end of the lobby and a ceiling ventilator at the other opening into the air.

Suggestions on these lines were made in a paper I read before the R.I.B.A. The essential point was that the w.c.'s were placed on one side of the corridor and the sink room exactly opposite on the other side; both compartments and that portion of corridor between them were kept low—not more than 8 ft.—so as to provide a blow-through above them, into which the ceiling ventilators opened.

R.I.B.A. Examinations

Twenty-six candidates passed the recent Intermediate Examination of the Royal Institute of British Architects. The names of the successful candidates placed in order of merit are as follows :

Messrs. L. W. T. White, A. M. McKewan, R. O. Vine, A. V. Montagu, H. J. Coates, C. E. M. Fillmore, S. C. McManus, C. C. Gray, A. W. Hodges, G. Wilde, D. Cuthbertson, E. G. Felgate, W. H. Ford, J. Byers, G. C. P. Gough, C. T. Prangnell, G. J. Bragg, B. Cowser, A. G. Geeson, R. T. Green, G. R. Barnsley, R. J. Carter, A. W. Ecclestone, N. R. England, J. C. Richard, K. S. Tayler.

Eighty-five candidates were relegated.

The following candidates passed the Final and Special Examinations : Messrs. W. Baillie, W. A. C. Ball, B. Butler, F. N. Gilder, E. L. Gunston, M. R. Hofler, E. K. D. Hughes, A. G. Jenson, G. W. M. Leverkus, W. B. T. Newham, D. S. Petrovitch, A. S. Reid, F. A. Richards, W. Ryle, F. J. Sawyer, H. D. Sugden, A. E. Williams. Messrs. W. J. Allcorn and E. G. Hines passed the examination in Part I only (Design).

The Ashpitel Prize (£10 in books), and a mark of distinction for his thesis, have been awarded to Mr. A. S. Reid, of Aberdeen. Fourteen candidates failed.

The following candidates passed the Special War Examination : Messrs. C. W. Allen, L. M. Austin, G. H. Backway, W. F. Ball, H. C. Bankart, C. D. Barnard, L. J. Bathurst, S. L. G. Beaufoy, C. N. Beeston, W. Beeston, J. W. Binge, E. L. Bird, T. Blakeley, A. V. Booker, H. E. Box, J. Bramwell, R. Briars, J. S. Broadbent, C. S. Brothers, W. Brown, C. J. A. K. Buysman, W. H. Caley, G. B. Carter, W. Cartwright, A. M. Chisholm, J. Clack, E. H. Cornes, G. H. Crickmay, J. H. Crowther (Junr.), R. S. de Burgh, A. R. Dent, C. G. Dixon, F. G. Eastwood, F. W. Eggins, J. Ellis, A. C. Fare, A. V. Farrier, A. C. Flitcroft, A. T. Flutter, L. R. Foreman, C. W. Francis, B. Fraser, E. Fryer, G. C. Gadd, C. E. George, J. S. Glass, L. R. Gower, J. Gray, H. J. Hall, L. W. Hall, M. A. Hall, J. F. Hampton, P. Hickey, W. F. C. Holden, J. Hopwood, L. C. Howitt, G. E. Hubbard, S. D. Igglesden, H. E. Jarvis, L. John, W. A. Johnson, T. E. Jones, L. H. Kemp, C. Kendall, C. W. Kennedy, H. C. Killender, G. E. King, K. Kinna, S. C. Kirby, A. S. Knott, F. H. Lambert, G. V. Lidbury, R. A. H. Livett, H. G. Lonsdale, D. A. Lumsden, J. R. A. McDonald, R. S. S. Mackay, R. M. McNaught, A. McWilliam, B. G. L. Mansergh, J. G. Marr, C. W. Milburn, J. S. Milner, W. S. Minty, S. G. Monk, H. L. Moody, F. A. Moore, A. T. Newsum, C. Noble, E. J. Nutt, E. D. O'Connor, E. C. R. Page, K. Palmer, J. R. Piggott, C. W. Pike, H. W. Pritchard, G. G. Quarmby, D. C. Rae, A. Rankine, J. F. Rees, H. G. Riley, W. J. Rogers, D. J. A. Ross, H. A. Scott, J. C. Shepherd, G. W. Silk, E. H. Skipper, L. E. Skipwith, L. S. Slaughter, W. L. Starling, C. G. Stillman, H. J. Stribling, S. H. Suthers, C. P. Tanner, W. L. Taylor, W. R. Templar, B. H. Toms, F. E. Towndrow, R. J. Troup, W. L. Vinycomb, H. Wessen, G. Whittaker, H. C. Wilkinson, W. P. W. Williams, S. J. Willmott, J. W. G. Wilson, M. L. Winslade, C. W. Yates, J. R. Young, T. Yoxall. Eighty-five candidates failed to satisfy the examiners.

The Tenth International Congress of Architects

The Tenth International Congress of Architects will be held under the auspices of the Société Centrale d'Architecture de Belgique in Brussels from September 4 to 11, 1922, and will be accompanied by an International and a National Retrospective Architectural Exhibition.

It will be remembered that the outbreak of the war interrupted the preparations for the Tenth Congress of the regular series, which was to have been held in Petrograd in May 1915, under the patronage of the late Tsar.

The Société Centrale de Belgique will be celebrating the fiftieth anniversary of its foundation at the time of the Congress, and the architects of Belgium extend a cordial invitation to their foreign colleagues to join them in the celebration.

The Congress will include delegates from many foreign countries. The Belgian Committee is under the chairmanship of M. J. J. Caluwaers, with M. R. Moenaert as secretary.

Programme.

September 4.—Morning: Meeting of the Permanent Committee of the International Congress of Architects. 2 p.m.: Formal opening in the Palais des Académies. Evening reception.

September 5.—10 a.m.: Opening of the Architectural Exhibition in the Palais d'Egmont. 2 to 6 p.m.: Conferences. Evening receptions.

September 6.—9 a.m. to Noon: Visits to buildings of interest in Brussels. 2 to 6 p.m.: Conferences. Evening receptions.

September 7.—Visits to the devastated zone, stopping at Ypres and spending the night at Bruges.

September 8.—Visits about Bruges, returning to Brussels in the evening.

September 9.—Excursion to Antwerp; visits about the city and up the Scheldt. 2 to 5 p.m.: Conferences; returning to Brussels in the evening.

September 10.—9 a.m. to Noon: Visits to the Exposition. 2 to 6 p.m.: Conferences. Evening receptions.

September 11.—10 a.m.: Closing exercises.

Subjects for Discussion.

1. The responsibilities of the architect.
2. Schedule of charges.
3. The appointing of State and Municipal architects.
4. The rights of authorship of the architect.
5. The profession of architecture: its aims and its rights.
6. Women architects.
7. Public, national, and international competitions. The position of the winning architect in an international competition or of one working in a foreign country.
8. Town planning.
9. Small houses.
10. The influence of locality on architecture.
11. The preservation of historic monuments: with consideration of their economic, hygienic, and social aspects.

Exhibitions.

An Architectural Exhibition will open on September 5 in the Palais d'Egmont, lasting two weeks.

It will be divided into two general classes:—(*a*) Belgian: (1) Retrospective; (2) Contemporaneous (Jury: Messrs. Maukels, Mercenier, and Van Montfort). (*b*) Foreign: There will be as many sections as there are countries represented.

Fees.

The fees for members will be fifty francs; for ladies accompanying members (wives and daughters only) thirty francs, which will give them the privilege of visits, excursions, and receptions.

Language.

Official delegates may address the meetings in their own language. The official language of the Congress will be French, though any other language may be used provided a "résumé" in French is submitted at the same time.

British Architects Invited.

All British architects are cordially invited to take part in the Congress. All those desiring to attend or to receive further information should communicate with the Secretary, The R.I.B.A., 9 Conduit Street, W.1.

Correspondence

Architectural Perspectives

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—In going round the Architectural Room at the Royal Academy this year, it is not unnatural that one should find oneself recalling Professor Rothenstein's recent remarks on the subject of architects' drawings, and trying to look at the exhibits through the eyes of an ordinary lay visitor with some intelligent interest in art. And one wonders whether all this slickness and brilliance of "rendering" is not dazing us into overlooking the standards of criticism which we should apply to any other form of drawing or painting.

Most of the perspectives are in watercolour; but it would surely be difficult to find any watercolourist of recognized ability and taste who would tolerate the anarchic recklessness in the choice and use of colour which staggers the visitor to our room at the Academy. Here, lawns or shutters of blistering green fester into gamboge and orange, and the smarting eye turns in vain to find repose in shadows, which merely add an intenser note of solid ultramarine or violet. The surroundings of the English suburban house, no less than those of the Eastern palace, send forth "visible music-blasts" of devastating stridency.

"But, my good man, these *aren't* watercolours; they're architectural perspectives," may be a sufficient answer; and if so it is a most interesting one. But it does seem rather as though, just as we unthinkingly adopt from our quantity-surveyors and builders such perversions as "cill," "molding," and "lintol;" we are inventing for specialized use a new horror in the form of an architectural picture to which the ordinary rules of picture-making do not apply.

How effective the quieter and more "normal" methods of drawing may be in architectural perspective can be seen this year in Mr. Hepworth's cool drawings, and in Mr. Farey's splendid sepia "Theatre Design"; and a drawing by Mr. H. R. Poulter of "Old Walls, Camberley"—clean pencil line with a very reticent use of flat wash—suggests that the methods we use in our ordinary architectural sketching would be much more suitable for the illustration of our buildings, at the Academy or elsewhere, than all the kaleidoscopic stunt-work which is so eagerly imitated at the present moment

A. L. N. RUSSELL.

The Young Architect's Future

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I disagree with P.L.D. when he says that the "real" architect has no concern with buildings of the factory type and has depended largely on the more artistic side of the profession for the realization of his ideals. I think P.L.D. is advocating an extremely dangerous doctrine, and one calculated to confirm the idea in the public mind that the service which architects can render to the public is limited in its scope. It is because this view has been expressed in the past by some members of the profession that the public have taken the whole on this valuation, with the result that a great deal of work which in my opinion should come within the scope of the architect goes elsewhere.

I maintain that a "real" architect is as capable of designing a factory as he is of erecting a church, and your pages contain from time to time illustrations showing that factory buildings in the hands of a competent architect can be produced in accordance with the accepted canons of architectural design in regard to outline and proportion.

I agree with P.L.D. in the last paragraph of his article, the more so because it happens to coincide with the advice which I am constantly giving to those who invite my opinion on this aspect of the subject.

C. MCARTHUR BUTLER,
Secretary of the Society of Architects.

The R.I.B.A. Registration Committee

The first meeting of the Registration Committee was held on July 24 at No. 9 Conduit Street. The following appointments were made: Mr. A. W. S. Cross, Vice-President, Chairman; Mr. George Hubbard, Vice-President, and Mr. C. B. Flockton, Vice-Chairmen; Mr. Sydney Perks, Hon. Secretary.

A sub-committee consisting of Mr. A. W. S. Cross, Mr. George Hubbard, Mr. C. B. Flockton, Mr. Sydney Perks, Mr. W. Gillbee Scott, Mr. Herbert Shepherd, and Major Harry Barnes, M.P., was formed for the purpose of considering the various Registration Bills that have been promoted, interviewing representatives of other bodies, and submitting suggestions to the main committee.

Architects' Fees for Abandoned State-Aided Housing Schemes

THE following memorandum (General Housing Memorandum No. 61) on the subject of fees payable to architects in connection with State-aided housing schemes is just issued by the Ministry of Health :—

The Minister of Health has given careful consideration to representations which have been made to him relative to the terms and conditions of payment for abandoned work as provided for in G.H.M. No. 52. While he considers the payments there authorized to be generally reasonable, he has recognized that, as between different schemes partially abandoned, the fees provided for could be more equitably apportioned in relation to the proportion of the work which is carried out; that, moreover, there are certain cases where schemes have been completely abandoned, in which the scale of payment for plans does not sufficiently allow for all the general work which may have been involved. In consultation with representatives of the Royal Institute of British Architects, the Minister has decided, therefore, that the following modifications shall be made in the terms as set out in G.H.M. No. 52.

A.—G.H.M. No. 52 refers to "plans which are abandoned after approval by the Minister." This applies also to the present Memorandum; it is recognized, however, that plans may have been prepared by an Architect to the instructions of a Local Authority, which have not been approved by the Minister, or even submitted for approval; and that the Architect may be entitled to payment for them. Provided the instructions to prepare plans were properly given for an extent of work and number of houses not exceeding those with which the Local Authority had been authorized to proceed, and that the work was abandoned with his approval, the Minister is willing to consider whether these plans are of a character which would have been approved had they been submitted, and what payment can be allowed to be charged to the Housing Assisted Scheme Account in respect of fees for such plans.

G.H.M. No. 52. II.—Roads and Sewers.

B.—For sub-clauses (i) and (ii) of Clause 1 the following will be substituted :—

(i) If the preliminary scheme of roads, drains, and sewers based on contour levels has been prepared, the proportion of the scale of fees, set out under the heading "B"—"Roads and Sewers," in G.H.M. No. 31, to be paid shall be .. $\frac{1}{6}$

(ii) If, in addition, the roads have been pegged out and the levels taken for sections the additional proportion to be paid shall be .. .. .. $\frac{1}{6}$

(iii) If, in addition, the sections have been set up in accordance with the levels taken and embodied in the working drawings of Roads and Sewers the additional proportion to be paid shall be .. .. .. $\frac{1}{6}$

(iv) If, in addition, Specifications and Bills of Quantities have been prepared, and all the work necessary for the purpose of obtaining tenders has been done, the additional proportion to be paid shall be .. $\frac{1}{6}$

Total proportion .. $\frac{2}{3}$

For Clause 2 the following will be substituted :—

In all cases of partially abandoned schemes the fees payable for the abandoned work shall be three-quarters of the fees indicated in (i), (ii), (iii), and (iv) of the preceding paragraph according to the circumstances of the particular case.

G.H.M. No. 52. III.—House Plans.

C.—Sub-section (*c*) shall be amended as follows :—

In so far as plans were prepared prior to July 1921, the fees shall be calculated on an assumed average cost of £700 for all types of houses. In the case of plans prepared in or after July 1921, the fees shall be calculated upon the average price at which tenders were approved by the Minister for the types concerned during the month previous to that in which the scheme was abandoned, but in no case to exceed £700.

D.—For paragraph 3 there shall be substituted the following :—

3. (*a*) In the case of partially abandoned schemes the fees shall be a fraction of those payable in the case of schemes totally abandoned, according to the proportion of the work abandoned. The fees set out in paragraph 1, sub-paragraphs (i) or (ii) of Section III of G.H.M. No. 52, shall be multiplied by a fraction calculated as follows :—

(i) For the purpose of the calculation, the work in any scheme of an Architect or Panel of Architects shall not be deemed to include more than 250 houses; any cases involving more than that number shall be treated as if they had comprised 250 only.

(ii) The denominator of the fraction shall be the total number of houses for which plans were prepared by the Architect or Panel of Architects on the definite instructions of the Local Authority, provided that plans for that number were approved by the Minister and they are shown on an approved large scale lay-out plan, but limited by the maximum of 250 as above.

(iii) The numerator shall be the number by which the number of houses in the denominator as defined in (ii) exceeds the number of houses erected.

(*b*) In any partially abandoned scheme in connection with which an Architect has prepared plans for a greater number of houses than 250, there shall be paid, in addition to the fees arrived at in accordance with (*a*) above, for any separate designs prepared for the abandoned portion, and not utilized for the portion erected, one half of the scale fees allowed for such designs under sub-paragraphs (i) and (ii), paragraph 1 of Part III of G.H.M. No. 52.

E.—The following additional clauses shall be added to G.H.M. No. 52, Part III :—

4. In all cases in which the Royal Institute of British Architects satisfies the Minister that an Architect has been commissioned to carry out a housing scheme and has prepared plans approved by the Minister, but that no houses have been erected from his plans on the housing scheme of any Local Authority for which he has prepared plans, the following scale of payment for house plans will apply instead of that provided in G.H.M. No. 52, and the Local Authorities concerned will be notified by the Minister as to the amounts payable.

(*a*) For preliminary negotiations with the Local Authority and the Ministry, and for preparing sketch plans and all other general work incidental to the abandoned scheme, payment will be made to each Architect on the following scale, based on the number of houses for which plans were prepared by him as defined and limited in paragraph D. 3 (*a*) above.

For the first 12 houses the fee shall be £10 per house; next 60, £3 per house; next 178, £1 per house. Maximum number, 250.

(*b*) If all the work necessary for obtaining tenders for houses has been completed, an additional fee of £26 will be paid for each separate design approved by the Minister for which working drawings have been made.

F.—In all cases before payment of fees, the Local Authority should be satisfied that the Architect has properly carried out the instructions of the Council and the requirements of the Ministry, and that all the work covered by the respective stages has been done.

G.—The foregoing terms and conditions will not apply in any cases where an agreement providing specifically for abandoned work has been made or where a final settlement has already been arrived at between the Local Authority and the Architect prior to the date of this Memorandum. If the Local Authority have made any such agreement or final settlement without the approval of the Minister, the terms of the agreement should be notified to the Minister.

G.H.M. No. 52. General.

H.—The last paragraph of G.H.M. No. 52 shall not apply to abandoned work on house plans. Both for the purpose of calculating the fee and ascertaining the proportion abandoned, the work of the individual Architect or Panel of Architects for each Local Authority shall be taken to be a scheme.

Supplementary.

I.—Travelling expenses : In Memorandum to Housing Authorities 51/D, reasonable travelling expenses are allowed to an Architect in respect of journeys over 25 miles from his office. In cases where, although the journeys may be less than 25 miles from his office, an Architect is involved in unusual expense owing to the Site or Sites being situated more than three miles from a railway station, and not served by any other regular public means of conveyance, the Minister will be prepared to allow as a charge to the Housing (Assisted Scheme) Account the reasonable out-of-pocket costs necessarily incurred in travelling from the nearest railway station to the Site.

K.—In cases where no Bills of Quantities have been provided and the Architect has been required to supply the necessary extra copies of drawings and specifications from which to obtain tenders, allowance shall be made for the reasonable out-of-pocket charges incurred for the purpose.

L.—Owing to the doubts which have existed as to the application of the provisions of G.H.M. Nos. 4 and 31 in regard to abandoned work, payments to Architects have, in some cases, been delayed. In view of the further information contained in this Memorandum, Local Authorities should make prompt settlement, or substantial payments on account, in respect of the amounts payable to their Architect for professional services rendered.

A copy of this Memorandum should be handed to the Local Authority's Financial Officer.

Ministry of Health,
Whitehall, S.W.1.
July 1922.

The Memorandum is published by His Majesty's Stationery Office, and may be purchased, price 1d., through any bookseller or directly from H.M. Stationery Office at the following addresses : Imperial House, Kingsway, London, W.C.2 ; 28 Abingdon Street, London, S.W.1 ; 37 Peter Street, Manchester ; 1 St. Andrew's Crescent, Cardiff ; 23 Forth Street, Edinburgh.

Contemporary Art Exhibitions

The Twenty-one Gallery and the Independent Gallery

THE vagaries of Fate ! The ironies of Hazard ! How they dog our steps and play upon our fortitude and patience !

An English painter, young, active, and, above all, extremely able, had the whim, a few years ago, to enter the competition for the Prix de Rome in painting. Pleasant to relate, he won it ; he therefore went to Italy, where he strengthened an already brilliant talent.

His achievements and the promise which he gave had been bruited abroad, and so it came to pass that one of our Dominions, sensing a fine painter, gave him an order for a war painting to celebrate the valorous deeds of its soldiers. He made a fine canvas of it. It was bold, apt, and "modern," but some pernickety folk said that it was a little hard and intransigeant. But he got paid for it all the same, and the picture—a large one—duly crossed the water, and now adorns the walls of an important museum.

It is only right to say that even on this side critics could be found who admitted that this painting gave obvious proofs of the artist's ability to handle big subjects in a decorative way, and that, beside a sense of colour and rhythm, he also possessed architectural qualities. His decorative panels, in other words, would fit a large modern building with an ease similar to that of Luca Signorelli's frescoes in the Chapel of the Madonna at Orvieto, or of Puvis de Chavannes at the Pantheon in Paris. Yet, known as he must be by now, his talents are never used in that connection, though anyone can see it is the kind of work he would most wish to do.

All the while Time rolls on and the £ is worth eleven and nine . . . So Mr. Colin Gill, former Prix de Rome, and a credit to the Slade and to Prof. Tonk's teaching, in order to make an honest shilling, and fill his idle hours has turned his talent to portraying and caricaturing the notabilities of the Labour Party ! If you go to the Twenty-one Gallery, in the Adelphi, you will see a small but choice selection from his later portraits and sketches.

The portraits are indeed splendid. Mr. Gill is perhaps a little less happy in caricature, but then it is one of the hardest imaginable subjects to treat. A good caricaturist, one gathers, is one who draws, as a rule, from memory, and does not allow himself to be hampered by irrelevant exactitudes. Salient peculiarities remain in his mind's eye, and these he puts down, exaggerated or not, even at the expense of anatomical truths which do not interest him. Apart from physical individuality he tries to make his drawings indicate character, and the better the caricaturist, the less dependent is he for this end upon accessory properties.

We are fortunate enough to possess in England a few remarkably good caricaturists. Mr. Max Beerbohm, Mr. Kapp, Mr. Evans, for instance, all with their delightful peculiarities, though the first gentleman is still so supreme in that respect that his influence is felt in unlikely quarters ; even Mr. Gill is not quite able to banish from his mind the mannerisms of our incomparable "Max."

Of the eleven caricatures shown at the Twenty-one Gallery, those of Mr. J. H. Thomas (21), Mr. Clifford Allen (28), and of "Mr. Webb and Mr. G. B. Shaw" (24) are the most effective. They have pep, and they are beautifully drawn.

If the others are possibly not quite so happy it is at any rate arguable that the blame can be laid at the door of the subjects as much as the artists. The L.P. leaders are not all so distinguished-looking as their Graces and Lordships, nor so distinguishable as their rank and file as seen by, say, Mr. George Belcher ! Hence an initial obstacle difficult to overcome. Nevertheless much fun can be got out of the show. Plebeian noses, mighty chins, absurd angel wings, and volcanic pipes at their most tremendous . . . yes, it is all very amusing.

The portraits give a better idea of Mr. Gill as a draughtsman. They are characterized by exactitude, a certain reticent power, and an impeccable line. But, oh ! how Mr. Gill must all the time yearn for large, decorative canvases, with trestles, brushes, and big surfaces upon which he can let rip, to the astonishment — and satisfaction — of the architect, down below ! . . .

Equally modern, but less bound by formal tenets, is Mr. Jean Marchand, whose paintings and drawings are now on view at the Independent Gallery, Grafton Street. This French artist has an especial love of landscape. The contrast between his work and Mr. Gill's could not be greater. Mr. Gill, in his decorative panels, rather like Mr. Brockhurst, is still attached to the Florentine and Siennese way of painting. Mr. Marchand, on the contrary, follows no one, but is influenced by Cézanne and Vlaminck.

There is something impatient and unfinished about his paintings which does not in the least detract from the attraction. It is all a little loose, but it has power. He does what abstract art splendidly aims at but rarely achieves, what all true artists have achieved but rarely aimed at, he does it because he emotionally feels the intellectual in art.

It is to his credit that he avoids all easy ways of being charming ; he almost cultivates the new austerity. His admirers, by now, have become accustomed to his method of approach. Would that he had more, and that more got accustomed to —though were still thrilled by—this method which, in his landscapes, seems to treat a wide diversity of motifs with a startling directness, as of diagram.

No. 16, "Dans les Oliviers," shows a curvilinear system imposed on a rectangular one, but the representational incidences and the atmospheric effect which he brings to play about them invest these systems of composition with great artistic activity. The forty exhibits shown are all extraordinarily able, and the many visitors, chiefly artists and eager students, who seem to have made a point of seeing his paintings, are an eloquent proof of the regard in which he is held in England as well as in his native country.

G. HOLT.

St. Paul's Ball and Cross:

Photography under Difficulties

The ball and cross crowning the lantern of St. Paul's Cathedral are now being repaired and regilded, and the scaffolding which has been erected for this purpose has provided a unique opportunity for taking a "close-up" photograph (courteously sanctioned by Mr. Mervyn E. Macartney, B.A., F.R.I.B.A., Surveyor to the Fabric).

This photograph, the one reproduced on the right-hand side below, was taken under extraordinary difficulties. Our operator, after climbing through the staging surrounding the lantern, had to ascend the ladder against the small cupola shown in the left-hand view below (which, it should be explained, was taken with a telescopic lens from a distance), in order to reach the topmost platform, which is somewhere about 360 ft. above ground level.

Lying on his back upon this platform, which is only about 3 ft. wide, his feet held by two workmen, his head hanging in space, our operator made his exposure. He used a field camera with a wide angle lens, giving a shutter exposure of about one-twentieth part of a second. The camera was manipulated by hand, as it was of course impossible to erect or use a stand at this height and on such staging. A dizzy business, this! but we are glad to say that our operator safely survived it.

The extraordinary daring of the workmen (none of whom is a steeplejack) is shown in the left-hand view, one man actually standing upon an arm of the cross which is only about 16 in. wide!

It is interesting to recall that the original ball and cross, made by Andrew Niblett in 1713, weighed over 94 cwt. They were both renewed in 1821 by C. R. Cockerell, then Surveyor to the Cathedral. The present cross weighs about 3,360 lb.

Law Report

Contractors' Compensation Claim.

In the Civil Court at the Glamorgan Assizes at Swansea an action was brought by Messrs. Topham, Jones, and Railton, the well-known contractors, against Messrs. Stewarts and Lloyds, Ltd., engineers, to recover £300 paid as compensation in respect of a fatal accident to a carpenter's labourer named Graham, who was killed through the alleged negligence of defendants' workmen on October 24, 1919, during the erection of Messrs. Baldwin's new steelworks at Margam.

Mr. Villiers Meager appeared for the plaintiffs, and Mr. A. T. James for the defendants.

Mr. Meager stated that Messrs. Baldwins contracted with plaintiffs for the laying of the foundation works of the new steelworks, Messrs. Topham, Jones and Railton supplying the labour, and with the defendants for certain engineering steam piping, Messrs. Baldwins in this case supplying unskilled labour. Graham, who was employed by plaintiffs, met his death as the result of an iron pipe rolling down over him, and the negligence alleged against defendants was that the pipe was not properly secured. There was no dispute as to the payment of the £300 compensation money to the representatives of the deceased, and plaintiff's contention was that they were legally entitled to be indemnified by Messrs. Stewarts and Lloyds, who were in control of the unskilled labour supplied by Messrs. Baldwin.

Mr. Justice Coleridge, in summing up, told the jury they would have to ask themselves whether the pipes in the position they were in on the boiler casing would not have suggested to any careful workman that they were in a dangerous position and liable to shift.

The jury found for the plaintiffs for the amount claimed, and judgment was entered accordingly.

THE BALL AND CROSS OF ST. PAUL'S.

The A.A. Prize-giving

The annual prize-giving and exhibition of students' work at the Architectural Association took place last Thursday; Mr. Hamp, the new president, taking the chair.

They were met, said Mr. Hamp, to do honour to the students who had completed a strenuous year's work. He was glad to announce a new Bernard Webb Scholarship, to the value of £300, to be presented every two years. It would enable the winner to spend twelve months in Rome or elsewhere at the discretion of the committee.

He hoped that there would be keen competition among the students for the various scholarships and prizes, and that they would remain the full four or five years necessary for complete training.

Sir Reginald Blomfield, addressing the students, described the development of the school system twenty-five years ago, when he and some others in consultation realized that the old pupilage system had ceased to fulfil its purpose. It was said that academic training tended to stereotyped design, but they must realize that it was only a means to an end. He emphasized the fact that too elaborate drawings were simply waste of time. Students must seek mastery of their art, and not merely endeavour to catch the eye with beautiful drawings.

The study of old buildings was of the first importance. Sketching and critical analysis of buildings enabled them to visualize their own designs, and a knowledge of antiquity would preserve them from solecisms.

Architecture was now so complicated a business that it was impossible to master all the necessary knowledge. They should co-operate with the various specialists, devoting themselves mainly to the art of architecture.

Lady Fletcher, proposing a vote of thanks in the unavoidable absence of Mrs. Wintringham, M.P., said that she was sure the students would take Sir Reginald's address as a text. He was both an artist and a logician, and had penetrated the inner meaning of French architecture, its imaginative faculty and its logical spirit. She thanked him for both his spoken and his written word.

Major Barnes, M.P., seconding the vote, said that Mrs. Wintringham had expressly charged him to express her very great regret for her unavoidable absence. She was engaged at the House on a committee where her services were indispensable.

He wished to apologize for his own presence, and could only think that he had been introduced to point the moral in the manner of Hogarth's industrious and idle apprentices. The industrious apprentice in the person of Sir Reginald Blomfield had become a member of the Royal Academy, his idle brother in the person of himself had merely become a member of Parliament. (Laughter).

The A.A. was the leading school in England, and therefore in the world, and he had the greatest respect and regard for it. The pace was getting fierce now that women were admitted as students, and only the fittest would survive. The list of prizewinners, in fact, seemed to indicate that men lacked staying power, since the highest honours had fallen to the ladies. The competitive spirit in architecture was for the benefit of the school and of the profession.

Mrs. Stanley Hamp then handed the various prizes to their recipients, and the afternoon concluded with tea in the members' dining-room. The awards were as follows :

Public School Entrance Scholarship, value £63	J. V. Hamilton (Charterhouse)
Open Entrance Scholarship, value £63	Not awarded
A.A. Essay Prize, open to all students, value £10 10s. ..	Not awarded

First Year Course.

First Prize, "Howard Colls" Travelling Studentship, value £15 15s.	R. C. Erith
Second Prize, Books, value £5 5s.	D. A. John
Art Subjects, value £3 3s. ..	M. Tha Tun
General Progress Books, value £2 2s.	D. H. Beaty-Pownall
Scolarships tenable for one year in Second Year Course, value £63	E. T. Nash W. E. Palmer

Second Year Course.

First Prize, A.A. Travelling Studentship, value £26 5s. ..	W. Lewis
Second Prize, Books, value £10 10s.	F. E. Bennett
Art Subjects, Books, value £5 5s.	F. E. Bennett
General Progress Books, value £3 3s.	F. E. Green.
Scholarship tenable for one year in Third Year Course, value £63	J. W. Wood

Third Year Course.

Holloway Scholarship, value £150	Hon. H. A. Pakington
First Prize, "Henry Florence" Travelling Studentship, value £50	R. E. Enthoven
Second Prize, Books, value £21	H. Braddock
Third Prize, Books, value £15 15s.	Miss J. E. Townsend
General Progress Books, value £5 5s.	G. Whittaker
"Alec Stanhope Forbes" Prize for best colour work during year, Books, value £5 ..	R. E. Enthoven

Graduate Courses, Fourth and Fifth Year.

R.I.B.A. "Henry Jarvis" Scholarship, value £50	J. C. Shepherd
Scholarship from Fourth Year for One Year in Fifth Year Course, value 30 Gns. ..	J. C. Shepherd
Design.—First Prize, value £6 6s.	Miss I. M. Chambers
Second Price, value £4 4s.	Miss E. G. Cooke
Decoration.—First Prize, value £6 6s.	Miss E. G. Cooke
Second Prize, value £4 4s.	Miss I. M. Chambers
Town Planning.—First Prize value £6 6s. ..	Miss E. G. Cooke
Second Prize, value £4 4s.	E. Sheppard
Construction.—First Prize, value £6 6s.	Miss E. G. Cooke
Second Prize, value £4 4s.	J. C. Shepherd
Architectural Association Diploma.—On satisfactory completion of Five Year Course ..	Miss E. G. Cooke W. A. Devereux
Medal presented annually by the Société des Architectes Diplômés par le Gouvernement to the best Diploma Student of the year	Miss E. G. Cooke

It was also announced that the first prize in the Archibald Dawnay Scholarship, £50, had been gained by E. M. Channon, and the second, £25, by C. S. White.

Reconstruction & Finance in Belgium

By May 31, 1922, out of 78,000 buildings which were destroyed, 52,000 had been rebuilt. In addition 1,150 workmen's houses have been built where there appeared to be need for them, apart from the ordinary reconstruction claims. In all, 836 public buildings have been restored. Of roads, 2,165 kilometres have been relaid, and 54,000,000 francs have been spent on the restoration of bridges, culverts, etc. By the end of 1922 Belgium will have spent approximately sixteen milliards of francs on the restoration of the country.

R.I.B.A.

Following are notes from the minutes of the Council Meeting held on July 17 :

R.I.B.A. Boards and Committees.

The Council adopted the report of the Selection and General Purposes Committee, and appointed the various Boards and Committees of the R.I.B.A. for the year 1922–1923.

International Housing Congress at Rome : September 1922.

Mr. G. Topham Forrest was appointed delegate of the R.I.B.A.

International Congress of Architects at Brussels : September 1922.

Mr. Paul Waterhouse, P.R.I.B.A., and Mr. Edward P. Warren, F.R.I.B.A., were appointed delegates of the R.I.B.A.

Mr. Maxwell Ayrton on Mural Decoration

In an interview published in "The Morning Post" Mr. Maxwell Ayrton discussed the British Pavilion at Rio, a model of which was recently exhibited in London.

"The general public took a great interest in the Pavilion and its decoration," he said, "and in most cases hope was expressed that the demand for mural painting would grow. In recent years the art schools, particularly those associated with Professor R. Anning Bell, Professor Gerald Moira, Mr. Walter Bayes, and Mr. Charles Sims, have directed the attention of students far more than they did formerly to decorative design and painting. There is, I think," continued Mr. Ayrton, "a big field open for painters if their work could be organized and brought into line with other forms of decoration, such as glass, wood, and marble work. The field should not be restricted, as it is at present, to the occasional painting of a few panels here and there in public buildings. All sorts and conditions of buildings should be included, nor should the less ambitious class of decoration be excluded. Plain surfaces relieved by stencil work, painted enrichments on door mouldings, cornices, and so on, should be considered. These simpler exercises should be included in the work undertaken by the artist.

"But before a comprehensive scheme of this kind can be effected artists must organize," said Mr. Ayrton. "They must, in short, be prepared to work on a business footing; be able to give carefully thought out estimates as to the cost of decorating a church or a chapel, a public-house, or even a pigstye. Architects have to supply such estimates. Stained-glass designers, also, have to act in similar fashion. They without the least hesitation will quote a price per superficial foot for plain lead-light glazing with small decorative panels, for coats of arms in one part of a window, and an elaborate figure scheme for the remainder.

"What I feel is that if it were known that painters were ready and able to adapt themselves to the side of art in its humbler phases, the simpler and less expensive decorative work, they would soon have more important and remunerative commissions. In conclusion," Mr. Ayrton added, "all mural decoration should, wherever possible, be actually painted in the position it is to occupy permanently."

Builders' Benevolent Institution

The seventy-fifth annual general meeting of the Builders' Benevolent Institution was held on July 25 at 48 Bedford Square, when the annual report and the accounts for the year were received and adopted. Major R. J. Holliday, M.C., F.I.O.B. (Messrs. Holliday and Greenwood, Ltd.) was elected president for the ensuing year.

Mr. Frank May, J.P. (Messrs. Holland and Hannen and Cubitts, Ltd.) was re-elected treasurer. The following were re-elected members of the Committee of Management: Mr. A. H. Adamson (Messrs. T. H. Adamson and Sons), Mr. J. T. Bolding (Messrs. John Bolding and Sons, Ltd.), Mr. Ben Carter (Messrs. Stephens and Carter, Ltd.), Mr. P. C. Culver (Messrs. Wm. Harbrow, Ltd.), Mr. H. S. Foster, Mr. F. G. Minter, Mr. J. F. Parker (Messrs. Patman and Fotheringham, Ltd.), Mr. A. Ritchie, Sir Howell J. Williams (Messrs. Howell J. Williams, Ltd.); and Mr. Sidney Gluckstein (Messrs. Bovis, Ltd.) and Mr. H. M. Lorden (Messrs. W. H. Lorden and Son, Ltd.) were elected members of the committee.

The proceedings terminated with a vote of sincere thanks to the president for the past year, Mr. A. B. H. Colls, F.I.O.B. (Messrs. Trollope and Colls, Ltd.).

The report states that the president's appeal at the annual dinner in November last was so generously responded to that the total amount contributed was a record for the Institution. The committee express their sincere thanks to the members of the family of the late Mr. Joseph Hill, who have transferred to the trustees of this Institution certain investments, the income from which is sufficient to endow a pensioner. The only conditions attached to this gift are that it shall be known as the "Joseph Hill Memorial Fund," and that one pensioner shall be identified therewith.

The Report on Adhesives

The first report of the Adhesives Research Committee of the Department of Scientific and Industrial Research is just issued; this report embodies the results of certain of the investigations initiated by the Adhesives Committee of the Conjoint Board of Scientific Societies and also the researches of a more fundamental character which have been undertaken by the Adhesives Research Committee of the Department of Scientific and Industrial Research. The report is thus a comprehensive summary of the work from its inception in 1918 up to the end of 1921. The contents of the report are arranged under the following headings: I, Introduction; II, Mechanical Tests of Adhesives for Timber; III, Casein Adhesives; IV, Gelatin Adhesives; V, Vegetable Adhesives; VI, Other Adhesives. Appendix I, Descriptive Bibliography of Gelatin. Appendix II, The Bearing of Results obtained in recent Investigations of Soap Systems upon the Structure of Gelatin Gels. The first appendix is a comprehensive survey of the scientific literature of gelatin viewed from the physico-chemical standpoint. The report is illustrated by diagrams and photographic plates.

The report is published by His Majesty's Stationery Office for the Department of Scientific and Industrial Research. Copies, price 4s. (by post 4s. 3d.) may be obtained through any bookseller, or direct from H.M. Stationery Office at the following addresses: Imperial House, Kingsway, London, W.C.2, and 28 Abingdon Street, London, S.W.1; 37 Peter Street, Manchester; 1 St. Andrew's Crescent, Cardiff; 23 Forth Street, Edinburgh.

List of Competitions Open

Date of Delivery.	COMPETITION.
Aug. 11—Jan. 31, 1923	Labour-Saving Flats, Hampstead Garden Suburb. Premiums £500, £300, and £200. Assessors: L. Rome Guthrie, F.R.I.B.A., J. C. S. Soutar, Lic.R.I.B.A., and E. J. Cooper, Secretary, Second Hampstead Tenants Ltd., to whom, at Temple Fortune House, Hampstead Way, N.W. 11, applications must be made by August 11.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8,000 francs.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Nov. 1	New Town Hall and Municipal Offices in Victoria Park, Colombo. Cost not to exceed Rs. 1,000,000. Premiums Rs. 5,000, Rs. 3,500 and Rs. 2.000. A F.R.I.B.A. will act as assessor. Apply Secretary, Municipal Council, Colombo. Deposit Rs. 25.
No Date	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
	Southend Proposed Secondary School. At the request of the Competitions Committee of the R.I.B.A., the drawings required in this Competition will be to a scale of 16 feet to the inch.

Greenock War Memorial.

The successful competitors in the above competition are Messrs. Wright and Wylie, 212 Bath Street, Glasgow.

Carnarvon War Memorial.

In the Carnarvon War Memorial competition the design of Mr. Rowland Lloyd Jones, M.S.A. (County Architect), was selected by the assessor.

New Synagogue, Southport.

In the above competition, for a synagogue to seat about 600 and to be erected in Arnside Road, Southport, Messrs. Packer and Crampton, A.R.I.B.A., Architects, Shaftesbury Buildings, Southport, have been placed first.

Weybridge War Memorial.

The War Memorial Committee has selected a design submitted by Mr. Hatchard-Smith, F.R.I.B.A. It consists of a base surmounted by a military figure, and on the base will be recorded the names of all those from Weybridge who fell in the war.

Newmarket Hotel, Bury.

The above competition is banned by the R.I.B.A. and the Society of Architects.

Hampshire Association of Architects

The Hampshire and Isle of Wight Association of Architects recently arranged an at home and exhibition of prize drawings at Wolvesey. The proceedings were attended by upwards of fifty members and friends, including the President of the Association, Sir William Portal, Bart., and also the Very Rev. the Dean. It had been arranged that Mr. Paul Waterhouse, F.R.I.B.A., President of the Institute, should come down and address the members, as he did last year, but the Hon. Secretary of the Association (Mr. R. F. Gutteridge, A.R.I.B.A.) announced that he had received a letter from Mr. Waterhouse to the effect that he was unavoidably prevented from doing so.

Following the ordinary business meeting in connection with the Association, Mr. Gutteridge conducted the party around the exhibition of prize drawings, kindly lent for the occasion by the Institute, in addition to which were several drawings by student members of the Association in connection with the competitions carried out last winter. Passing from drawing to drawing, Mr. Gutteridge quoted from the criticisms of the same by Mr. Theodore Fyfe. After tea, the Rev. G. Sampson, of Ramsdell, gave an illustrated lecture, his subject being "Chartres Cathedral." The final event in the programme was an inspection of the ancient ruins at Wolvesey.

British Engineering Standards Association

The British Engineering Standards Association has issued two new reports dealing with dimensions for malleable and soft cast-iron pipe fittings of nominal sizes from ⅛ in. to 4 in. Both the reports contain, among others, clauses relating to special sizes of reducing fittings, screw threads, and the method of specifying outlets. These are followed by tables of dimensions of British Standard Equal and British Standard Reducing Fittings, and the reports conclude with type drawings of the fittings.

British Standard Dimensions for long sweep type malleable iron pipe fittings for steam, water, and gas, are limited to fittings designed for use where the maximum "delivery head" is needed and where the question of frictional resistance is important.

British Standard Dimensions for malleable and soft cast-iron pipe fittings for steam, water, and gas include all fittings in general use.

Publications Received

Trade and Craft

Memorial Panel, Tardebigge Church.

The models for the carving on the War Memorial Panel in Tardebigge Church (illustrated on the frontispiece and half-title page of this issue) were made by Monsieur E. Madeline, of 70 High Street, Lambeth. The contractors, who also did the carving, were Messrs. Farmer and Brindley, of 63 Westminster Bridge Road.

The London County Hall.

We are informed that the Korkoid and Ruboleum Tile Co. laid Ruboleum flooring in the lobbies east and west of the Council Chamber, the corridors north and south of the Council Chamber, and in several other lobbies and entrances. The total approximate area laid by the company was about 650 square yards.

Electrical Contractors' Staff Outing.

A very successful staff outing of Francis Polden & Co., Ltd., was held on Saturday, July 22, the party going to Brighton by charabancs. Luncheon was taken at the Clarence Hotel, and during the course of the speeches that followed congratulations were tendered to Mr. Polden that his company had now grown to a size which made such a large gathering possible, and presentations were made to him both on behalf of the outdoor staff and also the office staff, as tokens not only to mark this the first staff outing, but also to show the esteem in which he is held by the entire staff.

Bush House, Aldwych, London, W.C.

Messrs. Doulton & Co., Ltd., of Lambeth, have received the order for the sanitary fittings for the above building from the architects, Messrs. Helmle and Corbett. All the fittings are of the highest class, and an interesting departure is being made from the usual practice in that no w.c. cisterns are being used, all w.c.'s being flushed by means of Doulton's new patented "London" flushing valve. This water waste preventing valve, approved by the Metropolitan Water Board, is, it is claimed, noiseless in action, and when the expense of providing and fixing the usual flush and overflow pipes, etc., is eliminated, costs very little more than a good class cistern.

Cooking Ranges.

We have received the following communication from The London Warming Company, Ltd. :—

"We have noticed an article on cooking ranges in a recent issue of your paper, wherein comments upon trial with ranges, carried out by Professor Barker for The Fuel Research Board, are reported. While acknowledging the value of such tests, and fully appreciating the enormous work involved, there is ample room to query the efficiency figures quoted for the various functions of cooking and hot-water supply.

"We are makers of the well-known 'Kooksjoie' ranges, and are quite satisfied that, whilst agreeing with the observations and stricture on ranges generally, embodied in the report issued by the Research Committee, the figures quoted do but scant justice to our own production. We had, previous to the publication of the report, carried out trials on our ranges, and have, since its appearance, verified our figures, and are satisfied that efficiencies varying considerably in excess of those obtained by the Professor may in everyday use be attained. Our trials show that overall efficiencies, i.e. for oven, hot-plate, and hot-water supply, of from 40 to 50 per cent., depending on the rate of fuel consumption, are obtainable."

An Important Amalgamation.

Messrs. Rippers, Ltd., the well-known firm of joinery manufacturers, shop fitters, etc., of Castle Hedingham, Essex, and 165 Gray's Inn Road, London, have acquired a controlling interest in the old established firm of Geo. Evans and Sons, Ltd., timber merchants, importers, and joinery manufacturers, of Newton Heath, Manchester.

The Newton Heath business will be carried on under the same name as before, but under the direct management of Mr. H. T. Ripper, as Chairman of Directors, assisted by his two younger sons, Mr. Donald C. C. Ripper and Mr. Dennis F. A. Ripper. The leading members of the staff have been retained, including Mr. A. V. Evans and Mr. C. T. Gresham.

Every kind of joinery is manufactured, and timber suitable for all purposes can be supplied at market prices. The Newton Heath Works are being thoroughly reorganized and brought up to date, and new blood is being introduced into several departments.

Building Activity in Liverpool

Great progress is being made with the erection, from the designs of Messrs. T. Arnold Ashworth and Son, architects, of the new steel-framed building for the National Bank in James's Street, Liverpool. The erection of this building by Messrs. Wm. Moss and Sons, Ltd., of Liverpool, contractors, has followed quickly that of the new building for Barclays Bank, which has superseded the old head offices of the Cunard Steamship Company in Water Street, Liverpool. Barclays building is now being finished internally; all the scaffolding and lifting apparatus has been removed. The joint architects are Messrs. Peacock and Bewlay, and Edmund Kirby and Sons.

The larger dress and drapery companies of Liverpool have been responsible for some of the more extensive building operations carried out of late in the more central shopping district of the city.

"Lewis's," the clothing, drapery, and household stores, are extending skywards their large block of premises at the corner of Ranelagh Street and Renshaw Street. The entire scheme is not yet completed. Lifts extending to the full height of the building have been installed, and a series of spacious new floors provided. The architect is Mr. G. de C. Fraser.

The Bon Marché, a large costume, drapery, and fancy goods emporium in Church Street and Basnett Street, Liverpool, has similarly been extended by building upwards under the superintendence of the same architect.

Another large dress and ladies' goods house, that of Wm. Henderson and Sons, Church Street, has also been enlarged by additions to existing upper stories. Mr. G. de C. Fraser is also responsible for this work.

The proprietors of a large general furnishing warehouse in London Road, Liverpool, Messrs. Ray and Miles, announce that extensive alterations of their premises are about to be made.

Victoria & Albert Museum Chinese Furniture

The Victoria and Albert Museum has acquired, by gift, what may perhaps justly be described as the most important example of Chinese furniture yet seen in this country. For some weeks, the throne of the Emperor Ch'ien Lung has been on exhibition in Messrs. Spink and Son's Oriental Gallery, and the museum was given an option of purchase on favourable terms. Its resources were quite unequal to so large an undertaking; and the nation owes this splendid acquisition to the generosity of a private donor, Mr. George Swift, J.P. The throne is 3 ft. 11 in. in height, 4 ft. 1½ in. in width, and 3 ft. in depth; and the seat is still furnished with its original cushion of fine old brocade. It is now exhibited in Room 41 of the museum.

Travelling Scholarship for Textile Designers

The activities of the Federation of British Industries in organizing (in co-operation with the Board of Education) a scheme of refresher courses at the Royal College of Art for designers in industrial works, has concentrated attention upon the value of such an opportunity for the craftsman to study the finest examples of art as applied to his especial branch of industry. It is therefore of interest to note that the Royal Manchester Institution is offering a travelling scholarship of the value of £35 for the best set of designs for textile printing, and that it is expressly stipulated that the successful competitor must spend not less than three weeks visiting London or some other approved centre for the purpose of studying textile designs, and must submit a written account of his or her visit and studies.

Feodora Gleichen Memorial

At the inaugural meeting of the Feodora Gleichen Memorial Studios for Women Sculptors, held at the Royal Academy, a committee was approved to further the proposal to raise a fund to build and endow a number of studios in London, as a memorial to Lady Feodora Gleichen. The studios would be for the use of women sculptors, who, on completion of their studentship, may enter their profession equipped with the necessary facilities for the execution of large work. The committee is as follows: Earl of Plymouth, president; Sir Aston Webb, vice-president; Sir William Plender, hon. treasurer; Mr. F. W. Fladgate, hon. solicitor; Mr. W. Reynolds-Stephens, chairman of executive committee; Lord Edward Gleichen, Lady Helena Gleichen, Lady Valda Machell, Grace Countess of Wemyss, Sir W. Goscombe John, Sir John Burnet, Sir Cecil Harcourt Smith, Mr. Ernest Gillick, Mr. John Tweed, Mr. C. Hartwell, Mr. David Jaggers, and Miss Elinor Hallé, with Miss Phillpotts, secretary.

The Week's News

Stowe Palace.

The historic palace of Stowe, in Buckinghamshire, with its estate of many hundreds of acres, is again to be sold.

Harrogate Spa Rooms.

Plans have been submitted to the Council for the rebuilding of the Spa Rooms attached to the Royal Hall.

L.C.C. Building Scheme.

The London County Council is arranging for the erection of blocks of tenements on the Tabard Garden estate and the Brady Street slum area.

Ballater War Memorial.

The War Memorial at Ballater has been completed. Designed by Sir John J. Burnett, it takes the form of a Celtic Cross of Kemnay granite.

Southwark Town Hall Extension.

Southwark Borough Council has adopted a scheme for the extension of the Town Hall, Walworth Road, at a cost of £25,924.

Old Kent Road Tenements.

The City of London Corporation's original scheme for erecting eight blocks of tenements in the Old Kent Road has been reduced to three blocks.

New Church, Govanhill.

Work is proceeding with the erection of New Briggate United Free Church, Govanhill. The architects are Messrs. Thompson, Sandilands and McLeod, of Glasgow.

Golders Green Improvements.

Approximately £2,400 is to be expended on extending accommodation at Golders Green Tube Station; and, in view of the tube extension from Golders Green, road widenings in Queen's Road, Park Road, and Vivian Avenue are to be carried out.

A Brighton Improvement.

The Health Committee of the Brighton Corporation has defined a scheme for the improvement of the Paradise Street and Hereford Street area. The estimates provide for a total sum of £27,000. The area affected is an acre and a half.

New Barking Power House.

The County of London Electric Supply Company, having received the consent of the Electricity Commissioners to erect a new electric power house at Barking, propose immediately to proceed with the erection of the station.

Richmond Bridge.

Although Richmond Bridge was described by the mayor, Councillor Morrison, as dangerous and likely to lead to a fatal accident on account of its narrowness and unsuitable approaches, the Surrey County Council has refused to recommend that a new bridge be built.

Middle Temple Roof in Danger.

Fearing that the wonderful hammer-beam roof of their ancient hall is in danger owing to decay, the Benchers of the Middle Temple have closed the hall so that a thorough examination may be made. This roof is one of the extremely rare examples of the "double hammer-beam" type.

Shoreham Bridge.

The old Norfolk suspension bridge over the River Adur at Shoreham is to be pulled down and replaced by a modern structure. The reconstruction, which is to be carried out by the Unit Construction Company, will probably occupy about five months.

Architect's Housing Bill.

At the Pwllheli Town Council meeting a bill was submitted from an architect for £587 for preparing plans in connection with the abandoned housing scheme. It was decided to press the Ministry to pay the architect's bill in full, as they were responsible for the expense.

Proposed New Public Library for York.

As a result of negotiations between the York Public Library Committee and the Carnegie Trustees, the latter body have agreed to allow their offer of £12,000, made in 1916, to be used towards the proposed erection of a portion of the new library, and to increase the grant by 10 per cent.

Professional Defence in New Zealand.

The minutes of the proceedings of the New Zealand Institute of Architects annual meeting held on February 15 show that a resolution was passed calling upon the Institute to set up a Professional Defence Committee on the lines of the Society of Architects Professional Defence Organization.

Projected City Improvements.

A proposal is before the Corporation of London to widen Bishopsgate at its junction with Leadenhall Street, and Gresham Street between Basinghall Street and Coleman Street, at a cost respectively of £40,000 and £70,000, of which the London County Council will pay half.

Buckfast Abbey Church.

On Thursday the Abbey Church of the Benedictine Abbey of Buckfast is to be inaugurated by Cardinal Bourne. This has been rebuilt during the past twenty years under the direction of Mr. Fred Walters, F.S.A., architect of the Abbey buildings. The work has been executed by the monks themselves.

New Cardiff Schools.

The local education authority has recommended to the city council that the plans of the proposed new schools for Mynachty and Ely should be prepared by the city engineer. The South Wales Institute of Architects have protested to the committee concerned, and a further effort is to be made to get the matter referred back.

The Royal Northern Hospital.

It is hoped that work will shortly begin on the proposed extension to this hospital which is to form part of Islington's War Memorial. Messrs. Adams and Holden are the architects for the work, which is to consist of a complete casualty department, with observation wards. It is to be hoped that adequate funds for its rapid completion will be forthcoming at an early date.

New Conditions of Contract.

Mr. John Slater, past vice-president of the R.I.B.A. and chairman of the Practice Standing Committee, has been appointed as the architect member of the tribunal which, under the chairmanship of Sir Wm. Mackenzie, K.C., will have the deciding voice on any points on which the Conditions of Contract Conference are unable to agree.

"The Decorator."

The first number of a new volume of "The Decorator" (the twenty-first) is just issued. It contains a wealth of matter on different aspects of decorative work, including articles on Colour Decoration, the Use of Ready-mixed Paints, Wallpaper Complaints, The Decorator-Architect, Painted Woodwork and Furniture, Transfer Designs, etc.

Mander Brothers' Welfare Club.

During the recent visit of the Duke of York to Wolverhampton the members of the executive committee of Messrs. Mander Brothers' Welfare Club were specially presented to H.R.H. at the station. Owing to shortness of time the Duke was unable to visit the recreation ground laid out by the firm for their employees, which, as President of the Industrial Welfare Society, he had desired to do.

University College Medical School.

The scheme of the Rockefeller Foundation for the establishment at University College, Gower Street, of a model medical school is to be put in hand at once. The new buildings will include a large six-storied obstetric block, new operating theatres, laboratories, and other medical school buildings. The architects are Mr. Paul Waterhouse, P.R.I.B.A., and Mr. George Hornblower, the hospital's consultant.

New Criterion.

More than £200,000 is to be spent on erecting a new building and improving the Criterion Restaurant, Piccadilly Circus, W., subject to the scheme being passed by the licensing authorities. It is proposed to erect a new building on the vacant site at the corner of Regent Street, giving frontages on Piccadilly Circus, Jermyn Street, and Regent Street. Shops will occupy the ground floor, and above will be a luxurious grill-room and up-to-date business offices.

Portraits at Manchester City Art Gallery.

A series of seventeen portraits by Mr. Francis Dodd of ex-presidents of the North-western Federation of Building Trade Employers, says "The Manchester Guardian," is on view in one of the rooms of the City Art Gallery during this week. The Federation wished to mark in some suitable way the services of those who had been its presidents, and the scheme under which this uniform series of portraits has been made was adopted as a way of showing them honour. The portraits are to be hung in the board-room of the Federation, and a replica is to be given to each sitter. Mr. Francis Dodd has been chosen to carry out this very excellent idea.

Rates of Wages in the Building Trades*

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, masons, carpenters and joiners, woodcutting machinists, slaters, plumbers,* plasterers, painters †) and labourers in the building industry. The labour rates for London are given in the Table of Current Prices on pages xxi, xxii.

District.	Grade A.		Grade B.		Grade C.		Grade D.

* In the case of towns printed in *italic type* below, the rates shown in the Table for craftsmen do not apply to plumbers.
† Except in Scotland, where painters are not included within the scope of the area grading scheme.
‡ Excluding Liverpool and Birkenhead, where the rates are 1s. 11d. for plumbers, 1s. 10d. for other craftsmen, and 1s. 5d. for labourers.
§ Excluding Aberdeen, where the rates remain unaltered at 1s. 7½d. for masons, joiners, and plasterers, 1s. 8d. for slaters, and 1s. 9d. for plumbers.
‖ It is reported that the Plasterers' Union in Scotland has not accepted the national reduction in June and that a large number of men have ceased work.
¶ In Scotland, labourers are not included in the general grading scheme.

Grading of Towns.

The localities in which the above rates have been reported to be in operation are as follows. In the case of localities printed in *italic type*, the rates shown in the above Table for craftsmen do not apply to plumbers.

NORTH EAST COAST :—

Annfield Plain, *Birtley*, Bishop Auckland, *Blackhill*, *Blyth*, *Chester-le-Street*, *Consett*, *Darlington*, *Durham*, *Ebchester*, *Gateshead*, *Hartlepools*, *Hebburn*, *Hexham*, *Jarrow*, *Lanchester*, *Leadgate*, Medomsley, *Middlesbrough*, *Morpeth*, *Newcastle*, *North and South Shields*, *Seaham Harbour*, *Stanley*, *Stockton*, *Sunderland*, *Thornaby*, *Tynemouth*, *Wallsend*, *Whitburn*, and *Whitley Bay*.

YORKSHIRE :—

Grade A.—*Altofts*, *Barnsley*, *Batley*, *Bingley*, *Birstall*, *Bradford*, *Brighouse*, Calder Valley, Castleford, *Cleckheaton*, *Colne Valley*, *Crosshills*, *Dewsbury*, *Doncaster*, *Gomersal*, Grimsby, *Guiseley*, *Halifax*, *Harrogate*, *Hebden Bridge*, *Heckmondwike*, Holmfirth, *Horbury*, *Hoyland*, Huddersfield, Hull. *Ilkley*, Immingham, *Keighley*, *Knottingley*, *Leeds*, *Liversedge*, *Mexborough*, *Mirfield*, *Morley*, *Normanton*, *Ossett*, *Penistone*, Pontefract, Pudsey, *Rawdon*, *Rotherham*, Scunthorpe, *Selby*, *Sheffield*, *Shipley*, *Sowerby Bridge*, *Stocksbridge*, *Wakefield*, *Wombwell*, *and Yeadon*.

Grade B.—Barnoldswick, Beverley, Bridlington, Goole, Hornsea, Scarborough, Skipton, *Whitby* (plumbers 1s. 7d.) and York.

Grade C.—Driffield, Kirby Moorside, Malton, Norton, Pickering, and Wetherby.

NORTH WESTERN COUNTIES :—

Grade A.—*Accrington*, Adlington, *Alderley Edge*, *Altrincham*, *Ashton-under-Lyne*, *Atherton*, *Bacup*, Barrow, Birkdale, Bispham, *Blackburn*, Blackpool, Blackrod, *Bolton*, Broughton (Flints), *Burnley*, *Bury*, Carlisle, Chester, Chorley, *Church*, Cleveleys, *Clitheroe*, *Colne*, Connahs Quay, Dalton-in-Furness, *Darwen*, *Denton*, *Droylesden*, *Eccles*, *Farnworth*, Fleetwood, Frodsham, *Glossop*, *Great Harwood*, *Haslingden*, Hawarden, Helsby, *Heywood*, Higher Kinnerton, *Horwich*, *Hyde*, Lancaster, *Leigh*, Leyland, *Littleborough*, Longridge, Lymm, Lytham, *Manchester*, *Middleton*, Morecambe, *Mossley*, *Nelson*, *Ormskirk*, *Oswaldtwistle*, *Oldham*, *Padiham*, *Pendlebury*, Poulton, *Preston*, *Prestwich*, Queensferry, *Radcliffe*, *Ramsbottom*, *Rawtenstall*, *Rishton*, *Rochdale*, Runcorn, St. Anne's-on-the-Sea, St. Helens, *Saddleworth*, *Sale*, *Salford*, *Shaw*, Shotton, Southport, *Stalybridge*, *Stockport*, *Swinton*, Thornton, *Todmorden*, *Tyldesley*, *Walkden*, *Warrington*, Westhoughton, *Whalley*, *Whitefield*, Widnes, Wigan, and *Wilmslow*.

Grade B.—Askam, Broughton, Buxton, Cleator Moor, Congleton, Coniston, Crewe, Distington, Egremont, Grange-over-Sands, Harrington, Knutsford, *Macclesfield*, Maryport, Market Drayton, Middlewich, Millom, Mold, Nantwich, *New Mills*, Northwich, Sandbach, Tarporley, Ulverston, Winsford and Over, Whitehaven, Workington, and Wrexham.

Grade C.—Ambleside, Bala, Bangor, Bowness-on-Windermere, Carnarvon, Colwyn Bay, Conway, Grasmere, Holyhead, Holywell, Kendal, Langdale, Llandudno, Llandudno Junction, Mostyn, Penrith, Prestatyn, Rhos, Rhyl, and Windermere.

MIDLAND COUNTIES :—

Grade A.—Alfreton, *Belper*, Bilston, *Birmingham*, *Blackheath*, *Burslem*, *Cheadle*, *Chesterfield*, Coalville, Coventry, *Derby*, *Hanley*, Heanor, Hinckley, *Ilkeston*, Kenilworth, *Leicester*, Lincoln, *Long Eaton*, *Loughborough*, *Mansfield*, Newcastle-under-Lyne, *Nottingham*, *Nuneaton*, Oldbury, Ripley, Stoke-on-Trent, *Sutton Coldfield*, *Sutton-in-Ashfield*, West Bromwich, Willenhall, and Wolverhampton.

Grade B.—Atherstone, Bewdley, Boston, Brierley Hill, Bromsgrove, Burton-on-Trent, Cannock, Coseley, *Darlaston* (plumbers 1s. 7½d.), Dudley, Gainsborough, Gornal, Grantham, Halesowen, Hednesford, Kidderminster, Knowle, Leamington, *Leek*, Lichfield, Louth, Malvern, Market Harborough, *Matlock*, Melton Mowbray, *Newark*, Northampton, Oakengates, Old Hill, Peterborough, Redditch, Retford, Rugby, *Rugeley* (plumbers 1s. 7½d.), Sedgley, Shifnal, Shrewsbury, Skegness, Sleaford, Solihull, Southwell, *Stafford*, Stamford, Stourbridge, Stourport, Stratford-on-Avon, Swadlincote, Swanwick, Tamworth, *Walsall* (plumbers 1s. 7½d.), Warwick, Wednesbury, Wellington, Worcester, and Worksop.

Grade C.—Ashbourne, Bridgnorth, Church Stretton, *Horncastle*, Kettering, Ludlow, Newport, Oakham, Oundle, Raunds, Rushden, Spalding, Thrapston, Uttoxeter, Wellingborough, and Wirksworth.

Grade D.—Buckden, Eaton Socon, Huntingdon, St. Ives, and St. Neots.

EASTERN COUNTIES :—

Grade A.—Baldock, Bedford, Berkhamsted, Biggleswade, Braintree, Brentwood, Chelmsford, Cambridge, Colchester, Halstead, Hatfield, Harpenden, Hemel Hempstead, Henlow, Hertford, Hitchin, Hoddesdon, Ingatestone, Ipswich, Letchworth, Luton, Norwich, Ongar, St. Albans, Sandy, Sawbridgeworth, Stevenage, Stotfold, Ware, Welwyn, and Witham.

Grade B.—Aldeburgh, Ampthill, Attleborough, Aylsham, Braughing, Chatteris, Cromer, Dovercourt, Dunstable, Ely, Fakenham, Felixstowe, Frinton, Gorleston, Halesworth, Harwich, King's Lynn, Leighton Buzzard, Leiston, Lowestoft, March, Much Hadham, Newmarket, North Walsham, Puckeridge, Renthem, Saxmundham, Southwold, Standon, Stowmarket, Walton-on-the-Naze, Wickham Market, Wisbech, Woodbridge, Wymondham, and Yarmouth.

Grade C.—Bungay, Coltishall, East Dereham, Royston, Saffron Walden, and Tring.

SOUTHERN COUNTIES :—

Grade A.—Abingdon, Addlestone, Amersham, Ascot, Ashford (Middlesex), Banbury, Beaconsfield, Bournemouth, Bracknell, Brighton, Byfleet, Chalfont, Chesham, Christchurch, Cremborne, Eastbourne, Eastleigh, Egham, Eton, Gerrard's Cross, Goring, Gosport, Gravesend, Guildford, Henley, Hove, Laleham, Maidenhead, Marlow, Northfleet, Oxford, Poole, Portsmouth, Reading, Southampton, Staines, Stanwell, Sunningdale, Sunninghill, Tilehurst, Tonbridge, Tunbridge Wells, Wallingford, Windsor, Winkfield, Woking, Wokingham, and Wycombe.

Grade B.—Arundel, Ashford (Kent), Aylesbury, Bagshot, Basingstoke, Bexhill, Bicester, Bletchley, Bognor, Bosham, Broadstairs, Brockenhurst, Buckingham, Burgess Hill, Camberley, Canterbury, Chatham, Chichester, Chipping Norton, Cranleigh, Deal, Dorking (plumbers 1s. 5d.), Dover, Fareham, Faringdon, Faversham, Fenny Stratford, Folkestone, Gillingham, Godalming, Hailsham, Haslemere, Hastings, Havant, Herne Bay, Horsham, Hythe, Lambourn, Liphook, Littlehampton, Lymington, Maidstone, Margate, Midhurst, Milford, Milton Regis, Newbury, New Milton, Newport Pagnell, Oxted, Pangbourne, Petworth, Ramsgate, Redhill, Reigate, Rochester, Sandgate, St. Leonards, Sevenoaks, Sittingbourne, Strood, Stony Stratford, Stow-on-the-Wold, Thame, Walmer, Wantage, Wendover, Westerham, Westgate, Whitstable, Winchester, Winslow, Witney, Wolverton, Woodstock, and Worthing.

Grade C.—Andover, Ardingley, Farnham, Godstone, Hawkhurst, Hartley Wintney,* Haywards Heath, Horley, Isle of Wight, Liss, Petersfield, Rye, Smallfield, Staplehurst, Steep, Turners Hill, and Uckfield.

[N.B.—Leatherhead :—painters, 1s. 5½d.; plumbers, 1s. 6½d.; other tradesmen, 1s. 6d.; labourers, 1s. 1½d.]

SOUTH WESTERN COUNTIES :—

Grade I.—Bristol.

Grade II.—Plymouth * and Devonport.*

Grade III.—Dartmouth,* Exeter,* Kingswear,* Newton Abbot, Paignton, Portishead, Stroud,† Taunton, and Torquay.

Grade IV.—Barnstaple, Beaminster, Povey Tracey, Bradford-on-Avon,* Bridgwater, Bridport,* Brixham, Bruton, Burnham-on-Sea, Calne,* Castle Cary, Cheddar,* Cirencester,* Clevedon, Coleford,* Corsham,* Crewkerne,* Dawlish, Dorchester,* Exmouth, Fairford,* Frome,* Glastonbury, Lydney,* Melksham,* Midsomer Norton, Minehead,* Radstock, Shepton Mallet, Street, Swanage,* Teignmouth,* Tetbury,* Thornbury,* Totnes,† Trowbridge,* Wells, Westbury,* Weston-super-Mare, Weymouth,* and Yeovil.*

[N.B.—Bath, Cheltenham, Gloucester* (except painters), Hereford,* and Swindon* :—tradesmen, 1s. 5d.; labourers, 1s. 0¾d.]

SOUTH WALES AND MONMOUTHSHIRE :—

Grade A.—Aberavon, Aberdare, Abergavenny, Ammanford, Barry, Bridgend, Briton Ferry, Brynmawr, Cardiff (plumbers, 1s. 8½d.), Chepstow, Duffryn Valley, Ebbw Vale, East Glamorganshire and Monmouthshire Valleys, Garw Valley, Gorseinon, Llanelly, Maesteg, Merthyr, Mountain Ash, Neath, Newport, Ogmore Vale, Pontardulais, Pontypool, Pontypridd, Porthcawl, Port Talbot, Rhondda and Rhymney Valleys, Sirhowy Valley, Swansea, and Tredegar.

Grade B.—Haverfordwest, Pembroke and Pembroke Dock.

[N.B.—Brecon and Carmarthen :—tradesmen, 1s. 6d.; labourers, 1s. 1½d. Llandrindod Wells :—tradesmen, 1s. 5d.; labourers, 1s. 0¾d.]

SCOTLAND :—

Grade A—Airdrie, Alloa, Alva, Armadale, Ayr, Bathgate, Bellshill, Bridge of Weir, Buckhaven, Burntisland, Clydebank, Coatbridge, Dumbarton, *Dundee*, Dunfermline, Edinburgh, Falkirk, Glasgow, *Gourock*, Grangemouth, *Greenock*, Haddington, Hamilton, Harthill, Irvine, Kennoway, Kilmarnock, Kirkcaldy, Larbert, Largs, Leith, Leslie, Leven, Markinch, Methil, Motherwell, Neilston, Newmains, Paisley, Pencaitland, Perth, *Port Glasgow*, Renfrew, Stenhousemuir, Stirling, Uddingston, Uphall, Wemyss, Whitburn, Windygates, and Wishaw.

Grade B.—Arbroath, Montrose, and Peebles.

Grade C.—*Dumfries*, Galashiels, Hawick, and *Maxwelltown*.

---

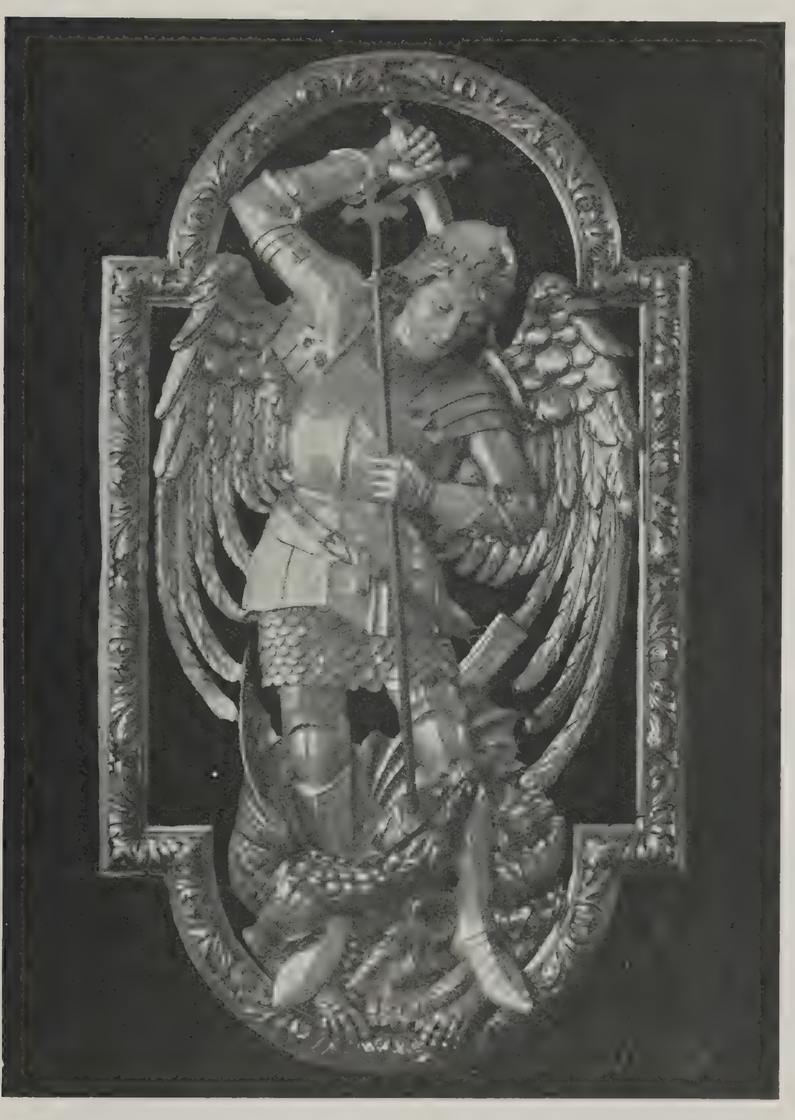
THE ARCHITECTS' JOURNAL & Architectural Engineer

With which is incorporated "The Builders' Journal"

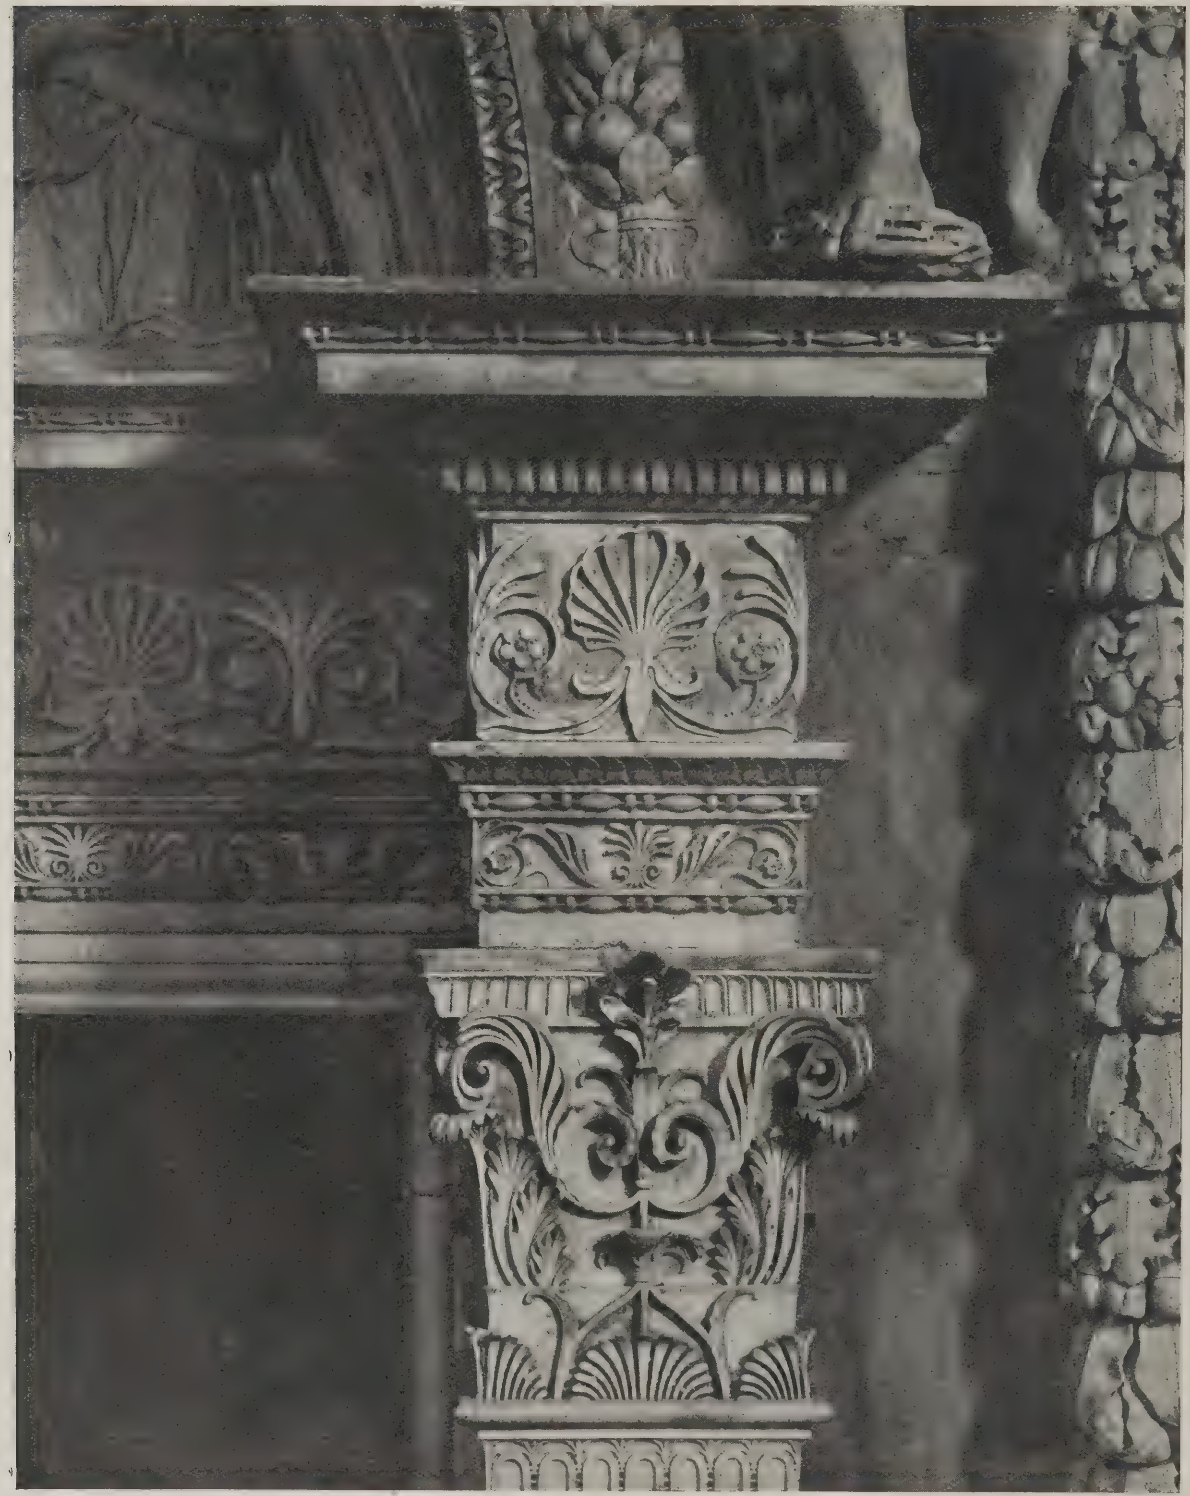


This figure of St. Michael (nearly life-size) is carved in wood, chiefly by Mr. Lewis Smallcorn of Bath, finished, coloured, and gilded by Mr. Guglielmo Tosi, of Brompton Road, London, the silver leaf work on the armour being highly effective. The two semicircular portions of the frame are eighteenth-century work, in all probability taken from a Bristol reredos. The figure is suspended from the ceiling in the north aisle of Christ Church (City) Bristol and is a thanksgiving for the preservation of Major Aubrey Du Plat Thorold Cole, O.B.E., M.C., 6th Dragoon Guards (Carabiniers), through the two wars 1899 to 1902 and 1914 to 1919. Mr. C. F. W. Dening, F.R.I.B.A., R.W.A., was the architect.

27-29 Tothill Street, Westminster, S.W. 1.

Architectural Details. 30.—Monument to Carlo Marsuppini, Florence

Desiderio da Settignano, Architect



Desiderio da Settignano was born in 1428, and became an architect and a sculptor. His most important work was the Monument to Carlo Marsuppini, Chancellor of the Florentine Republic, who died in 1453. The monument was erected in the Church of S. Croce at Florence, and this illustration gives some idea of the delicacy of its handling. Settignano died in 1464, at the early age of 35.

The Question of the Bank of England

THE great architectural question of the moment that is exciting layman and professional architect alike is the proposed alteration to the Bank. Further on in this issue Mr. A. R. Powys, the secretary of the Society for the Protection of Ancient Buildings, discusses the matter. To all Londoners and lovers of London the "Old Lady of Threadneedle Street" is so familiar and, we might say, beloved a landmark, that any proposal for any alteration is bound to cause a searching of hearts and an outburst of criticism. Soane's masterpiece is an integral part of the City; it is as impossible to conceive the City without the Bank as the Bank without the City.

Perhaps, without exaggeration, it may be said that it stands for far more than the City; that its low impressive walls of solid masonry symbolize the integrity of the British Empire—it looks solid and safe, and is one of our most beautiful, as well as one of our most famous buildings.

The drawings which were published in our last issue showing the proposed alterations are described "as being under the consideration of the Directors," so that it would appear that they have been put forward at this stage to test public opinion.

The critics of the proposals are divided into three camps:

1. Those who would do away with the present building entirely.

2. Those who accept the proposals put forward in their entirety.

3. Those who agree with the retention of the outer walls of the present building, but do not consider that the treatment of the new interior blocks is the best solution of an admittedly difficult problem.

The views of the first class of critics were ably set out in a leader which appeared in a recent edition of "The Westminster Gazette."

The opinion expressed was that London already suffered too much from patch-work buildings, and that it would afford a much better chance to the architect entirely to scrap the present structure and to rebuild the new bank unfettered with any of the old conditions.

We do not think that many people, except, perhaps, a few case-hardened Philistines, who really appreciate and care for London and London's architecture, will after mature consideration agree with these views. As Mr. Powys says in his article on a later page, it is worth a tremendous effort to retain as much of Soane's masterpiece as possible, provided always such retention can be accomplished without unduly hampering the effective use of the new building, and provided also that the new portion of the building shall be in harmony with, and enhance the older work.

We are, of course, assuming that the present premises are quite inadequate for their purpose, and that some solution other than of retaining the present building as it is is imperative.

The present plan, though possessing many delightful features, is a veritable rabbit-warren; but granted this, we do not think that any mere question of convenience should be considered of sufficient importance to justify any wholesale remodelling.

But assuming that the Directors of the Bank are justified in demanding greatly increased accommodation, we think that the main proposals of Messrs. Baker and Troup are on the right lines, at any rate as far as the plan is concerned.

Their scheme retains the familiar screen wall, with Soane's rooms behind it, and Taylor's Court-room. And we feel quite convinced that any successful solution of the scheme must retain these features. As we have said, generally speaking, we think the problem of the plan, with, perhaps, the exception of a few minor details which will no doubt be modified before the scheme assumes concrete expression, is on the right lines—it is when we consider the architectural treatment of the new superstructure that we do not feel quite so happy. And this brings us to the third group of critics—the second group we need not consider.

It is when we examine the drawings for the design of the superstructure that we feel that "The Westminster Gazette" had some reason for saying that the proposals were patchwork.

We like the treatment of the present walls as an outer palisade or keep, with the main block rising behind it; but unfortunately the idea is lost on the Threadneedle Street front, where a meaningless portier projects from the main block, and piles up with crushing effect on top of Soane's magnificent entrance.

We feel sure that this aeriel portico, in competition with the porticoes of the Royal Exchange and the Mansion House, would be most unfortunate, and would be a very grave error in civic design.

We are, of course, in the dark as to the exact amount of extra accommodation required by the Bank authorities. In the report accompanying the drawings it is stated: "It will be between this inner court and the outside sequence of Soane's banking halls that it is proposed to rear the new building to the fullest height which may be held to be legitimate and advisable for the architectural harmony of the building as a whole, and for the light and health of the surrounding narrow streets and buildings." Without going into the question of "the light and health of the surrounding narrow streets and buildings," we are inclined to think that the "architectural harmony of the building as a whole" would have greatly gained by the omission of the two top stories.

The introduction of the mansard roof with the dormer windows is particularly unfortunate, as it introduces a quasi-domestic note quite out of keeping with the stern simplicity of the existing building.

The present screen walls, particularly on the Threadneedle Street side, contain so much of architectural interest that it would seem that any new building should be subservient to them and not in the nature of an anti-climax.

A modern office block finished with a mansard roof rising jauntily above the old walls savours too much of dignity and impudence.

We feel, above all, that the character of the bank should be retained, that the new structure should be simple and dignified even to austerity—should suggest invulnerability and endurance.

Personally, as we have said, we should prefer to have seen the new structure finish two stories below the present proposed height, crowned with a strong cornice and flat roof, with, if possible, the corridors on the external wall, with the windows in this wall reduced to a minimum and the main rooms lighted from the central courtyard.

The new structure should in effect be a stone chest protected by an outer guard—the nation's money-box on ramparts!

Judging from what we know of Mr. Baker's work in South Africa we should say he was exactly the man to have afforded the best solution on these lines. We remember those simple square buildings with frowning cornices recalling the houses of the merchant princes in Florence, which are famous throughout South Africa, and we wish Mr. Baker could have given us something similar at the Bank.

Following the precedent of most great buildings the scheme will probably go through many changes before it is ultimately realized in masonry, and when this ultimate realization does take place we hope it will be along the lines we have indicated.

The architect who is called upon to add to a famous building is beset with difficulties, and these difficulties are increased when the addition is in a vertical instead of a lateral direction.

A building such as the Louvre or Greenwich Hospital may grow by the addition of successive wings, and each addition may add to the architectural beauty and harmony of the whole, but whether the additions take the forms of wings or are in the nature of additional stories we are sure that these additions must be planned and executed with the maximum of courage, and that to be timid is to court disaster.

Acoustics and the Architect

Architects having been, at one time or another, so roundly abused for the " defective acoustics " of buildings, it is pleasant to note an example to the contrary. Mr. Robert Jones, of Bootle, writing to " The Times " to suggest that good examples are profitable for study, instances the Philharmonic Hall, Liverpool, as being a favourable specimen. " To my certain knowledge," he says, " a whisper from a vocalist or the *pianissimo* from an instrumentalist can be heard from any seat in the hall, and there is no reverberation from the *fortissimo* playing of an orchestra." That is indeed a good hearing! It is contended, moreover, that the London County Hall case has been greatly exaggerated, and that what is really the matter is a fault that no architect can possibly correct, namely, the deplorably faulty speaking of the members, few of whom seem at all aware that public speaking is an art. Possibly the County Hall will teach them the futility of mere mumbling and grumbling.

Apotheosis of the Village Pump

A leader-writer in " The Times " has waxed dithyrambic about the Village Pump. He poetizes, however, not about the pump *per se*, which he takes as a symbol of the local pride which he would fain encourage. The local patriot is eager to descant to the visitor upon local excellences, and to display the characteristics which constitute a unique claim to admiration: the Norman church, the quaint market-cross, the far-flung panorama from the Down above, the scientific lay-out of the latest garden city. Towns are known which make a boast of their railway stations. Even this old London of ours lends herself to the prideful proliferation of man into his surroundings. But concerning that Pump, metaphorical or material. This is the moral it conveys: " Every man is fated to live within sight of this village pump or that. Let him see to it that, so far as in him lies, it is a village pump that transcends all others. However that may be, let him be ready to maintain, and to believe, that ' the whole round earth ' can show no village pump just like it." From a beautiful pump will eventually be evolved a beautiful village; and this Parable of the Pump is a very welcome incitement to the feeling that leads up to civic patriotism and beyond.

The Amenity of Brighton

A majority of one is insufficient for carrying a momentous decision. The French Academy of Letters resorts to several ballots before it declares a candidate for membership to be duly elected. Certain trade unions require what they term a "clear majority"—two-thirds of the votes recorded —before giving effect to the result of a ballot. Yet the Brighton Corporation accept a majority of one as sufficient warrant to confirm their decision to lease the Brighton Aquarium building to a motor company, for use as a motor-coach station. Many residents, however, object to this use of the old Aquarium. A large garage, they hold, would not increase the amenities of the sea-front, and the question is being referred to the Ministry of Health, who have decided to hold an inquiry. In what way the question of health arises is not quite obvious, except that it is unhealthy to be "run down," and that one consults "Dr. Brighton" with the exactly opposite object.

Amenity and the Cenotaph

All good things being doomed to abuse sooner or later, by someone or other, it is not surprising, but is nevertheless painful, to hear that the Cenotaph in Whitehall has not altogether escaped this fate. In a reply to Mr. Gilbert, in the House of Commons the other day, Sir J. Gilmour said that complaints had been received as to political inferences in certain memorial notices laid on the Cenotaph. Wreaths commemorating children and relatives of ex-soldiers have also been placed on the Cenotaph, which, Sir J. Gilmour felt compelled to reiterate, was erected as a direct memorial to those who lost their lives in connection with the Great War. Further, Sir J. Gilmour said, with very gentle rebuke, "May I add that the practice of placing permanent memorials—bronze tablets, metal wreaths, and glazed artificial flowers—seems inappropriate, as such objects are unbecoming in themselves and prevent the proper display of humbler and more transitory tributes of affection." We trust that due heed will be paid to these mild hints, lest drastic measures be taken to ensure that the memorial shall not be abused so lamentably.

The Inventor of the Telephone

So firmly established an institution is the telephone that many of the young persons who operate it must have been surprised to read, in the obituary notices of its inventor, that the first telephone came into existence no longer ago than 1875, and that the first long-distance transmission of speech dates only from August 1876. Many will have learnt with surprise, too, that Alexander Graham Bell was not primarily an electrician, nor even a physicist, but a physiologist. Like his father and grandfather, Graham Bell was keenly interested in phonetics and the mechanism of speech, and even when a pupil teacher at Elgin, in Scotland, he made the observations from which, many years afterwards, at Brantford, he developed the idea of the telephone, which, at first received with derision, is now so indispensable a feature of every architectural lay-out of any importance, business, institutional, or domestic. Who can tell whether " wireless " will ever entirely supersede it? If " wireless " were in very deed without the disfiguring transmitters, no architect would feel aggrieved at the supersession of the telephone.

Remodel or Rebuild?

The Problem of Old Buildings

By A. R. POWYS

THE proposed rebuilding of the Bank of England raises a question which is of so great importance that it interests the whole of the London public whether they have given much time to the consideration of architecture or not. This question is, when, if ever, should an acknowledged masterpiece of architecture be altered or destroyed? Everyone knows certain buildings of this class which no longer serve any purpose in the economic scheme of our present civilization, but which at the same time have other qualities of such great value that they could on no account be spared. On the other hand, there are many buildings which, either by reason of their associations or of their individual characteristics, would be hardly spared, though which, in the face of economic pressure, that is to say, of everyday public needs, might make way for others better suited to changed conditions. It is the purpose of this article to discuss this question and to discover, if possible, some guiding principle for those among us who have to balance the various aspects of such cases.

The question is further complicated by the rights of private property. It would be a fairly simple matter in actual practice to decide such questions did they relate to a straight issue affecting public welfare alone. Owners of fine buildings who are responsible to large numbers of their fellow citizens for the incomes derived from them might be legally held to be neglecting their duty did they not consider their property as a means of raising revenue to the exclusion of any other value it may possess. Indeed, it may be seen how difficult the whole matter is to the guardians and trustees of ancient buildings when we consider the conflicting claims of the City churches. There is a group of buildings endowed and erected for the services of the Church which, we are told by some churchmen, are no longer fulfilling their purpose. The majority of the citizens of London know full well that the existence of these buildings amid the money-making houses surrounding them is a real source of inspiration. Are we, then, to condemn the Church because it feels it to be its duty to release the money locked up in them and in their sites so that it may further the interests of those it represents, and this in spite of the ennobling influence they have on men's lives? Is it right to condemn the Freemasons for the destruction of Boswell's House in Great Queen Street, loved as it was by all who ever passed that way, when in the interests of that fraternity the site was more conveniently occupied by an extension of their hall, although its very existence deadens the finer perception of all who see it?

To what standard of right and wrong can we appeal in deciding questions of this sort, and, in making our decision, are we not hampered by the very certain fear that what is to take the place of buildings so destroyed will be barren, dull, and likely to blunt the senses which make the life of human beings worth the living?

It may be well to turn and see what the men did who built in times when architecture was free and not hampered by a vast knowledge of all the forms of preceding days.

There is no doubt at all that if the owner of a building in the thirteenth century had found it more convenient for his purposes to pull down and reconstruct a building, by whomsoever designed, and in whatsoever century built, he would not have hesitated to do so. Neither do we of this generation, who at least may claim to be masterly judges of the past, condemn him for that decision.

We may say, then, that there are three important reasons why fine works of architecture should not be altered or destroyed. First, it is an offence to our sense of beauty that they should go; secondly, their disappearance is a direct break with the past from which we can learn much to guide our future; and, thirdly, we hate to think—and we are so seldom disappointed in the thought—of the nature of the building which will rise so quickly from the dust of one which has moved us to feelings akin to human friendship and love. Experience has taught us that we do not get anything as good as that which we destroy.

Before condemning a proposal to alter a building of this kind it is necessary to appreciate all the circumstances of the case, both the clearly defined right of the private owner, and his vague but equally certain obligations to the public. It becomes, in fact, an appeal from conflicting human interests to our sense of abstract right and fitness.

We must apply to the consideration of the question all the faculties of personality. The application of practical reasoning is alone insufficient. The human instinct must be allowed free play; imagination and the æsthetic senses must not be neglected; the desire for order should be encouraged. The economic requirements of human life are for ever pressing; the avoidance of them creates an atmosphere of affectation.

While I have been writing these words I have had in my mind certain buildings which are universally acknowledged to be fine works; but in actual practice, unless a building has been praised in the guide books of two or three generations, the whole of one's argument is made difficult to hold by the bold assertion that it has little or no architectural merit. All who have pleaded the cause of buildings must occasionally have been faced with this disconcerting statement; and it is one which is very effective, for it is as difficult to describe in words the qualities which make a building fine as it is to convey to the mind of another by the same means the harmony of a musical composition.

I believe there are few people who are unable to feel a strong appreciation of the wall which surrounds the Bank of England, or of the halls which it contains; yet it is quite possible for those who best know its worth to feel that it would be better to remove it and build the Bank anew throughout than to preserve it and add within its walls a high building which will satisfy the requirements of a greatly increased staff. It seems to me, however, that this is quite clearly a case when no sacrifice of beauty or of usefulness will be made by the retention of the part of the existing building for which even those with no knowledge of architecture have almost insensibly acquired an affection.

A great deal of the interest that we have in the Bank is due to the fact that it is a building that has grown up bit by bit, under the guidance of different architects, each, in his own day, a leader in matters of taste. The Bank has grown as grew the great cathedrals, and I think that very much of our pleasure in contemplating these buildings is due to that very fact. It is difficult to imagine that anyone would welcome any other plan than one by which change and growth are acknowledged principles, and by which connection with the past is maintained. We may differ as to the advantages of the internal arrangements, we may even hold that it is better not to attempt to reproduce halls which were designed by Soane—indeed, the new plans indicate that this is the view taken by the architects employed by the Directors—but I think that there is no doubt at all that it is right to retain the great encircling wall. In the new design it has acquired a fresh value, owing to its relation to the tall superstructure.

Ypres

THE plan of Ypres which accompanies these notes is a careful adaptation from Popp's Cadastral plan which was published in 1853, and is, so far as we have been able to ascertain, the first detailed plan published since the war. It fairly and accurately represents the town as it stood prior to the war.

The additions after the date of Popp's plan were not important, and were almost confined to work on the outskirts of the southern area and in the vicinity of the railway station.

Ypres was, even up to March 1915, a town of infinite charm and haunting beauty, a place of profoundest quiet, and steeped in the romance of history; Laurence Binyon says "grass grew in the streets."

Since then it has become peculiarly significant to English people, and so it remains, a synonym of the great war and a place of pilgrimage.

The cult of Ypres and the "salient," the defence of which cost over 250,000 lives, is organized and fostered by the Ypres League, of which Field-Marshal Earl French of Ypres is the president.

It was during the period when the design of the hostelry, which the League proposes to establish at Ypres, was under consideration that the plan we illustrate was prepared owing to the difficulty experienced in procuring a sufficiently large scale reference plan of the sites and properties which formed the town.

The name Ypra, or Yprae, appears to have come from the little Yperlée which ran through its centre, or rather on the banks of which it grew.

The nucleus of a town was founded round a reconstructed fort by Baldwin III in the second half of the tenth century, and enlarged by Thierry d'Alsace, Ferrand Count of Flanders, and Jeanne Countess of Flanders.

Thriving on its industry of cloth-weaving, and patronized by the Counts of Flanders, the town grew daily more prosperous. Having obtained certain franchises and liberties it held an exalted position among the cities of Flanders. These privileges facilitated industrial and commercial relations not alone in the country, but also abroad. From the year 1127 the Ypres market was the resort of the merchants of Europe and the East. In the thirteenth century it may be said that Ypres was at the zenith of her power. Her population numbered 200,000; she possessed seven parish churches, and within her walls more than 8,000 trades and crafts flourished with unceasing activity. The guild of drapers, or cloth-weavers, erected out of their own funds the imposing Cloth Hall—the most remarkable civil monument of the Middle Ages.

Louis VI of France took the town by assault in 1128, when it was in part pillaged and burnt. It was taken by Phillipe Augustus in 1213, and in great part burnt in 1240 and 1297.

A siege by the Gentois aided by "les Anglois" in 1393 was abandoned after six weeks owing to the stout resistance put up by the inhabitants. Philippe le Hardi, Duke of Burgundy, newly fortified Ypres, enlarging and building a new wall round it in 1388.

As time went on, the traders, finding they were ignored and overruled by the very classes whom they had enriched, rose up in revolt, determined to assert their rights. Hence the violent strife in the fourteenth century between rulers and subjects, the great and the small. Allied to Bruges and Ghent, Ypres took up arms against the Counts of Flanders, who tried to restrict its ancient privileges, and against the Kings of France, always inimical to the Flemish nation. Among themselves, the great communes were divided by commercial rivalry. These incessant troubles and ruinous wars paralysed industry and drove away the foreign merchants who had their counting-houses here. The cloth trade declined irremediably, and Ypres gradually lost her power and greatness.

Ypres experienced a full share of the plague of religious "reform" in 1566, when her churches were pillaged and more than twenty of the priests of the diocese killed; the surrender of the town to the Prince of Parma eighteen years later put an end to this "Reformation."

Taken by the Prince of Condé in 1648; retaken in the following year by the Archduke Leopold, it submitted nine years later to Marshal Turrenne after four days "de tranchée ouverte."

Returned by the Treaty of the Pyrénées, it reverted to France under the Treaty of Nimègue in 1678, after a siege conducted in person by Louis XIV, to be surrendered once again to the Etats-Generaux by the Treaty of Utrecht in 1713.

Such, in scant outline, is the story of Ypres, the shuttlecock of the powers and factions in the centre of the "Cockpit of Europe."

Spanoghe in "Les Délices des Pays Bas," says the population in 1342 was 200,000 and "le circuit de la Ville etoit alors de 673 verges géométriques; c'est-à-dire, trois fois plus grand qu'il ne l'est aujourd'hui."

Immediately before the war in 1914 the population was between 17,000 and 18,000; last year about 10,000.

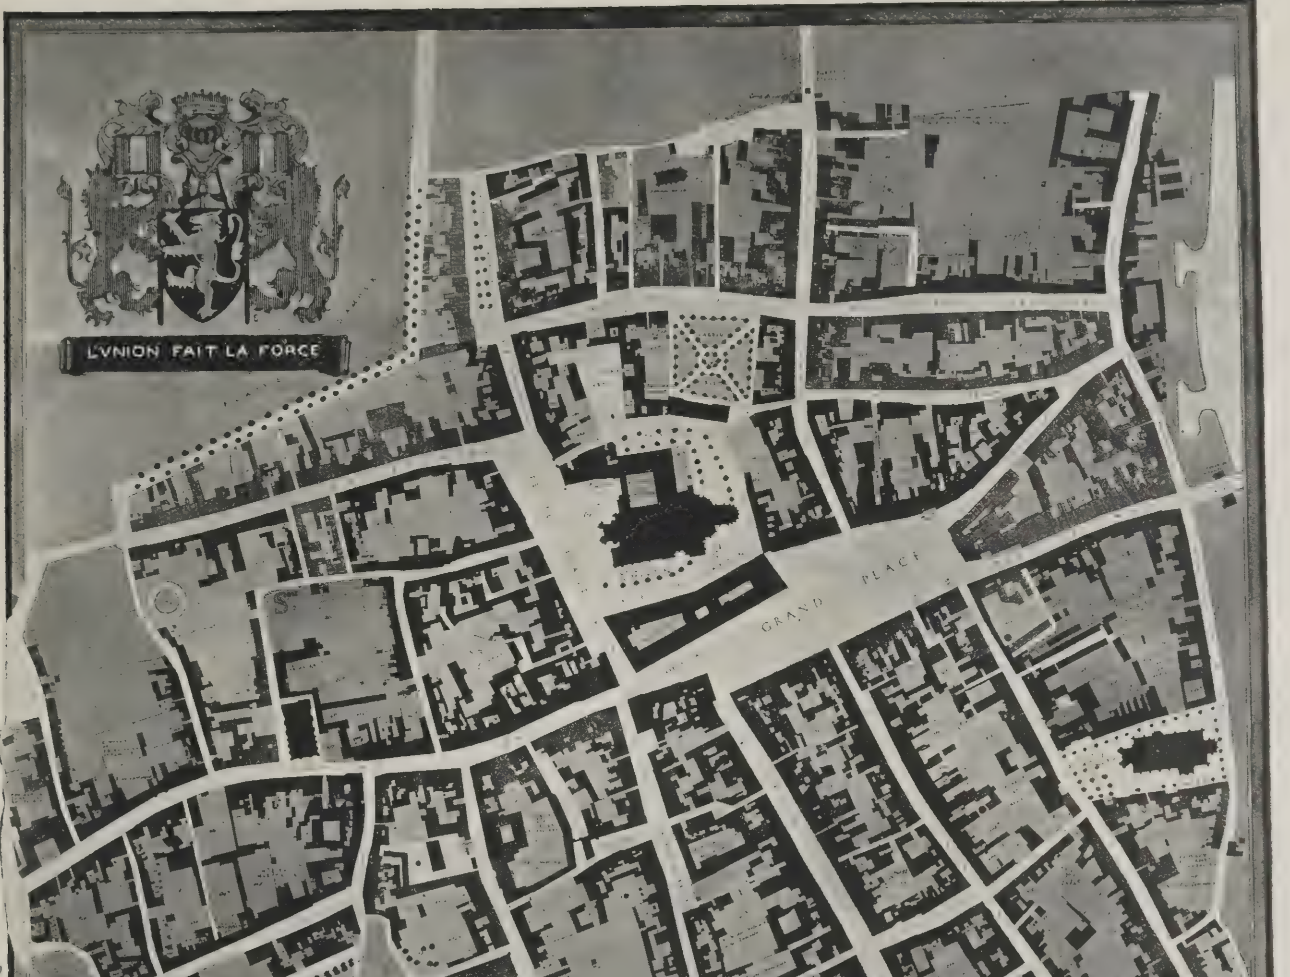
Sister Marguerite of the Sœurs de Marie has written an account of the progress of rebuilding in the "Ypres Times" of January last, and a correspondent in an article in "The Daily Mail" (February 20) says "the people are filled with a passion for reconstruction."

Camille Lemonnier, speaking of Ypres prior to the war, says: "Je ne sais pas de plus effrayant témoignage du retour des choses d'ici-bas que l'immobilité de la vie contemporaine dans la solennité et la magnificence de ce décor d'une ville autrefois grande entre toutes . . . le cadre à peine a changé parmi la mort de tout le reste . . . toute une vielle gloire continue à palpiter par dessus les pâles ombres errantes de ses places, plus semblable à des cimetières qu'à des lieux de circulation et de vie."

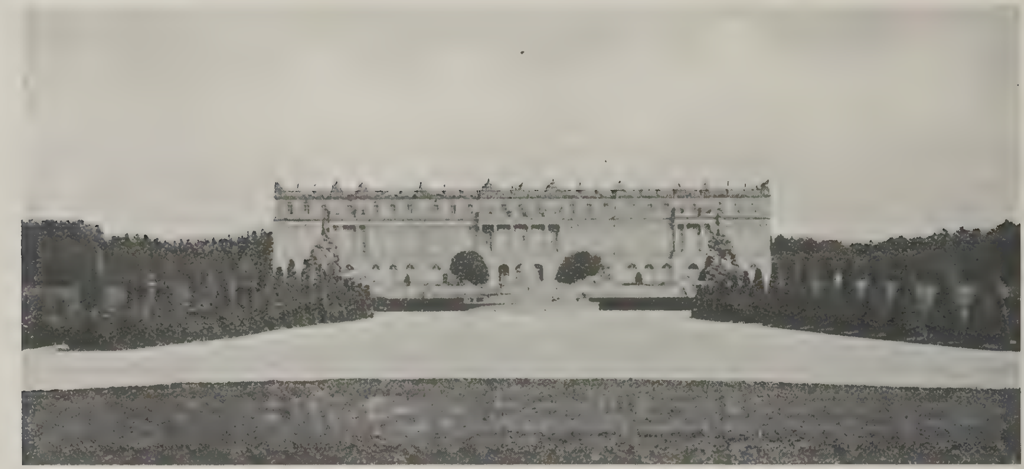
Laurence Binyon, relating a visit paid by himself and William Strang, says: "I remember well the morning we spent on the banks of the great moat that lay beneath the ramparts of Ypres. Ypres was then a town that seemed haunted by silence, and appeared to have betaken itself to a sleep that nothing would ever disturb. Grass grew in the streets. ("The Print Collector's Quarterly," December 1921.)

Says Guicciardini the Florentine, of "Iperae," in the middle of the seventeenth century:

"Dissidet Brugis novem, Gandavo vero circiter tredecim leucis, estque opidum non tam moenibus aliisve ab arte munitionibus, quam situ et loco firmissimum, ut quod non una de causa castris sit in accessum, et aegre admodum queat obsideri, caetera lautum, pulchrum, amoenum, et sic satis etiam opulentum aedificia ejus et domus bonae, etsi ob lignea magnam partem frontispicia parum spectabiles, templa coenobiaque pulchra et veneranda, et primarium quidem Divo Martino sacrum est, ac destinatum nuper Cathedrae novi Episcopatus in hac urbe instituti, qua dignitate hodie fungitur Petrus Simonius, doctus, pius et religiosus Praesul. Jactatur vulgo hoc opidum fundum habere ex plumbo, idque ob multitudinem inibi tuborum, seu fistularum plumbo ductilium, fluvialibus aliisque asquis per singulas fere domos et opportuna quaeque urbis loca varie dispensandis." NICHOLAS AND DIXON-SPAIN.



FROM A DRAWING BY NICHOLAS AND DIXON-SPAIN, FF.R.I.B.A.

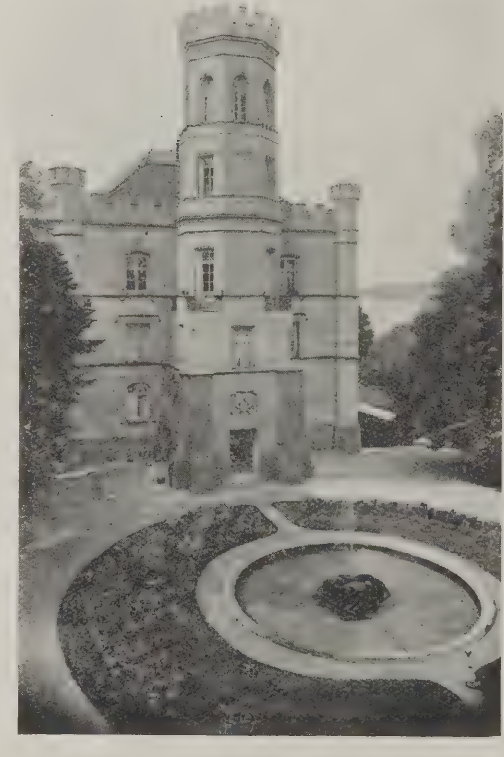


THE CASTLE, HERRENCHIEMSEE.

Two Bavarian Castles

By H. J. BIRNSTINGL, A.R.I.B.A.

THAT certain buildings seem to have received a deep personal impress which they continually radiate to the susceptible visitor, while others, at the best, can but suggest historical associations rather than a clear-cut personality, is a fact which, although its investigation falls within the province of psychology, is of particular interest to architects. The castles of Herrenchiemsee and of Berg are as different as it is possible for two royal palaces to be, yet the one in its indescribable sumptuousness and magnificence, and the other in its unadorned simplicity and parsimonious equipment, are both expressive of that great tragic figure which, beaten down in an unequal struggle against insanity, dropped out of existence into the waters of the lake of Starnberg at the end of last century.



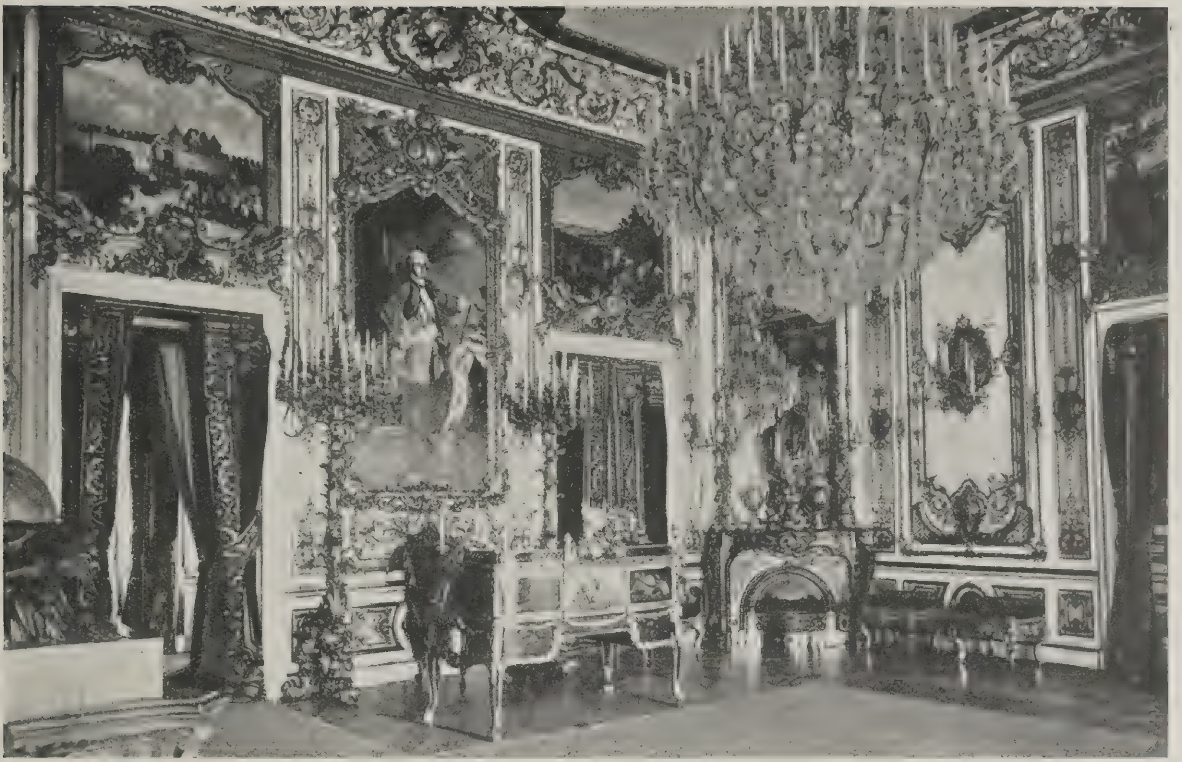
CASTLE BERG.

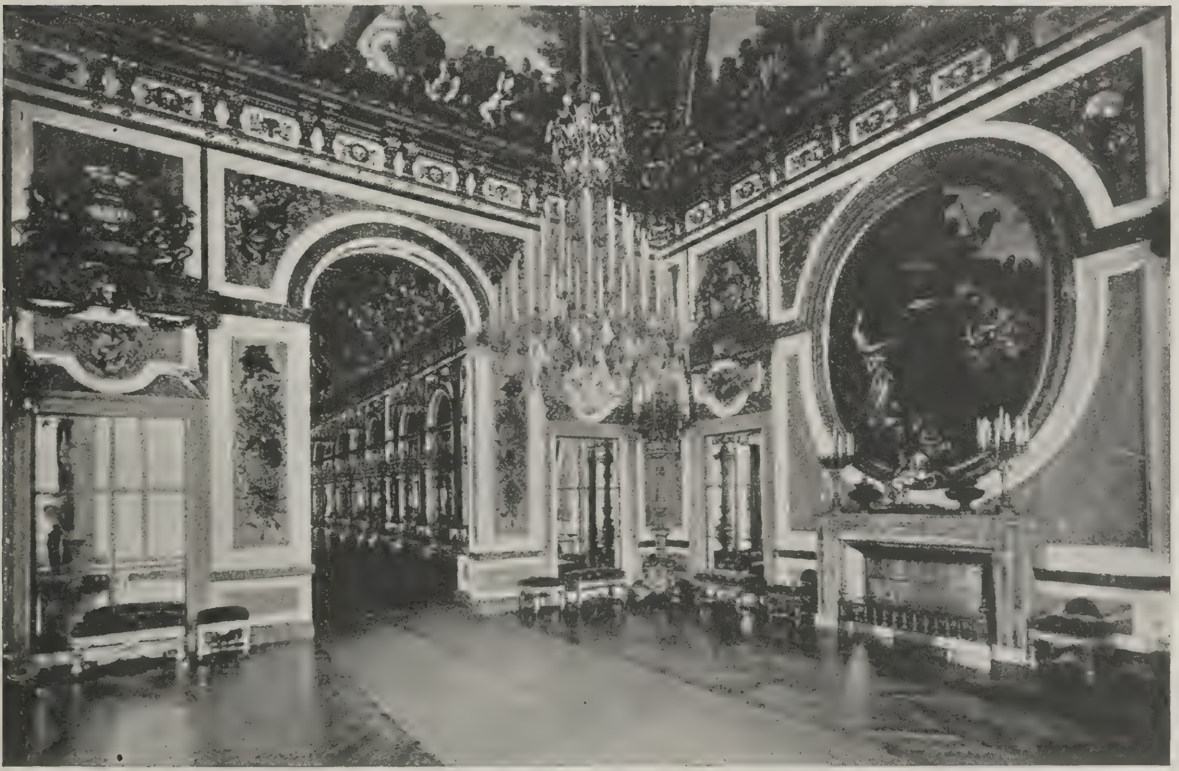
A building should always have some connection with life, in relation to which it must be considered if its real value is to be truthfully assessed. Such relationship may be intimate and personal, it may be functional, or it may be a combination of these qualities. The palace at Herrenchiemsee is at once regal, and at the same time as expressive of a certain aspect of the complex character of King Ludwig II of Bavaria as Versailles—upon which it is modelled—is expressive of Louis XIV of France; and if the significance of the building is to be understood it must be considered in connection with the life of its owner, whose personality so strangely dominates it.

In Ludwig II we have the tragic spectacle of a figure burdened with the temperament of an artist, who is yet impotent himself to create, and in whom, moreover, congenital madness insidiously spreads like a cloud which, at first no bigger than a man's hand, slowly envelops the sky, so that in the end he becomes a melancholic, shunning men's company and seeking to find solace in vast megalomaniacal schemes. If a generalization about anything so complex as a personality be permissible, it may be said that Ludwig's characteristics are threefold: a love of all the arts, a desire to project himself into the rôle of some one else, and a love of solitude. And as these traits have an important bearing on the buildings that we are considering, a slight dilation upon them is necessary.

Although the artistic urge of his personality found its completest realization in the works of Wagner, leading to a patronage and friendship that became the gossip of Europe, nevertheless Ludwig's cravings were for every art form, and particularly for architecture and painting; and so he built castles and palaces for himself all over his kingdom, filling them with priceless examples of every kind of craftsmanship. Inextricably bound up with this yearning for beautiful and rare things was the desire to identify himself with historical or mythological figures.

His pleasure in and admiration for the works of Wagner are partly to be accounted for by the eagerness with which he identified himself with such figures as Lohengrin and Parsifal. And in Louis XIV he saw the perfect type of king, reigning by a divine and absolute right, surrounded by every sort of splendour and every outward manifestation of absolute power. And as the palace of Versailles seemed to Ludwig to be the perfect setting for such an omnipotent and imposing monarch, he decided to build for himself a symbol of equal greatness. Herrenchiemsee is the visible manifestation of this desire. Striking curiously and antagonistically to this love of visible splendour was the ever-growing craving for solitude. This led to the selection of secluded spots for his castles. Castle Berg, which was an old family residence, is situated on the





APARTMENTS IN THE CASTLE HERRENCHIEMSEE, BAVARIA.

banks of the Starnberger lake. Castle Herrenchiemsee hides its magnificence on a small island in the lake of Chiem; two other of his castles, Neuschwanstein and Hohenschwangan, are comparatively inaccessibly placed in the Bavarian Highlands.

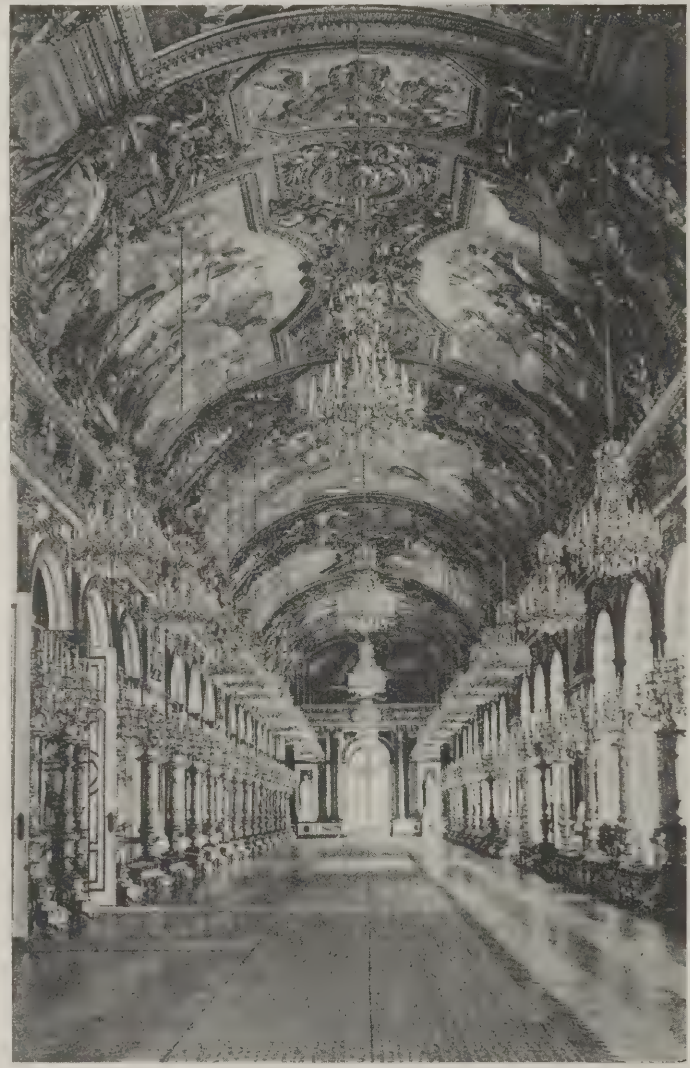
His persistency in shunning social intercourse and Court functions led to many unpopular extravagances. Command performances of operas and plays were held at the Court Theatre, at Munich, at strange hours, at which no one but the king was present. These performances were produced with the utmost pomp and attention to detail, for those were the days of realism in dramatic representation. On the roof of the Residenz at Munich he caused to be constructed a winter-garden with a lake, and exotic plants, and an ingenious mechanical moonlight effect. Here, in the most complete seclusion, he would float across the miniature lake in a swan-drawn craft garbed as Lohengrin.

These are but the briefest indications of that strange personality that emanates like a faint perfume from the tapestry-covered walls, the polished floors, the gilded appointments of the Castle Herrenchiemsee, and from the simple homely rooms of Castle Berg.

There is something particularly satisfactory in the contemplation of an old building which throughout the ages has preserved the purpose for which it was originally intended, just as there is something a little melancholy in the thought of an old building diverted from its original purpose after long years of patient service to perform some other and perhaps less dignified task. Who upon entering an old church has not at some time felt the very atmosphere to be impregnated with age-long supplications, and the dim past itself brought near by this unbroken continuity of function within its walls? And who, on the other hand, has remained unmoved at the sight of a street once lined with a stately array of houses suggestive of a life of ease and dignity, now fallen a victim to the claims of commerce, which has transformed the elegant lower story into a blatant fascia-crowned shop-front?

Something of this melancholy it is which strikes the visitor on the little island at Chiemsee. This great fabulous creation, which was built for the delectation of a king, fulfilled its royal function on only twenty-three occasions. On twenty-three nights did Ludwig seek respite from the unceasing inward struggle, in the great golden-canopied bed. He sought in vain; the very magnificence that he had created rose up and seemed to smother him; a feeling of its utter futility must have beset him so that he fled in the night to the modest Castle Berg.

This absolute newness is a powerful contributor to the impressions of Herrenchiemsee; for whereas its vaster prototype at Versailles bears the honourable scars of history, and is soiled with the passions and the comings and goings of powerful monarchs and deep enterprises, Ludwig's castle has about it the perfect freshness of a newly fashioned ring, or a sumptuous but unworn vestment fresh from the hands of the weavers. And now all this unused magnificence is turned over to satiate the curiosity of crowds that gape incredulously at such a heaping together of riches and splendour. For splendour that comes down to us from the past has about it something of the fabulous that attaches itself to past epochs, but here is a building that is almost contemporary (it was begun in 1882) and which indeed has never been finished, so that one passes, by a sudden transition, from rich rococo decoration into a vast apartment showing its bare brick walls and cornice awaiting the apparel of stuc, plaster, gold leaf, and damask hangings.



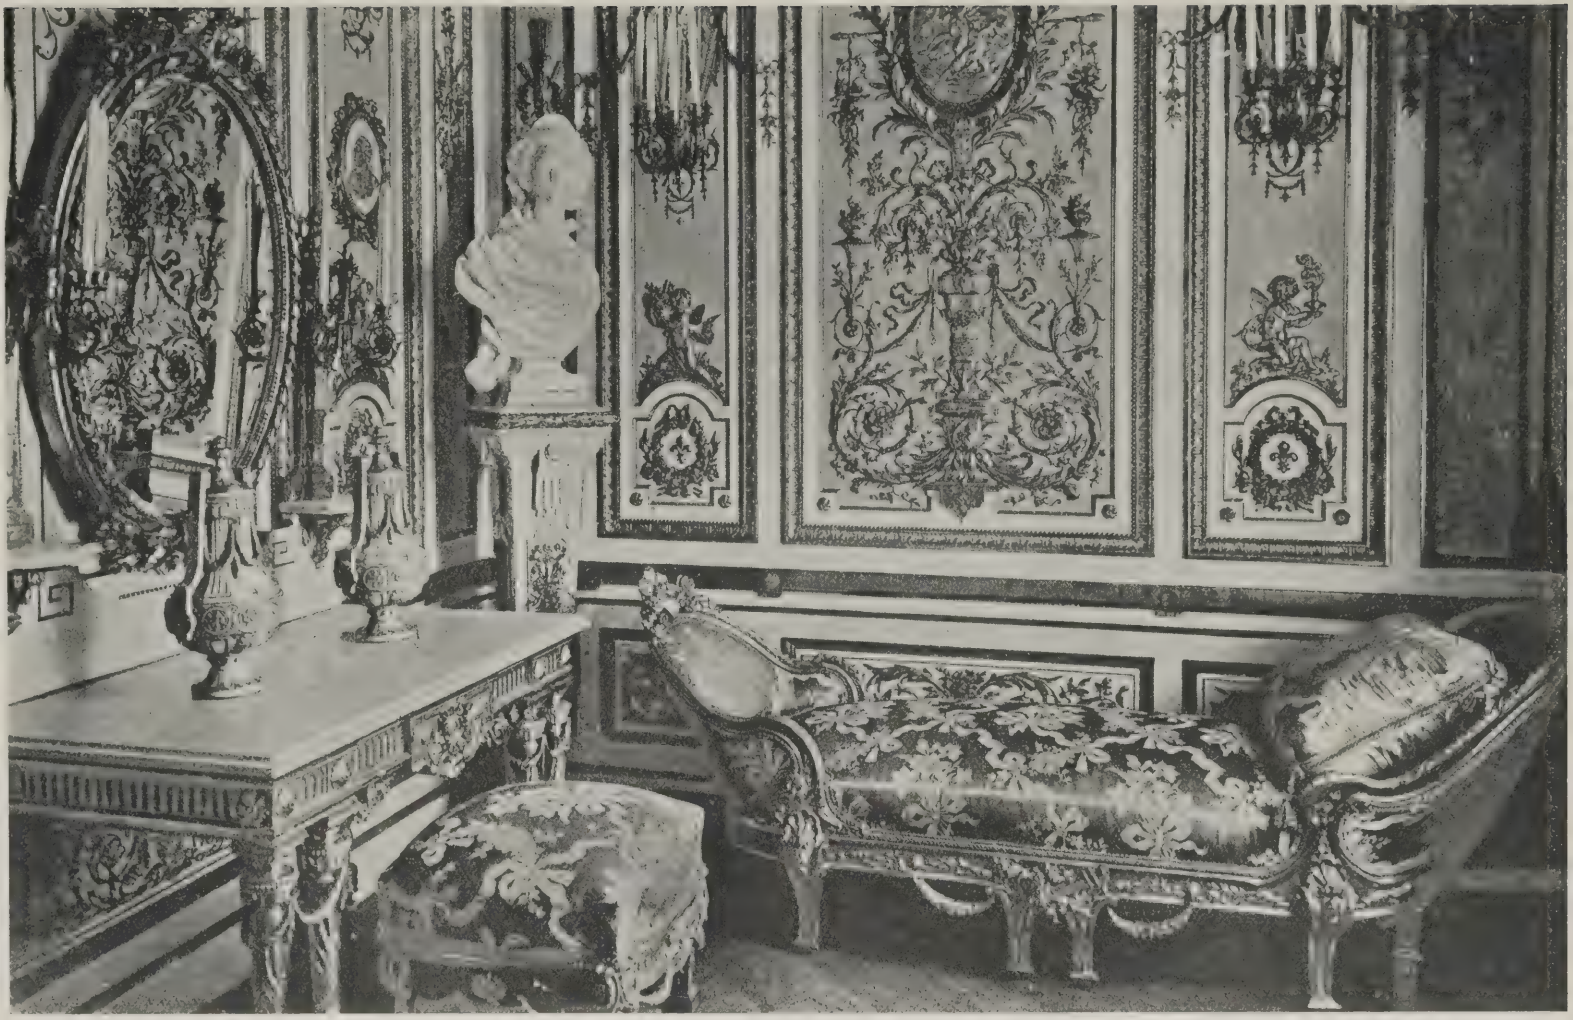
THE HALL OF MIRRORS, CASTLE HERRENCHIEMSEE

It is not possible to describe the rooms individually; their character is general rather than particular; but over all is the rich veneer of baroque decoration. As in its prototype, the rooms are arranged *en suite*, and one passes overwhelmed from magnificence to magnificence. The hangings and upholsteries are of the richest textures and embroideries, and on the massive settees in the long gallery the golden embroidered fleurs-de-lis stand up a quarter of an inch above the surrounding surface of velvet, so that an impress of some distinction would be left upon the clothes of anyone having the requisite audacity to seat himself.

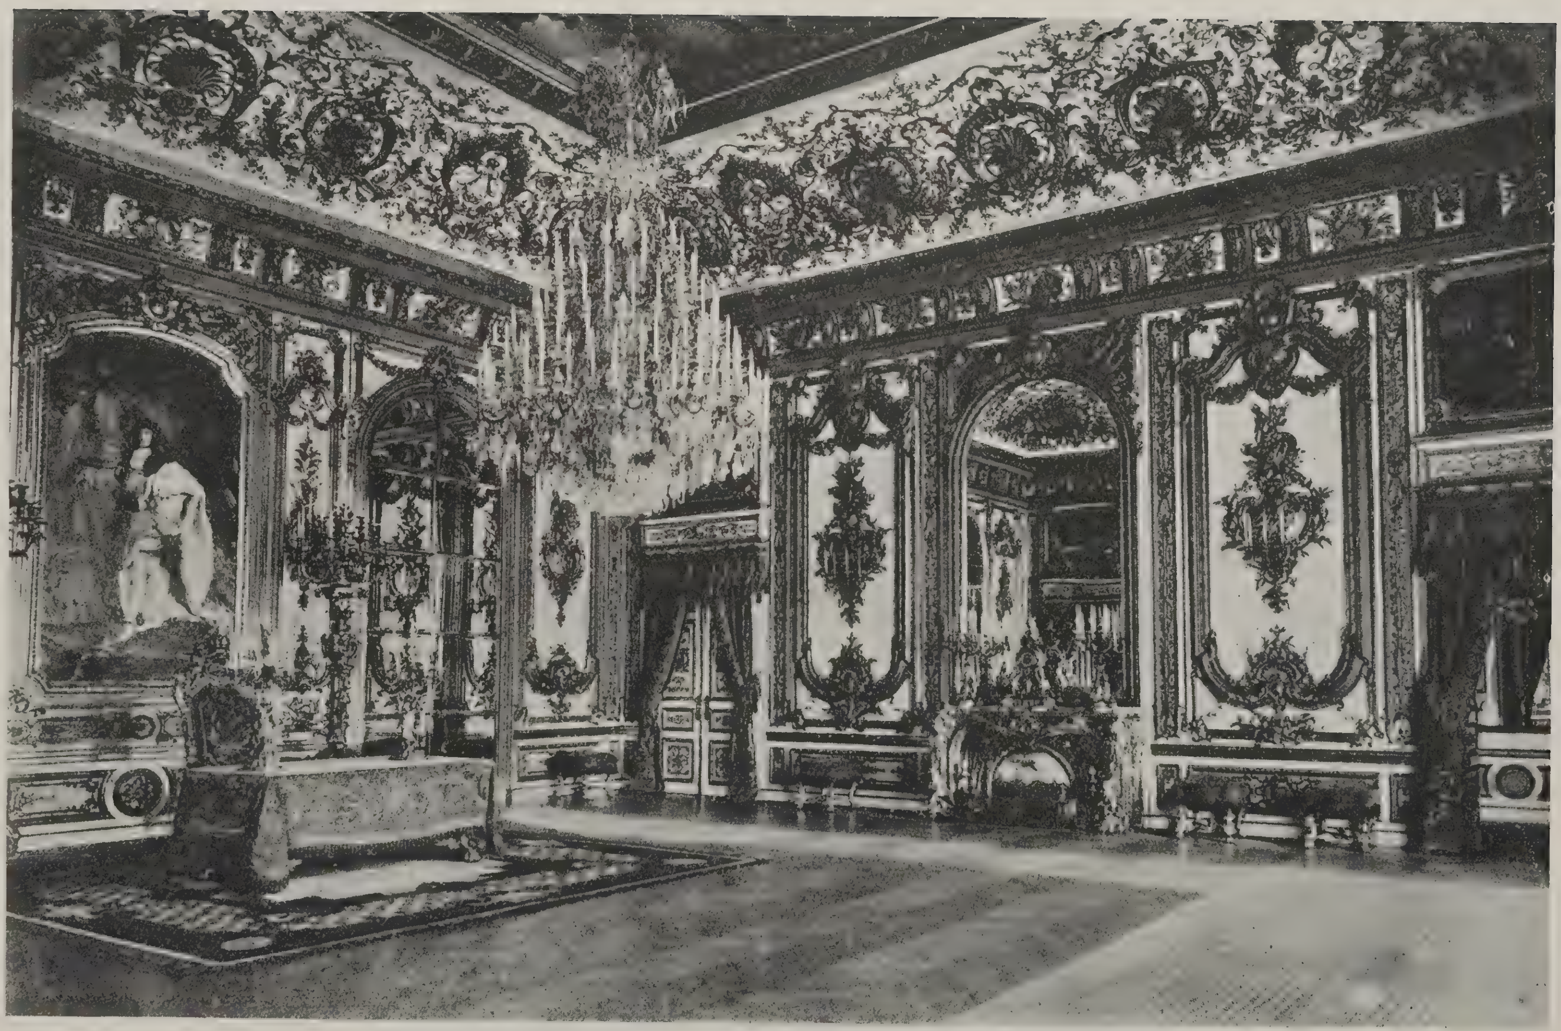
It is the function of architecture to collate the subsidiary arts and crafts, and in this respect Ludwig was an ideal patron. Painters and sculptors, clockmakers and goldsmiths, tapestry weavers and potters, furniture designers and metal workers, all have contributed to the enrichment of this palace. There is a room lined with mirrors of Venetian glass; there is another in which the whole decoration, including certain tables, is of Meissener porcelain; there are cut glass, Venetian glass, porcelain, gilded wood, and metal chandeliers of the most exquisite workmanship. There is a room containing clocks that display the utmost ingenuity of the craft; clocks that follow and register every movement of the sun, the earth, and their countless known satellites; clocks which, upon the striking of the hour, become animate with little moving figures.

Some of the ceiling paintings display that curious attempt at realism that was so common in the eighteenth century, which consists in a combination of the pictorial and plastic arts, so that here and there a three-dimensional plaster limb protrudes below the cornice merging into a painted figure, or a vast curtain is part flat and part modelled.

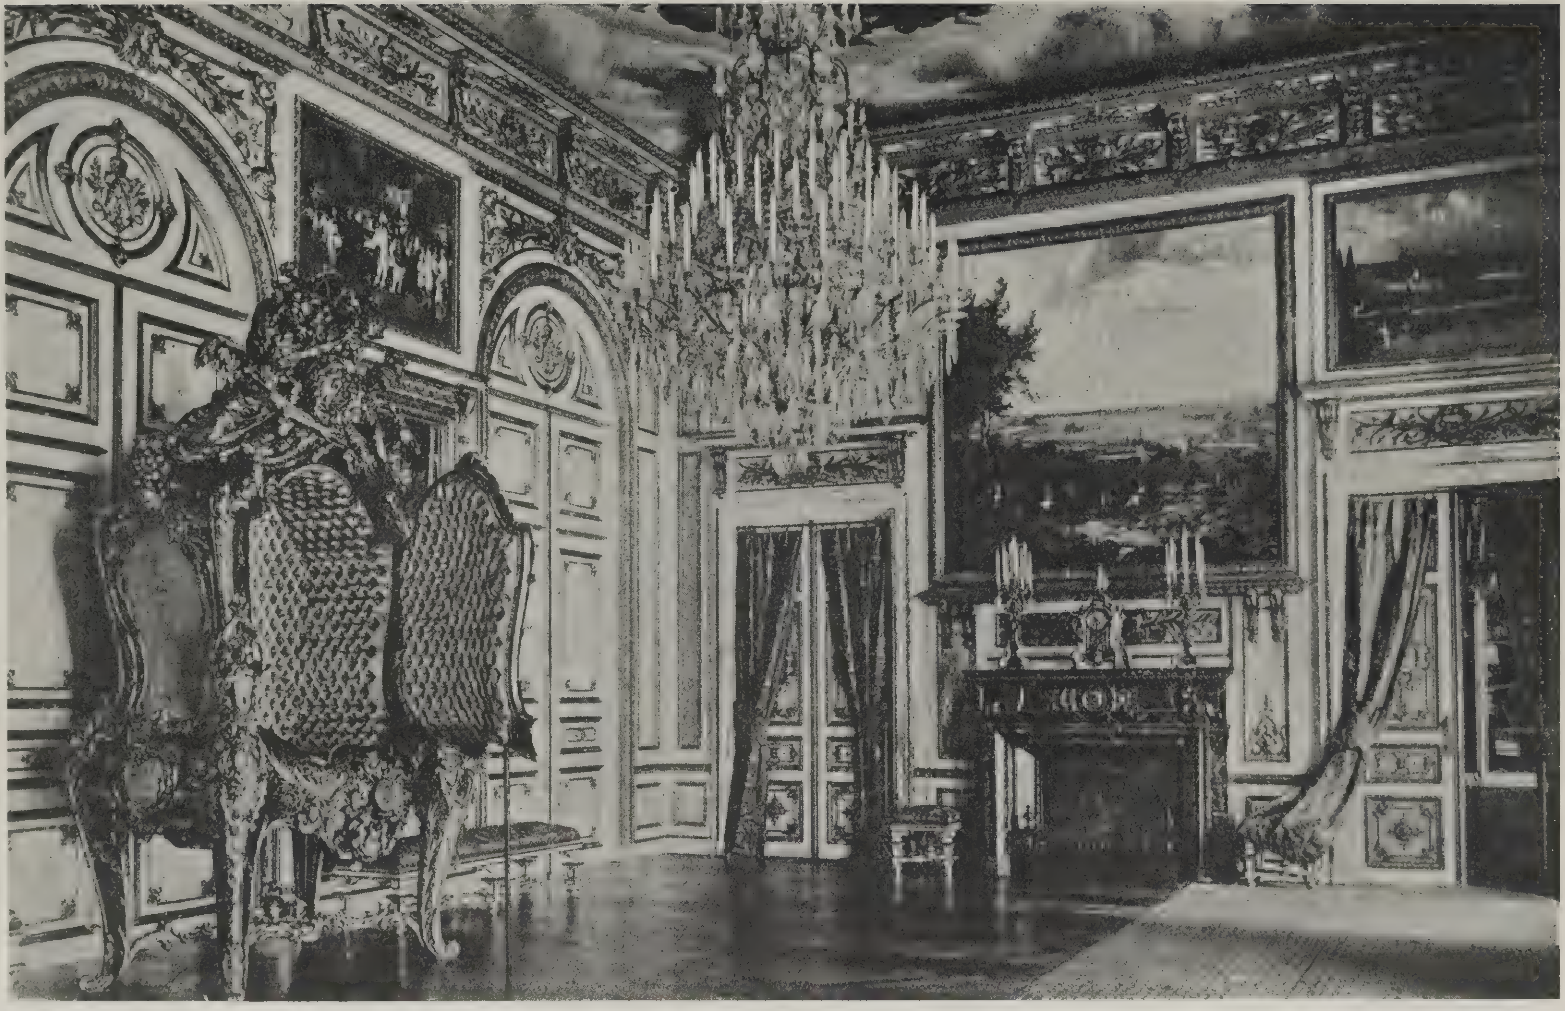
Many of the costly fittings have never been supplied, for



THE BOUDOIR OF THE CASTLE HERRENCHIEMSEE, BAVARIA.



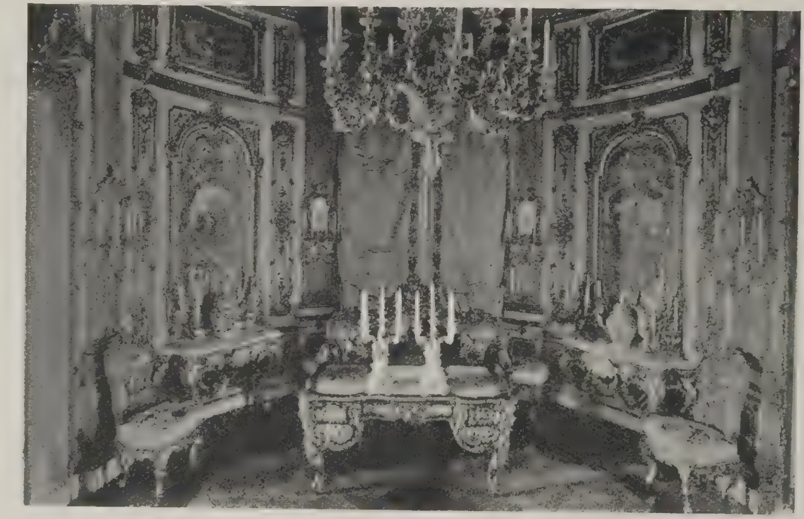
A STATE APARTMENT OF THE CASTLE HERRENCHIEMSEE, BAVARIA.



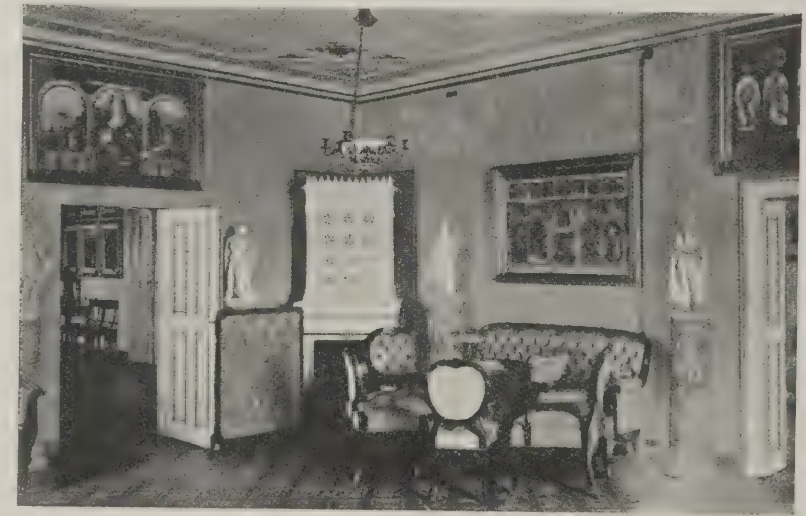
ANTE-ROOM OF THE CASTLE HERRENCHIEMSEE, BAVARIA.

the unceasing drain upon the exchequer caused by such great schemes led to the abandonment of the work before its completion. So that one comes across a trial plaster counterfeit of a sculptured group, or a chandelier whose temporary life has been unexpectedly extended. In the preparation of these fittings an impetus was given to local industries which still survives, and the interest which Ludwig took in the arts and sciences is comparable to that taken by the Prince Consort in England, whose efforts culminated in the great exhibition of 1851; for in this heaped-up splendour, by which Ludwig sought to recapture the glamour of the French Courts of Louis XIV and Louis XV, he did not search for works of the period, but caused everything to be made anew. In the painting of his castles, such artists as Aigner and Hauschild were employed, Walker and Wagmüller were his sculptors, and Dollmann and Hofmann were the architects responsible for most of his private work.

The gardens of Herrenchiemsee are laid out in the French manner with fountains and groups of statuary and formal beds, but in their long tree-lined axial avenues, at back and front, leading to the blue lake, with visions of the hilly shores beyond, there is a charm of which even Versailles in its greater splendour cannot boast. Externally the design compares unfavourably with its model. It lacks the richness of the pavilions and the broken frontage. The building is divided into three stories, the middle and chief one of which does not receive the emphasis due to its importance. The cornice is insignificant, and the surmounting balustrade, punctuated with sculptured figures is tawdry. The whole is undistinguished, and has the restlessness due to endless repetition without any massing or grouping of parts. One elevation is entirely devoid of projections, while on the other there is no differentiation between the wings and the main body from which they project.



THE PORCELAIN ROOM, CASTLE HERRENCHIEMSEE.



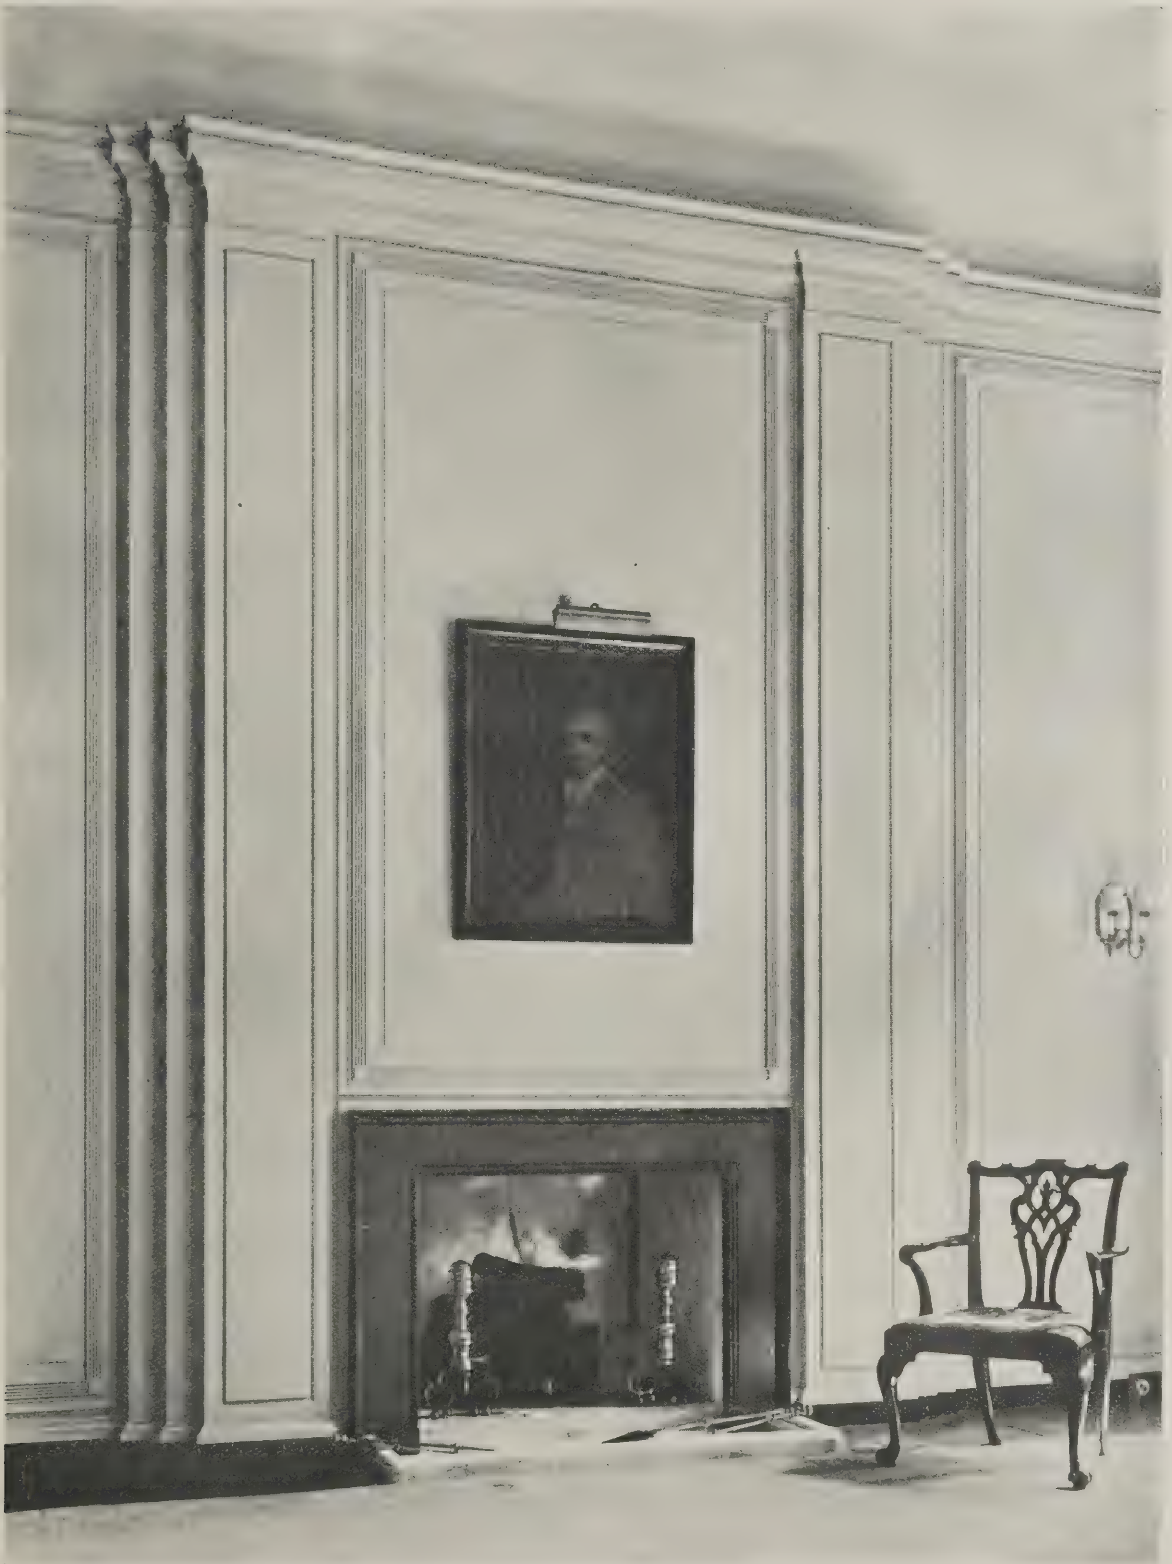
THE BLUE ROOM, CASTLE BERG.

Herrenchiemsee is a monument to magnificence at the expense of comfort. The very human body and its frailties and functions is an incongruity amidst such flamboyant opulence, where the chairs are not built to support the human frame, but to vaunt the richness of their coverings and the extravagance of their curves; where the surface of the tables is so valued and so polished that to set upon it the ordinary commodities of life would be a desecration; where there is no furniture for clothes and no place for books; where the very pen of gold must tire the hand that wields it, and where the bright-eyed cherubs in the ceilings or the marble busts of Louis on the mantelpieces look down in derision on the monarch who thus sought to recapture the past.

This is at one end of the scale, and at the other is Castle Berg, which quietly and unobtrusively stands amongst the rich foliage on the banks of Lake Starnberg. Here there was no need for a sacrifice of comfort, and Ludwig, no longer compelled to immolate himself upon the altar of emulation, was able to surround himself with the things he loved. And so Castle Berg became filled with tributes to the outstanding friendship of his life; reminders of his love for Wagner and his admiration of his works fill every room. Etchers, water-colourists, oil-painters, all were commissioned to portray scenes from the operas; these adorn the walls, while all about the rooms are sculptured groups and figures of Lohengrin, Tannhäuser, Siegfried, and the rest. These, and the bed upon which the dripping corpse was laid, with the water stains still showing, are all there is of visible interest in this castle; for the building itself, although of old foundation, is a kind of nineteenth-century Gothic, and the furniture is the German counterpart of our own mid-Victorian stolidity. The building consists of a few suites of moderate-sized rooms. It even lacks adequate sanitary arrangements. At the front and back of the house there are a couple of fountains surrounded by gay flowering borders; for the rest, there is undulating park-land extending to the water's edge. Away in the middle of the lake is a little island—the Island of Roses—on which there is a small summer pavilion. Thither, in his boat "Tristan," Ludwig would sail after sunset to dine with Elizabeth of Austria. And the little island would be bright with Chinese lanterns, and on the shore fireworks would illumine the sky.

Modern Domestic Architecture. 43.—The Chimneypiece, 4 St. James's Square, London

Milne and Phipps, FF.R.I.B.A., Architects



This chimneypiece belongs to the dining-room of 4 St. James's Square. The mantelpiece itself is of black marble, while the panelling is tinted a warm cream colour. A striking effect is got in the simplest possible way by a judicious handling of shadows and colours.

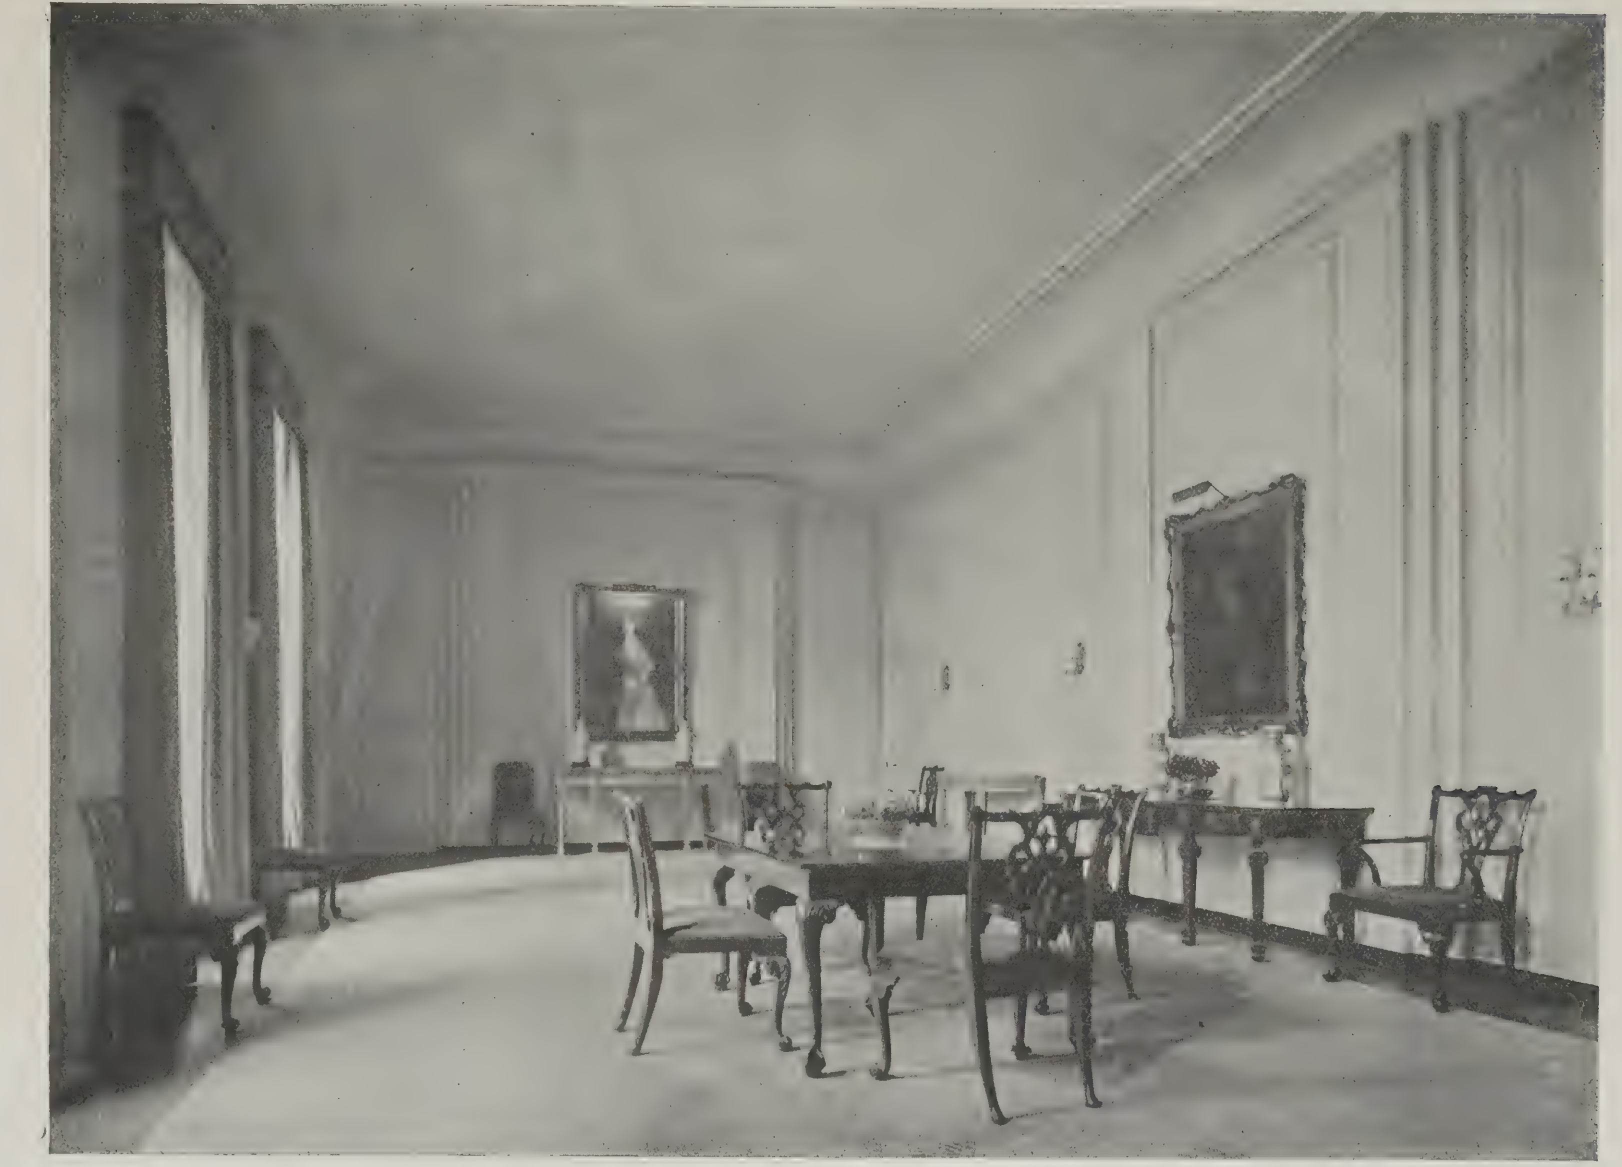
UNIVERSITY OF ILLINOIS

Modern Domestic Architecture. 44.—The Dining-Room, 4 St. James's Square, London

Milne and Phipps, FF.R.I.B.A., Architects



This room is panelled in plaster. The plaster is cream-coloured, and the panels are outlined with grey-blue lines which are in tone with the carpet and curtains. A black skirting acts as a border line between the walls and the floor.

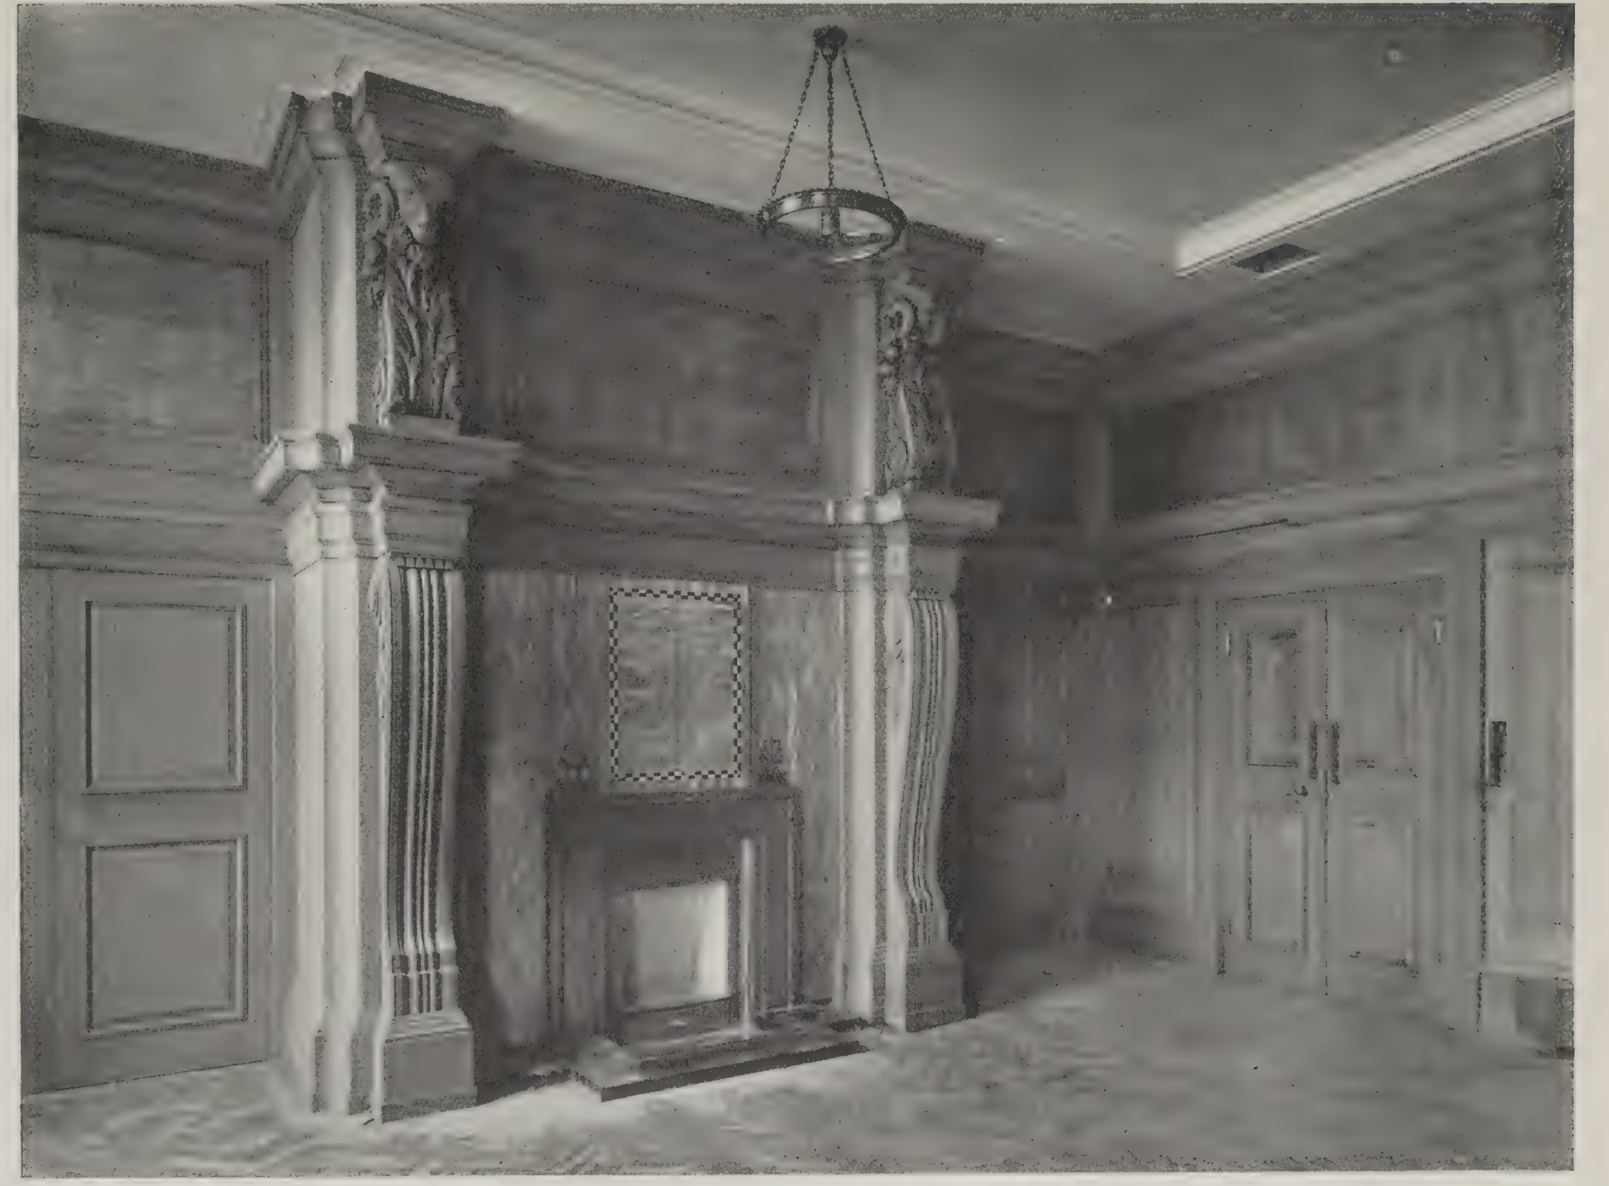
Current Architecture. 163.—The London County Hall: Chimneypiece in the Lady Members' Room

Ralph Knott, F.R.I.B.A., Architect



The chimneypiece in the Lady Members' Room, an unconventional though remarkably effective piece of design, is notable for the employment of what may be termed elongated consoles, the upper pair being richly carved and terminated with rams' heads. The panelling is of deal, covered with stamped silk in plum colour.

New Coptic General Hospital, Cairo

THIS hospital, the foundation-stone of which has just been laid, is being erected in Cairo at Sharia Abbas, near Pont Limoun Station, on a piece of land nearly 4,000 metres square, or about one acre. It will replace a small general hospital which the Coptic Benevolent Society established temporarily some fifteen years ago in an old house at Sharia Abbas, close by the new site.

The new hospital is surrounded on all sides by streets. Sharia Abbas, on the north, is a wide avenue 22 metres wide, alongside an open space on which pass the Heliopolis tram and the Mataria railway line.

Sharia Kobbesy, on the south, is about 1.60 metres below Sharia Abbas, and the hospital ground will be on a level with it.

The outpatients' department is accommodated in the ground floor and has a special entrance near the S.E. corner; the outpatients, after being examined, will leave the hospital by the iron stairs (being supplied on their way with medicines at the pharmacy) at the N.W. corner.

The admission unit is placed on the left wing of the ground floor of the administration block. It is close to the outpatients' department, but has a special carriage entrance for ambulance cases.

The suspect or observation cases are dealt with in a special unit placed on the first floor, exactly above the admission unit. This unit has a special access from without through an iron staircase. Thus no communication exists with the rest of the hospital except by a door to be used only by the doctors.

On the first floor of the admission block are placed the principal offices and the waiting-rooms, with direct access through the entrance stairs from Sharia Abbas. The Society's board rooms, offices, etc., are placed on the right wing of the same floor and have a special entrance. This part is entirely separated from the rest of the building.

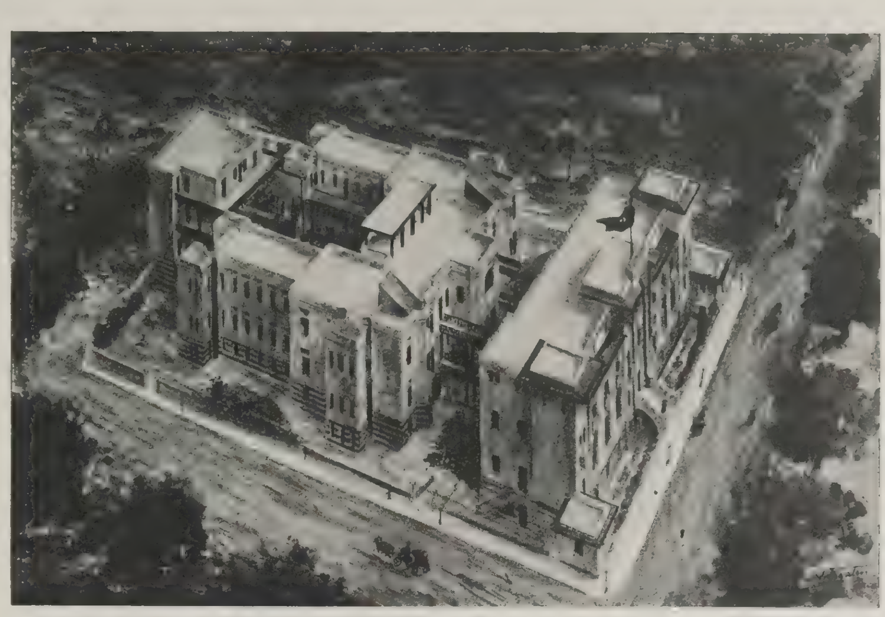
On the second floor of the admission block, facing due north (the most advantageous position for all kinds of building in Egypt) are placed twelve rooms for the use of first-class patients.

The third floor of this building is used for the sisters' and nurses' rooms.

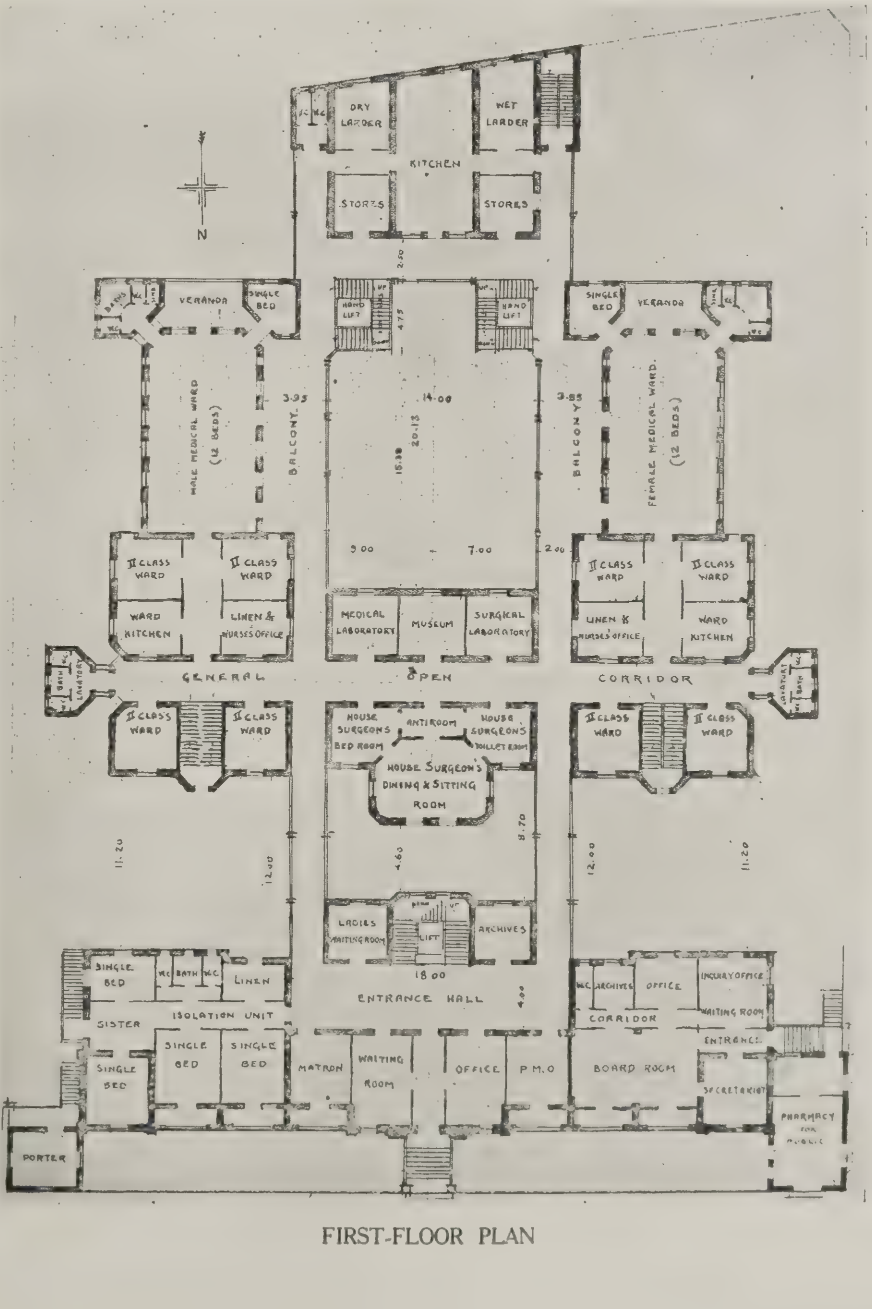
The operating unit, with the two pavilions on either side, form the central block of the hospital. Two iron footbridges connect this block with the administration on the first and second floors. The two pavilions have, besides, each a special staircase which gives on to an open corridor. The first floor of the pavilions is for the medical and the second for the surgical cases.

In the operating unit block the first floor is used for the private accommodation of the house surgeon. In this floor there are also three spare rooms used as surgical and medical laboratories and a museum. The operating theatre with all its accessories is placed on the second floor, where plenty of light and air can be easily obtained.

Of the four wards for general patients two are for male and two for female patients. All wards are identical. Each



A BIRD'S-EYE VIEW OF THE HOSPITAL. CH. BOUGATSOS, Lic.R.I.B.A., ARCHITECT.



FIRST-FLOOR PLAN

contains twelve beds for third-class patients, with a single bedroom for the serious cases, and four two-bed rooms for second-class patients. Each ward has a sectional kitchen, a nurses' linen room, and two disconnected lavatory blocks, one for the general ward and the other for the second-class patients.

Outside each pavilion are provided two verandas for the use of the patients. The convalescent can also use, during the summer, a part of the terrace as a rest place and promenade. Access to this is obtained by means of the ward staircases.

Two open iron staircases are placed on the south end of the central quadrangle, for emergency access to the ward. Each staircase is fitted with a heavy load hand lift.

The kitchen block, with all its accessories, is placed in a separate block on the south end of the site. Thus, smells and other nuisances are avoided, being blown away from the hospital by the prevailing wind, which in Egypt is generally from the N.N.W.

The ground floor of the kitchen block has a large room for boilers and one for fuel storage. A part of this floor is used as sleeping accommodation for the native male servants.

The kitchen, with its dry and wet larders, two stores, etc., is placed on the first floor. The second floor is occupied by the housekeeper, who has a working room, three stores for linen, and her private rooms. The third floor is used entirely as a laundry. To this are attached two disinfection and two ironing rooms.

A special semi-detached staircase and a separate exit are entirely for the service of this block. Separate hand lifts are also placed for the conveyance of the dirty and clean clothes to and from the laundry rooms.

The drying space is provided on the terrace of the two wards. The mortuary, with the necessary coffin room and a waiting-room attached, is placed at the S.W. corner. This unit has also a separate exit.

The lowest tenders for the construction of the building complete, except electric, water, and sanitary installations, amounted to about £30,000. Reinforced concrete is used for floors and roof.

Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

In the House of Commons last week, Sir A. Mond, replying to Sir R. Clough, said that during the current year 144 local authorities in various parts of the country had been authorized to obtain tenders covering 4,169 houses. The maximum and minimum price per house approved during the year was £696 and £299 respectively; the highest price sanctioned since the operation of the State assisted scheme was £1,240. 1,432 houses had not yet been definitely allocated under the scheme.

In answer to Major Barnes, who asked the total number of houses required to replace other houses which, although they could not at present be regarded as unfit for human habitation, fell definitely below a reasonable standard, as given by the local authorities under Section II (e) of the Form of Survey under the Housing, Town Planning, etc., Act, 1919, Sir A. Mond said that the figures required were 104,442.

Sir A. Mond, replying to Mr. L. Lyle, said he was aware that a number of local authorities in addition to Northampton were at present considering the question of erecting houses without financial assistance from the Government, and he had expressed his readiness to give favourable consideration to such proposals. Definite particulars as to the estimated cost of the houses and the rents proposed to be charged were not yet available.

Sir A. Mond informed Mr. A. M. Samuel that houses complying with certain prescribed conditions and completed by June 23, 1922, were eligible for the Government subsidy and there was no obligation or undertaking to subsidize further building. A certain number of certificates by local authorities of the proper completion of houses by June 23 were outstanding, and it was estimated that sums amounting to £400,000 still remained to be paid.

Royal Society of Arts: "Owen Jones" and "Mulready" Prizes

Following are the awards in the above competitions :—

Architecture.

Prize : Rex W. Woods, School of Art, Norwich (Marble Memorial Tablet). Commended : James E. Connor, Ryland Memorial School of Art, West Bromwich; Lot Ramsden, School of Art, Leeds.

Mosaic.

Medal and Special Mulready Prize of £20 : Miss C. Honor A. Howard-Mercer, L.C.C. School of Arts and Crafts, Hammersmith (Design for Mosaic with full size detail). Commended : Catherine M. Pargeter, School of Art, Watford.

Wood Work and Cabinet Work.

Prize : Henry W. Keil, School of Art, Guildford (Looking Glass and Stand—Design and Work). Commended : Arthur Clegg, School of Art, Cavendish Street, Manchester.

Textiles.

Prize : F. Smith, Municipal Technical College, Blackburn (Woven Tapestry Work). Commended : John Burgess, School of Art, Macclesfield; Fred Wright, School of Art, Macclesfield; Hilda Morfett, School of Art, Sunderland.

Carpets.

Prize : Walter J. Bartrum, L.C.C. School of Art, Oxford Road, Putney, S.W. (Design for Wilton Carpet and Border for same). Commended : George Kershaw, School of Art, Macclesfield.

Linoleum.

Commended : Ivan Stanway, School of Art, Macclesfield (Design for a Printed Linoleum).

Arrangements have been made for the exhibition to the public of the competing designs as in previous years. They will be on view until September 17 from 10 a.m. to 5 p.m. (on Sundays from 2.30 to 6 p.m.) in Room 132, Department of Textiles, Victoria and Albert Museum, South Kensington, S.W.

Town Planning Institute: Meeting at Manchester

The fourth annual country meeting of the Town Planning Institute is to be held at Manchester, from October 12 to 15. Manchester is providing a splendid welcome and a most interesting programme, and it is hoped that as many members and their friends as possible will be able to attend. In order that arrangements may be completed, and because hotel accommodation is limited, it is important that those intending to be present should inform the Secretary, Mr. A. R. Potter, 4 Arundel Street, Strand, W.C.2, not later than August 12.

The meeting will coincide with an important Town Planning Conference and Exhibition that is being held at the Town Hall during that week, when the following members of the Institute will, among others, read papers : Messrs. Abercrombie, Adams, Gibbon, and Pepler. The Institute morning and afternoon meetings on the Friday will form part of that conference.

Provisional Programme.

Thursday, October 12.—Reception by the Lord Mayor at the Town Hall at 7.30 p.m. (evening dress).

Friday, October 13.—Town Planning Exhibition will be on view at the Town Hall and meetings will be held there. In the morning : Professor S. D. Adshead, M.A. (Past President), will read a paper entitled "Architecture, Town Ornaments and Amenities." In the afternoon : Alderman Col. Turnbull, Chairman of the Manchester and District Joint Town Planning Advisory Committee, will give an account of the work of that committee. In the evening : Dinner at the Grand Hotel and discussion regarding establishing branches of the Institute.

Saturday, October 14.—In the morning : Visit to the Docks and Ship Canal and trip on the Canal. Inspection of Trafford Park industrial area. In the afternoon : Inspection of arterial roads being constructed by the Manchester Corporation. In the evening : Dinner at the Town Hall, by kind invitation of the Lord Mayor.

Sunday, October 15.—If a sufficient number notify that they desire it, a motor char-à-banc trip to Buxton, returning in time to catch evening train to London, can be arranged.

The Manchester and District Joint Town Planning Advisory Committee, which is representative of over seventy local authorities adjacent to the city of Manchester, will show in the Town Hall a large and interesting exhibition of maps, drawings, diagrams, and models illustrating town-planning work, civic and regional development, public services, etc.

A very interesting series of maps is now being prepared by the Joint Committee for the area within a fifteen miles radius of Manchester, indicating traffic movement; gas, water, and electricity areas and supplies; drainage areas, town-planning schemes, parks and open spaces, unhealthy areas, rainfall and population maps, etc., and it is also intended to exhibit maps and models from many towns in various parts of the country.

Efforts are being made also to obtain a series of maps from American and Continental cities.

Cubic Content Estimates

A Criticism and a Suggestion

By W. PARRY-JONES

When a preliminary or approximate estimate of the cost of a building is required, the traditional method is to ascertain its cubic content in feet and to multiply this by the price suggested by experience.

The reliability of this result, therefore, depends on the truth of two sets of figures: the number of units the building contains, and the price per unit. It is to be observed, however, that the data for the latter are obtained from calculations based on the former. In other words, the price per cubic foot is obtained by dividing the known cost of completed buildings by their cubic content.

Hence, it is clear that the cubic content is the foundation of the whole process. The character of this foundation is, I find, open to criticism.

For a description of the method of measurement I quote from Leaning's "Quantity Surveying" (1897):—"The most usual practice is to multiply the outside length of the building by the breadth and the result by the height from the bottom of the footings to half way up the roof." This is, I believe, still the most usual practice, if not the only one used to-day. On what principle it is based I have been unable to discover; it does not partake of the character of a mathematical constant, neither does it appear to follow any precedent. To measure a group of enclosed voids as solid, seems to me as absurd as cubing up a stack of empty boxes of all sizes, thicknesses, and qualities and estimating their cost on this basis.

In the case of buildings this absurdity is intensified. For instance you may have several structures all providing equivalent accommodation, but owing to the fact that one has 18 in. rubble walls, another 9 in. brick walls, and a third 4 in. timber skeleton-framed partition walls, the cubic content of each is different. Also the roofs may be flat or pitched to slopes to suit tiles or slates; the foundations, shallow or deep, or a concrete raft; each in varying degree causing a still greater diversity in the cubic content. These variations of the cubic content destroy its value. It is impossible on so unstable a basis to gauge from the price the relative cost of different types of buildings. The present system of cubing is irrational and can be, with little trouble, replaced with a better.

The better method here suggested is what may be called the *void* method in contradistinction to the *solid* method above described.

The basis of the idea is that the architect's problem is — from this restricted point of view—to enclose certain voids with floor, walls, and ceiling or roof, and to group these in the most economical and convenient manner. This at once suggests the void content as the rational foundation upon which to base our cubic content estimates. It at least has the merit of being constant in quantity and does not vary with the alternative methods of construction, except in so far as the thickness of the internal walls will affect the length of the corridors, which is as it should be, and a recommendation rather than otherwise.

To ensure consistency in the calculations I append rules for measurement:—

1. The cubic content shall be the sum of the internal voids throughout the building, including bay windows, oriel windows and similar features that increase the floor area.
2. The height shall be measured from the floor to the ceiling, and where there is no ceiling (such as in open timber roofs) the height shall be taken to that point where a ceiling would have been, if one had been provided.
3. No deduction to be made for piers, chimney breasts, or other internal projections.
4. No addition to be made for dormers, recesses, or other small voids.

On these lines data for the price per foot cube will more truly reflect the cost of different types of buildings. Furthermore, assessors will be better able to judge the economic merit of designs submitted in competition, by comparing the void cubic content as well as the price per unit.

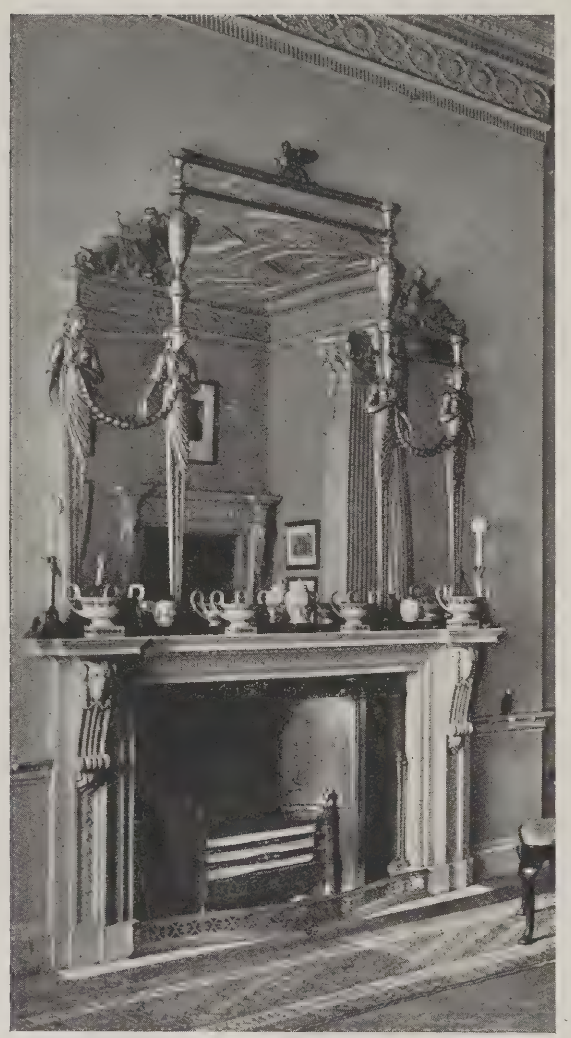
The adoption of this system will necessitate the collection of fresh prices, a simple matter, and one, moreover, that offers a good opportunity for classifying prices on a more informative and useful basis. For example, the price per unit of one or more storied buildings could be tabulated separately, and other groups formed as they suggest themselves.

The table hereunder is based on figures from actual practice last autumn. It will be observed that the price per unit of each method of construction as given under the solid system is identical, or nearly so; whereas, under the void system the relative cost is clearly indicated.

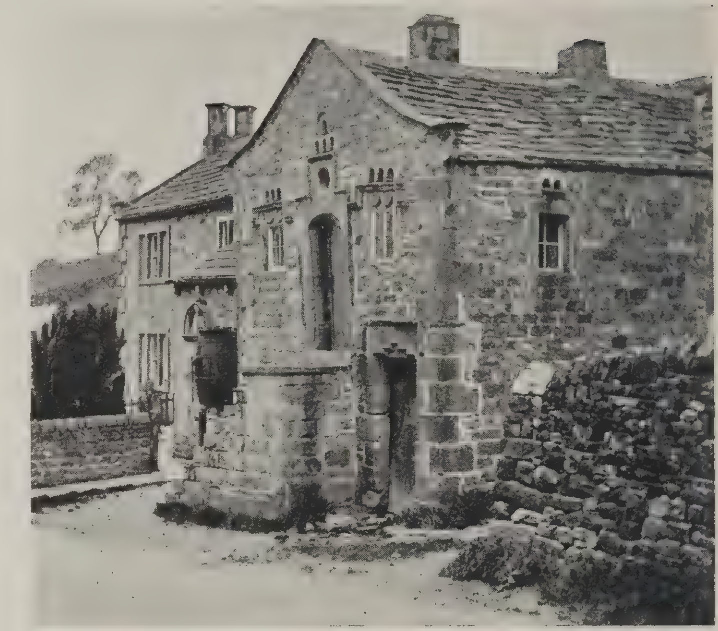
Type of Building. Sketch Plan.	Cube content.	Price per unit.	Amount.	Actual cost.
	Void system—			
	Cu. ft.	s. d.	£ s. d.	£
4 in. Stud partition walls	31,620	1 5	2,239 15 0	2,236
9 in. Brick walls	31,740*	1 8½	2,711 2 6	2,715
	Solid system—			
	Cu. ft.	s. d.	£ s. d.	£
4 in. Stud partition walls	45,150	1 0	2,257 10 0	2,236
9 in. Brick walls	52,600	1 0	2,630 0 0	2,715

* The small increase here is due to the longer length of the corridor caused by the thicker division walls.

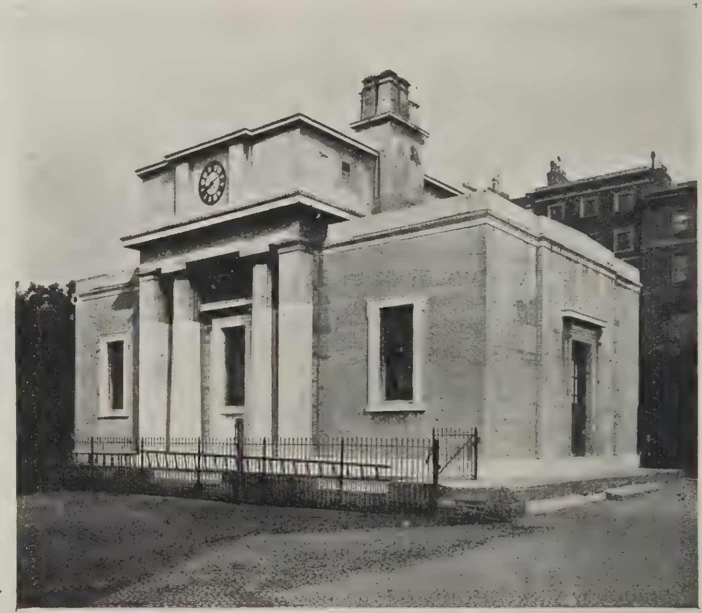
A Pictorial Review



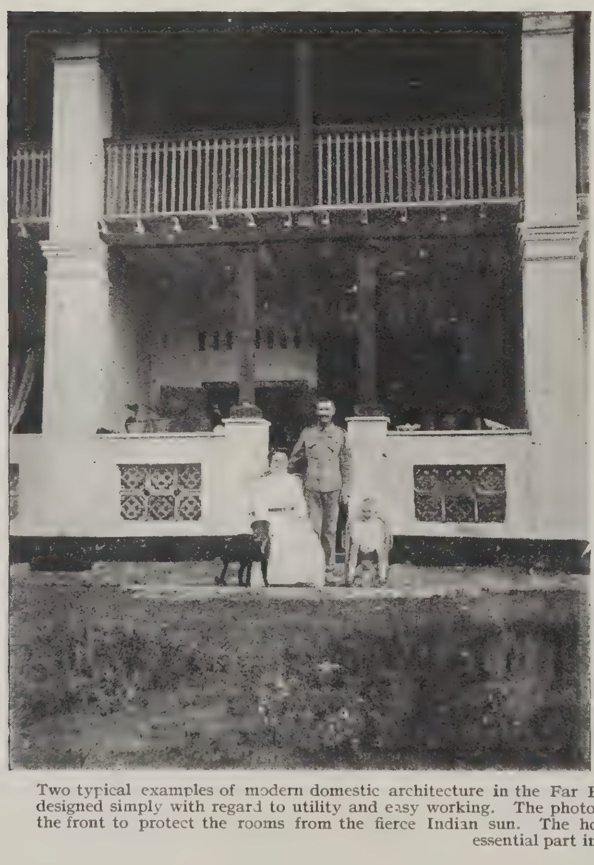
A chimneypiece from a house in St. James's Square, London, showing Robert Adam at his most sumptuous. The favourite ram's-head ornament appears in the brackets supporting the shelf, and upon the doorway reflected in the mirror.—L. H. ST. J.

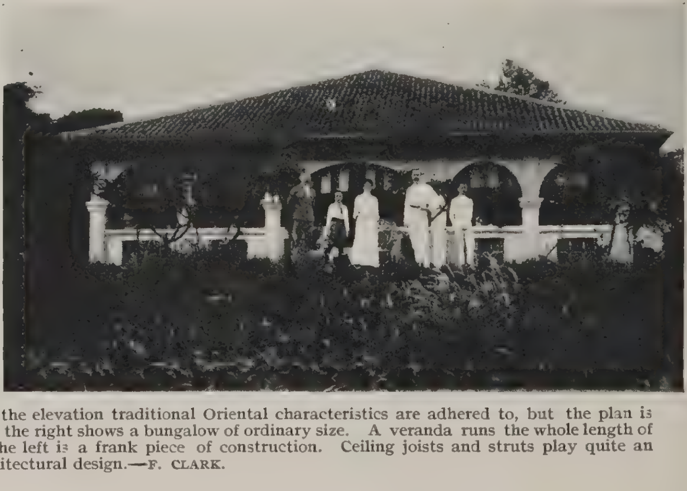


An old house, now a farm-building, at Appletrewich, Yorkshire. Notice the delightful way in which the ends of the gable are finished and the curious openings above the door and windows. The date of the house is about 1670.—E. L. GAUNT.

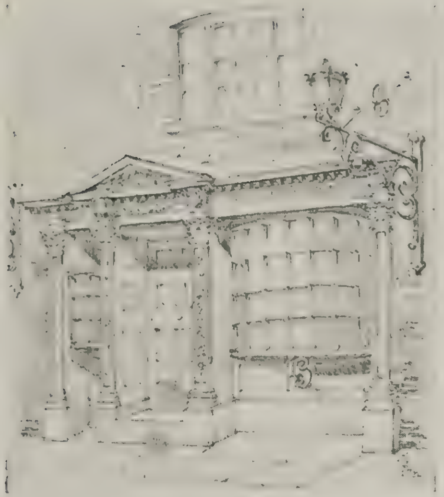


Besides designing the screen at Hyde Park Corner and the Arch at the top of Constitution Hill, Decimus Burton was also responsible for the various lodges in Hyde Park. The one shown in my photograph is near the Marble Arch. A Classic gate lodge with heavy Doric columns is a thing for the laughter of the gods. But how typical of the early nineteenth century !—P. T.

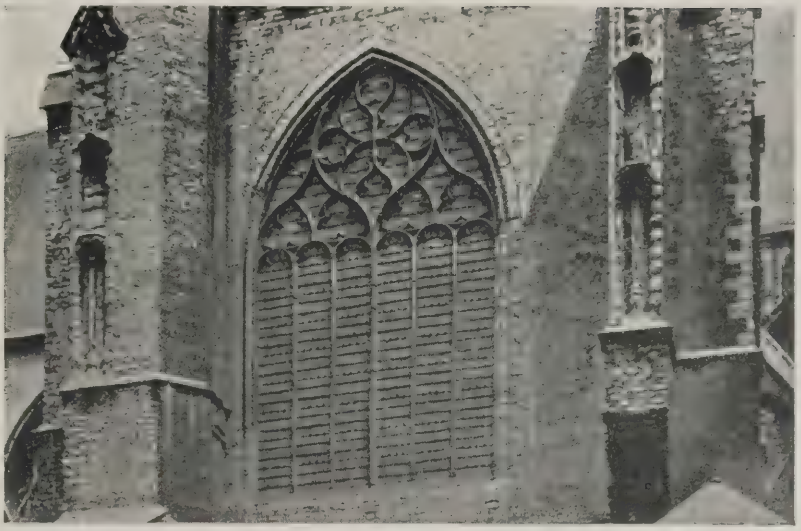




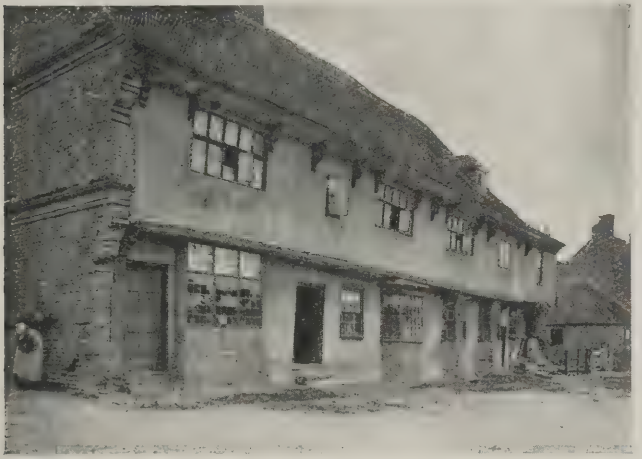
Two typical examples of modern domestic architecture in the Far East. In the elevation traditional Oriental characteristics are adhered to, but the plan is designed simply with regard to utility and easy working. The photograph on the right shows a bungalow of ordinary size. A veranda runs the whole length of the front to protect the rooms from the fierce Indian sun. The house on the left is a frank piece of construction. Ceiling joists and struts play quite an essential part in the architectural design.—F. CLARK.



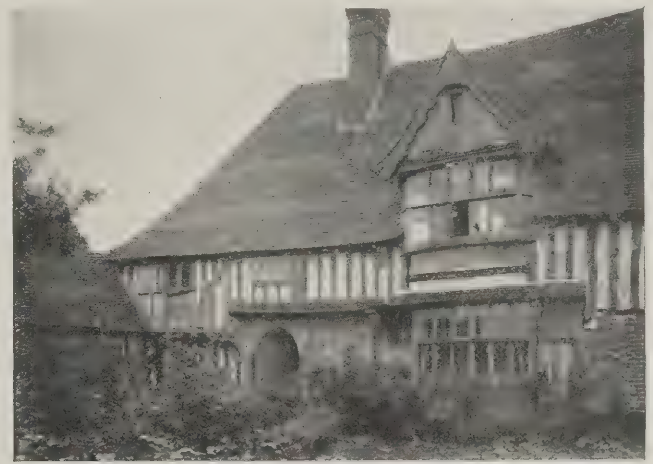
This little shop-front has recently been erected at the rear of the premises of Messrs. Levett, Frank, and Son, Ltd., in the Borough High Street. The oak door, carved pilasters, panelled reveals, and over-door were purchased by Mr. Frank in Holland, and the shield in the gable is dated 1636. The rest of the work is modern. The architect was Mr. A. W. Cooksey, F.R.I.B.A.—F. K. G. PAIN.



A window from the church of St. Pierre at Louvain, containing the most exquisite tracery I have ever seen. The church, though founded earlier, was entirely reconstructed in the fifteenth century, the date of the window being about 1440. It was gutted by fire, however, when the Germans sacked Louvain in 1914.—A. E. M. KERR.

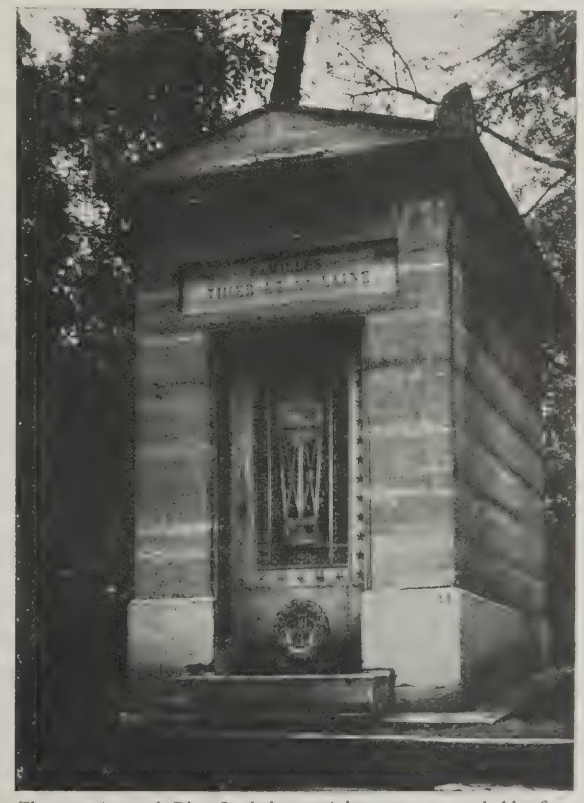


These old cottages at Eleham, Kent, date from Tudor times, and show the accretions of succeeding centuries. Note the bold eaves cornice supported on carved consoles, and the manner in which the end wall follows the contour of the front.—J. D.



This house is at Broadstreet, near Sellinge, Kent. Delightfully picturesque in general effect, it shows all the charm of Tudor work—good brickwork in combination with half-timber, fine casement and gabled windows, and a deep tiled roof.—J. D.

The American Institute of Architects held their banquet in the Old Fine Arts Building, at Chicago, on June 9. The setting under the dome was distinctly architectural, and served to focus attention on the efforts of the Illinois chapter to restore and preserve C. B. Atwood's classic masterpiece.



The cemetery of Père Lachaise contains many remarkably fine architectural compositions in the form of mausoleums, but none, I think, finer in monumental simplicity than this to the memory of the Thiébalt and Laine families.—F. P. R.

The Acoustics of the London County Hall

Those who complain of the acoustics of the Council Chamber in the new County Hall are, we suspect, focusing the blame in the wrong quarter. We recently heard part of a debate there, and were forced to the conclusion that the alleged difficulty was due to the faulty diction of the speakers rather than to the room itself. A voice that is properly produced is clearly audible in every corner of the Chamber; the mumbling or shrieking speaker naturally fails to make himself heard, as he would fail in any other hall of equal size. As a matter of fact, things are steadily improving as members become accustomed to the pitch of the Chamber, and the architects are confident that it is only a matter of time before difficulties vanish altogether.

Curtains are being tried over the Press gallery with success, and it should not be forgotten that curtains round the back row of the seating in the body of the Chamber were part of the architect's original plan. These were omitted at the wish of the Chairman, but they may possibly be hung if complaints should continue.

Cottages with Country House Equipment

To-day one of the difficulties of those who are giving up their country houses is to find a small place in which to live a life simpler yet not too far removed from their former one. One of the sharp stings of having given their best for the Empire is the difficulty of carrying on old standards and traditions. A red-brick villa with cramped rooms or a farmhouse with no modern conveniences is impossible. The need is a house of few rooms which does not entail much service, and which has no sordid surroundings.

It occurred to a woman that something on the lines of an Oxford Quad might help; a place where one could sport one's oak "when sick or sorry," and where acquaintance with one's neighbours need not necessarily be more intimate than in a block of London flats. With this thought some fifty acres of beautiful Sussex woodland, 400 ft. up, and within nine miles of Lewes, was bought, and a group of cottages erected, having the modern necessities of central heating, electric light, constant hot water, and a telephone; in fact the equipment of a good country house. Each cottage has a big living-room, long and low, with panelled walls and oak floors, and wide mullioned casement windows. There is also a tiny dining-room, a kitchenette, and three or four small bedrooms. The separate servants' quarters and servants' hall which serve the group are another country-house feature, and a few guest rooms help to solve one of the difficulties of small-house hospitality. Social life is possible in the club house or on the tennis courts, for a meeting-place apart from one's own little cottage makes for companionship and for privacy as well.

The wood is the attraction of the place; there are oak, chestnut, sycamore, and pine, and a thick undergrowth in which birds nest. A few acres may be reserved for a bird sanctuary.

It is hoped to attract as tenants Service men, especially naval, retired Indian Civil Servants, Varsity and literary men needing quiet; people who love the country and country life.

ANNABEL DOTT.

Government Lands

"All professional surveying and valuing staffs in the departments, with the exception of the Ministry of Agriculture and Scottish Board of Agriculture, should be completely amalgamated in a Central Lands Department, under a board of management responsible to the Treasury." This opinion is expressed in the report of the Committee, of which Sir Howard Frank was chairman, appointed by the Government to examine the question of concentrating in one department all Government purchases and sales of land and buildings and the management of the estates of the Crown and Government property.

The board of management, in the opinion of the Committee, should consist of a Treasury chairman, representatives of the Inland Revenue and the Office of Woods, and one representative of Government departments generally. All professional work in connection with the valuation, purchase, and sale of land and buildings should be undertaken by the Central Lands Department, acting as the agent for the purchasing and selling department.

The Committee recommends that the management of Government lands, so far as it consists of estate management in the usual sense of the term, should be entrusted to the Central Lands Department, and that the whole of the organization of the Office of Woods and Forests should be absorbed in the new department, the management of the principal agricultural lands being continued on the present basis. It is suggested that consideration should be given to a policy of gradual sale, as favourable opportunities occur, of the whole of the Crown agricultural properties, except where, for special reasons of national sentiment or expediency, the retention of a particular estate may be desirable, the proceeds of sale being utilized in the purchase of freehold town investments.

It is also recommended that the Central Lands Department, under the directions of the Treasury, should, in consultation with the departments concerned, investigate all Government holdings of property with a view to disposing of properties which it may be no longer necessary to retain for Government purposes, or which can with economy be replaced by alternative accommodation equally suitable for the purpose in view.

At least 1,200,000 acres of land in Great Britain and Ireland are administered by Government departments. Professional staffs, large and small, are maintained by several departments, not only at headquarters, but in the country. It is pointed out that the lands directorate of the War Department has a staff of land agents attached to each of the seven army commands in Great Britain, the valuation office of the Inland Revenue maintains 111 district officers distributed throughout Great Britain and staffed by professional valuers, and these are in turn controlled through thirteen divisional offices; and, similarly, the Office of Works, the Ministry of Agriculture, and the Commissioners of Woods have considerable professional staffs. The Committee "regard it as axiomatic that a qualified professional staff should be available for advising departments in regard to valuations, purchases, and sales, etc., of real property, and for the actual conduct of operations, and we cannot adopt any suggestion that valuations should or can be separated from purchases and sales (i.e. actual negotiations)."

The Central Lands Department would, in the opinion of the Committee, be the professional advisers and agents for each and every department, and departments should be instructed to ask for its assistance whenever occasion arises. "We regard it as cardinal that this rearrangement of professional staffs should result in a decrease in expenditure. It is clear that a certain immediate economy should result from the elimination of the several reserves of man-power which must necessarily have been created under the present system of maintaining professional staffs in several different departments. We feel confident also that the rearrangement will lead to more practical results in actual negotiations." The problem of concentrating the management of Crown and Government lands presents greater difficulties, but the Committee think the new organization which they have proposed should be entrusted with this work, as estate management is admittedly a function of a qualified surveyor and valuer.

With regard to the management work for the service departments, the Committee recommend that officers should be seconded from the Central Lands Department to the service departments so far as may be necessary. The total area of lands held permanently by the War Department is 219,480 acres, principally sites of barracks and camps, fortifications, training areas, and rifle ranges. It is obvious that many of these properties cannot be utilized in such a way as to produce revenue, and in these circumstances the control and management are to a great extent concerned with questions of maintenance, a matter chiefly for the works branch of the War Department. The Committee suggest that while the land agents in the commands should be absorbed in the Central Lands Department, that department should second such staff as may be necessary to carry out the local work of the commands.

As regards the management of Crown lands, the Committee are "strongly of opinion that the transfer of the work to the officers of the Central Lands Department will lead to an improvement of relations as between landlord and tenant, and will ultimately benefit the Crown revenues." They do not, however, contemplate that absorption in the central body will in the case of the agricultural lands necessarily involve a departure from the present system of management by outside professional agents and receivers, a system which, in their opinion, has worked well and is economical.

List of Competitions Open

Date of Delivery.	Competition.
Aug. 11—Jan. 31, 1923	Labour-Saving Flats, Hampstead Garden Suburb. Premiums £500, £300, and £200. Assessors: L. Rome Guthrie, F.R.I.B.A., J. C. S. Soutar, Lic.R.I.B.A., and E. J. Cooper, Secretary, Second Hampstead Tenants, Ltd., to whom, at Temple Fortune House, Hampstead Way, N.W.11, applications must be made by August 11.
Aug. 31	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
Sept. 16	Nurses' Home, Chelsea Hospital for Women. Premiums: £150, £100, and £50. Assessor, Mr. H. V. Ashley, F.R.I.B.A. Names by above date to Mr. H. H. Jennings, Secretary, Chelsea Hospital for Women, Arthur Street, Chelsea, S.W.3.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8,000 francs.
Nov. 1	Labour-saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C.4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Pavilion to cost £100,000 at Bournemouth. Premiums £300, £200, £100. Apply Town Clerk.

Competition News

Raffles College, Singapore.

The President of the R.I.B.A. has appointed Mr. John Begg, F.R.I.B.A., as assessor in this competition.

Town Hall and Municipal Offices Competition, Colombo.

The Secretary of the R.I.B.A. has been nformed that the above competition is imited to architects practising in the East. British architects should not, therefore, trouble to write for the conditions.

New "Daily Mail" Bungalow Competition.

"The Daily Mail" offers £500 in prizes to architects for designs for ideal labour-saving bungalows suitable for erection in the country or in the suburbs of a large town. The first prize will be £300; the econd prize, £125; and the third prize, £75.

The accommodation called for is: dining-room, drawing-room, four bedooms, maid's sitting-room, kitchen, and he usual domestic offices. The kitchen must not exceed 7 ft. by 8 ft. in size.

The total floor area of the bungalow must not exceed 1,500 sq. ft., including walls. The area of the rooms, with the xception of the kitchen, is left to the ompetitor.

Anyone practising as an architect, or in he employ of a practising architect, or in partnership or conjunction with a practising architect, is eligible to enter his competition. Engineers or others who wish to compete should arrange to ollaborate with an architect.

It is possible that the prize-winning design in the competition will be erected at the Ideal Home Exhibition at Olympia next March. In this case the prize-winning architect will be paid, in addition to his prize, the usual fees for superintending its erection. In any event substantial models will be on exhibition.

The last date for receiving entries for the competition is November 1, 1922. Full particulars, together with conditions of entry, are contained in a booklet which is now in the press. A copy of the booklet will be sent post free on application to "Ideal Bungalow," "The Daily Mail," 130 Fleet Street, London, E.C.4.

Chelsea Hospital for Women.

The Council of the Chelsea Hospital for Women propose to invite not more than twelve architects to submit designs, in competition, for their proposed nurses' home (some 100 bedrooms, etc.) to be erected in the hospital grounds.

Premiums of £150, £100 and £50 will be paid to the authors of the designs placed first, second and third respectively.

The Council have appointed Mr. Henry V. Ashley, F.R.I.B.A., to draw up the conditions and instructions of the competition, and to adjudicate thereon.

Architects willing to compete are requested to send in their names on or before September 16, together with their qualifications, to Herbert H. Jennings, Secretary, Chelsea Hospital for Women, Arthur Street, Chelsea, S.W.3.

Ramsgate Front Extension Competition.

It has been pointed out by the R.I.B.A. that the plan of the site of the West Cliff Estates submitted to competitors in the lay-out scheme does not mark the levels to enable architects competing properly to develop their schemes.

In consequence of this, the Borough Engineer went over the site with the assessor, who suggested that the levels should be supplied to competitors, and remarked that it would be necessary to extend the time for the delivery of designs.

The Council have decided to fall in with the suggestion made, and to extend the time of delivery of plans until August 31.

A Bank of England Exhibition

A special exhibition of the sketch models used by Sir John Soane, R.A., in the building of the Bank has been arranged by the Curator in the students' room on the ground floor of the Sir John Soane Museum, 13 Lincoln's Inn Fields. Among special features of the famous interiors of the Bank, too little known to the general public, are here shown the Princes Street entrance vestibule, the open loggia to the waiting room court, the accountants' hall, with a noble barrel vault, the Lothbury court, on the lines of Palladio's villa designs, the Bank Stock Office and the Consols Office, both of striking originality of design. There are in addition models and photographs of the Tivoli Corner and other parts of the exterior and interior of Sir John Soane's masterpiece. The museum is open free throughout August on Tuesdays, Wednesdays, Thursdays, and Fridays, 10.30 a.m. to 5 p.m.

Law Report

Light and Air Dispute

Slack v. Leeds Industrial Co-operative Society, Ltd.

July 11–14. Chancery Division.
Before Mr. Justice Romer.

This was an action by Mr. Charles H. Slack, of 23 and 24 Albion Square, Leeds, against the Leeds Industrial Co-operative Society, Ltd., of 10 Albion Street, Leeds, for an injunction restraining the defendants from erecting a new building in or near Albion Square so as to cause a nuisance by the obstruction of his ancient windows, as they existed before the pulling down by the defendants of the building, 15 Albion Square, or so as to obstruct or interfere with the roadway of Albion Square and the free use and enjoyment by the plaintiff of that right of way.

Mr. Hughes, K.C., and Mr. Harman appeared for the plaintiff, and Mr. Cunliffe, K.C., and Mr. Vernon for the defendants.

Mr. Hughes stated that the action related chiefly to ancient lights, but there were subsidiary points with respect to air and right of way. The defendants had paid £300 into court in full satisfaction of all plaintiff's claims and with a denial of liability. Mr. Slack's business was a very old-established one, and he had been there himself for nearly thirty years. Albion Square could be better described as a passage or a court. The only light Mr. Slack had was from the windows of his premises looking into Albion Square. The defendants were in a very large way of business. No. 15 Albion Square had been a low building, but the defendants were rebuilding it to a height which relatively was considerable. They were also building over Albion Square to the north of the plaintiff's premises, leaving a tunnel underneath 64 ft. long which, it was claimed, seriously obstructed the roadway over which the plaintiff had a right of way.

The hearing was continued on several days. Amongst the witnesses for the plaintiff were Lieut.-Col. H. M. Kirkby, consulting engineer, Westminster; Mr. Wm. Corby Hall, architect and surveyor, of Leeds; and Mr. Wm. Watson, of Messrs. Chadwick, Watson & Co., architects and surveyors, Crown Chambers, Albion Street, Leeds.

Mr. Cunliffe, for the defence, said the submission of the defendants with regard to the light was that while there would be a small diminution of sky area if the building was completed, there would be no material reduction in the light coming to the plaintiff's premises. With the white glazed bricks which the defendants proposed to use there would, in fact, be a substantial addition to the light. He said that the Court could not now grant an injunction or damages if the effect of what was done was to leave the plaintiff in a better position than he was before.

Mr. Percy James Waldram, consulting engineer, and expert on illumination, gave evidence on behalf of defendants.

At the conclusion of the legal arguments his lordship reserved judgment until after the long vacation.

The Week's News

Lambeth Bridge Reconstruction.

Reconstruction of Lambeth Bridge is to be considered by the L.C.C.

Torquay Roads.

A scheme of road widening in various parts of the district, involving an expenditure of over £20,000, is under consideration by the Torquay Town Council.

Reconstructing Teddington Weir.

Payment of £3,750 towards the cost of the reconstruction of Teddington Weir has been authorized by the Metropolitan Water Board.

New Dwellings in Lanarkshire.

The District Committee of the Lower Ward of Lanarkshire have authorized the erection of twenty-eight dwellings at Gartcosh. The architects are Messrs. Lennox and Macmath, Glasgow.

Bournemouth Improvements.

The Corporation are considering a proposal to erect cliff works, terraces, and groynes from Boscombe Pier to a point 100 yards east of Boscombe Manor steps at an estimated cost of £53,000.

Proposed New Tenements.

The Housing Committee of the London County Council urge that arrangements should now be made for the erection of the last two blocks of tenement buildings to be provided on the Tabard Garden Estate.

Hamilton Palace Grounds.

The grounds of Hamilton Palace, extending from Bothwell Bridge to Motherwell Bridge, and including a mausoleum and several lodges, have been purchased by the Hamilton Corporation for £20,250.

Australia's New House of Parliament.

It is the intention of the Federal Government to transfer Parliament at an early date to Canberra, where it will sit in about three and a half years. Architects are now preparing the plans of the Parliament House.

The Late Mr. A. Mackenzie.

The death is announced of Mr. A. Mackenzie, architect, Kingussie, in his sixty-seventh year. He was well known in the Highlands as an architect, having designed many buildings, including several of the largest distilleries on Speyside.

43–44 Albemarle Street.

In connection with the illustrations of the F.I.A.T. shop-front published in our issue for July 26, it should have been stated that the building 43–44 Albemarle Street, other than the shop-front, was planned and designed by Mr. Delissa Joseph, F.R.I.B.A.

Brooklyn Bridge in Danger.

One of the main cables of the Brooklyn Bridge connecting Manhattan (New York) with Brooklyn has shifted a short distance from its correct position on the summit of one of the towers, and the whole structure of the bridge has thereby been gravely weakened.

Church House Improvements.

It has been decided to make considerable alterations in the Great Hall and West Block. Arrangements to improve the lighting and general appearance of the Upper House of Convocation, and the arrangements for a restaurant in the West Block basement (part of which will be open to the public) have been approved.

Another London University Site.

A new suggestion is to build the university on both sides of the river by the Lambeth Bridge, where there are some twenty-eight acres of land available. A new bridge would unite the university buildings, which on one side would adjoin Lambeth Palace and on the other Millbank Barracks and the Tate Gallery.

St. Anne's, Soho.

The condition of the great east window in St. Anne's Church, Soho, is stated to be serious, if not dangerous, and it is suggested that the window should be put into thorough repair as a permanent memorial to the late rector, Prebendary Cardwell. The cost of a new iron frame and releading will be about £500.

Architect's Change of Address.

Mr. Alfred A. Ospalak, M.S.A., is removing from his present offices to more commodious premises at 25 Victoria Street, S.W.1. All communications and enquiries to be addressed to new offices. Telegraphic address: "Gavelskill." Telephone number as heretofore: "Victoria 5970."

New Richmond Bridge.

It is proposed to build a new bridge over the Thames at Richmond. The surveyors suggest leaving the old bridge for local needs and building a new bridge north of the railway river bridge, with an eastern approach nearly opposite the junction of the Kew and Lower Richmond roads and a western approach near St. Margaret's Railway Station.

Baths in the Parks.

The L.C.C. Parks Committee have reported in favour of the provision of open-air swimming baths in the parks. They recommend that application be made to Parliament in the session of 1923 for authority to construct at the parks and open spaces, under the control of the Council, open-air swimming baths, with the necessary dressing accommodation.

The Design of Schools.

A letter from the South Wales Institute of Architects has been read at a meeting of the Cardiff Council asking that the work of designing and executing the proposed new elementary schools at Cardiff should be taken out of the hands of the City Engineer, and that the architects for the buildings should be selected as a result of open competition. It was decided that the work should be done in the City Engineer's office.

White City for Sale.

Shepherd's Bush Exhibition Estate is offered for sale by private treaty. It is over 100 acres in extent and contains 35,000,000 cubic feet of buildings, all of which are now being repaired and redecorated. All the larger buildings and most of the smaller ones are constructed in an almost permanent manner, consisting of steel framework, with corrugated iron roof, breeze concrete walls reinforced with steel and concrete, and cement floors.

Mr. George Beaumont.

We regret to announce the death of Mr. George Beaumont, A.R.I.B.A., in America. He was a Leeds man, and at one time was well known in Yorkshire architectural circles. Mr. Beaumont won the gold medal of the Leeds and Yorkshire Architectural Society for a drawing of the beautiful chancel arch in Adel Church, and later on went to Chicago, where he practised very successfully and became the president of the architectural society in that city. Mr. Beaumont was about seventy years of age.

Greenhill Wood Estate, Otford, near Sevenoaks, Kent.

The above estate, comprising over 70 acres of good building land, is to be opened up for development, and roads will be formed. A feature is to be made of tennis and bowls courts for special use of the estate. The situation is a very fine one adjoining Greenhill Wood, Hilly Deal Wood, Otford Mount, and Flatdeal Wood, and water and gas are to be available. The surveyor to the estate is Mr. Sydney E. Castle, 28 Duke Street, St. James's, S.W.1.

Incorporated Church Building Society.

At the monthly meeting of the Incorporated Church Building Society, held recently, the Hon. Sir E. P. Thesiger, K.C.B., in the chair, grants were made towards building the church of All Saints, Luton, and rebuilding St. John's Church, Walthamstow. Grants were also made towards enlarging or repairing eleven other churches. As evidencing the increase in church building and repair, the number of applications dealt with at the meeting is the largest since the beginning of the war.

R.I.B.A. Archibald Dawnay Scholarships 1922.

In accordance with the terms of the Will of the late Sir Archibald Dawnay, the R.I.B.A. have awarded, for the first time, two scholarships, each of £50 per annum for two years, to Mr. E. U. Channon, Architectural Association, and Mr. D. J. A. Ross, Robert Gordon's Technical College, Aberdeen; and one scholarship of £25 per annum for two years, to Mr. C. S. White, Architectural Association. The scholarships are intended to foster the advanced study of construction and the improvement generally of constructional methods and materials and their influence on design.

Westminster Cathedral Addition.

Preparations are being made for the development of the land adjacent to the Roman Catholic Cathedral at Westminster. At the west and south sides of the oblong space outside the Cathedral bounded by Ashley Place and Morpeth Terrace a high monumental wall is to be built. The flank of the Cathedral will form the north side, while the east side will be almost closed in by an entirely new block of buildings in which it is intended to provide a song school, a chapter room, a large room for general purposes, and enough new classrooms to allow for more day boys being brought into the choir school.

Vol. LVI. No. 1441

THE ARCHITECTS' JOURNAL & Architectural Engineer

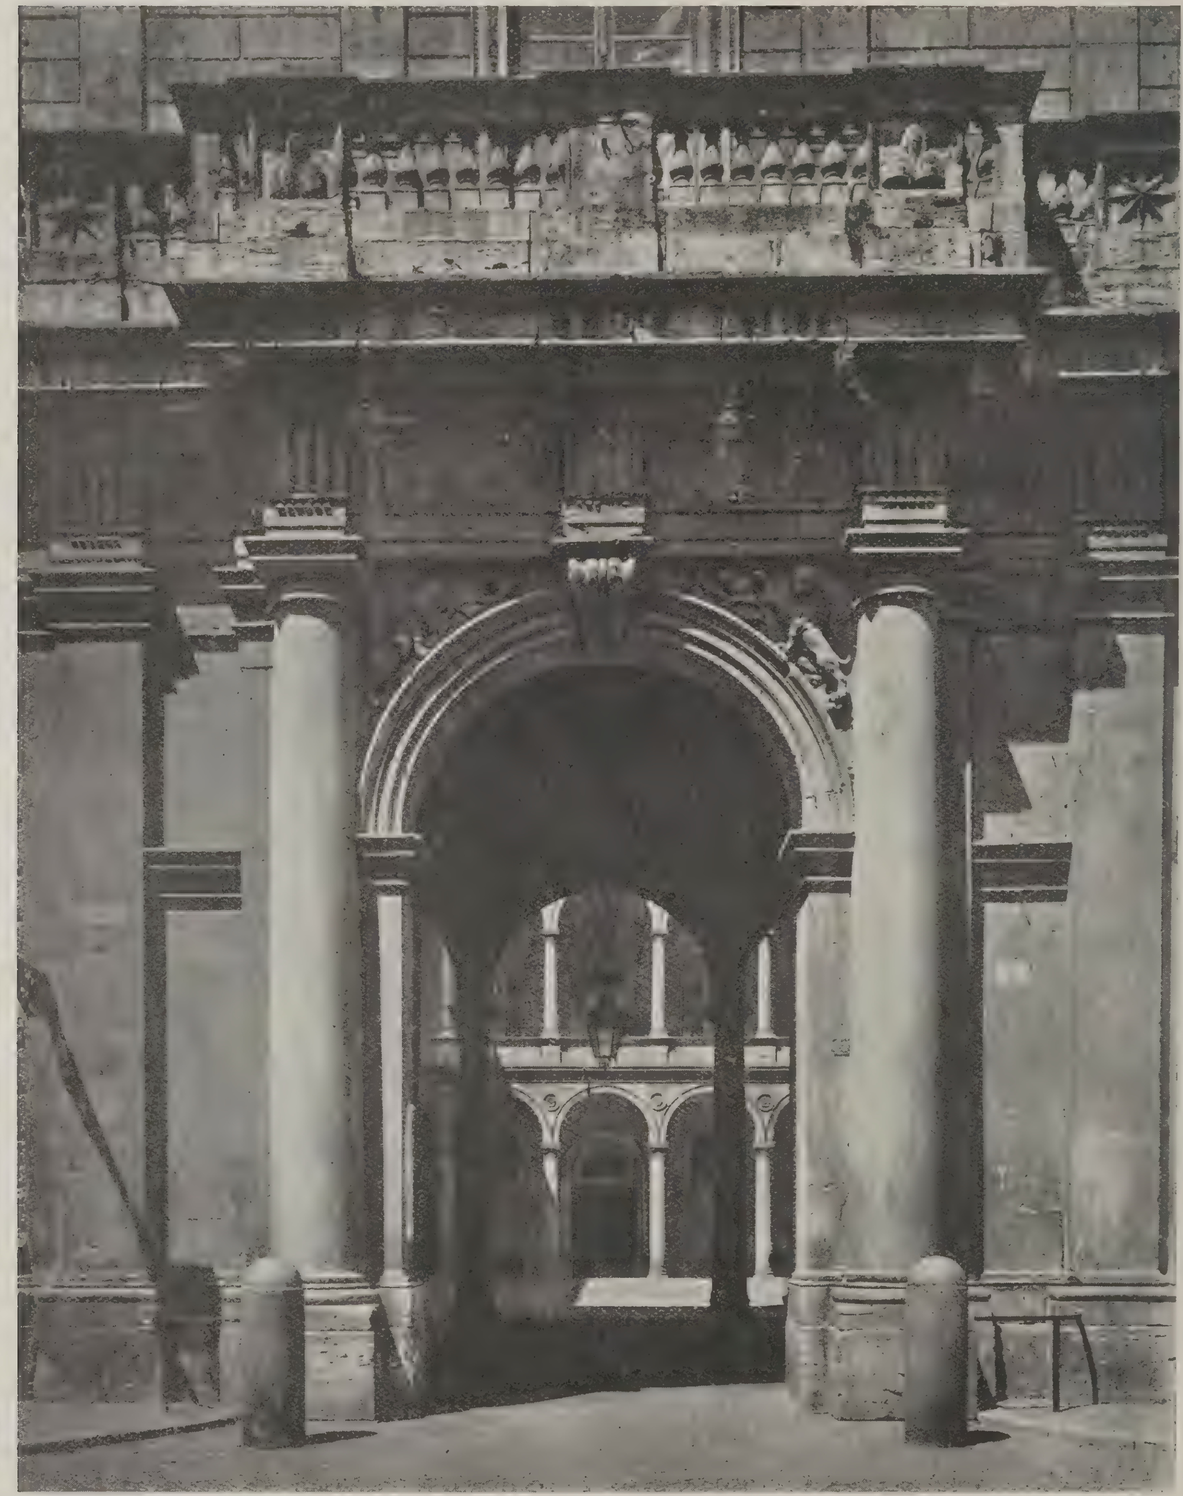
With which is incorporated "The Builders' Journal"

THE PALAZZO DELLA CANCELLERIA, ROME: THE CORTILE.
BRAMANTE, ARCHITECT.

27-29 Tothill Street, Westminster, S.W. 1.

Architecture of the Italian Renaissance. 18.—The Entrance Gateway, Palazzo della Cancelleria, Rome

Bramante, Architect



The Cancelleria Palace was built by Bramante between 1495 and 1505, but it was probably begun earlier by another architect. The gateway itself is of a later date, and has been ascribed to Domenico Fontana. Through the archway can be seen Bramante's cortile, the slender columns standing out with dazzling brightness from the shadows thrown by the arcade. Bramante himself was born about 1444, and died in 1514. He began as a painter, and studied under Piero della Francesca and Mantegna. He settled in Rome about 1499.

THE

ARCHITECTS' JOURNAL

Volume LVI. No. 1441

Notes and Comments

Architecture and the Lay Press

THE architectural horizon is expanding visibly. Like several other architectural educationists, Mr. W. S. Purchon, principal of the architectural department of the Technical College, Cardiff, is extending his sphere of influence far beyond the college walls by diligently writing for the lay press. We trust that the architectural professors will keep it up, and that they will be strongly reinforced by architects who are not professors, but are, nevertheless, competent to treat an inherently attractive subject in an appropriately attractive style. For many years we have advocated the more extended use of the Press for the popularization of architecture as a subject of interest to "the general reader," and at last the editors of the lay newspapers seem to be quite convinced of the fact. We note with pleasure that "The Times Literary Supplement," which has always given much evidence of its recognition of architecture as a fascinating subject of study by readers of cultured tastes, gives in its current issue a column of "Architectural Studies"; and the fact is one on which we take leave to congratulate both the editor and the author, but more especially the readers of the Supplement, and of similarly fortunate newspapers, in being offered a comparatively unfamiliar means of combining pleasure and profit in their reading.

Timber from Germany

Germany is such a confirmed laggard in reparation that her default in respect of timber is not surprising except in its impudent extent. In the House of Commons on August 3, Mr. Hilton Young, Financial Secretary to the Treasury, answering a question put by Sir W. Davison, made the remarkable statement that the maximum deliveries of timber by Germany in payment of reparations to this country should, in 1922, amount to 2,000 standards, of the value of £3,500,000, but that owing to delays it was not expected that more than a fourth of that quantity would be delivered within the stipulated time. Sir W. Davison thereupon very properly asked "whether the hon. gentleman could explain why so very paltry an amount of timber was being delivered by Germany, considering the fact that a fourth of the country was under scientifically planted timber." Mr. Hilton Young intimated that he should prefer to explain this matter carefully, and would then communicate with the member who raised the question. Mr. Young said that in 1923 the deliveries would be larger, but he did not state the grounds for this statement, which must be taken as hopeful rather than sanguine. Allowance must be made, no doubt, for certain difficulties of transport, but, nevertheless, Germany has only herself to blame if her notorious slackness all round in the matter of reparations suggests a sinister application of the proverb that "where there's a will there's a way." Unfulfilled expectations will have much the same kind of adverse effect on the timber market as on the money market, with an even more direct effect on building. Germany should, therefore, be pressed to deliver the timber supplies that, when they become plentiful, cannot fail to give an impetus to building. Yet it would be by no means wise to await that contingency. Full deliveries may not be confidently expected before the Greek Kalends; which is the more regrettable seeing that timber shortage in England is a serious menace to building by the ordinary methods; and there is much work for which other methods are for the moment impracticable.

The British Empire Exhibition

The underwriters of Lloyd's have very strikingly confirmed their high reputation for astuteness and enterprise. Having sent a representative party of delegates to the British Empire Exhibition at Wembley Park, they acted promptly and with fine chivalry on their delegates' report. The visiting party were so struck by the progress made in construction, and by the accessibility of the site, that they determined to do all in their power to assist the undertaking, and their efforts were enthusiastically backed at the Royal Exchange. The certificate guaranteeing the contribution, with the signatures of many hundreds of underwriters, was enclosed in a handsome album bound in blue morocco, with the Prince of Wales's feathers on one side and the arms of Lloyd's on the other, and presented to H.R.H. the President of the General Committee of the Exhibition with the accompanying loyal message: "The following underwriting members of Lloyd's present their loyal duty to H.R.H. the Prince of Wales, and request his acceptance from them of a contribution of £100,000 to the Guarantee Fund of the British Empire Exhibition, as a slight recognition of His Royal Highness's great services to the Empire." The Prince sent a very gracious reply; and his unfailing tact and unexampled popularity must insure for the British Empire Exhibition the greatest possible measure of success; and as, humanly speaking, that success implies national prosperity in full flood-tide, the underwriters at Lloyd's are to be congratulated on their patriotism and foresight in setting so fine an example to the rest of the business community, who now realize beyond a shadow of a doubt the British Empire Exhibition ranks "A1 at Lloyd's."

Scheme to End the House Famine

In an interview with a representative of "The Westminster Gazette," Mr. H. S. Abrahamson has prescribed a panacea to cure the house famine. He proposes that five hundred thousand houses shall be built at a cost not exceeding £350 per house, including cost of land. "The gross capital expenditure would, therefore, amount to £175,000,000, representing, at 4 per cent.—at which rate the State would be able to raise money—an annual outlay of seven millions. The entire programme," he suggests, "would either be undertaken by a firm of contractors, or, alternatively, administered by the Ministry of Health." Neither alternative is sound, the one savouring of monopoly, the other of incompetency; and there has been surely abundant experience to condemn both on sight; and, on the principle of "once bit, twice shy," the public are not likely to lend an attentive ear to any scheme that depends for success on Government interference in matters of which it has already made so glorious a muddle. Nor will Mr. Abrahamson's figures bear close scrutiny. A freehold house for £350 does not suggest "houses for heroes." Mr. Abrahamson's scheme is altogether too sanguine, and is not at all likely to commend itself to people made callous and sceptical through bitter disappointments. The builder's path is strewn with the wreckage of optimistic housing schemes.

Provision Against Abnormal Weather Conditions

Such violent storms as those experienced in various parts of England within the past few days can rarely have happened in this country during the first week of August, and the accompanying floods were exceptional for this time of year. At Sheffield the roads became rivers, flooding basements and cellars, and stopping the tramways; while the rainfall at Leeds was 3·44 inches, the highest ever recorded in that city. In the Ravensthorpe reservoir—the chief source of supply for Northampton, where a water famine had been feared, and consumers were rationed—the water rose eighteen and a half inches, equivalent, says "The Times'" correspondent, to thirty-five million gallons, or eighteen days' supply, but is still only half full. In such extraordinary conditions, street-flooding seems inevitable and complaint futile, drainage systems being planned to meet normal conditions only—the average steady English rainfall, not the sudden and violent downpour that is more common in the tropics. Still, if we are likely, as some meteorologists suppose, to become increasingly subject to alternations of drought and flood, such phenomena must be studied rather more intensively than the conditions have hitherto demanded. Against drought the only provision that has been suggested is the rather fantastic and impracticable one of digging moats and ditches about a building to keep the moisture constant in its foundations, thus to prevent shrinkage; but against flooding the only remedy short of enlarging the sewers and increasing the number of inlets seems to be that adopted in Paris against the rising of the Seine, and against abnormally high tides at some of our own seaside resorts—that of protecting the basement with stormboards.

Our New Literary Feature

It will be seen that this week we introduce a new literary feature. It is to appear once a month, under the title "Joking Apart," which will be recognized as an idiomatic phrase to which more than one interpretation can be given. What meaning the author intends it to convey may be best inferred from the series of articles as they successively appear. From them it will be seen that, as a rule, an occasional soupçon of Attic salt seasons a substantial dish, serving to redeem excellent common-sense fare from an insipidity that, for want of this condiment, is unappetizing and therefore falls short of full nutritive value. Let it not be for a moment surmised that "Joking Apart" will at any time warrant such an invidious construction as joking apart from solid sense. The cap-and-bells and gibbering-stick of the perfunctory professional jester are no part of his equipment. His peculiar vein of delicate humour—and he has elsewhere achieved high reputation in it—is never laboured, but always spontaneous and unforced, arising naturally, as all true humour does, from a swift yet penetrating perception of inconsistencies and incongruities, from a keen scent for life's little ironies and big hypocrisies, and from a firm determination to try always to discriminate truth from error, and to restate pointedly, if casually, with many a vivifying if sometimes jocose touch, truths and principles that are apt to fall flat on dull ears when dully and flatly expressed. Wholesome humour is always exhilarating when it bubbles up spontaneously and iridescently. What is so infinitely distressing about the spurious imitation known to Mark Twain—that most honest and earnest of moralists—as "alleged humour," is its ghastly and persistent irrelevancy. Here will be found none of the humour falsely so called "that for a tricksy word defies the matter." No silly irrelevancy, no word that is merely frivolous and insincere, no joking for joking's sake, or to "tickle the ears of the groundlings but make the judicious grieve," will ever find a place under "Joking Apart." That this new feature of the JOURNAL will be always marked by entire sanity and irreproachable taste, our contributor's threefold reputation as architect, humorist, and humanist is an ample guarantee. His humour is always good-humour, as genuine humour must ever be. And it will never stray far, if at all, from the many and various interests that are persistently uppermost in the architect's mind.

Stained Glass Collecting

Is there any class of object that has escaped the attentions of the collector? "Collecting old stained-glass windows" is, according to Mr. Maurice Drake—than whom nobody knows more about stained glass in all its bearings—"a hobby for millionaires." In support of this curious statement, he cites, in "The Daily Mail," some truly staggering figures. "A simple window of the type most frequently painted in the fifteenth century, with, perhaps, three figures on backgrounds of the diamond-shaped panes known as quarries, would be fairly cheap at £5,000." He cites a still more stupendous price. A thirteenth-century panel, containing only the head and shoulders of a saint, was bought by a dealer for £17,500. Mr Drake warns the embryo collector against stained-glass forgers, yet adds the reassuring statement that the holes or "shallow pits," like those found in York Minster windows, cannot be successfully imitated. Such holes, due to corrosion, while they attest the genuineness of the glass, depreciate its price, however. The presence of Mr. Drake's interesting and informative little article in "The Daily Mail" is a further gratifying proof of the growing attraction of art of all kinds for the "general reader," if only the subject be treated in a sufficiently popular style. Mr. Maurice Drake's interest in painted glass has descended to him even unto the third and fourth generation from ancestors who were noted experts in stained-glass manufacture; and to his high reputation in the gentle art of making painted windows he adds that of a writer of distinction, whether as the author of a standard treatise on stained glass or as the author of several successful novels.

Additions to Westminster Cathedral

It is intended to build, on the oblong space bounded by Ashley Place and Morpeth Terrace, an addition to Westminster Cathedral. A song school is among the new projects, and a high monumental wall is to be built, "possibly with alcoves or cloister-like arcaded corridors." A chapter-room, a large room for general purposes, and new classrooms for more day-boys for the choir school, are in contemplation, with a wide processional path and an "enclosure ending in a clump of trees, which should help to bring out strongly the picturesque roofs and galleries and buttresses of the cathedral apse." A great altar is to be erected at the east end of the enclosure. One would like an explicit assurance that this scheme is in strict accordance with Bentley's ideas, as we have no reason to doubt that it is.

Joking Apart

(A Monthly Causerie)

Two Post-mortem Examinations

LAURENCE OLIPHANT, in the opening paragraph of his memorable "Piccadilly," says that after reading the "History of Civilization" by his late lamented friend Mr. Buckle, it had occurred to him also to write a history of civilization—"*but after having seen the world, instead of before doing so, as was the case with that gifted philosopher.*" This strikes me as good sense and, on the ground that the proper time to discuss pictures is after people have seen them, and not before, justifies, I think, a reference to the late exhibition at Burlington House. Moreover, a true estimate of pictures is possible only on a full acquaintance with them: a man may go to an agricultural show, push his chin over the shoulder of the person in front of him, and from that position determine on the spot the rival merits of competitive turnips; but a work of art cannot properly be so disposed of. The fact is that the weightiness of the accredited art critic's opinion relies upon the completeness of his inability to do anything but criticize art; his authority, that is to say, depends on his limitations. I am not qualified by such limitations, but I make no apology for saying what I think about the pictures, for I pretend to no superior knowledge, and, as most of those who will read these lines make no such pretensions either, we can meet on easy terms of common understanding and mutual sympathy. It was, we may remember, a person pretending to superior knowledge of pictures who, visiting a London friend at her country house during the hey-dey of the cubists and saying, "What a charming portrait that is of your husband in the hall!" was informed that the picture was not a portrait of anyone's husband, but a plan of the drains.

* * * * * * *

There is a right and a wrong way to view pictures, whether at Burlington House or elsewhere. The wrong way is to gaze at them till nature rebels and we can endure the sight of them no longer. This is not getting one's money's worth, but getting *more* than one's money's worth. It produces "Academy headache," and is the usual method of the visitor to the summer exhibition, who frequently goes there not as a picture-lover, but in pursuit of sensation. It explains also why the chirping question "Have you been to the Academy yet?" is uttered in exactly the tone of one who during an influenza epidemic asks, "Have you been inoculated?" The right way to view pictures is to pay them short visits. The Royal Academy show this year justified many such visits, and the experience of dropping in at Burlington House eight or ten times in as many weeks to see how the pictures were getting on, was instructive. Some of the paintings got on well, but some pined away; some, that is, gained vigour, while others lost vitality and fell into an almost moribund condition. It was specially remarkable to note how the slick, startling, masterful portraitures of certain eminent painters soon fell into the background, and how the work of others—who, having reached pinnacles of popular recognition, are content to cling there with fingers and toes in denial of all further advance or adventure, like maiden ladies waiting for the undertaker—quickly became inconspicuous. The two notable portraits of Lady Rocksavage fully expressed themselves as advertisements of an accession to the aristocracy, but one speedily tired of Mr. Sims's picture, and Mr. John's "Mrs. Valentine Fleming" somehow drew away one's attention from Mr. Sargent's version of her Ladyship. What was it these pictures lacked? They certainly did not fail in mastery of the painter's craft; nor did Sir John Lavery's, yet of these last it can only be said that if the insolent pride, cruelty, arrogance, and sensuality which are the characteristics this painter seems to find in many of his fair sitters is as true to modern life as we like to imagine the dignity, gentle reserve, sensibility, and graciousness which Gainsborough depicted was to his times—why, then, God help us! Mr. Walter Russell, however, reassures us. He portrays women—not their vanities; and he has other business than to show how clever he can be. His portrait of his wife—the little lady in the black hat adorned with red and yellow fruit—grew, on acquaintance, to entirely possess the wall upon which it was hung, and remained one of the most memorable pictures in the exhibition. There were others besides Mr. Russell who redeemed the position; but, in their absence, any man might have found, in the array of feminine portraiture—including almost all the more conspicuous and important canvases—plausible justification for being a woman-hater.

* * * * * *

It was no less remarkable to observe the increasing respect which, in the light of familiarity, was claimed by even the most quaint and extravagant of the works shown in the room called by the irreverent the "jazz room," but known officially as No. XI. When I first saw these pictures I was seized with the idea of committing a canvas myself and sending it up next year. That ambition, however, soon cooled, and I realized that even if my work were to be fraudulently ascribed to Mr. Paul Nash (not represented at the exhibition this year), it might yet be refused admission. After several visits one began clearly to perceive that here, among the most bizarre and challenging exploits of the "jazz room," were ideas genuinely trying to get themselves expressed, and deserving the study by which alone a message conveyed through the medium of a new convention may be read. I gradually came to have a friendly liking even for the family grouped on the pink rush-woven hearth mat, which had, at the first encounter, repulsed me—the young father in black velvet jacket and basque cap, the gouty-looking mother, and the wooden child with its dirty, time-worn, debauched face. The picture grew on me; it was full of meaning, and replete with a subtle expressiveness; the difficulty was to understand its meaning and identify the sensations it awakened. Part of its expressiveness lay in the abject, workman's-dwelling mantelpiece with its deplorable "draped" hanging border, in the impossible perspective of the pink rush mat above referred to, and in the effect of structural dislocation it gave to the floor. It is, however, an exasperating futility to try to render one art in terms of another, and I will merely say that I began—so to speak—to smell a rat. The work, it seemed to me, was a complete picture, and with others of like genre was, in its reaching out, worlds removed from the complacent puppy-dog-and-Christmas-berry performances which afflicted the walls of Burlington House like a chicken-pox in the summer shows of twenty years ago. I became thoroughly interested in the work and, had I ever found myself alone with it, would have turned and viewed it through my legs with one eye shut in the hope of further sounding its depths.

* * * * * *

If the justification for autopsy may be considered to apply to yet another exhibition which has lately slipped away into the past it may be said of the International

Theatre Exhibition that in parts it was far too commonplace, and in parts not nearly commonplace enough. After more than one visit, "Herr Luckhardt's" two models revealed their latent idea, which was duly weighed in these balances and found wanting; but the stage settings of Mr. Gordon Craig, even when regarded in the light of the stage setting of himself in a photograph of such very soft focus as to suggest that Mr. Craig has begun to de-materialize and is already half way to heaven, remained inexplicable. I have, however, too much respect for the artist and too little esteem for my own vanity to condemn a work of art because I cannot understand it; but the preciousness of leaving everything to the imagination, so that you logically arrive at perfection with a white sheet as a back cloth and a row of tallow candles for foot-lights, involves, not the art of stage setting, but the art of explaining a theory. The theory, however, was not anywhere explained at the exhibition, and for all I know remains a secret in Mr. Craig's heart.

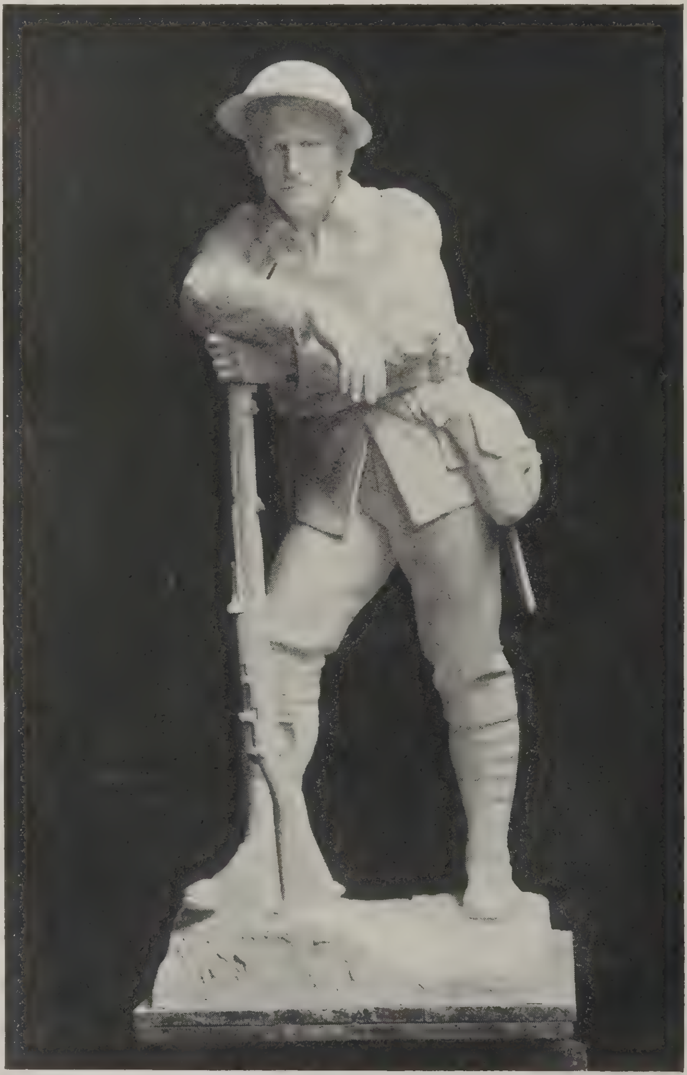
There is one respect, however, in which the stage settings exhibited seemed to commit an error, or repeat an oversight, which we all have frequent cause to regret when attending theatrical performances in which the spectacle—the scenic illusion—plays an important part. I refer to the omission to pay any regard to the floor of the stage. This neglect amounts to an eye-sore in contrast with such lovely settings and dress designs as those of the Russian Ballet. The proper position from which to view a ballet is the circle or balcony, so that the floor of the stage is seen in a perspective which reveals the pattern of the various measures. From the circle the visible area of the stage usually equals that of the back scene; from the balcony it far exceeds it, and the wide, dingy expanse of prosaic boarding mottled with discolourations and marked with the seatings of ring-bolts, traps, socket holes, and other contrivances of the stage carpenter, destroys the illusion of the glorious imagery of Bakst, Massine, and Stravinsky. It is not my business to tell Messrs. Diaghlieff, Butt, Moss, and Cochran how this defect is to be remedied, but I point out to these gentlemen that the matter calls for their immediate attention, and I hope they will not put me to the trouble of mentioning the subject again.

KARSISH.

The Sculpture of Gilbert Ledward

THE charm of Gilbert Ledward's sculpture lies in the fact that it has a future—a future which is shrouded in mystery. Of almost any other sculptor to-day it is possible to predict that he will go so far, and no farther; not because there are no other sculptors who have capabilities, but because it is hard to find, even in Mr. Ledward's generation, a sculptor who has not revealed his own limitations. Ledward's executed works are in the nature of experiments carried out under the influence of various powerful emotions. The artist, conscious of his strength, has taken up whatever modes of expression lay nearest to his hand, and has expressed himself through their medium, practising his skill much as a master-musician might practise his musical powers upon different instruments. And in his works carried out under these conditions there exists always a reserve of strength which leads one to say that Ledward has not yet discovered the limit of his powers.

Broadly speaking, his art, as far as it has yet gone, can be divided into three phases: The academical and student phase, of which the "Diana and Endymion" and the Figure of a Woman are examples; the Italian phase, which is illustrated by the Equestrian Statue; and the War phase, which includes his figures of soldiers and the Imperial War Museum friezes.



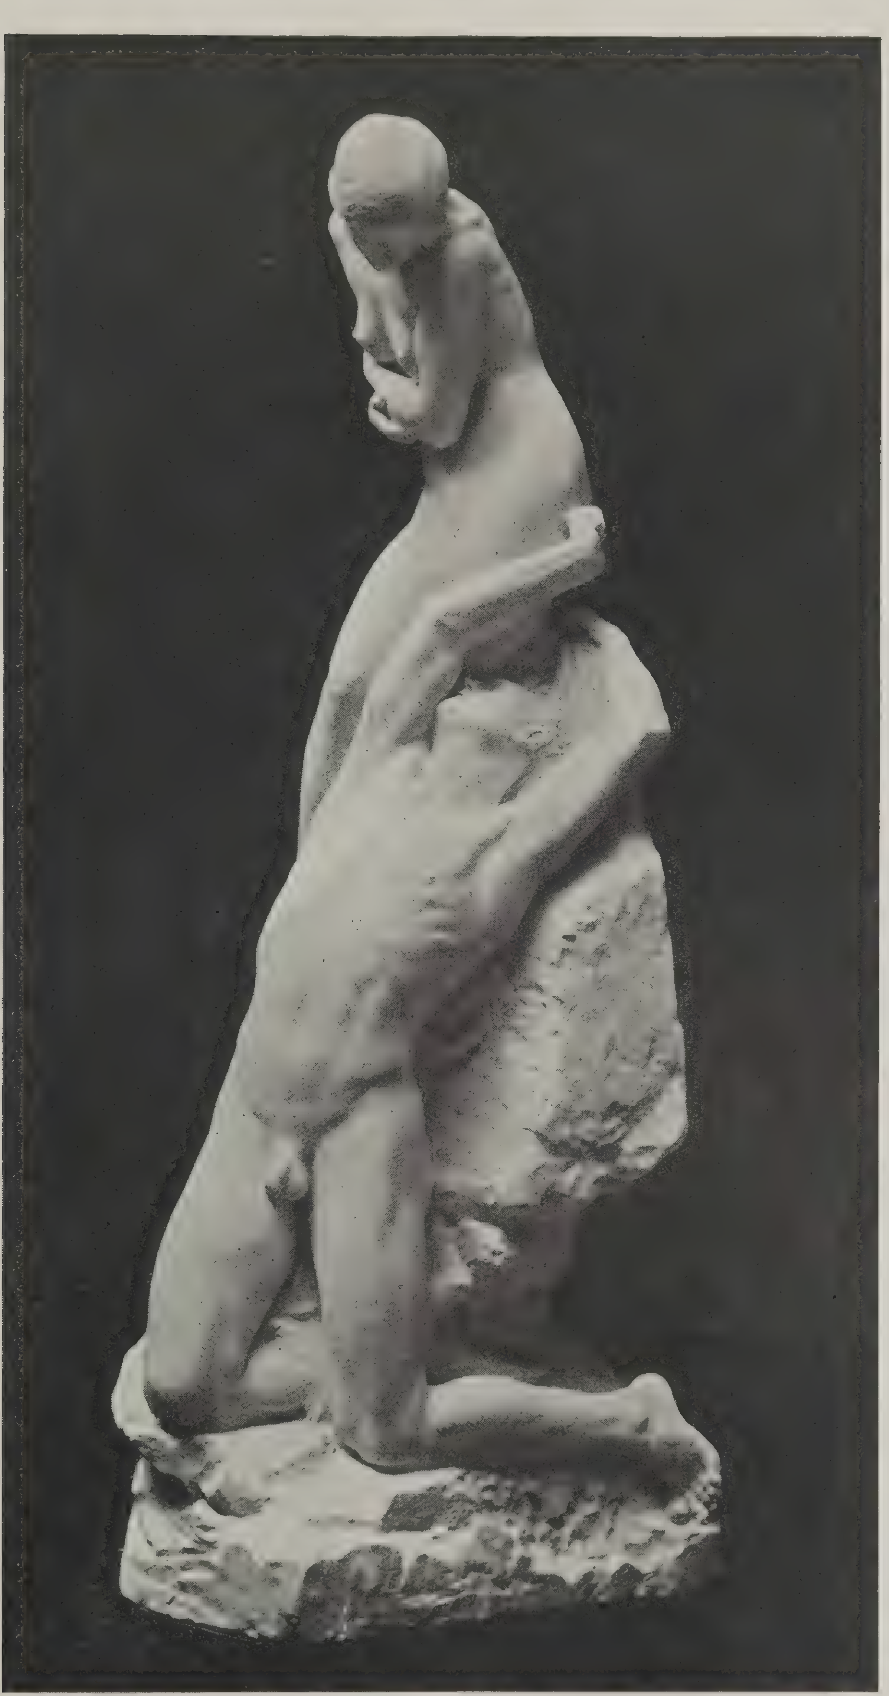
A FIGURE OF A SOLDIER.

With the "Diana and Endymion" Ledward won the R.A. Travelling Studentship in 1914. This is his earliest sculpture group; nor could anything display better the character of his work, for it contains a fusion of his two rarest qualities—power and a sense of grace. The unfettered action, the interplay of powerful and gracious lines, produce an effect which is at once lyrical and dramatic. The two figures in the group have the supple beauties of wild animals. Their actions are transitory, and change with the suddenness of light upon water. They flash into activity, and at the moment of the artist's inspiration they hover in a stillness quick with action.

The figure of the woman is powerful and graceful in the same way. This is done in plaster, and though simply a study of form, expresses by an exquisite flow of lines the same restless and hidden energy of life. Indeed, try as he will to confine himself to the abstract contemplation of form, Ledward cannot keep out of his creations that abundance of vitality which gives them realism and dramatic force—which, untapped as it is, and existing latently in the artist himself, induces the conclusion set forth above that he has not yet

Sculpture. 7.—Diana and Endymion

Gilbert Ledward, Sculptor

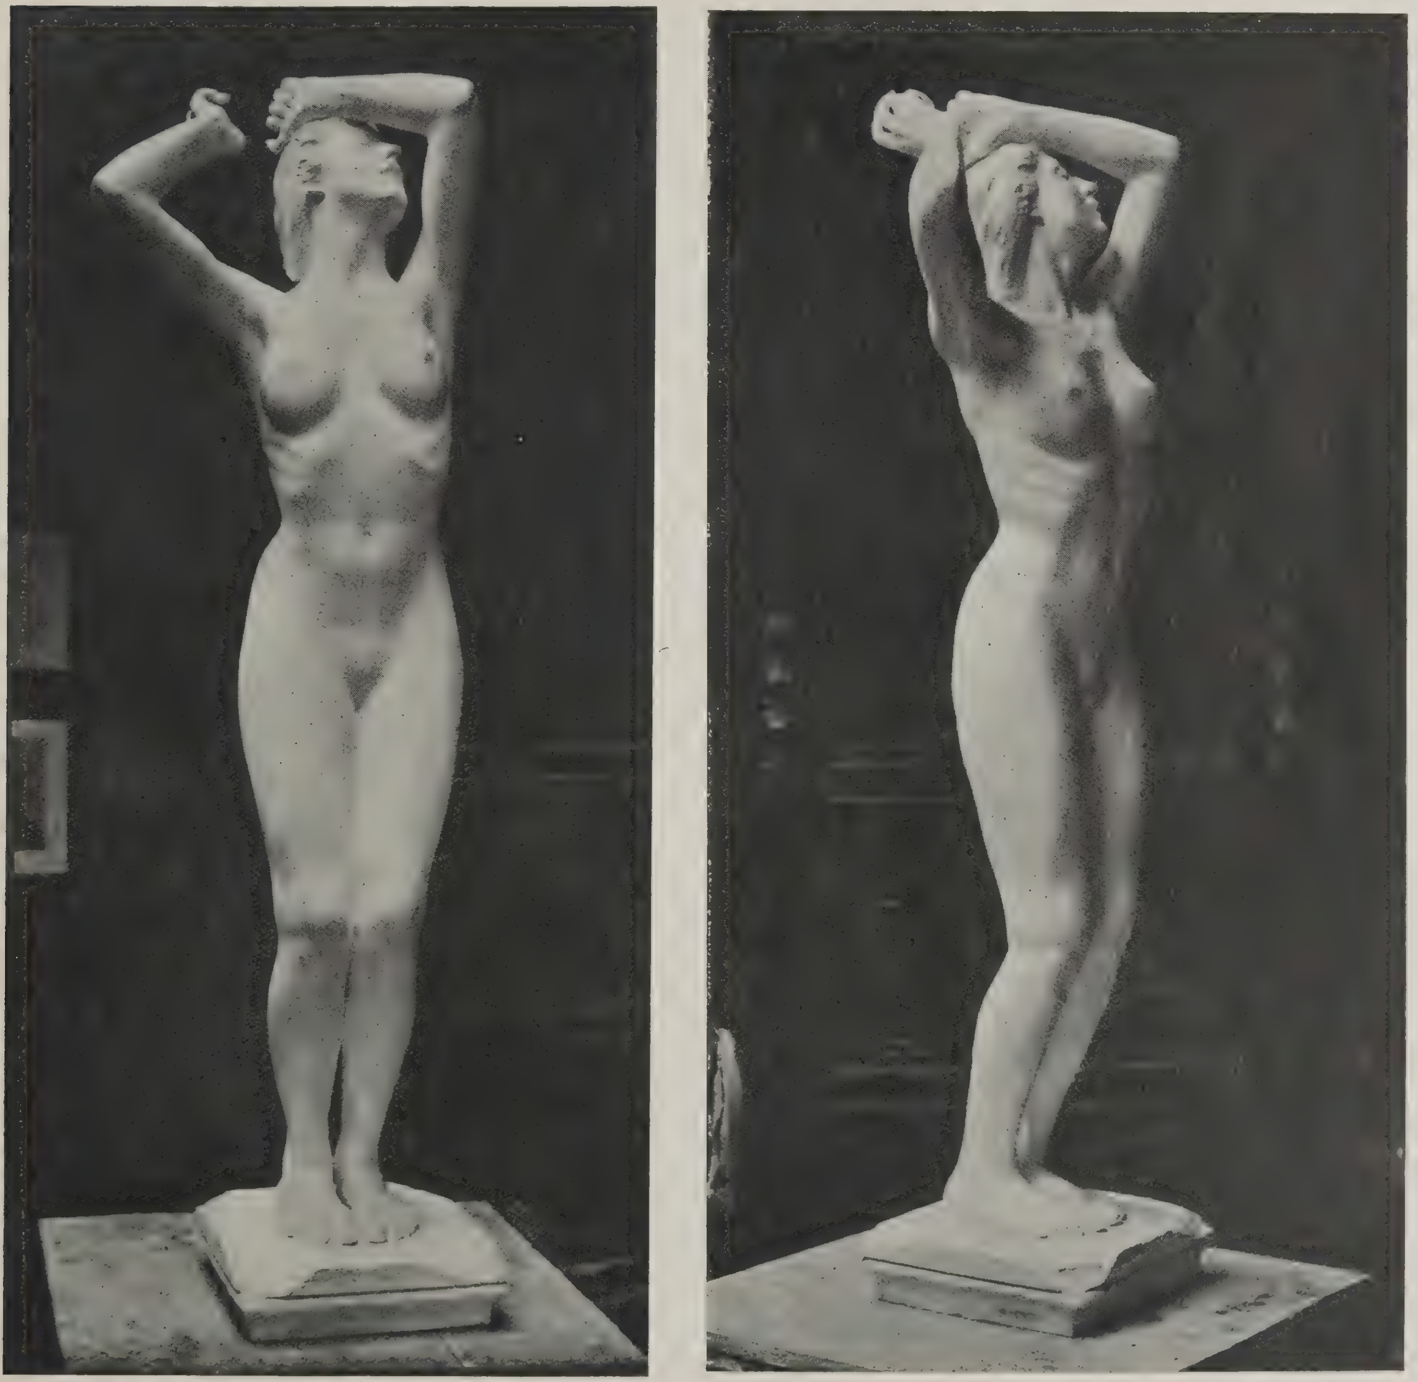


This group was awarded the Royal Academy Gold Medal and Travelling Studentship in Sculpture in 1914. Even at this early stage, the artist reveals a strongly developed sense of rhythm and power of expression. The play of line carried down from the figure of Diana through the arm to the body of Endymion is highly satisfying, and displays a sensitive feeling for the lyrical qualities of sculpture.

discovered the limit of his powers because he has not yet exerted his full strength.

In the Equestrian Statue—a sketch study in plaster—he perhaps approaches most nearly to an exercise in pure form, but here what is of primary importance in the study of Ledward's work is rather obscured. That is Ledward himself. This statue shows the artist under the spell of the Italian influence; and his drawing from the cast in the Bargello indicates the source of his inspiration. (It is, by the way, a beautiful drawing full of sensitive observation.) He is "all mazed" by the magnificence and the sumptuousness of the Renaissance Civilization as manifested in Italian art, and has wrought his subject while the ardency of his enthusiasm is still hot upon him. Stevens was inflamed in a like manner by Michelangelo, but what to Stevens was a constant source of inspiration and emulation, to Ledward—partly by force of circumstances—is merely a temporary infatuation. He profits by it to the extent of developing a passion for sumptuous forms, and passes on. Henceforth it becomes part of the artist, and mixes indistinguishably with the other influences which have moulded him.

The third and most recent phase in Ledward's art belongs to the period of the war—a phase which is equally unmistakable and clearly defined. His soldiers and battle groups are distinct from his other work, not simply in subject, but in the spirit in which they are carried out. And it is curious that this influence of war should follow so close upon the heels of the earlier influence exerted by his discovery of Italian art, for there could be no two forces more diametrically opposed. On the one hand you get the elevating and refining passion with which Italian art has kindled the heart of the artist, and on the other the coarsening effect of war with its emphasis upon fundamentals, upon the simplicity of life, and upon its brutalities. In the Equestrian Statue you find the artist toasting heaven, as it were, for the discovery of beauties beyond dreams, and in the next work of his hand—the Imperial War Museum friezes—you surprise him recording with equal intensity the brutality of war, its coarseness and shapelessness. With a sincerity which is

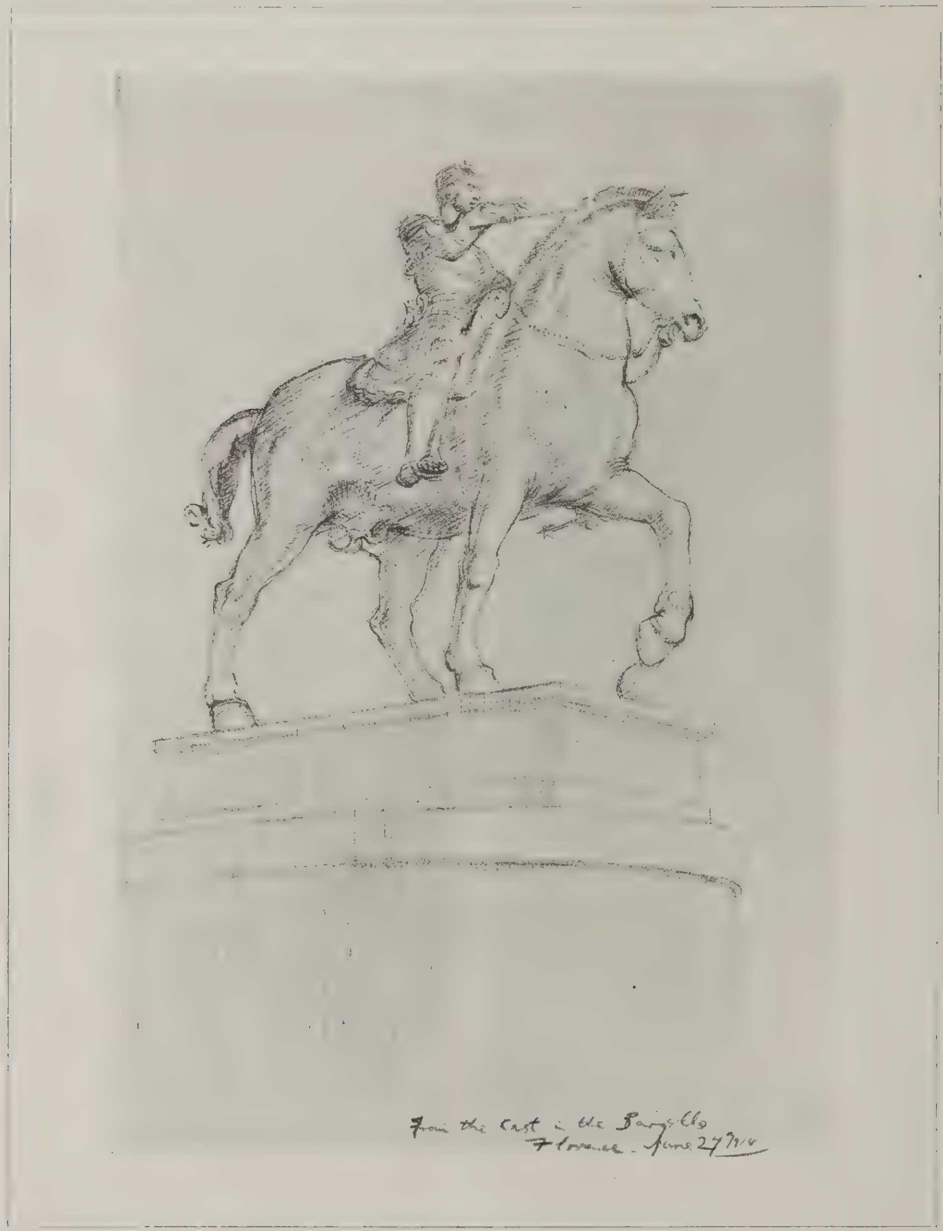


A LIFE-SIZE! STUDY OF A WOMAN. GILBERT LEDWARD, SCULPTOR.

essentially modern—even perhaps partly the outcome of the war—he prefers to express the disagreeable thing in a disagreeable way rather than to sentimentalize it by refinement. This is not a peculiar virtue of Mr. Ledward's. Nearly every artist who has tried to express the war has tried to express it with brutal truth. But where Mr. Ledward has succeeded above most others is in the fact that he has had the power at his command to express it. If his thraldom to Italian art has enlarged his faculties of perception, his thraldom to a soldier's tunic has enlarged his faculties of expression. If Italy has imbued him with grace, France has provided him with the occasion to exert his strength.

His figure of a soldier displays a warlike spirit which has nothing in common with the let-me-like-a-soldier-fall spirit that you see in most monuments of this sort. It is essentially the expression of the spirit of war, and not the replica of a soldier. It is symbolical, not imitative. One is immediately arrested by its personality. The sculptor has created a living thing, and the ruthlessness which peers out of the face comes from the personality within. In nearly every similar figure you will find that the features have been twisted by the sculptor to express what is his opinion of tragedy or war or whatever it is, whereas here the power is such as to give one the impression that the face has involuntarily assumed this expression as a reflection of the dark thoughts behind it. This is the most dramatic and the least conventional of any of his works, because he considers it impossible to conventionalize such a subject as a soldier.

For this very reason the fragments of the Imperial War Museum frieze are possibly not so satisfactory as the figure of the soldier. The artist is here forced to work in a convention—the very nature of a frieze determines it—but at the same time he endeavours to preserve the dramatic truth of the situation, with the result that a not altogether satisfactory compromise is effected. The composition of these two groups, however, is admirably handled.



From the cast in the Bargello
Florence - June 27th

A DRAWING FROM THE CAST IN THE BARGELLO, FLORENCE.

Ledward's latest work in connection with the war is, of course, the Guards Memorial, which is composed of five figures of Guardsmen representing the five brigades of Guards. These are not yet completed, and one wonders how Ledward will handle this difficult problem. After that we hope that there will be no more war monuments, but that the new beauties the artist found in Italy and the new strength he discovered as a result of the war will be combined in some final post-war phase in which he will bring to perfection his qualities of power and grace.

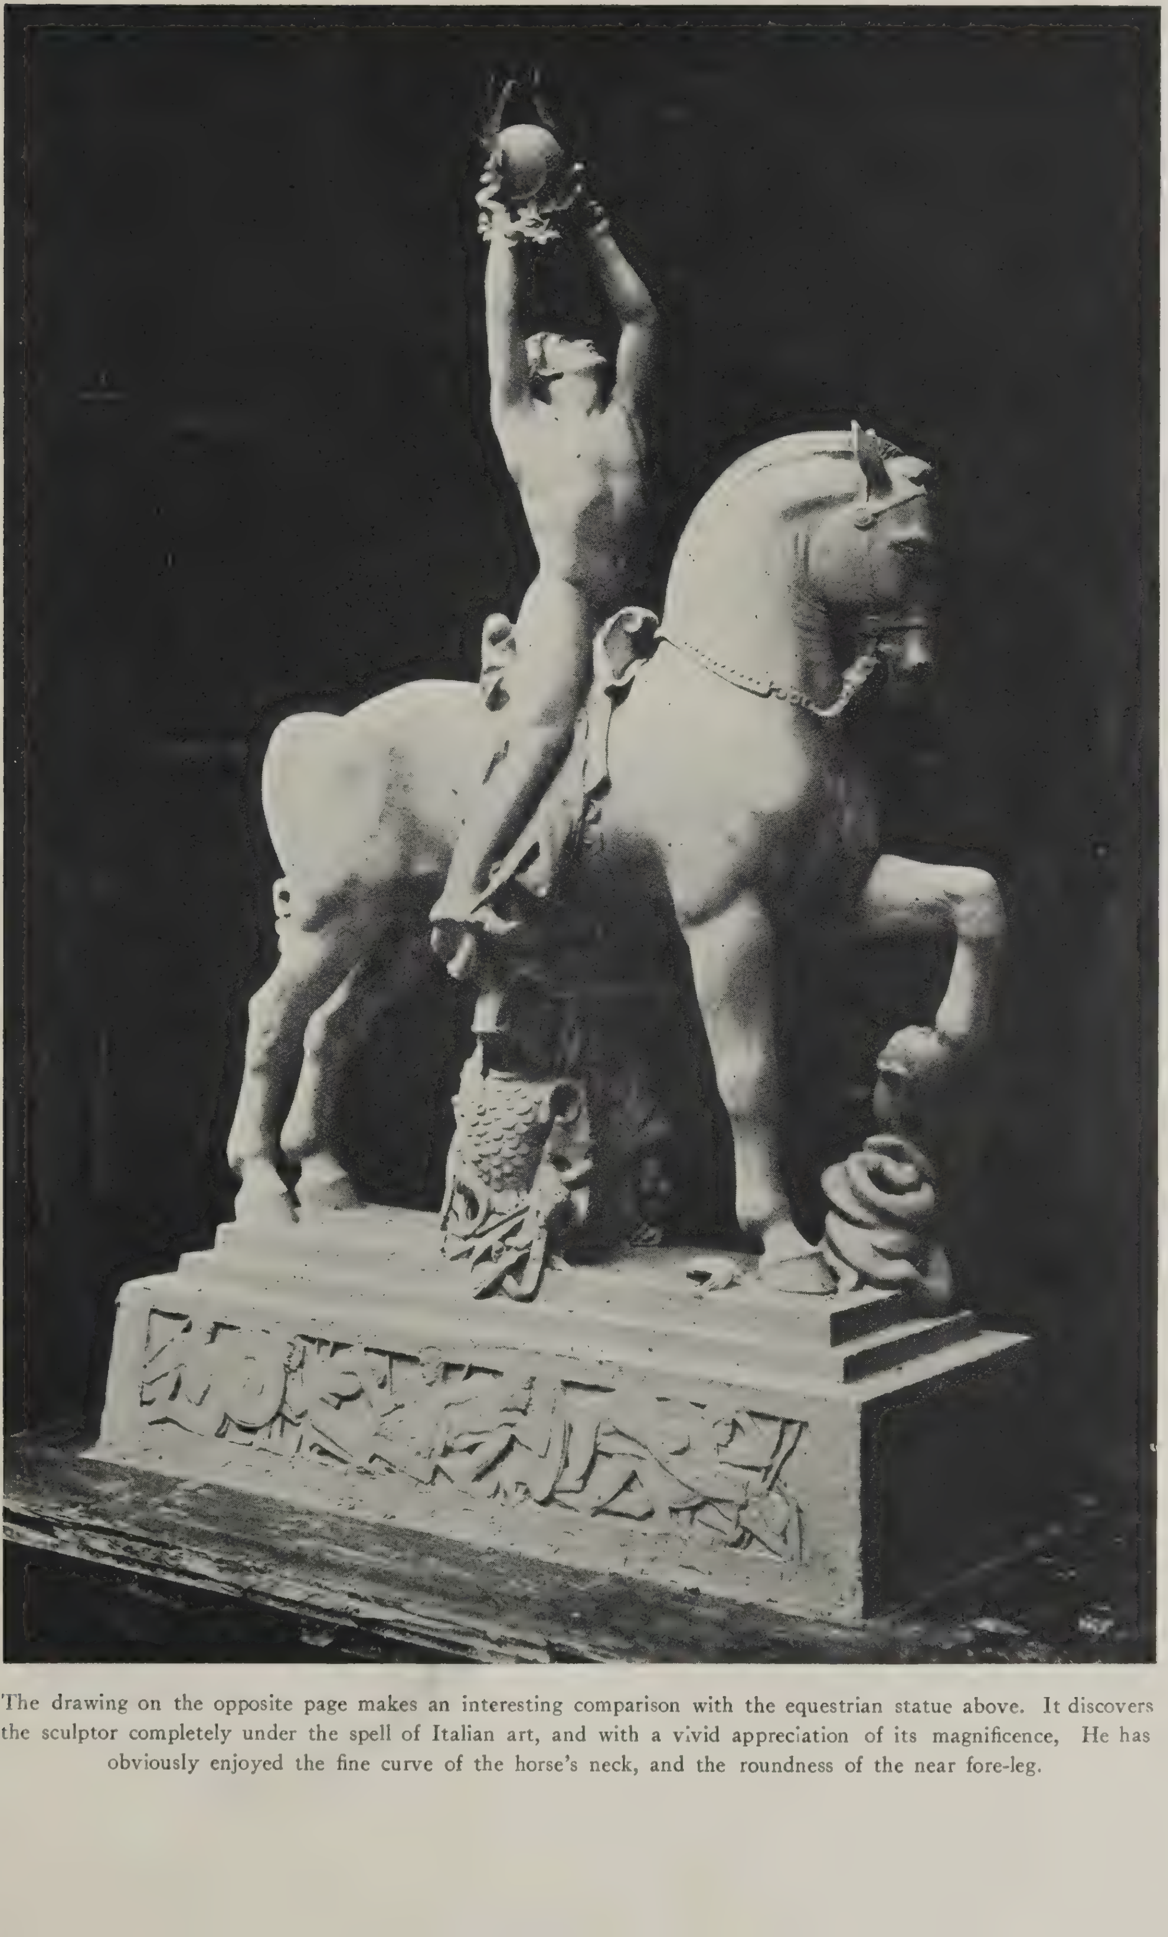
Sculpture. 8.—A Sketch Design for an Equestrian Statue

Gilbert Ledward, Sculptor



The drawing on the opposite page makes an interesting comparison with the equestrian statue above. It discovers the sculptor completely under the spell of Italian art, and with a vivid appreciation of its magnificence, He has obviously enjoyed the fine curve of the horse's neck, and the roundness of the near fore-leg.

Some Recent Domestic Work by H. S. Goodhart-Rendel

IN the following pages are shown some recent examples of domestic design by Mr. H. S. Goodhart-Rendel. The drawing on page 217 illustrates the proposed conversion into a villa of an old farmhouse which remains in the midst of the residential quarter at Cannes.

The farmhouse probably owes its survival to its having been used as the butler's house of the Château de Thorenc, an old property completely rebuilt in the last century.

The small plans differentiate between the old and the new work—of the former the loggia is the most recent bit.

The scheme at present is in abeyance, the sale of the property having fallen through, but it is hoped that a new purchaser may be readily found who will undertake to acquire the house when completed, at a pre-arranged price.

The style of the alterations is strictly that of the old house and of all old buildings in the district. The materials of the exterior will be rough plaster and straw-coloured Roman tiles mottled with red. The tile balustrade above the loggia is to replace a crazy and ill-designed wooden railing.

The drawing on page 219 shows the result of recent alterations and additions to an old farmhouse near Hertford.

The old house originally had two light wooden windows glazed in lead. Two of these are visible on the entrance front. The house was subsequently sashed, the cornice was reduced and partially destroyed, and offices were added, of wood.

Comparison of the plans will show what changes have been made; the fact that the house faces very nearly north accounts for the arrangement of windows in the projecting wing. In the new part the roof is tiled, the porch and the dormers are covered with copper, and the walls are built hollow in imitation Flemish bond of red bricks with grey headers.

A GENERAL VIEW.

Rood Screen and Altars in Glasgow Cathedral

Measured and Drawn by W. J. Smith, A.R.I.B.A.

THE rood screen at Glasgow Cathedral was erected by Archbishop Blackader (1483–1508), and stands on the choir floor-level between the eastern piers supporting the tower at the crossing. The screen is built of sandstone, the eastern face being of plain ashlar work. The panelled western face towards the nave, and especially the low, elliptical arched doorway, is reminiscent of French work. The Palais de Justice, Rouen, was built about the same time. The panels as they stand are plain and uninteresting, but they were formerly adorned by sculptured figures supported by carved corbels, and the broken surfaces where they once projected can still be seen. A moulded and sculptured cornice supports the graceful parapet of tabernacle work and open tracery. The single figures at the ends of the cornice are thought to be portraits of saints of the time, whilst the seven intermediate sculptured groups represent the seven ages of man : infancy, youth, manhood on the north; old age occupies the centre, with the schoolboy, the lover, and the sage on the south.

The two altars, built on the nave floor-level, and dating from 1503, at the entrance to the choir, have been preserved, but the tables are modern. The one to the north has five panels on the front with sculptured figures bearing scrolls. Archbishop Blackader's arms are carved on the north end. Six sculptured figures bearing scrolls adorn the front of the altar to the south, and the south end bears the Archbishop's arms and initials. Stately tombs of the fifteenth and sixteenth century were decorated with figures bearing scrolls or shields, and it was the custom to treat the altar fronts in the same way.

The screen doorway in the centre of the composition gives access from the nave to the choir, that portion of the Glasgow Cathedral which is now used for public worship.

W. J. SMITH, A.R.I.B.A.

The following general particulars are from the monograph on Glasgow in Bell's Cathedral Series. The cathedral was begun by Bishop Malvoisin between 1200–1202, who was transferred to St. Andrew's, where he built the cathedral.

The architect, like many of his contemporaries, treated the triforium and clerestory as one feature. The upper part of wall near the wall-head and in front of the clerestory windows is designed as an open arcade of sixteen arches, two above each arch of the main arcade supported upon groups of slender shafts, which rise from the level of the triforium floor.

The oak roof was of great age. As it was known to be in a dangerously dilapidated condition, its reconstruction was undertaken on the completion of the comparatively recent work of moving the choir.

The cathedral is of three aisles, with a nave of eight bays, a choir of five bays, and an eastern chapel; a centre tower or spire, north and south transepts, a great crypt beneath the choir, and one to the south of the transept, a chapter house and vestry, and a low building projecting northwards to the east of the north transept. The nave is 123 ft. long by 61 ft. 10 in. broad at the west end, and 62 ft. 8 in. at the east end. The centre aisle is 25 ft. 4 in. wide, and the difference between the piers of the main arcade from centre to centre is 15 ft. 6 in. The piers are 4 ft. 9 in. in diameter, the interior wall being 63 ft. 6 in. high.

The Society for the Protection of Ancient Buildings: Annual Report

THE forty-fifth annual report of the Society for the Protection of Ancient Buildings, just issued, fully maintains, if, indeed, it does not surpass, the standard of its predecessors, both in the record of work accomplished and in literary and pictorial content. Several pages are occupied with lists of cases that have come before the society during the past year, and extended notes are given on many, including Chester Cathedral, the City Churches, Westminster Hall, Southcote Manor, Reading (now unhappily demolished), the English Bridge, Shrewsbury, Tintern Abbey, and the proposed restoration of the Parthenon. And very excellent reading it all makes. The peculiar charm of the society's reports is that they are written in an interesting way, very far removed from the dry-as-dust manner that is all too frequently encountered in the proceedings of learned societies. The report under notice also contains, in addition to its regular contents, the full text of an address by Mr. Clutton Brock, some extracts from which are given elsewhere in this issue.

We note from the introduction that the number of members given in last year's annual report was 571, and that this year there is a net increase of 29. The need for more members is great, and present members are urged to draw all who sympathize with the work of the society into this closer and more effective position.

The committee has suffered further loss this year through the death of Lord Bryce, one of the few remaining members who, with Morris, helped to found the society; and of Mr. Basil Stallybrass, whose instructive understanding, unselfish devotion, and practical knowledge made him one of the society's two or three most valued helpers.

The committee hopes to begin the publication of a series of pamphlets shortly. These will describe in detail the methods it recommends for the repair of ancient buildings. Each pamphlet will be devoted to special operations. The first will be on "walling."

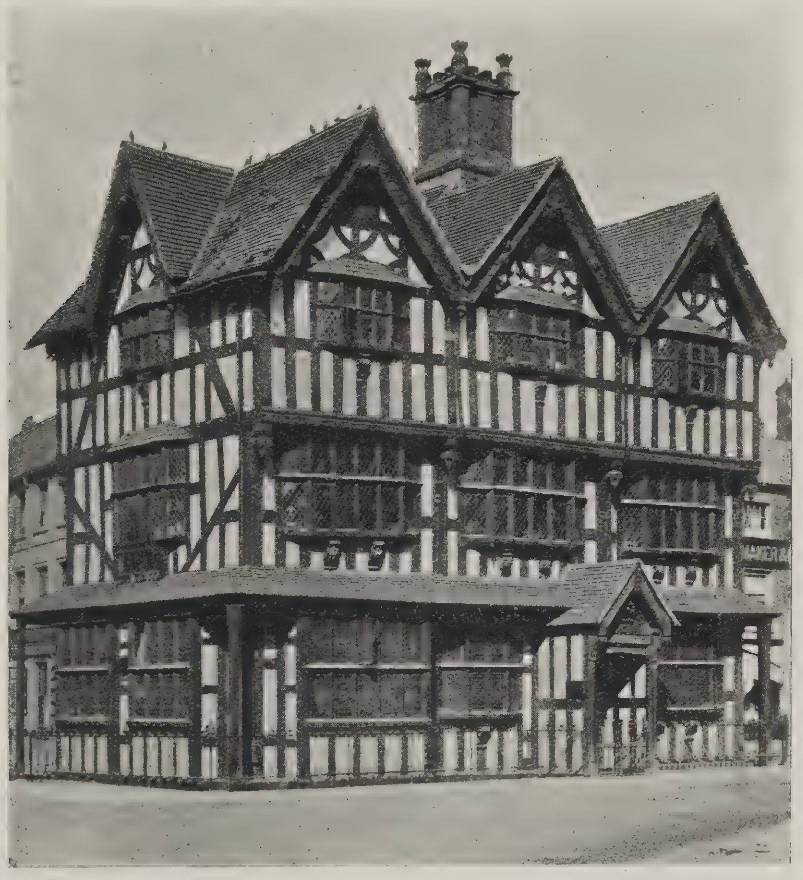
By courtesy of the society we are able to reproduce the accompanying illustrations, which appear in the report, with several others. The following notes are given in connection with them :—

Old House, Hereford.

The committee draw special attention to a very generous action by Lloyds Bank.

For many years the bank has used a fine old half-timbered house in Hereford as one of its branch premises. Having grown out of the accommodation which it afforded, the bank, instead of pulling it down and building new premises on the site, has, through its directors, made a free gift of it to the city of Hereford, to be maintained for ever for the pleasure of its citizens.

The committee expresses to the directors of Lloyds Bank its deep gratitude for the preservation of this fine building, and also its warm appreciation of the public spirit behind the donation.



AN OLD HOUSE AT HEREFORD GIVEN TO THAT CITY BY LLOYDS BANK.

The Guildhall, Cirencester, Gloucester.

The report contains a reproduction of a photograph of the Guildhall, Cirencester, as it was immediately after repair and as it is now. When, fourteen years ago, the Guildhall was repaired, the society was severely criticized on the ground that the limewhite coating, which as a means of preservation had been applied to the whole surface of the stonework, had completely destroyed the romantic appearance of the building; and that the loss of beauty and interest was irrevocable.

The society's answer was that limewash was the most satisfactory protective for stone both from attack by vitiated atmosphere and by weather; and that the loss of mellowness complained of was but temporary.

Those who have not seen the building lately may now, from this recently taken photograph, form their own judgment as to the true merits of the case (see p. 226).

Copies of the report may be obtained, price 2s., from the Secretary, Mr. A. R. Powys, 20 Buckingham Street, Adelphi, London, W.C.2.

Sham Gothic

An Address given before the Society for the Protection of Ancient Buildings

By A. CLUTTON BROCK

I FIND that there are still many people who do not see why we should not "restore" old Gothic buildings, why we should not have modern imitative Gothic, why we should not have imitative art of any kind. I often talk to people on that subject, try to argue with them, and often I find that I cannot begin to make an impression. I have the same effect upon them that people have on me who try to explain Einstein. I have no doubt that here we all agree on the subject, but I think we want reasons for our faith; for one thing, so that we may propagate it, and for another because, without reasons, your faith is not firmly established in your own mind. If you hold a belief for which you cannot give reasons, so that you are merely angry if anybody contests it, then you hold that belief insecurely, and your very anger is a symptom of fear lest it might be undermined. Therefore I will try to give reasons for my belief that you cannot have imitative art.

In imitative restoration or imitative Gothic of any kind, the case is just the same as in the case of copying a picture. The impulse of imitative architecture is different from the impulse of the original, because the original architect was not trying to make his building as much like another building as he could, whereas the imitative architect is trying to make his as much like another building, or at least as much like another style, as he can. If the impulse, the cause, is different, the result will be different; and though the two things may seem to your eye very much alike, to your mind they will be utterly different; because they will produce utterly different feelings. There are experts in different arts whose business it is to know forgeries from originals; and it is a curious fact that the most learned experts—not charlatans at all, but very learned men—are often taken in by forgeries. Why was it that Herr Bode bought, as by Leonardo, a bust by a gentleman called Lucas, done in the reign of Queen Victoria? It was because his business was to know whether works of art were genuine. By the very fact that he was always looking at minute particulars in the work of art he was cut off from the only kind of æsthetic experience which would enable him to tell whether it was a forgery or not. The only final test, the test which must baffle the skill of the forger, is the test of feeling. All forgeries, we may say, if they are only forgeries, must be dull, because their impulse is not the impulse that produces works of art. No doubt things which are not forgeries are dull too, but if a man resolved that he would have nothing to do with things that seemed to him dull, he would never be taken in by a forgery. It is because experts look at details all the time that they are cut off from the only æsthetic experience which would enable them to know a genuine work of art. It is because people look at details only in buildings, because the clergy often learn to recognize style, and are pleased when they can say that a building is Early English, or what not, that they are cut off from the only kind of experience which would enable them to know whether it was expressive building. Architecture is a language, a mode of expression; and so, if a building gives you that peculiar feeling of dullness, of mustiness, of being unable to believe in anything whatever, which is produced by, say, Worcester Cathedral in its present condition, then you may be sure that, no matter how much it seems like the real thing, it is not the real thing.

I do not care what vulgarity is produced—I go as far as that—frank vulgarity would be better than mere imitation. If it produced vulgarities instead of gentilities—and I think vulgarities better than gentilities—it would be leading somewhere, whereas the imitation of Gothic leads nowhere. It cuts the architect off from the whole of that future which he might enter into. Gothic, I am convinced, is now simply a bad habit, and it is a bad habit encouraged by the clergy because they think it religious. They have identified the Gothic style with the Christian religion in some mysterious way—perhaps they suppose the early Christians built in Gothic—and they do not realize that nothing can be less religious than a style which is mere imitation.

If you habitually worship in a church which is sham Gothic your religion will become sham Gothic itself. It will have the same taint of unreality. Further, sham Gothic is itself actually a symptom of something unreal in our religion. If that was perfectly genuine we should not be able to endure a sham religious expression; and if the clergy were aware of that, instead of insisting upon sham Gothic as being religious, they would demand rather even a pretence of originality as being religious. They would see that blatant vulgarity is better than gentility because gentility is suppressed vulgarity. Our modern Gothic reminds me of the genteel manners of people out to tea and uneasy because they do not know how to hold their teacups. It is more Gothic than real Gothic; just as people who are not quite sure about their aitches put them in where they are not wanted. That kind of gentility, I contend, is worse than frank vulgarity.

There is this further evil that church architects, forced to be Gothic by the clergy and their congregations, are cut off from real religious expression by sham religious expression. So, finally, I would insist that the problem of this Society is not merely restoration, but the whole problem of church architecture. This Society is not merely an Antiquarian Society trying to preserve things as if they were in a museum; its cause is the cause of all true architecture. This Society wishes to preserve things precisely because it does not want anybody to imitate them. It would preserve them as examples, but as examples which are not to be imitated because they themselves did not imitate anything. If you can grasp the fact that Gothic is original architecture in which men were really expressing themselves, and really solving the structural problems of their time; that it has the thrill in it of people making discoveries, a thrill which nobody can imitate, then you will not try to imitate it—and then you will wish to protect an ancient building because, although there are great works of art all through the ages, you can never have precisely that one again. You can never recover the particular state of feeling expressed in it. It is an unique creation once and for all. I take it that is the real principle of the Society; and for that reason the Society must advocate originality in architecture.

And I think that, if once we grasp these principles, we shall see that we can have religious expression in architecture now only with austerity. I do not mean that austerity is necessary always; but if you have been a drunkard, moderate drinking is impossible and you must take the pledge. We have had so much claptrap, so much insincerity, so much machine-made and imitative ornament, that for the time we have got to do without ornament altogether. Our case is like that of writers who fill their writing with "clichés," with dead metaphors which get in the way of what they want to say; they must give up all metaphors and learn to express themselves in the simplest language. At present our architecture is full of dead metaphors; and it must be purged of them. We must aim only at the sense of things in our building. Then, when by that process we have recovered our reason and logic, the natural inclination for ornament will return and find genuine expression. But for the time we suffer from dipsomania and must take the pledge.

Ipswich War Memorial Competition

THE awards of the Assessor (Mr. H. V. Ashley, F.R.I.B.A.) in the above competition are as follows:—

First (premium £150)—Mr. Edward Adams, A.R.I.B.A., Whitworth Park, Manchester.

Second (premium £75)—Mr. C. H. N. Roberts, 61 South Molton Street, London, W.1.

Third (premium £50)—Messrs. J. C. Prestwich and Sons, Bradshaw-Gate Chambers, Leigh.

No fewer than 180 designs were submitted in this competition, and of these six were disqualified owing to the violation of conditions, disclosure of identity being the general fault.

It was suggested that the memorial should be a restrained and dignified composition, of such character as fittingly to record some 1,400 names, the total cost, including layout modifications and foundations, not to exceed £4,500. Many competitors ignored the fact that the placing of 1,400 names on a memorial, the price of which must not exceed £4,500, necessarily influences the design to a marked degree. In some cases very little space has been provided for names, and in others it would be almost an impossibility to read them without the aid of ladders, were the memorials erected. Several designs could not possibly be erected in the material stated in the report, at the figure; and although many of the designs are excellent as architectural compositions, they are not at all suitable for the purpose in view.

The author of the design placed first (Mr. Edward Adams, A.R.I.B.A.) provides a memorial in the form of a cenotaph separated from a screen wall bearing the name tablets. This idea is distinctly superior to the grouping of the central mass with the screen wall. At the base of the cenotaph is a bronze trophy of arms, symbolizing the putting away of the impedimenta of war. The studied use of bronze, as a decoration with well-balanced horizontal masses and the vertical mass of the cenotaph, gives a reposeful and dignified composition. In the matter of detail, the lettering and some of the ornament might have been rather more refined in character.

The design placed second (Mr. C. H. N. Roberts) shows a central cenotaph with flanking walls bearing the names. A bronze panel in low relief is placed on the front of the cenotaph, and the paving, on plan, is laid out with suitable lettering and a brass coat of arms. Although the proportions are studied and the idea pleasing, there is a feeling of heaviness in the whole.

The design placed third (Messrs. J. C. Prestwich and Sons) is commanding to the point of severity. A simple cenotaph rising out of a base, square on plan, and totally devoid of any mouldings, relies wholly on its proportion to the base for effect, a relief being provided by four low walls, the name tablets, and four bronze wreaths.

Four designs receive honourable mention. That by Mr. R. C. Arnold, of Ilford, is again a cenotaph with flanking walls curved on plan. This is less severe than some, and has a Stone of Remembrance several feet in front of the cenotaph itself. One feels that this design would have been better had more careful consideration been given to the ornamental detail.

The design by Mr. W. Bevan, of Croydon, takes the form of an enclosed shrine, dignified and massive in its composition. The straight-through portals tend to destroy the idea of seclusion; after all, the memorial itself is the climax, and the site really only allows for one approach.

A pleasing idea, well carried out, is that of Mr. C. Upcher, of Norwich—a central cross of Gothic feeling, on a base triangular on plan, surrounded by three detached walls, carrying the names on the outside. There are three approaches at each point of the triangle. This design would be better suited for a memorial to be placed more centrally, as it gives practically the same effect from any point.

A design of considerable merit is that by Mr. Martin J. Slater, A.R.I.B.A., of Ipswich. The central piece takes the form of an altar, classical in feeling and very rich in design. This is spoilt by the walls on either side being rather severe, forbidding in fact. On the whole, it is one of the finest pieces of design in the competition, and an excellent type of architectural draughtsmanship.

Mr. C. P. Garrard, of London, has a central column giving relief to a cross on all four sides, and also in section. The idea is original, but the column lacks sufficient support from the side walls.

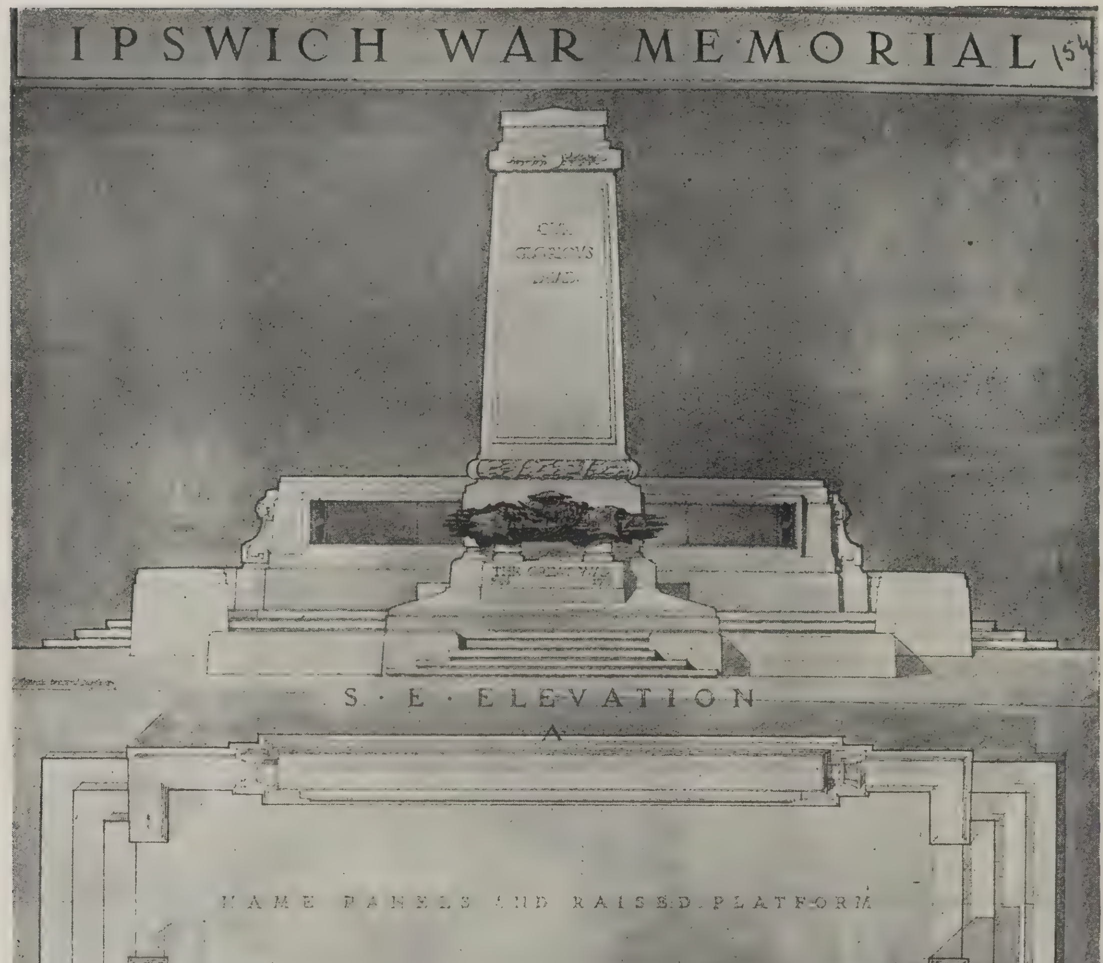
Another design which arrests attention by its imposing and refined composition is that by Mr. E. Thos. Johns, of Ipswich. This has a classical portico with a central group surmounted by a dome, behind which is a semicircular screen wall. The idea is evidently to give a practically enclosed Court of Remembrance. Although the composition is good, it is hardly suited to the purpose, and would certainly prove more expensive than desired.

A design worthy of mention is that by Messrs. Walker and Pearson, Beckenham, Kent. It has a Gothic tendency and many good points, but the repose is spoilt by too many small openings, giving a restless effect.

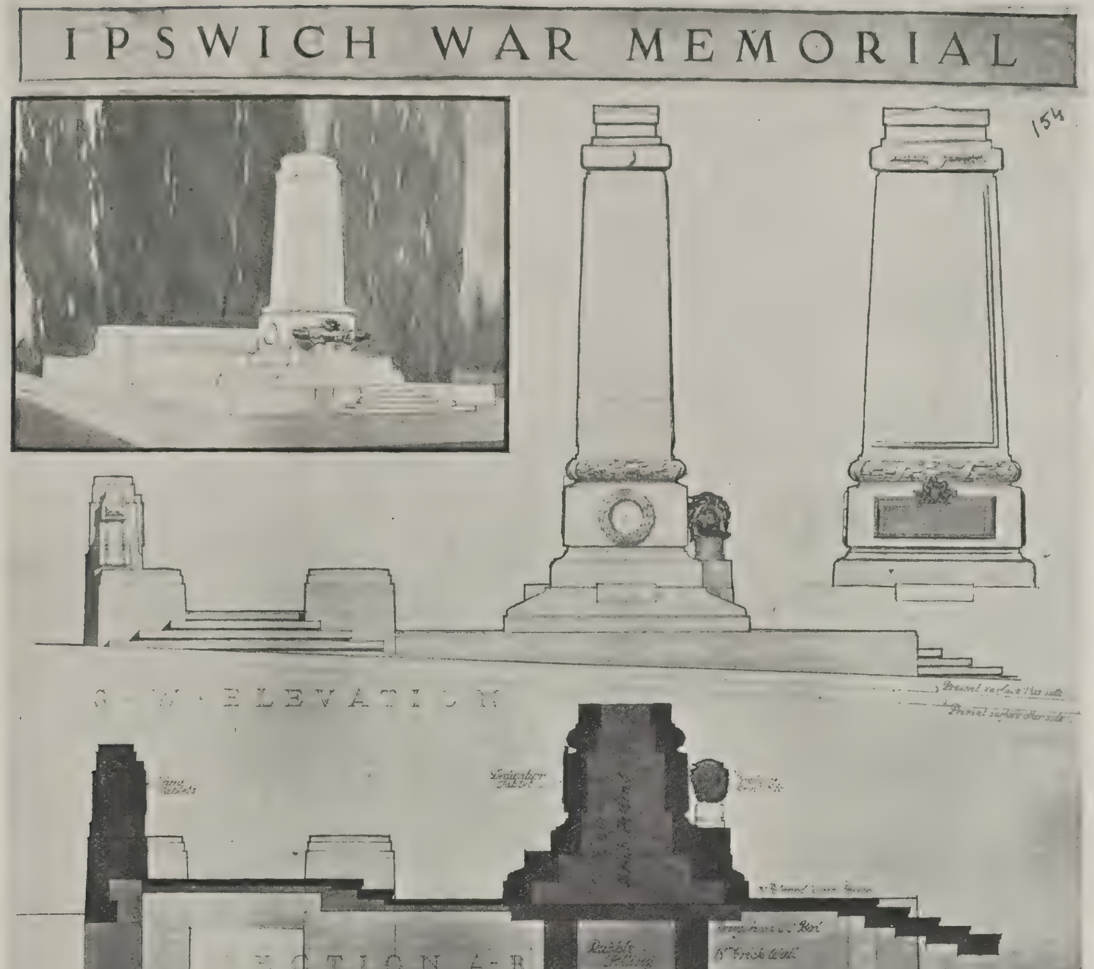
A point which is very marked is the weak finish of some of the designs, especially with regard to the tops of the cenotaphs and obelisks. Over elaboration in ornament also mars many otherwise good ideas.

Taken generally, the competition is a credit both to the authors of the designs and to the Ipswich War Memorial Committee.

G. R. F.



THE WINNING DESIGN. BY EDWARD ADAMS, A.R.I.B.A.



THE WINNING DESIGN. BY EDWARD ADAMS, A.R.I.B.A.

Correspondence

" On Going Forward "

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Mr. Burford tackles his subject in a delightfully fresh and vigorous way—one feels that his method of discussing the problem is one which well may help us to go forward. I hope he will either forgive or approve my suggesting that he is the kind of architectural Bernard Shaw who is much needed, one who is not prepared to accept the normal and the fashionable as the last word, but one who is prepared to encourage the experimentalist. The lot of the head of a school of architecture who tries experiments is not always easy, for the work his students produce may quite possibly fail to please examiners who lack Mr. Burford's philosophic temperament.

It is therefore with great pleasure that we read of the success of Mr. Burford's friend, for as O. Henry so excellently put it, the man who has a corona with a demi-tasse on the verandah has to do things well.

Professor X — as I may call Mr. Burford's friend—has some fine ideas and the right spirit at the back of them, and while I, and doubtless many others, thoroughly approve his main principles, we may not like some of the details of his scheme. But the main principles and the spirit at the back of them are the things which matter in education and in architectural education, no less than in education of other types. For it is in no narrow, hard-and-fast way that we can produce men with the breadth of mind and vigour necessary to enable them to distinguish between the fundamental and the merely ephemeral. Most thoughtful architects who have reached the cigar stage have seen the " last word " in architecture in so many varied guises during the last twenty-odd years that they ought to be hard to deceive by now. And yet with each passing change — some trick of draughtsmanship — a gold border, a blue sky, meticulously worked shadows, or again shadows less meticulously worked and a sky suggestive of Arnold Bennett and his Five Towns rather than of the Mediterranean, or on the other hand, some modification of detail in design—and so many of us put on that rapt expression and agree that we were wrong the last time but that now we really " have the goods."

There seems, however, to be a fly in Professor X's ointment; his conversational powers seem to be developed to such a phenomenal extent that it is difficult to believe that his students would have much chance to ask questions and join in the discussion of his lectures. Even Mr. Burford seems to have been in that difficulty. I wanted to hear far more of *his* views. Unfortunately Professor X did not.

To be more serious, however (which is rather difficult on an August Bank Holiday), the scheme savours somewhat of the Montessori system. Its advantages, as applied to a system of professional training for architects, are not so obvious as some claim is the case with primary education, for in the normal school of architecture there is, after all, considerable freedom in studio work, and formal lectures take up but a small part of the time available. One at least of Professor X's points is not clear to me: I cannot see why, under his scheme, a smaller amount of general education is required before starting, and he has not convinced me that it is better to start with the indefinite and lead up to the definite than to start with the definite and lead up to the indefinite, or to deal with the two side by side.

W. S. PURCHON,
Head of the Department of
Architecture and Civic Design.
The Technical College,
Cardiff.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I have read Mr. Burford's article with great interest. The principles of training enunciated seem to me to be so sound as to call for practically no comment beyond commendation. I believe that to-day all educationists must be agreed that it is essential to teach principles first, and their application afterwards. Mr. Burford's words, " to proceed from the indefinite towards the definite " are, however, to me imperfectly expressive, since one feels that the laws of composition should be theoretically as capable of definite formulation in the early study of " filling spaces in the most satisfying and harmonious way " as in their later application to architecture proper. The difficulty lies in understanding and " codifying " the laws governing composition, but whether Dow's method or another is followed, I think we are all aiming at the same goal.

If I understand Mr. Burford's article correctly, we seem to be carrying out, at the Architectural Association Schools, the principle of the system which he describes, with certain modifications in detail dictated by necessity or experience.

The first and great difficulty is to ensure students remaining for the five years' course in the School. Too many are obliged to leave after three years.

Another question is that of examinations. These seem to be necessary under present conditions of qualifying for the professional bodies—and also, alas, we have not arrived at the ideal state where the incentive to study the less congenial subjects of the curriculum is not partially provided by the necessity of reaching a certain standard under test.

As regards two long terms relieved by short weeks, the practical difficulty is the unsettling effect occurring at the beginning and end of any period of study. At the Architectural Association we have such a break during the summer term, and utilize it for outdoor measuring and sketching. The arrangement of terms is, however, governed also by custom, and the demand for holidays at the usual periods of the year.

" Discipline maintained by interest and not by coercion " quotes Mr. Burford with special reference to lectures. This principle is surely correct; indeed it is the same which is being increasingly applied in many preparatory schools inspired by the Montessori system. Mr. Burford's interlocutor wisely extends it to technical schools.

The successful application, of course, practically depends on the staff, and I think we all wish that circumstances permitted a course for training instructors. On the other hand, the existence of such a course might from some quarters call forth the cry that architectural training was becoming a properly commercial business!

HOWARD ROBERTSON,
Architectural Association.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—While the method outlined by Mr. Burford is most interesting, yet, nevertheless, it only shows that the education of architects may be carried out in more ways than one. If a master takes pains to teach he will soon develop ways of his own which lead to thoroughly satisfactory results.

CHARLES GOURLAY.

University Degrees in Architecture

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Your leading article on " University Degrees in Architecture " in your issue for July 12 is excellent in its grasp of the present situation, and of the part to be played by the Universities in the advancement of architectural education.

At the present time emphasis needs to be placed upon the distinction between a University Degree and a Diploma such as might be obtained by a student at a school, both of which should carry the right to practise. The object of a University Degree Course is to *educate*, that of a School Diploma Course is to *instruct*.

The difficulty in the institution of a University Degree in Architecture, therefore, is that if it is to carry the right to practise then its course must include both education and instruction. A University Degree Course is not intended to produce merely skilful draughtsmen, but rather to develop culture in architects. But the cultured architect holding the Degree must also be so instructed as to be sufficiently practical and businesslike in order to succeed in architectural practice. Hence the necessity for the Universities and Schools of Architecture co-operating with architects in practice to produce the best type of architect.

University Degrees are generally obtainable after a three or four years' course, but owing to the diversity of the ground to be covered in an Architectural Degree course, coupled with the necessary practical training, it appears that a longer time, probably five years, will be required for a Degree in Architecture.

CHARLES GOURLAY.
The Royal Technical College,
Glasgow.

"Cubic Content Estimates"

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Referring to Mr. Parry Jones's article in your issue of the 9th inst. entitled "Cubic Content Estimates: A Criticism and a Suggestion," it has recently become the custom to deride the old-established method of arriving at an approximate cost of a proposed building. For instance, the Government Committee report on Housing states that cubic content is not in direct relation to cost—one result of which is the unimaginative rows of cottages now being erected to the detriment of our pre-war pre-eminent world position in housing.

In his article Mr. Parry Jones says, "multiply this (the cube content) by the price suggested by experience," but in the next paragraph we read, "The price per foot is obtained by dividing the known cost of completed buildings by their cubic contents"—the latter is the correct method.

My experience in early days in provincial offices (where it was the practice for the architect to take off his own quantities) was that to reduce the cost of contemplated buildings one simply reduced the cube the required amount and remeasured—subsequent prices received being satisfactory.

Building in any district was then a very regular matter and cubing eminently satisfactory, which brings me to my point—that Mr. Parry Jones has merely devised a method for arriving at relative values for different constructions, say, stud partitions versus rubble stone walls.

H. E. ROLLEY.

Our Knowledge of Acoustics

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—With reference to the article on the above subject in your issue for Aug. 2, you quote at length the opinions of two eminent persons in the University of Cambridge to the effect that "so far no attempt has been made to ascertain the factors which determine acoustical efficiency in an auditorium." This is typical of the ignorance of people, who should know better, on the subject. Neither Sir W. J. Pope nor Sir Joseph Larmor mention the case of the pathological lecture-room at Cambridge. This lecture-room had a long reverberation of several seconds, and was notoriously bad for the speaking voice. In 1919 Dr. Alex Wood, of Emmanuel College, a university lecturer in physics, using Sabine's law, calculated the absorbing material required and reduced the reverberation to the necessary one second for the speaking voice in a small hall. The lecture-room was converted, as anticipated, into a useful auditorium. The results in table form of the Harvard experiments are to be found in at least three modern text books for builders and engineers. From ten years' close observation of auditoria of all kinds I have not yet encountered one which, by its virtues or defects, does not bear out the results of the Harvard experiments in reverberation, sound absorption, resonance, and the placing of reflecting surfaces. Accurate designing for acoustic effects has for many years been successfully accomplished in America for all classes of auditoria.

HOPE BAGENAL.

The Rebuilding of the Bank of England

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I consider that it is most desirable to retain the existing outer wall or screen that we are all familiar with. It gives a feeling of strength and security appropriate to the first bank in the country, and as an architectural example it is well worth keeping.

In the circumstances. windows are precluded in this outer wall, and therefore rooms constructed against it could only be lighted from the top or the interior. This renders it necessary to erect any new structure at some distance from the boundaries, and this course is also rendered necessary if there is to be no undue interference with rights of light which doubtless exist on at least three sides of the site.

On the whole, therefore, I consider that the architects have adopted the better course, and there is certainly no reason why they should not make the new buildings a great architectural success.

HENRY TANNER.

R.I.B.A. Boards and Committees

Following is a list of the Boards and Committees which have been appointed by the Council of the R.I.B.A. for the session 1922–23:—

Finance and House Committee.—The President, the Hon. Secretary, Messrs. Sydney Perks, F.S.A., H. D. Searles-Wood, Stanley H. Hamp.

Fellowship Drawings Committee.—The President, the Hon. Secretary, Messrs. E. P. Warren, Heaton Comyn, C. Lovett Gill.

The Royal Gold Medal Committee.—The President, Messrs. A. W. S. Cross, George Hubbard, H. D. Searles-Wood, C. Heathcote, the Hon. Secretary, Mr. J. A. Gotch, Sir Edwin L. Lutyens, R.A., Sir Reginald Blomfield, R.A., Messrs. Francis Jones, C. B. Flockton, Heaton Comyn, T. R. Milburn, E. P. Warren.

Board of Architectural Education.—The President, the Hon. Secretary, Messrs. H. D. Searles-Wood, George Hubbard, A. W. S. Cross, Professor S. D. Adshead, Messrs. Robert Atkinson, H. Chalton Bradshaw, Walter Cave, E. Guy Dawber, Professor A. C. Dickie, Messrs. H. M. Fletcher, W. Curtis-Green, Sir Robert S. Lorimer, A.R.A., Professor Beresford Pite, Mr. W. S. Purchon, Professor A. E. Richardson, Professor C. H. Reilly, O.B.E., Messrs. Alan E. Munby, H. Austen Hall, E. Stanley Hall.

Town Planning Committee.—The President, the Hon. Secretary, Professor Patrick Abercrombie, M.A., Professor S. D. Adshead, M.A., Mr. Robert Atkinson, Major Harry Barnes, M.P., Sir Reginald Blomfield, R.A., Messrs. Walter Cave, Arthur Crow, T. Raffles Davison, W. R. Davidge, F. M. Elgood, Edwin T. Hall, W. Haywood, Col. R. C. Hellard, C.B., Sir Herbert Jekyll, Messrs. H. V. Lanchester, H. J. Leaning, Professor W. R. Lethaby, Sir Edwin Lutyens, R.A., Mr. D. Barclay Niven, Professor Beresford Pite, M.A., Messrs. C. H. B. Quennell, W. E. Riley, R.B.A., W. H. Seth Smith, Herbert Shepherd, John W. Simpson, Raymond Unwin, Sir Aston Webb, P.R.A.

The Competitions Committee.—The President, the Hon. Secretary, Professor Patrick Abercrombie, M.A., Messrs. W. H. Ansell, M.C., Henry V. Ashley, G. Leonard Elkington, L. Rome Guthrie, E. Vincent Harris, H. V. Lanchester, F. Winton Newman, William A. Pite, T. Taliesin Rees, J. Douglas Scott, Septimus Warwick, Herbert A. Welch, W. G. Wilson.

The R.E. Mess Memorial Committee.—Messrs. Horace Cubitt, Gilbert Fraser, T. F. W. Grant, M.C., Maurice E. Webb, D.S.O., M.C.

The London Building Acts Committee.—The President, the Hon. Secretary, Professor S. D. Adshead, Messrs. Walter Cave, Horace Cubitt, W. R. Davidge, C. A. Daubney, E. Guy Dawber, F.S.A., Matt. Dawson, Sir Banister Fletcher, Messrs. H. Austen Hall, George Hubbard, F.S.A., J. J. Joass, Delissa Joseph, Sydney Perks, F.S.A., H. D. Searles-Wood, Digby L. Solomon, B.Sc., Sir Henry Tanner, C.B., I.S.O.

The Registration Committee. — The President, Messrs. H. D. Searles-Wood, George Hubbard, A. W. S. Cross, M.A., C. Heathcote, the Hon. Secretary, Messrs. W. Gillbee Scott, C. B. Flockton, Sydney Perks, F.S.A., Delissa Joseph, Herbert Shepherd, W. G. Hunt, H. G. Fisher, Major Harry Barnes, M.P., Messrs. Arthur Welford, W. E. Riley, Heaton Comyn, W. R. Davidge, T. R. Milburn, A. O. Collard, Frank Woodward, G. Topham Forrest, Percival M. Fraser, L. A. Culliford, C. Lovett Gill, W. W. Scott-Moncrieff.

The Charter and By-laws Committee.—The President, Messrs. A. W. S. Cross, M.A., C. Heathcote, George Hubbard, H. D. Searles-Wood, the Hon. Secretary, Messrs. W. H. Ashford, Max Clarke, Sydney Perks, F.S.A., Herbert Shepherd, J. A. Swan.

The Sessional Papers Committee.—The President, the Hon. Secretary, Messrs. Martin S. Briggs, Walter Cave.

The Annual Dinner Committee.—The President, the Hon. Secretary, Messrs. Walter Cave, William Woodward.

Additional Members to the Four Standing Committees.

Art Standing Committee.—Messrs. F. R. Hiorns, W. R. Davidge, C. Lovett Gill, H. P. Burke Downing, Walter Tapper.

Literature Standing Committee. — Messrs. J. A. Gotch, Harry Sirr, Basil Oliver, L. A. Culliford, W. H. Ward.

Practice Standing Committee.—Messrs. T. R. Milburn, Percival M. Fraser, Francis Jones, Harry Teather, W. Henry White.

Science Standing Committee.—Messrs. J. Ernest Franck, S. B. Russell, E. Fiander Etchells, J. E. Dixon-Spain, A. W. Moore.

Liverpool University School of Architecture

The prospectus of the University of Liverpool School of Architecture for the session 1922–23 has just been issued. Full particulars are given with regard to the general education which should be obtained by intending students, the courses of study and lectures, etc., together with interesting information concerning, among other things, the School of Architecture Atelier, The Architectural Society, the Zeta Chapter of the Tau Sigma Delta Honorary Fraternity, and the studentships, scholarships, and prizes of the University. The courses of the school lead to the combined certificate and degree of Bachelor of Architecture (B.Arch.), and to the combined certificate and diploma in architecture. The University grants the certificate at the end of the third year of either the degree or the diploma course; students who obtain this certificate in the first class are exempted from the Intermediate Examination for Associateship of the R.I.B.A., while students who obtain the degree or diploma are exempted from the whole of the Final Examination for Associateship of the Institute except in the subject of professional practice, in which subject they are required to take a paper set by the Institute's examiners. Among the illustrations in the prospectus are the designs for a lake-side restaurant, submitted in the preliminary round for the Rome Scholarship by Stephen Welsh, Rome Scholar 1922, and by George Checkley, Jarvis Scholar 1922. The school opens on October 5.

List of Competitions Open

Date of Delivery.	Competition.
Aug. 31	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
Sept. 16	Nurses' Home, Chelsea Hospital for Women. Premiums: £150, £100, and £50. Assessor, Mr. H. V. Ashley, F.R.I.B.A. Names by above date to Mr. H. H. Jennings, Secretary, Chelsea Hospital for Women, Arthur Street, Chelsea, S.W. 3.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8.000 francs.
Nov. 1	Labour saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C 4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Jan. 31, 1923	Labour-Saving Flats, Hampstead Garden Suburb. Premiums £500, £300, and £200. Assessors: L. Rome Guthrie, F.R.I.B.A., J. C. S. Soutar, Lic.R.I.B.A., and E. J. Cooper, Secretary, Second Hampstead Tenants Ltd., to whom, at Temple Fortune House, Hampstead Way, N.W. 11, applications had to be made by August 11.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.

Law Report

Liability for Defective Chimney

Whymark v. Abrahams.

July 31. King's Bench Division.
Before Justices Bailhache and Shearman.

Plaintiff in this case appealed from a decision of the County Court Judge at Portsmouth.

It appeared, it was stated, that a brick from the chimney of a house in the Portsmouth High Street fell and hit the plaintiff, and he sued the defendant, who occupied the part of the house that was used for habitation over a shop.

Plaintiff sued the defendant as the owner of the property, and to establish that relied upon the fact that the defendant had had served upon him a notice by the local sanitary authority to repair the property.

It was also said that the defendant's having had other repairs done provided further evidence to support the contention that he was the owner.

Mr. du Parcq appeared for the appellant.

The County Court Judge found for the defendant on the ground that the mere fact that a notice to repair had been served upon the defendant did not prove that he was the owner liable for the repairs, neither did it prove his liability because he had ordered repairs to be done to the property.

After hearing Mr. du Parcq, for the appellant, the Court dismissed the appeal with costs, holding that the findings of the County Court Judge were accurate.

A New Reversible Firegrate

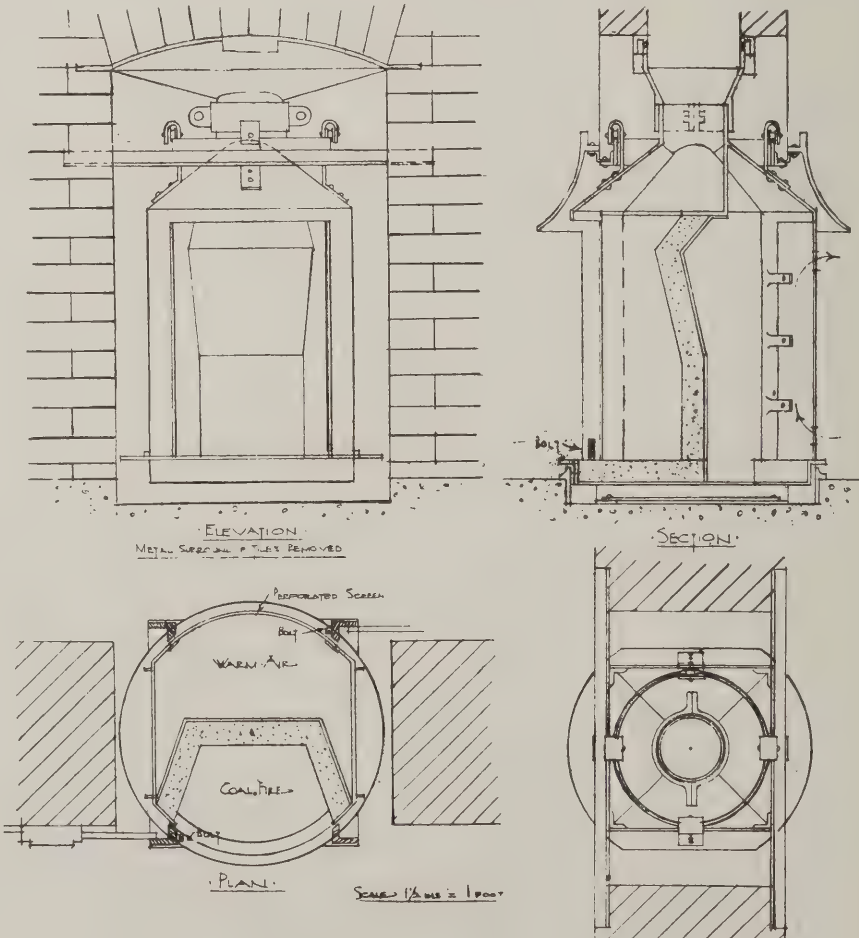
This firegrate, which has been designed and patented by Mr. G. Noel Hill, A.R.I.B.A., is of that type adapted to be located in an opening in the division wall between two rooms, so that it may be used to heat either of the rooms directly with the coal fire, and at the same time be used to heat the other room by a circulation of warm air.

The interior of the grate rotates within the metal and tile surround about a vertical axis guided by and suspended by rollers running on a circular rail supported on a fixed framework.

Connecting the grate to the flue is a fixed smoker trunk, the connecting flange being halved to enable fixing. The warm air behind the fireback is circulated through an ornamentally perforated screen, which could be formed of any suitable metal. There is no friction when the grate is being turned. All parts are designed for easy fixing and replacement.

The grate is turned and fixed in the following manner. Fixed to the metal surround at the front and rear of the grate is a bolt. Both bolts are permanently dropped and run on the circular rail at the bottom of the grate; the nose of each bolt is rounded to run easily. In the circular rail is one hole. The hole is so placed that when either of the two bolts have dropped into it the grate is in the correct position.

To turn the grate the bolt in use is temporarily raised and the grate is turned with an ordinary poker (projections are formed in which to engage the poker).



A REVERSIBLE FIREGRATE.
DESIGNED AND PATENTED BY G. NOEL HILL, A.R.I.B.A.

The Week's News

Nelson Hospital War Memorial.

Nelson Hospital, Merton, is to have a ar memorial.

Proposed New Library for Gateshead.

The Corporation are contemplating the rection of a new public library.

New Baths for Malvern.

The Council have appointed Mr. A. J. aylor, of Bath, as architect for the contruction of public baths.

Workmen's Flats for Marylebone.

Thirty-two workmen's flats to be uilt by Marylebone Council will cost 29,067.

Middleton Housing.

The Middleton Town Council are pplying to the Ministry of Health for ermission to erect seventy-two houses.

New School for Troon.

A secondary school is to be constructed t Troon by the trustees of the late Ir. Charles Kerr Marr, of London, a ative of Troon.

Wrexham Town Planning Scheme.

Wrexham Town Council have approved town planning scheme. Professor bercrombie, of Liverpool, acted as xpert adviser.

Leicester Builder's Estate.

Mr. Francis Hallam Stevens, of Leicester, builder, who died on April 19 last, eft estate of the gross value of £4,522, f which £1,018 is net personalty.

Dewsbury War Memorial.

Dewsbury Town Council have agreed o grant the War Memorial Committee site in Crow Nest Park for the proposed own's war memorial.

New Cinema for Norwich.

At Norwich the foundation-stone has een laid of the new Regent Picture heatre, which will have a seating apacity of 1,800.

Wolverhampton Public Hall Proposal.

Wolverhampton Town Council have lecided to appoint a special committee o consider whether a public hall should e erected out of the rates.

Halifax Housing.

Halifax Town Council are seeking the ermission of the Minister of Health to rect, free of Government control, 500 vorking-class houses.

Renfrew War Memorial.

The war memorial for Renfrew has een designed by Mr. Hamilton Neil, .R.I.B.A. It is of freestone and is ctagonal in form.

Memorial to the late Sir Henry Wilson.

A tablet to the memory of Field-Marhal Sir Henry Wilson, who was murdered utside his house in London, is to be rected in the main line booking hall at he Liverpool Street terminus of the reat Eastern Railway.

More Houses for Rosyth.

The Scottish National Housing Company are proceeding with the building at osyth of forty additional five-apartment lwelling houses. They are for naval lockyard men.

New Church for Swansea.

The Roman Catholics of Swansea have decided to erect a new church in the Uplands district, for which a site has been secured at a cost of £1,000, and also a new school in the Greenhill district.

New Church for Walthamstow.

The foundation-stone of the new Church of St. John, Walthamstow, will be laid on October 28. About £9,000 of the £13,000 required has been raised up to the present.

London Builder's Estate.

Mr. George Small, of Balham, retired builder, who built a considerable portion of modern Clapham, and who died on April 27, aged eighty-three, left £7,307 gross and £7,138 net.

New Convalescent Hospital for Edinburgh.

In connection with the provision of a convalescent hospital, the Ainslie Trust have purchased properties to the extent of £70,000 in the south side of Edinburgh.

Army Huts as Houses.

Owing to acute housing shortage at Freshwater (Isle of Wight) the Council have decided to ask the military authorities to allow disused army huts near the barracks to be used by civilians.

Henstridge War Memorial Wrecked.

Within twenty-four hours of its unveiling, the Henstridge, Somerset, war memorial was wrecked by a motor-coach. A boy, while placing a wreath on the memorial, and a girl were injured.

Great Central Railway Memorial.

In the presence of 8,000 relatives and friends of the fallen men, Earl Haig unveiled a memorial at Sheffield to 1,304 employees of the Great Central Railway Company who died in the war.

Ancient Cemetery Unearthed.

A necropolis of 700 B.C. has been unearthed near Tropea, in Calabria, during archæological excavations. So far sixty tombs, made of stone blocks covered with hard-pressed earth, have been found at a depth of about four feet.

£35,000 Sea Front Scheme.

Herne Bay Town Council are considering plans to build at a cost of £35,000 a sea wall with a concert stage, shelters, and dressing-boxes for bathers, covered in by a roof promenade. A large swimming pool is also proposed.

Airdree War Memorial.

A cenotaph is to be erected as a war memorial at Airdree. The plans have been selected by Sir John Burnet, A.R.A., architect, Glasgow, and the successful architect is Mr. J. Maurice Arthur, F.R.I.B.A., C.M.G., D.S.O. White Creetown granite is the building material.

Port of London Authority's New Offices.

The Prime Minister will perform the ceremony of opening the Port of London Authority's Head Office Building, Tower Hill, on October 17. Designs for the building were invited in 1911, when those of Mr. Edwin Cooper, F.R.I.B.A., were selected.

New Hospital for Aberdeen.

A new joint hospital, to be erected near Aberdeen, will embrace general hospital, tuberculosis hospital and sick children's hospital, and university buildings for the training of medical students. Plans have been prepared by Mr. William Kelly, A.R.S.A., LL.D. Aberdeen.

Electrical Development at Torquay.

The Electrical Committee of the Torquay Town Council has accepted tenders for a large portion of the plant which is to be placed in the new electrical generating station at Newton Abbot. The station will serve both Torquay and Newton, and will cost about £200,000.

The Howard N. Potts Gold Medal.

The Howard N. Potts gold medal of the Franklin Institute, Philadelphia has been awarded to Professor E. G. Coker, of University College, London, for his photo-elastic method of determining the distribution of stress in structural and machine members.

Battle Abbey to Become a School.

Battle Abbey, near Hastings, is being converted into a school, which will be opened next month. Every schoolboy knows that outstanding date of 1066, when William of Normandy defeated Harold at the Battle of Hastings. On the spot where Harold fell William built the Abbey.

Timber Disposal Department.

The Timber Disposal Department, Board of Trade, was transferred from 49 Wellington Street, Strand, W.C.2 to the Board of Trade Offices, First Floor, Great George Street, S.W.1 on August 14. Telephone address: Victoria 3840; Telegraphic address: "Timdissect Parl, London."

Oxford and Unemployment.

A meeting convened by the Oxford and District Alliance of Employers and Employed has, with a view to lessening the amount of unemployment, passed a resolution recommending the City Council to build 1,000 houses and to construct a reservoir on Hincksey Hill, to the south-west of the city.

Craig-y-Nos as a Hospital.

Craig-y-Nos Castle, in the Swansea valley, has been converted by the King Edward VII Welsh National Memorial Association into a hospital for the treatment of pulmonary consumption. The property, with all its fixtures and fittings, was acquired by the Association at a cost of £19,000, and many thousands of pounds have been spent on repairs, alterations, and equipment. The castle is estimated to have cost Mme. Patti over £100,000. Beds will be provided for 104 patients. The organ at Craig-y-Nos forms part of the purchase, and the modern theatre, with all its fittings, is also taken over.

R.I.B.A. Examinations.

Apropos the results of the R.I.B.A. Examinations published in our issue for August 2. Mr. Ian MacAlister, Secretary to the R.I.B.A., informs us that the name of Mr. J. K. Parker, who passed the Special War Examination, was unfortunately omitted from the lists sent us.

R.I.B.A. Visit to Hampton Court.

A visit to Hampton Court Palace has been arranged by the R.I.B.A. for Saturday, August 19. Members and friends taking part should assemble at 2 p.m. at the Trophy Gate, Hampton Court, when the official guide will take charge of the party. Members desiring to take part should notify the Secretary of the R.I.B.A. as soon as possible.

The Empire Exhibition.

The underwriting members of Lloyd's have sent to the Prince of Wales, the president of the general committee of the British Empire Exhibition at Wembley Park in 1924, a contribution of £100,000 to the guarantee fund of the exhibition. The guarantee fund now amounts to more than £1,150,000, and it is hoped to reach £2,000,000.

More Houses for Blackpool.

The Ministry of Health has given sanction for the Blackpool Corporation to proceed with the erection of forty-eight houses to complete the scheme of 254 houses on the Watson's Lane Estate, on condition that the Corporation undertake to build an additional 100 houses independent of the Government scheme. The Blackpool Corporation have agreed to carry out the conditions.

Brighton Aquarium Site.

There is still activity in the campaign against the leasing of the Aquarium site for a motor-coach garage and terminus. It is intended to ask the Town Council to fix the terminus for the motor-coach traffic at open spaces to the north and south of the enclosure known as the Level, with a garage at the corporation depot, formerly known as the Lewes Road Water Pumping House.

The New Extension at Olympia.

Messrs. Francis Polden & Co., Ltd., have been entrusted with the carrying out of the electrical equipment in connection with the new extension at Olympia. The contract includes the general lighting of the new hall; mains; lighting in rooms generally; all secondary lighting; wiring to lifts; ventilating fans; signs; motor generators and switchgear; battery and charging booster; and fire alarms.

The Concrete Institute.

Members desirous of reading papers before the Concrete Institute during the forthcoming sessions are invited to communicate with the Secretary of the Institute, at 296 Vauxhall Bridge Road, S.W.1. The title of the paper should be stated, a summary of the subject matter should be enclosed, and a suitable date should be intimated. Papers should not exceed 10,000 words in length for printing, and are subject to approval by the Literature Standing Committee.

The Housing Shortage.

Mr. George Hicks (Building Trade Workers), opening a debate in the Midlands on housing, said over 100,000 building operatives were unemployed, and 40,000 had been discharged from housing schemes since October last. A programme of one million more houses would not be in excess of requirements, and the shortage would have to be met by municipal schemes.

Temporary Dwellings in Wales.

At various places along the Welsh coast there have recently sprung up little colonies of bungalows, huts, and other temporary dwellings. In many cases these have been erected without the submission of plans to the local authority. One of the first Councils to take action is Penypont, in the Bridgend area, which has decided to take proceedings against about a dozen owners.

Civic Adviser to the City of Jerusalem.

Mr. A. C. Holliday, A.R.I.B.A., has been appointed Civic Adviser to the City of Jerusalem, Palestine. For the past two years he has been Research Fellow and Lecturer in the Department of Civic Design, University of Liverpool, and joint editor of the "Town Planning Review," with Professor Abercrombie. Mr. Holliday is a Bachelor of Architecture, and an Associate of the Town Planning Institute.

The late Mr. D. J. Gibson.

It is with deep regret that we have to record that Mr. D. J. Gibson, son of Mr. J. G. S. Gibson, F.R.I.B.A., was accidentally killed while taking part in a motor race at Brooklands. Mr. Gibson was a competitor in the eight-and-a-half miles handicap. While rounding a curve in the second lap and going at the rate of 100 miles an hour Mr. Gibson attempted to pass one of the cars in front. He, however, dashed into the fence, and was killed instantaneously.

Building Trades Sports.

A sports meeting arranged by the building trades, with several events open to all trade unionists, attracted a fair attendance to Stamford Bridge. F. R. Gaby, the A.A.A. hurdle champion, took the hurdles and the long jump as well as second place in the furlong, and E. J. Toms, of Queen's Park, won the half-mile, and was third in the furlong. E. M. Allen jumped well, as after winning the high leap at 5 ft. 1 in. he easily cleared 5 ft. 6 in. A good mile was taken by R. Pigott, Luton Un. H., in 4.23 3-5 sec

Starkie Gardner & Jaques.

The partnership business carried on by Mr. J. Starkie Gardner and Mr. Oswald Hastings Jaques under the style of "Starkie Gardner & Jaques" has been dissolved, and the business is now being carried on by Mr. Gardner on his own account under the style of "J. Starkie Gardner," at 121 South Lambeth Road, S.W.8. All debts owing to the late firm should be paid to Mr. Gardner, who has undertaken to discharge the late firm's outstanding liabilities as on August 3.

Irish Architects' Council Meeting.

At a meeting of the Council of the Royal Institute of the Architects of Ireland, the President reported having had an interview with Sir Philip Hanson with regard to the appointment of architects in connection with the transfer of the military barracks and the distribution of money awarded for destroyed buildings. A letter was read from the secretary to the Scariff District Hospital, saying that the committee would agree to accept the Institute's conditions of competition in connection with the proposed hospital building. It was proposed to hold an exhibition of American architecture, but the Council decided that, under existing conditions, it would be better to postpone arrangements. A circular letter is to be sent to the Irish Urban and Rural District Councils with regard to the appointment of architects for housing schemes, and urging the importance of entrusting the work only to fully qualified men.

CAMBRIDGESHIRE WAR MEMORIAL.

This memorial has been erected to the men of Cambridgeshire, the Isle of Ely, and the Borough and University of Cambridgeshire, who served in the war. The figure of the soldier, the work of Dr. Tair McKenzie, sculptor, is of bronze, and the base, which stands 10 ft. high, is of Portland stone. On the four sides of the base are panels carved with the arms of Cambridgeshire, the Isle of Ely, and the Borough and University. The base was designed by Messrs. George Hubbard and Son, architects, and carried out by Messrs. Rattee and Kett, contractors. The memorial was unveiled, last month, by the Duke of York.

Air Views. 10.—Piccadilly Circus, London

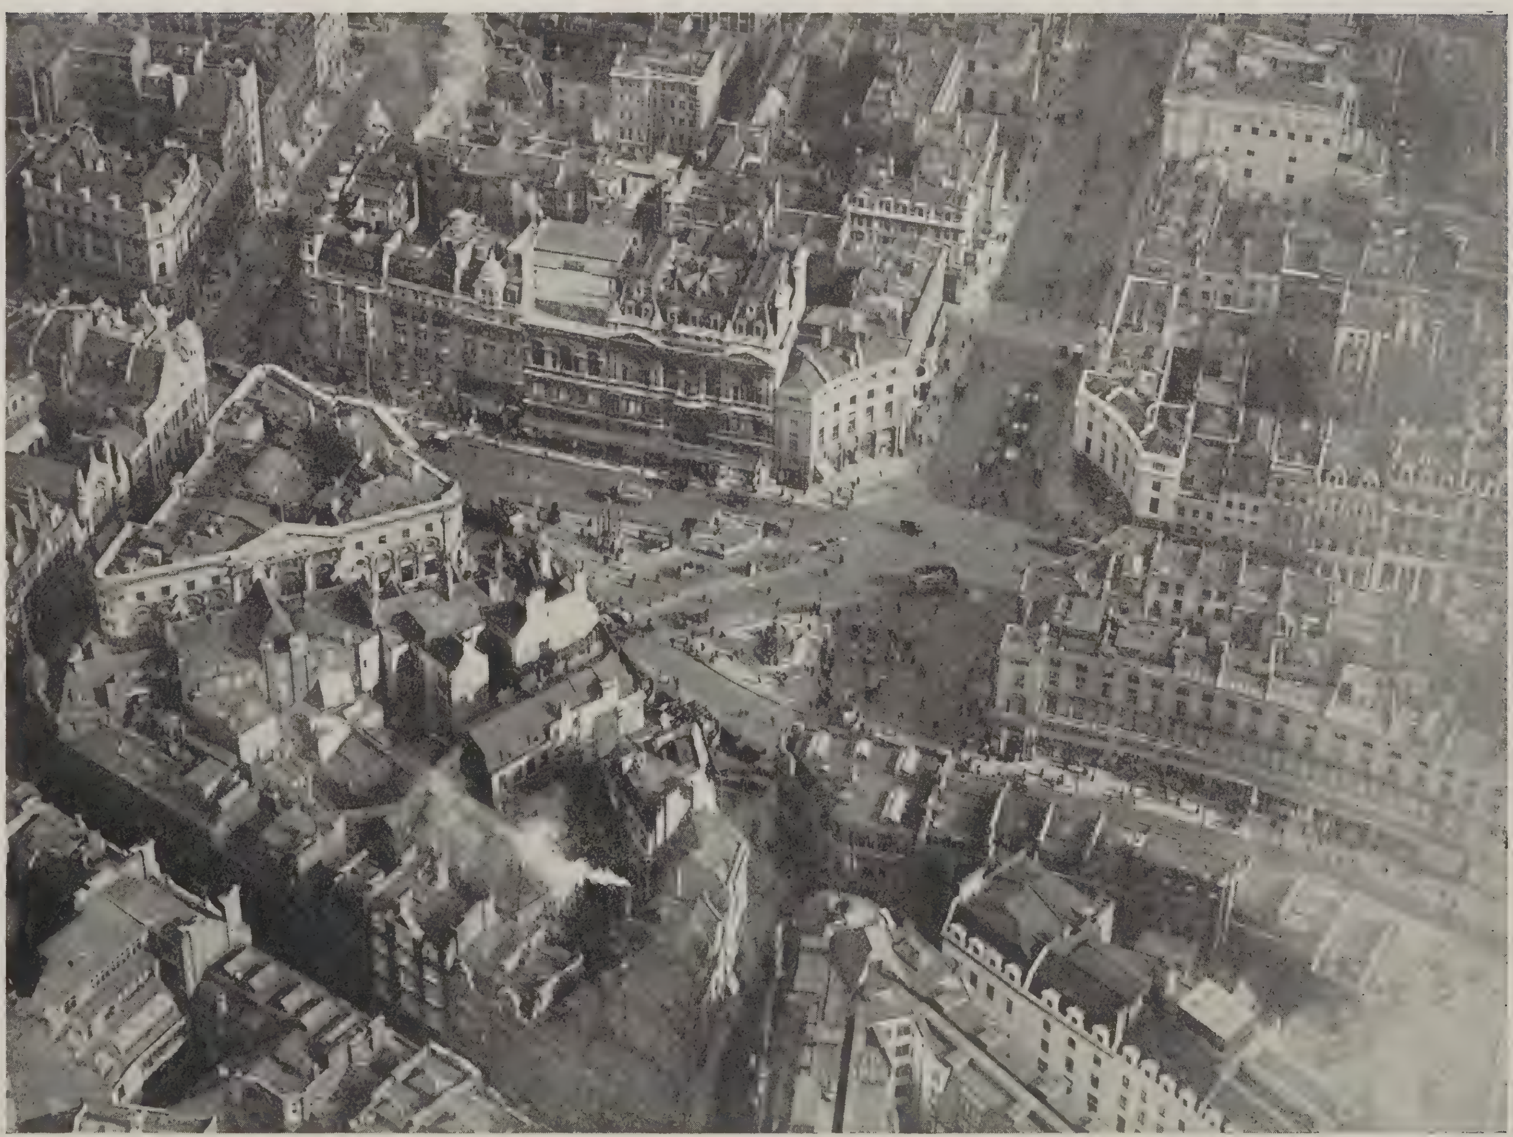

Photo: Aerofilms Ltd.

This view shows Picadilly Circus as it stands to-day, with Lower Regent Street at the top, Picadilly and the Quadrant of Regent Street on the right, and Coventry Street leading into Leicester Square on the left. While the South side of the Circus belongs to H.M. Office of Woods and Forests, the North side belongs to the L.C.C., and there is no communication whatever between the two bodies on the subject of reconstruction. Thus each is to carry out its own rebuilding without any kind of reference to the other, and the result can hardly be less than chaos—a chaos which could easily be averted if precautions were taken to procure a combined scheme.

Piccadilly Circus

TOWN-PLANNING in this country unfortunately would appear to be in danger of falling into the hands of the utilitarians. We have, perhaps, in the immediate past suffered from purely paper schemes, which from their extravagantly impracticable nature have done much to prejudice the case for what might be called "imaginative" town-planning.

When town-planning was made compulsory in 1919 town planners and those who cared for civic design rejoiced, and imagined that the great end had been achieved. But the country as a whole has not risen to the occasion. We believe that very few local authorities have even started to think of their town plan, and those that have, in a good many cases, have treated it as a matter which the borough surveyor might attend to in his odd moments, without very much concern as to whether he had any particular qualifications for this work or not.

And, generally speaking, town-planners themselves since the war seem to have been paying much more attention to the purely practical aspects of the subject, and to have ignored the higher and larger considerations.

In some ways this is all to the good; but, however, important traffic problems, zoning, betterment, and all such details are, we must never forget that if we are to achieve anything with our town plans that is to have any permanent value, these plans must embody the quality of imagination. We must not forget that town-planning is an art as well as a science, and that it is something more than a matter of mere convenience.

It is often said that we English are not an artistic nation, which is only another way of saying that we do not know how to live.

Now this is a singular fallacy. We do, as our past has shown, both in its history and in its buildings, know how to live better perhaps than any other nation; but we have always shown a decided and insular determination to live our lives and to enjoy ourselves in our own way.

Since the advent of the industrial age, we have, however, undoubtedly been losing this joy of life, which is able to espress itself in art, and chiefly through a growing habit of compromise. We have come to regard our tendency to compromise as expressive of our moderation, when in reality it is expressive of little but our indecision.

The Greeks were the most moderate of people, but they were also the most uncompromising, and therefore the most artistic of all nations past or present.

It will be remembered that some short time before the war a trio of very distinguished architects—Sir Aston Webb, Sir Reginald Blomfield, and the late Mr. Ernest Newton—produced, under the authority of His Majesty's Office of Woods and Forests, a scheme for the remodelling of Piccadilly Circus. And within the limits of their reference it was a very good scheme—the trouble is that their reference was too limited.

Their proposal was briefly to "square off" the two circular portions of the original Circus that terminated Lower Regent Street, and to rebuild these corners with fine modern buildings.

The remaining third portion of the Circus, occupied by Messrs. Swan and Edgar's premises, was also to be remodelled by the setting back of their building in a line with the side of the left-hand corner of the new entrance to Lower Regent Street.

In our view the proposals, though an improvement on the existing nondescript muddle, do not go nearly far enough.

When Shaftesbury Avenue was formed, the Circus, as Nash had planned it, was irretrievably ruined, and it appears to us that what is now wanted is a complete scheme for the remodelling of the whole of this area.

At present there is no real scheme for the re-planning of Piccadilly Circus, and the effect of the rebuilding as contemplated will simply be the creation of a new muddle in place of the old one.

The greater part of the property on the north side of the Circus belongs to the London County Council, and their intentions with regard to rebuilding, when the existing leases fall in, are entirely unknown! It would appear that what is wanted is a liaison between the London County Council and the Office of Woods and Forests, while there is still a chance to make Piccadilly Circus into something worth looking at.

Here is a chance for London to acquire a really fine "Place" on broad and generous lines—something that should express our awakened civic consciousness. We do not want a Place de la Concorde, or Grand Boulevards on Hausmann lines, but we do want a scheme that shall express London at its best and most enlightened.

Cannot the Town Planning Institute devote a little of its time given up to the consideration of such important subjects as zoning and other technical matters, and join, perhaps, with the London Society in a policy of inquiry and propaganda?—inquiry as to what is the best scheme to embark upon, and propaganda as to the best means of getting it carried out.

The London County Council's success with Kingsway should give it heart to undertake the new adventure, and we are sure from what the Office of Woods and Forests have already done in the way of preparation, that that department would willingly co-operate as far as was in its power to secure a great London improvement.

We shall be told, of course, that there is no money at the present time for ambitious architectural schemes! We were told the same thing with regard to Kingsway, and those who croaked the loudest are now claiming that the success of the undertaking was in a great measure due to their prescience and far-sightedness!

We have only to remember that Nash's great scheme for Regent Street and Piccadilly Circus was initiated and carried out when we had been for years at war with France, and when the financial position of this country, considering the comparative population then and now, was in a much worse condition than it is at the present time.

There had been some twenty years of ruinous war, and this country was supposed to be physically and financially exhausted; but this did not prevent London embarking upon a great scheme of improvement.

When compared with what Paris has done, even London's mightiest efforts in town improvement appear insignificant.

Parisians in all ages, no matter in what desperate straits the national or municipal exchequer has been, have never lacked courage to carry out great civic undertakings in the broadest and most generous way.

At the present time, nearly all the great municipalities of America are spending millions of dollars on the improvement and remodelling of their cities. Where the American municipalities have been backward, private citizens have stepped into the breach, have formed committees, collected funds, inaugurated town-planning schemes, and generally educated their fellow citizens in what they ought to do.

Are Londoners less courageous than the citizens of Paris or New York, or is it that they are more apathetic?

London has grown by a gradual absorption of small villages, and it would seem that London was ever to be thwarted of her finest civic expression by the parochial rivalries of her various governing powers. The Charing Cross Bridge scheme is endangered, and there is the possibility of an entirely unnecessary bridge being built on the skew at St. Paul's, because Mr. Alderman Beanfeast cannot conceive London as extending beyond the ancient boundaries of her mediæval city.

During the immediate future, much of London will, from one cause or another, have to be rebuilt, and it is to be hoped that London's lovers will do everything within their power to see to it that the new London shall be expressive of the finest ideals of her citizens.

The New Regent Street

The stucco architecture of Regent Street is fast crumbling away. Every week it seems that a fresh assault is made upon some surviving part of it. Before long nothing will be left; not a fragment is to remain to bear testimony to the civic wisdom and architectural genius of our great-grandfathers. Perhaps it is just as well, for a few scattered fragments of a great conception make but a melancholy memorial. In truth, Regent Street had had its day; to expect it to adapt itself to the needs of the modern drapery trade would be as reasonable as to expect a "Flying Scotsman" performance from Stevenson's "Rocket." We can only hope that the destruction may be completed as quickly as possible. Anything would be better than the present half-and-half condition of things. It is some satisfaction to know that the rebuilding is to be carried out entirely in Portland stone. At least there shall be no distracting medley of massing materials in the new Regent Street, and for this the Office of Woods and Forests deserves our best thanks. But it is with heavy hearts that we bid farewell to old Regent Street—one of the world's landmarks. We would almost as soon have seen St. Paul's sold up into office lots.

The "Temporary" (?) War-Building

Unsightliness is by no means the only offence of the belated war-building. For instance, "correspondence has reached 'The Times' in which complaints are made of the presence of buildings in Regent's Park hitherto described as 'temporary,' which have every appearance of becoming permanent." Householders in the vicinity declare that they have renewed their leases in the belief that the park would very soon be wholly cleared of such buildings, and they fear that the lease of the "temporary" buildings will be renewed. The public should put pressure on the authorities to bring speedily to an end this long-continued abuse of amenity.

Clutton Brock and Sham Gothic

The following communication has been received from one who wishes to remain anonymous, with reference to the address given by Mr. Clutton Brock on Sham Gothic before the Society for the Protection of Ancient Buildings. (This address was published in the last issue of the JOURNAL).

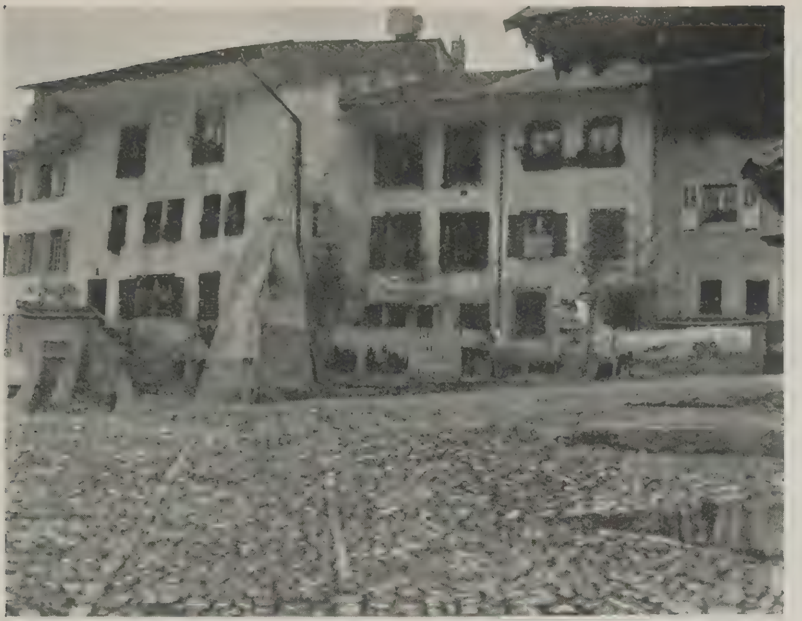
"Mr. Clutton Brock," says our contributor, "heads his address 'Sham Gothic,' and I am prepared to agree with all that he says as long as his remarks are confined to what I may call genuine sham Gothic. But he does not confine himself to genuine sham Gothic. Apparently he is absolutely unable to distinguish between the Gothic movement of the romanticists of the nineteenth century and the sham Gothic activity of those hangers-on in Society who were only eager to do the fashionable thing.

"To call Street's Law Courts, as Mr. Clutton Brock has done, sham Gothic, is nothing less than absurd. You might call Street's Law Courts absurd, but you could not under any circumstances whatever call them sham Gothic—that is, imitative architecture. What the Gothicists of the nineteenth century were really trying to do—and they *were* trying with all their might—was to form some new basis upon which the English architecture of the future might develop. They were the first people to realize that a classic basis was not only unsuitable to the climate and geographical position of England, but was also unsuitable to the character, mentality, and outlook of the English people. Looking backwards, on the contrary, they saw (as they could not help seeing) that the Dark Ages had evolved a means of architectural expression (called Gothic), which formed an almost perfect medium for the expression in architecture of the curious English character; and thus, naturally, they began to experiment with those forms, saying in effect, 'Let us through these forms (which are the natural English means of expression), build up a new English architecture.'

"Where they were wrong was in thinking that the right building-forms would create the right architectural expression; but even if they were absurd, they were no more absurd than Inigo Jones was in dressing house-walls with pilasters and Italian ornament. If you are going to call the Gothic Revival ridiculous you must in all fairness call the Renaissance ridiculous. Probably Mr. Clutton Brock does. One thing he cannot do, however; he cannot call the Renaissance architecture in England a dry-as-dust imitative architecture. And I contend that he has no more right to apply these epithets to the Gothic Revival, whose apostles were of all men the most enthusiastic and original."

The Co-operative Spirit in Road Repairing

Great road reforms are foreshadowed and should not be much longer delayed. Mr. James Moncur, county surveyor of Staffordshire, having suggested that the Automobile Association patrol traffic should assist in the diversion of traffic from roads undergoing repair, the Association has responded, in true patriotic spirit, that it is willing to co-operate on national lines. It insists, however, that the proposal cannot succeed without the co-operation of all highway authorities. The wisdom and justice of such a demand cannot be disputed, and such co-operation would be the first really practical step towards the complete nationalization of the roads. Great things were expected of the Road Boards, and their supersession by the Ministry of Transport does not seem to have greatly increased the probabilities of early reform. If, however, the local authorities, and influential road-users like the Automobile Association, unite in an agitation for some system of central control of the roads, the demand cannot be much longer resisted; for the contention that nationalization of the roads is incompatible with the spirit and principle of local self-government is a mere evasion of the point at issue, and could only be tenable if the main roads were used only locally, which is impossible.



ROUGH COBBLED STREET AND QUAINT HOUSES.

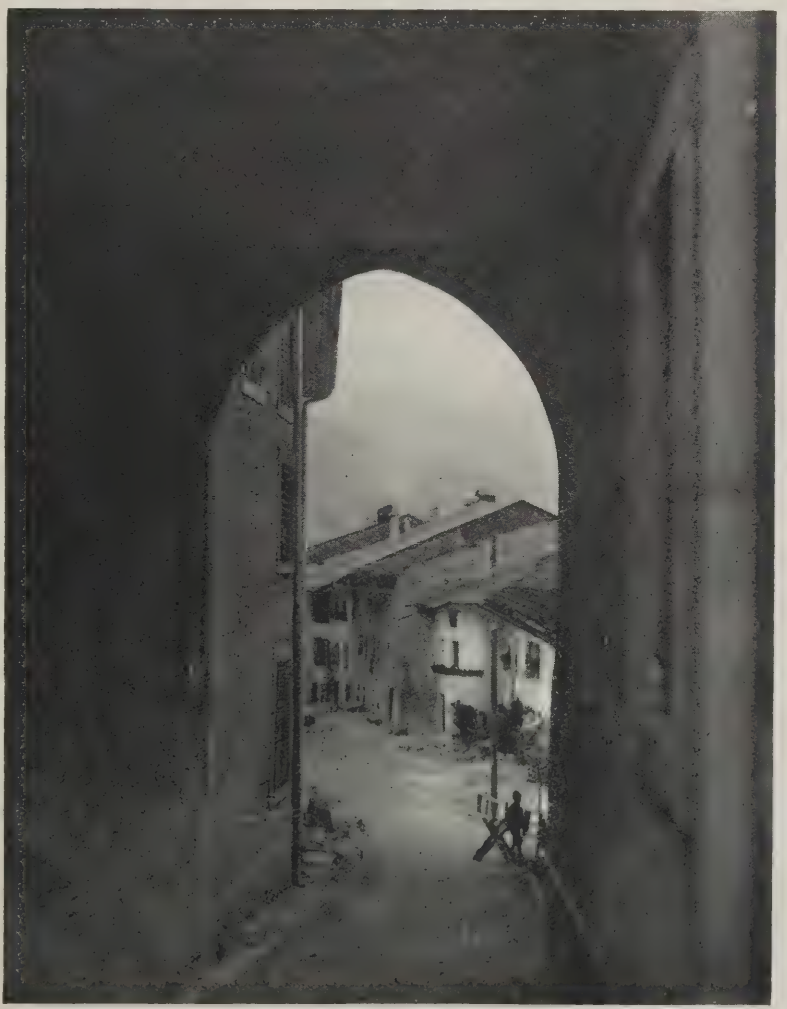
Gruyères

By H. A. J. LAMB, A.R.I.B.A.

IT would be very difficult to describe adequately the beautiful position of the wonderfully picturesque little town of Gruyères, situated as it is on the top of a hill in a wide valley, bordered by mountains, and commanding a fine view on all sides. Gruyères can easily be reached by mountain railway from Vevey or Montreux on the Lake of Geneva.

Climbing up the hill from the station, it will be noticed that the town is surrounded by a wall with battlements. Dominating everything and on the highest point is the castle, with its high-pitched roof, and flanked by a round tower, which is of great age. The castle, which is now unfortunately closed to the public, dates from the eleventh century, but since then it has been restored many times.

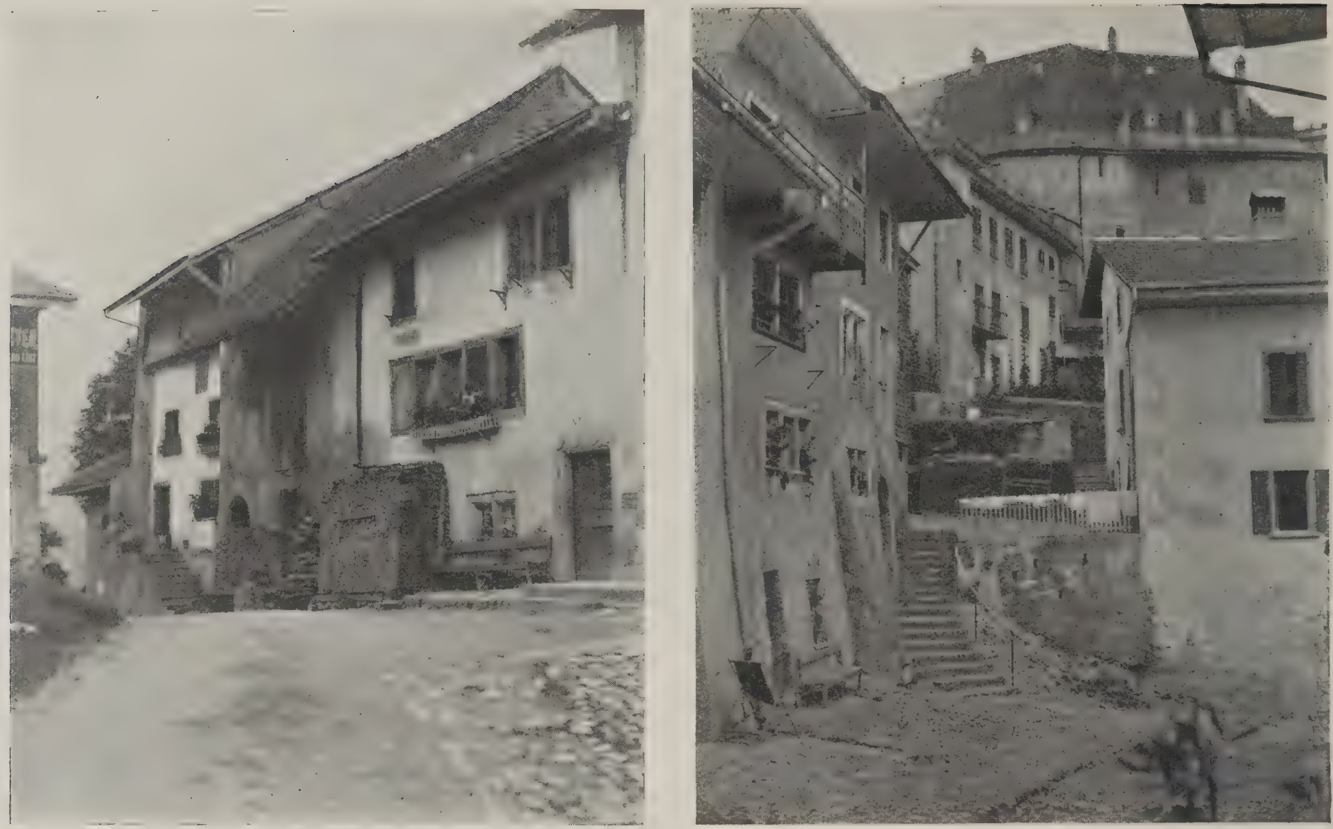
At the top of a narrow lane is the Porte du Belluard the main gateway, consisting of a pointed archway with small gallery and a line of machicolations above. Opening directly on to the slope of the hill is another small gateway, evidently intended as a means of escape, as it is very narrow indeed.



A GLIMPSE THROUGH THE ARCHWAY LEADING TO THE CASTLE

On turning to the right after entering the Porte du Belluard the Place is reached. This is paved with cobble stones, and from here one can practically see all that Gruyères consists of. At the bottom of a dip in the road, running through the town, and called "The Street," is a picturesque fountain, around which the washing is done. At the top of the dip, at the other end of the street, is a large brightly-coloured crucifix, standing under a pent-house roof; passing this on the right the road leads through another archway until it eventually reaches the castle.

Before reaching the crucifix, and standing well back from the road, is the house which originally belonged to Gerard Chalamala, who died in 1349, and who was court jester to the Count of Gruyères. This house is very small, and consists of two stories, the entrance being reached up a flight of steps. The stone framework to the windows is profusely carved. Projecting from the deeply overhanging eaves is a curiously fashioned rain-water pipe, which terminates in a highly-coloured ser-



TWO VIEWS IN PICTURESQUE GRUYÈRES.

pent's head, with a wide open mouth and jagged teeth, from which the water drips on to the cobbles beneath.

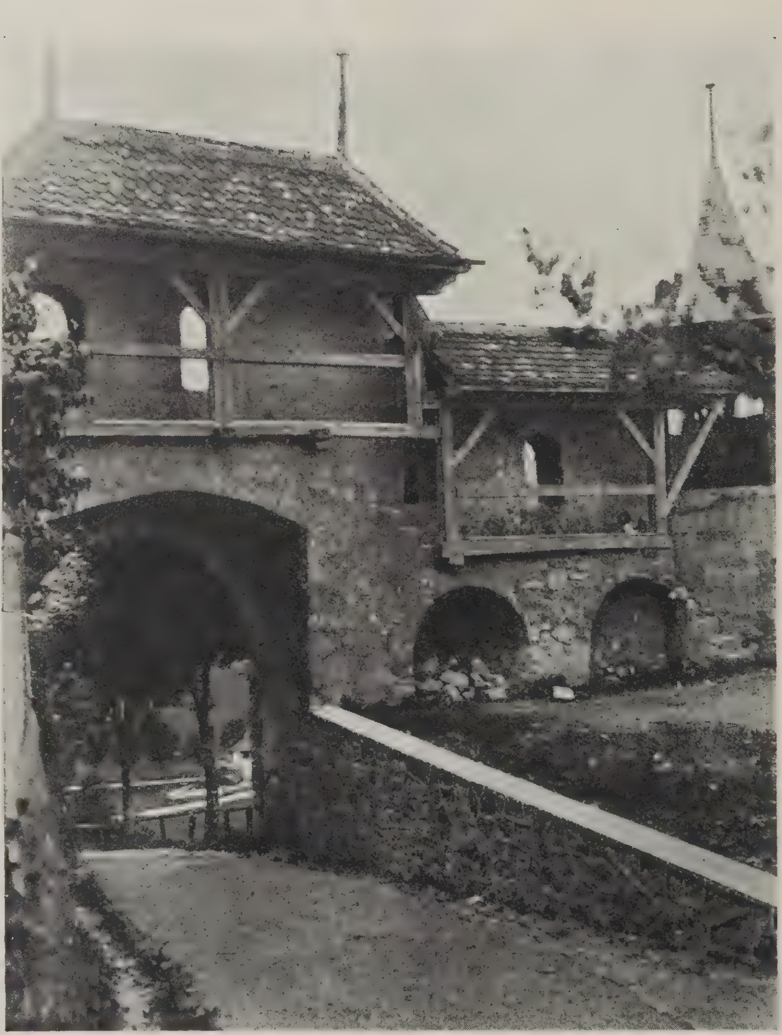
Opposite this house on the other side of the road is the ancient "Mesures," a large block of stone with five deep basins carved in it, with a hole at the bottom of each. At one time these were used to measure corn, which was poured into the bowl and drawn off by the purchaser through the hole at the bottom.

Standing by this stone one gets a most charming view of the quaint old houses which run down each side of the street. They are packed closely together, with the line of their roofs broken by the fall of the road. Many of the houses have fine stone doorways with varying dates—1543, 1594 — carved over them, and several have curiously carved gargoyles. Most of the houses have vividly coloured shutters and window-boxes. The latter, which are full of flowers, make brilliant splashes of colour down both sides of the road. Outside each doorway is a bright green seat, on which the owners sit knitting or gossiping, behind a screen of shrubs planted in boxes.

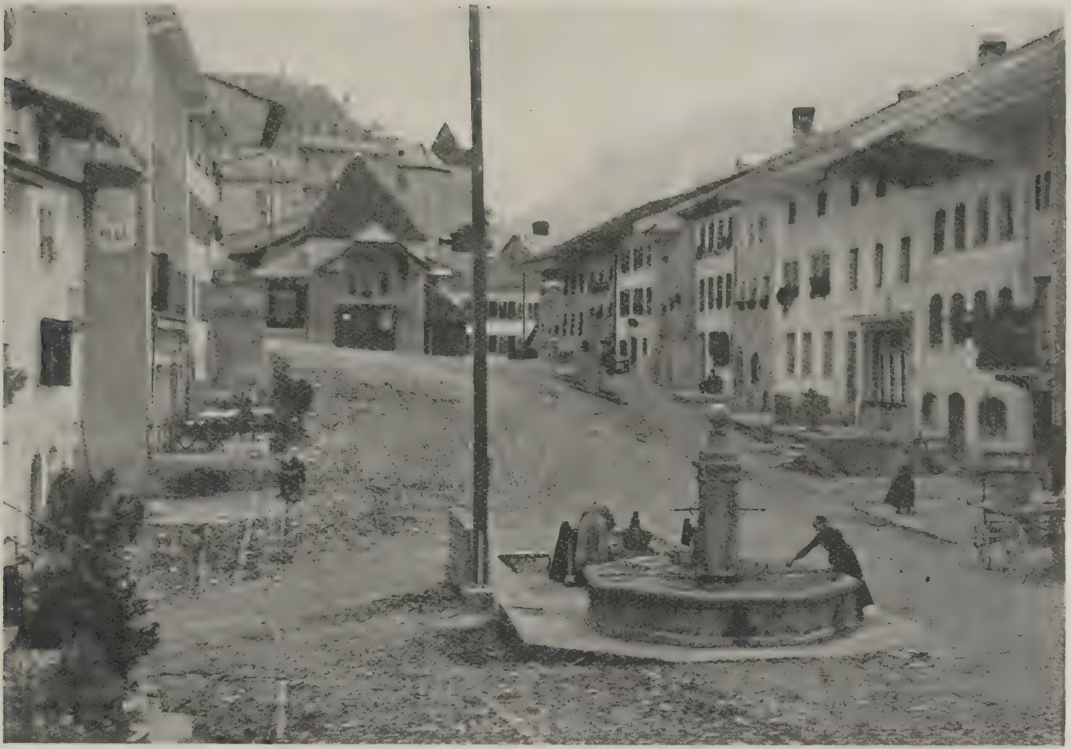
In front of each house is also a big pile of neatly cut pine logs, which exude a most fascinating scent.

Anyone visiting Gruyères for the first time will be struck by the apparent calm, contentment, and peaceful air of the inhabitants. Unless spoken to, they entirely ignore the visitor, which is rather relieving.

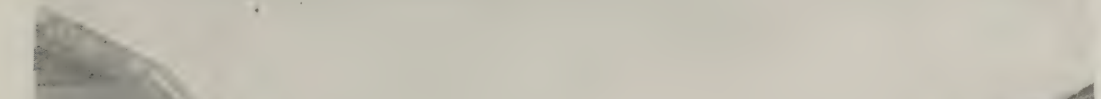
If one wishes to sketch, paint, or photograph, there is no lack of subjects, and it is possible to do this without being hindered by the usual crowd of curious and inquisitive spectators, and small children begging for money.



THE PORTE DU BELLUARD, THE MAIN GATEWAY, WITH DEFENCE GALLERY OVER.



A VIEW OF THE PICTURESQUE "STREET," SHOWING FOUNTAIN AROUND WHICH WASHING IS DONE.



THE VIEW DOWN THE "STREET."
On the left-hand side is the "ancient measures," a block of stone with five basins for measuring grain. Note the immense depth of the eaves.

Sketching and Measuring for the Student

By E. B. MUSMAN, A.R.I.B.A.

M. HENRI DEGLANE, whose name one associates so intimately with the Ecole des Beaux Arts, in the course of an address to his students, gave the following sound piece of advice: "Carry a two sous sketchbook with you, and draw everything you come across, using the fewest possible lines." Excellent advice this. In what better way could the student learn to use his pencil with freedom? The very fact of making a sketch, apart from its value as a drawing or a record, enables him to concentrate on the subject chosen more closely than if he merely attempted to record it mentally.

The Sketchbook

This small sketchbook should be his inseparable companion; it should accompany him throughout his journeyings, and when filled, should take its place on the shelf next many another equally full, ready to hand for future reference and study. Its pages will be full of interest; here a sketch of an old doorway, elegant, perhaps, in its proportions, unusual in its detail; there an interesting treatment of a gable end or a dormer window; on one page may be found a few roughly-drawn lines explaining broadly the principal elements of some good plan; on yet another the study of a tree, or a stretch of open country, with banks of clouds.

In this way he builds up a series of invaluable records, from which he can derive inspiration when the occasion offers. His powers of observation are quickened, and the steady improvement in his draughtsmanship stimulates him still further to reach a higher standard. In the course of a few rambles through town or country, sketchbook in hand, noting down whatever arrests the attention, he can get into closer touch with architecture and nature than by reading any number of works on the subject. The better way is to let the ramble and the book join hands where possible, and the study of the two together should then secure the happiest results. At the same time, however, the fact must never be lost sight of that the study of architecture is the ultimate goal, and that draughtsmanship is but the means to that end.

Measuring Up

The little sketchbook, too, is his friend in the measuring up of old work. It is quite unnecessary to sally forth with steel tape, five-foot rod, levelling instruments, and all the paraphernalia of the surveyor's outfit. A two-foot rule, the counting of brick courses both horizontally and vertically, a sketch elevation and a few notes and details roughly dimensioned should suffice. From data of this nature, and with the exercise of a little common sense, it is possible to produce a well-rendered measured drawing, sufficiently accurate for all ordinary purposes. The point to be remembered is that minute accuracy is not what the student requires when measuring for the object of study, but enough information to enable him to get the proportions and main lines of the various parts correct.

As a general rule too much attention is paid to measuring up. Some students sacrifice many valuable hours in making elaborate surveys of far too many buildings, and spend many more in drawing them out with meticulous and painstaking care. As records, doubtless, the drawings might be of value; as examples of rendering and draughtsmanship they may be beyond reproach; but as a means of improving his architectural knowledge it is questionable whether they will be of more use than the few rough notes and sketches, which, if intelligently made, can teach just as much and take but a fraction of the same time to accomplish. Sketch everything should be the watchword rather than measure everything.

Measuring, nevertheless, if kept within bounds, is quite an important factor in the training of the student. Let him take one or two examples of undoubted repute. It matters not what they are or who may be their author as long as they are good and do not lead him into wrong paths, and set up a standard of inferior design and poor detail. These he should study intimately. If he is conscientious and reasons as he measures, he will find that these few examples will teach him all the lessons which this form of work can teach. He will, in a sense, be able to visualize the scheme as its designer visualized it; he will be able to appreciate the relation of one part to another, and will gain an insight into a hundred and one little subtleties and refinements of detail and design, which to a casual observer would not be apparent.

The actual measuring itself will present no difficulties. The constant employment of the diagonal, particularly in the case of an irregular plan; the use of running dimensions, and the elimination of unnecessary detail when obtaining the main sizes of plan and section, are the chief points to keep in mind. Always remember to indicate clearly the chief structural points, and never allow them to lose their position when working from floor to floor. Details, such as architraves, cornices, and so forth, should be treated separately.

Drawing on the Spot

The whole process is simple enough, and in the course of a few days' work he will have formed methods and short cuts of his own. It is a good plan occasionally to draw some particularly excellent detail to scale on the spot (say, quarter size if too large to do full size). In this way it is possible fully to appreciate the beauty and refinement of a moulding or the delicate craftsmanship of some good piece of ornament.

During the long summer vacation the student has every opportunity of putting these precepts into practice. For the time being his more serious studies are interrupted, and he is at liberty to roam wherever his fancy leads him. He may decide to "do" some particular district. If so, let him set about it in a systematic manner. With a congenial companion he can wander from place to place, explore the hidden byways, and on every side discover some fresh delight. Let him raid the picture postcard stall, pry into the old bookshop, talk to the village crony, study the traditions, habits, and customs of the inhabitants, and absorb the very atmosphere of the place.

If he possess a small camera let him take it with him; he will find it of the greatest assistance in helping him to add to his store of information. As he wanders, so should he always be noting the ever-changing phases of nature, the glories of the sunset, or the play of light and shade on some creepered wall or noble façade; the materials used, their texture and colour, the effect of the whole, and how it blends and harmonizes with its surroundings, all this should be impressed upon his mind and recorded on his paper. Let him study his subject from every point of view, analyse its composition, investigate its detail. Thus will he be able to imbibe its spirit and its charm.

The Media

Let us now consider a few practical points on the materials necessary for sketching and how best to use them. For outdoor sketching shun a hard pencil as one would the plague. It will be found that the most delicate line can be drawn with a 2B or a 4B grade, while at the same time perfect gradation and the strongest blacks can easily be obtained. Some may prefer a soft carbon or a conté pencil, others a stick of charcoal. The latter is, perhaps, the best of all for sketching purposes. Handled lightly it is possible to produce with it the finest line, and used with decision and firmness to secure the richest darks. It creates a beautiful texture, and forms an excellent basis for water-colour. Above all, its use teaches the student to treat his subject broadly, and to avoid smothering his drawing with hundreds of niggling lines.

There are many other media. Let him try them all—pen, wash, pastel, water-colour, and so forth, with all their infinite combinations. He should learn to appreciate their various qualities, and to express them in his drawing. For sketching it is better to avoid a paper with a very rough surface or one that is too glossy or smooth; that which gives a slight bite, as with ordinary cartridge, is the more satisfactory. Every one, however, has his own particular taste. Until the student has gained some experience he should reject all fancy papers of unusual texture and varied tones. Their use at first will only serve to mislead him and give a quality to his drawing which it would not otherwise possess.

When using water-colour, work with a small palette; and the fewer colours in the box the better. A red, a blue, and a yellow, and their combinations will give as wide a range of tones as the average draughtsman will ever be likely to need.

Freehand Drawing

As a general rule there is far too little freedom in freehand drawing. The student, however, must guard against the danger of going to the other extreme, and of allowing his work to become too loose and uncontrolled. He must use judgment and discrimination. It is not necessary, of course, to draw every brick, modillion, or dentil. Suggestion rather should be his motto; the power to indicate character and form with as few lines as possible. For most architectural effects it is advisable to employ firm, sharp strokes rather than soft, woolly ones. If the outline is crisp and snappily drawn, the sketch will gain additional interest and life by being very lightly tinted. In this case the outline drawing is the important factor. On the other hand, the painting is a mosaic of colour areas and the drawn outline only serves to indicate the placing of these areas and is lost in the finished picture. The former method will be, in most cases, the more serviceable to the architect.

Perspective

It may be of interest here to say a few words about freehand perspective. The average architectural student as a general rule has an advantage over the art student in this respect, for his knowledge of geometric perspective is often very much more comprehensive. Through laying out the points and projections mechanically his eye becomes trained to recognize its difficulties, so that when he proceeds to sketch an object he can the more easily understand its true perspective. It is as well, however, to utter a note of warning. Let him beware of trying to secure the mechanical accuracy of the set-up perspective in his freehand sketch.

Aids to "Setting-up"

The following aids, if not already known to the student, are well worth bearing in mind when settling the preliminary lines of a sketch. If we split up our object—a building, for instance—into a number of rectangles in perspective, the drawing will be considerably simplified. The use of the diagonal is of the utmost value in the finding of centres and the dividing of spaces. Fig. 1 shows the method of finding the perspective centre E of the rectangle ABCD by drawing the diagonals AB, CD. This rule is invaluable when sketching a gable or pediment in perspective. Fig. 2 shows a method of dividing a space into 2, 4, 8, . . . parts by first finding the centre of the whole rectangle and then the centre of each half and so on. Fig. 3 illustrates the method of dividing a space into any number of parts, odd or even. Divide the verticals AB, CD equally, each into the number of parts required. Draw either diagonal. Through the points of intersection E, F, . . . draw verticals. The rectangle will now be divided perspectively as required. These principles can easily be applied when dividing a building into bays, or when finding the intersections of roofs, or the centres of all kinds of rectangular blocks.

Study of Composition

Finally, let the student keep in mind that if he wishes to succeed, he must be continually studying composition, not only in architecture but in everything. He should seize every opportunity of seeing good pictures and drawings and of analysing good buildings. When he discovers something that appeals or the reverse, he should at once proceed to ask himself why it pleases or displeases. He must be the unsparing critic of his own work and should keep a watchful eye lest so-called originality and freakish presentation creep in and clog his progress. Above all, let him draw continually that in the end he may become master of his pencil.

A Model Fish Shop

Designed by Leslie Mansfield, F.R.I.B.A.

IN designing the fish shop at 46 Old Bond Street, London, for Messrs. Mac Fisheries, the idea of Mr. Leslie Mansfield, F.R.I.B.A., the architect, was to produce a shop which would be pleasant to use; one where the goods would be protected as far as possible from contamination, and kept in a cool and well-drained place, allowing easy inspection by the purchaser and comfort in service by the assistants. As it was necessary to produce as hygienic a shop as possible, all mouldings were eliminated, and the decoration was provided by the materials used.

With the exception of a small portion of the screen at the end of the shop, and perhaps the lift doors, the use of timber, on account of its absorbent nature, was restricted. The floors and walls are lined with Subiaco marble, banded with Zola, and emphasized by the introduction of lines of black marble, the trade mark of Mac Fisheries being inlaid in coloured marble in the centre of the floor. The ceiling is of modelled plaster, painted and coloured, with a restrained use of gilt, the motif of design being fish, with seaweed, prawns, oysters, and cockles forming the central wreaths.

The most important part of the scheme is the method of display. This is arranged on a series of shelves which set back one above the other and allow each shelf to drain free of the one below. All the shelves are formed with trays resting on coils which are refrigerated, with the result that the fish lies in a cooled atmosphere, which has the effect of preventing, to a large extent, the attention of flies. The freedom of drainage tends to reduce contamination of the atmosphere. The use of trays in a fish shop was largely an innovation, and has the advantage of allowing the goods to be arranged in the cleaning shop, and the complete display to be brought up and placed in position. This practice ensures the shop being kept clean and tidy. As soon as one tray becomes empty or partially so it can be removed, and a full one brought to take its place. This type of fitting makes inspection of the goods simple and clean, and there is no fear of one's clothes being spoiled; in fact, it is possible actually to lean against the cases without damage to clothes. Hitherto it has been the custom of the trade to do most of their business on the footpath, so to speak, and Messrs. Mac Fisheries were

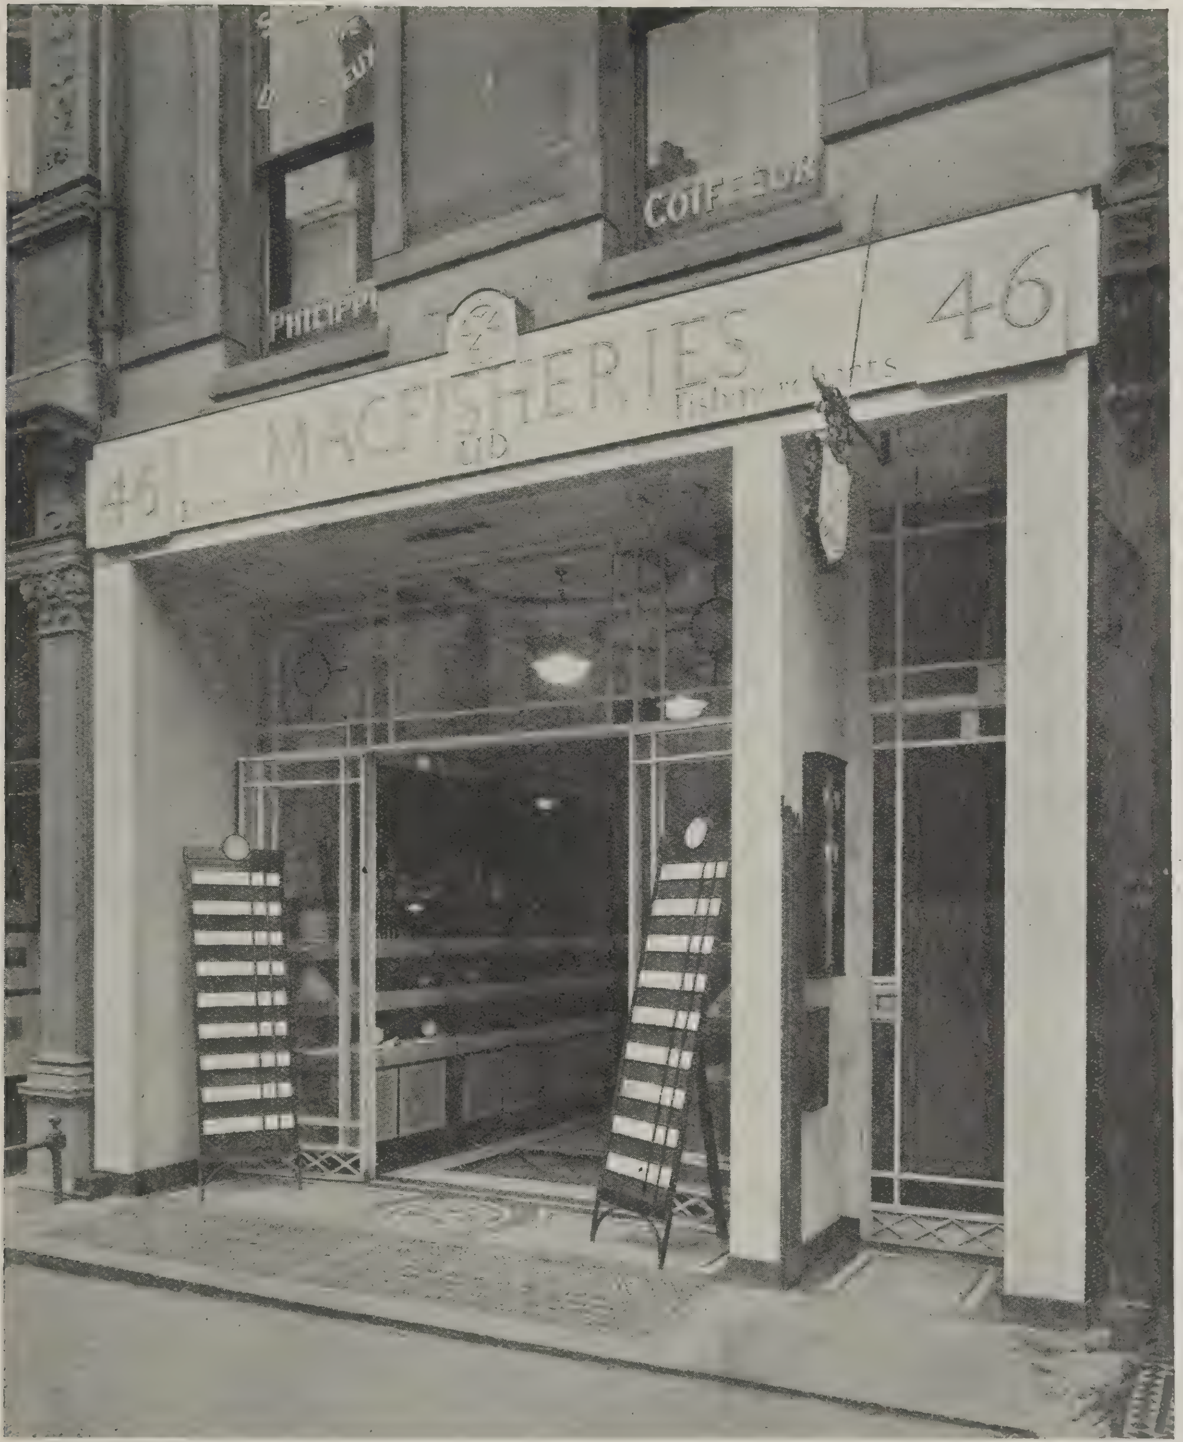
PLAN AND SECTION OF THE MAC FISHERIES FISH SHOP IN OLD BOND STREET.

Shop Fronts. 9.—The Mac Fisheries Fish Shop, 46 Old Bond Street, London

Leslie Mansfield, F.R.I.B.A., Architect



Mr. Leslie Mansfield has here produced a fish shop which is every bit as dignified as its aristocratic neighbours devoted to the display of jewellery and fine art. To avoid the effect of a hole in the wall, Mr. Mansfield has introduced a metal front, slightly set back. The doors open outward and are hardly noticeable. The lettering on the fascia was drawn by Mr. Eric Gill. The four fish sign is the work of Mr. Kruger Gray.

anxious to set a new fashion, that of going into a fish shop to trade. In other words they wanted their premises to be a shop rather than a wayside booth.

In developing the scheme it was felt that in a street like Bond Street, which has some of the finest shops in the country, there was an opportunity to show that fish could be shown, and shown to advantage, in a place every bit as finely fitted as a jeweller's. It was realised that fish in itself is full of colour and very decorative; therefore a neutral background was indicated with the lively colour of the goods reproduced upon the ceiling as a balancing note.

In designing the shop front proper there was a danger that the proximity of numerous other shops, all with fine fronts, would result in an exaggeration of the hole in the wall effect of the average frontless fish shop. To avoid this a simple metal front was introduced. The doors, owing to the fact that they open outwards, are hardly noticeable, and render the work of "shutting up the shop" very simple. The partial enclosure of the shop with glass was also helpful in designing the facade.

The extremely narrow limits of the site made it difficult to provide proper means for receiving delivery of goods, but this was overcome by a lift from the ground floor to the basement. This lift is concealed beneath the doormat immediately inside the entrance; the doormat being fitted in a frame which forms the top of the lift. When the lift rises into position to take the goods the mat is moved upwards, and when the lift descends the mat returns to its normal position. This is an adaptation of a method applied to dinner lifts to avoid the obstruction of casing.

DISPLAY TABLE AT END OF SHOP.

It was necessary to provide facilities at the back of the shop for cleaning the fish in addition to the large cleaning and storage department arranged in the basement. In the former case it was necessary that the fish should not be taken out of sight to be cleaned, therefore a dividing line had to be arranged to separate this department from the showroom. A screen was introduced and used as an adjunct to the permanent display. This screen conceals a sink, properly drained and covered with a grating, upon which it is possible to arrange a display of fish or even ice without fear of the water getting on to the floor of the shop.

Apart from the fittings described there are glass and bronze showcases—similar to those seen in drapers' shops for showing dressed fish such as crabs, lobsters, oysters, etc., arranged as and ready for the table in glass dishes, the glass top having been used for the display of samples—which can be tasted.

The production of this shop did not end with the structure. The architect co-operated with the other departments, including the publicity section of the firm, with the result that the labels on the potted goods and numerous other articles, such as the price tickets, notice boards, etc., were brought into line with the scheme. The lettering on the fascia was drawn by Eric Gill, and the four-fish sign, which occurs so often, is the work of Kruger Gray.

One of the most difficult problems encountered in a fish shop is that connected with the drainage from the fish-cleaning tank. During the cleaning of the fish an immense amount of small pieces of flesh, skin, etc., detach themselves, with the result that with the ordinary trap, which quickly becomes blocked, the water flows all over the place. In this shop the sinks are arranged in the basement with straight outlets, which discharge over a wide open channel with a large stable yard gully at the end fitted with a fine mesh basket. This gully can easily be removed and emptied when desired.

Generally speaking, the whole scheme is an endeavour to put into operation an arrangement which should show progress and embody modern ideas. Modern science, construction, and planning, has to a large extent ignored the fish shop, and it was felt that the period of "after-war," when ideals had in many cases been subject to reconstruction, was a favourable time to tackle such a problem. The difficulties of obtaining materials at this period were very great, but they were ultimately overcome. There is no doubt that the success of the scheme was very greatly due to the willing and generous co-operation of the builders and the various sub-contractors. The work took approximately nine months to complete.

Messrs. Holland, Hannan & Cubitts were the builders. The sub-contractors being as follows: Messrs. Joseph Whitehead & Sons (marble work); Messrs. Richard Crittall (display cases and refrigerating plant); Messrs. Martin van Straaten (tiles); Messrs. Pontifex & Sons (sanitary fittings); Messrs. Edbrook, of Bristol (metal shop front and office grilles); Messrs. Richie (goods lift); and Messrs. Joseph Armitage (plaster work). The trade mark of The Mac Fisheries in the centre of the floor was also carried out by Messrs. Whitehead, and is a particularly fine piece of work.

The New President of the Architectural Association

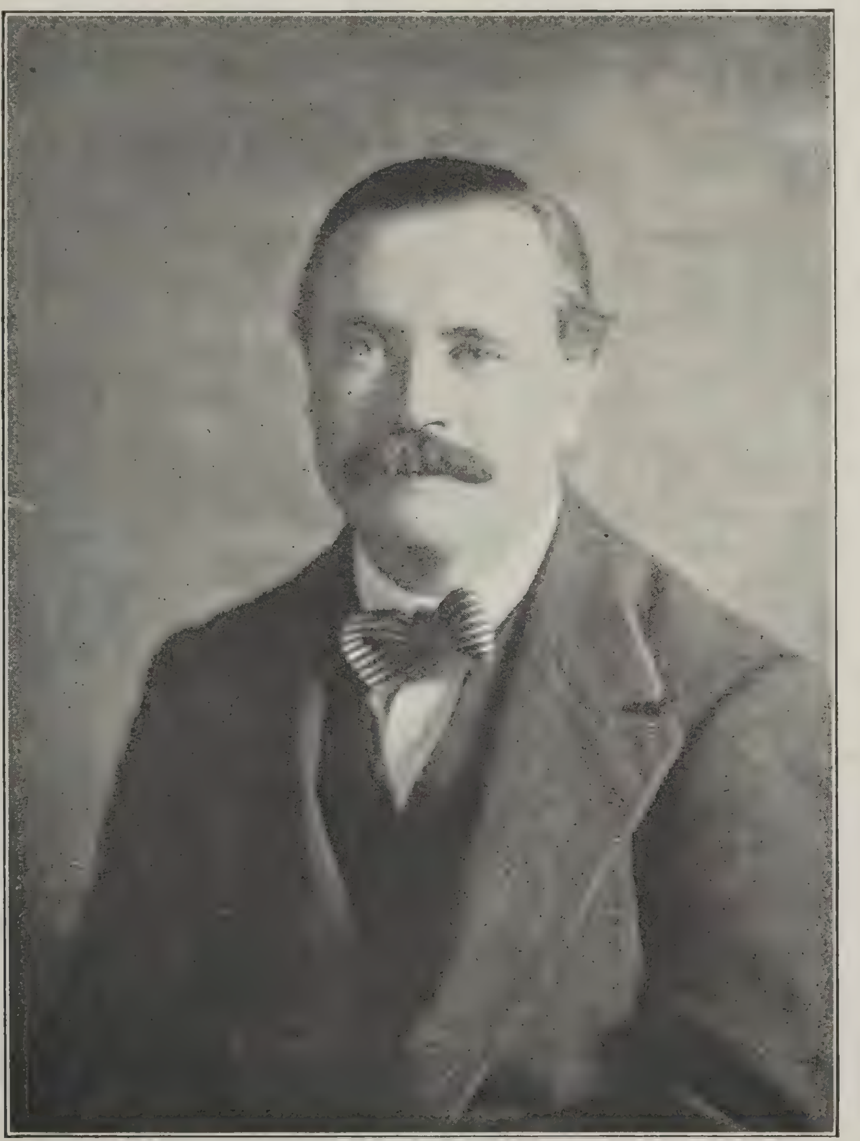
THE new President of the Architectural Association, Mr. Stanley Hamp, whose portrait is reproduced on this page, was born in 1877, and was educated at the City of London School on the Embankment, where he was a contemporary of Mr. Ralph Knott, architect of the London County Hall. He was articled to Mr. Colcutt at the age of seventeen, and began work at No. 36 Bloomsbury Square, the house designed by Mr. Colcutt, which for many years was the home of the firm. Mr. Hamp attended the A.A. Schools in Great Marlborough Street in 1895, and after sitting for the examinations, qualified for the Associateship of the R.I.B.A. In the year 1900 he started practice and worked alone for a year. During this period he carried out some domestic work. Shortly after, however, he returned to 36 Bloomsbury Square, and entered into partnership with Mr. Colcutt. During many years of successful collaboration, a great deal of work was accomplished.

The firm of Colcutt and Hamp have something of a European practice. They have carried out a good deal of interesting work, both in France and in Spain.

During the war Mr. Hamp served with the anti-aircraft force. Recently, in the field of war memorials, he has designed and carried out the fine classical monument at Mill Hill School. In addition to domestic work, hospitals, office buildings, and the ordinary professional range of architectural subjects, Messrs. Colcutt and Hamp have a special knowledge of interior decoration of ocean liners and have carried out a great deal of work for the P. & O. Line.

The following are some of the buildings for which Mr. Hamp is personally responsible :—

City Offices : Thames House, Queen Street, E.C. ; Messrs. Cayzer, Irvine, Ltd., St. Mary Axe ; offices for P. and O. S.N. Co., Leadenhall Street.



MR. STANLEY HAMP, F.R.I.B.A., THE NEW PRESIDENT OF THE A.A.

Public Buildings : King George V Sanatorium for Sailors, Bramshott, Hants ; Hospital for Tropical Diseases, Endsleigh Gardens.

Golf Club Houses : Swinley Forest ; Beaconsfield ; Le Touquet ; Prestatyn.

Domestic Work : Davenies, Beaconsfield ; Flag Court, Tadworth ; The Grove, Mill Hill ; additions to Roffey Park, Horsham ; to Hook End Farm, near Reading ; to Coldharbour Wood, Liphook ; Studio and additions at 40 Queen's Road, St. John's Wood ; Studio and additions at 34 Addison Road for Professor Gerald Moira.

The portrait of Mr. Hamp is reproduced by courtesy of the A.A. Journal.

Book Reviews

The Public Library

Some years ago, many of the municipal authorities in this country paused temporarily during their deliberations on dust-destructors and drainage systems to accept Mr. Carnegie's offer of new public library buildings. As a direct consequence, most of the younger members of the architectural profession of that period were incited to spend their leisure in the preparation of competitive designs for public libraries. Indeed, it really seemed at one time as though public libraries were likely to become almost as numerous as public houses: that the demand might exceed the supply; that there might possibly be more competitions than competitors; and that every young architect might confidently expect to be entrusted with a commission to build at least one public library, somewhere or other.

But the demand did not continue, and after the municipal stalwarts had pronounced benedictions on their own particular building at its opening ceremony, they elected one another in a humorous sort of way to act on the library committee, returned to their interrupted deliberations on dust-destructors and drainage systems, and once more relegated the public library to its traditional part of Cinderella in the municipal pantomime.

Dr. Baker deals in a comprehensive manner with the whole question of the public library service, and not only is his new book an interesting record of what has been accomplished under adverse circumstances in the past, but it is also an indication of what may be achieved under more enlightened conditions in the future. After looking through the photographs of library interiors with which the volume is illustrated, the reader may perhaps be somewhat disappointed to find that the author is not greatly concerned with the buildings themselves. In fact, there is no reference at all in the text to some of the illustrations.

Dr. Baker regards the public library building as "the mere case that holds the books," and in his opinion "the need is for more books, and better books, rather than more buildings," but it is quite certain that, if many of his recommendations are adopted in the future, a drastic rearrangement of the interiors of most of our public libraries will become necessary. He points out, for example, that the ladies' reading-room is already obsolete, that separate rooms where students may read or write should be available, and that in addition to a large lecture hall, small tutorial or class rooms are very desirable.

But above all Dr. Baker appeals for a more intimate association between the various educational activities of the municipality; between the art gallery, the museum, the library, and the schools. He states that "we have now had public libraries for three-quarters of a century; but, for the arrears of intelligent use we have to make up, we might have only just begun experimenting with them," and it is an astonishing reflection on our educational system that most classes of school-children are taken to the public baths and shown how to swim, but very few are taken to the public libraries and shown what to read.

The plain fact appears to be that the composition of the bodies who direct the activities of public libraries is all wrong. Every one will agree with Dr. Baker that more representation of the actual users of the public library is needed, and that the preponderance of town councillors on these committees is, at the present time, absurd. A person does not attain the dignity of a town councillor by reason of his literary knowledge, and the fact that he is able to decide what his fellow-townsmen may or may not read is as ludicrous as though he were allowed to decide that there shall never be more than nine inches of water in the public swimming bath because he himself does not happen to be able to swim.

Some people may read Emmanuel Kant as a task, and "The Adventures of Deadshot Dick" as a recreation. Others may find Kant almost flippant, and "Deadshot Dick" a trifle laborious. Dr. Baker contemptuously dismisses inflammatory literature of the latter type as "chewing gum," but if the public library is not labouring under an assumed name, the general public are entitled to expect reasonable arrangements to be made so that they may be able to read exactly what they like, without any harassing restrictions as to how or where they shall read.

It is often forgotten, for instance, that large numbers of provincial architectural students are dependent on the local public library for many of their books of reference, and among the reforms that Dr. Baker suggests, the interchangeability of books in the reference and loan departments would probably prove of the greatest assistance to them, if provincial librarians could be persuaded to adopt the idea. It is surely inconsistent to a decree that, say, "De Architectura" may be borrowed for home-reading, whilst "The Grammar of Ornament" can only be perused in the fastnesses of the reference library.

The fact that the present curriculum of the School of Librarianship includes lectures on "Library Architecture" suggests that the coming generation of librarians proposes to keep the coming generation of architects up to the mark. There is no reason why the latter should not return the compliment by keeping an eye on the librarians.

Building Supervision

It is impossible to overrate the importance of efficient supervision in the erection of buildings. All the skill brought into play in planning and designing a building may be entirely wrecked by incompetent supervision and result in an unsatisfactory structure with disastrous consequences for the architect. In building supervision, as in everything else, it is the little things that matter, and Mr. George W. Grey in his book has made a very successful endeavour to set forth the items to look for. The book has reached a second edition and has been carefully revised and certain sections have been extended. The risk of an unsatisfactory building as the result of slipshod specifications or inefficient supervision is pointed out; and the causes of dampness, dry rot, settlements and the like are mentioned, and the precautions which would have prevented such defects are specified. The duties of the clerk of works are expounded, and there are valuable sections dealing with the protection of buildings during construction, extras, daywork, supervision of workmanship and selection of materials in all trades. Mr. Grey has had many years' experience in superintending the erection of buildings of all sorts, designed by various well-known architects. The book is one of the best we have seen on the subject.

Building Supervision. By George W. Grey, P.A.S.I., Licentiate R.I.B.A., Member of the Concrete Institute. Second Edition. Price 3/6 net. E. and F. N. Spon, Ltd., 57 Haymarket, S.W. 1.

A Handy Pocket Book

Any pocket book containing a good supply of practical information on building matters not to be found concentrated elsewhere is sure of a ready welcome. In the book under review the needs of the novice as well as the most skilled artizan are amply provided for. The book commences with so simple a matter as the multiplication table up to 60 times 60, the object being to save time. With the same object the sizes of different sorts of girders are given according to the span. Here again much time will be saved in calculation. There are also many valuable recipes for cleaning and renovating, a particularly well illustrated glossary of terms, and a large amount of useful data and other information of every day use. Mr. Arthur Seymour Jennings, the author, is one of the foremost authorities on painting and decorating, and his book should be in the hands of everyone connected with or interested in the building industry.

The Builders', Plumbers', and Decorators' Pocket Book. By Arthur Seymour Jennings, F.I.B.D. Price 5/- net. Thomas Tofts, 93–94 Chancery Lane, London.

The Condition of St. Paul's

The Commission appointed by the Dean and Chapter of St. Paul's in October last "to examine the building and advise what methods should be adopted for its preservation," have issued their interim report. The Commission consisted of Sir Aston Webb, and Messrs. G. W. Humphreys, Mervyn Macartney, Basil Mott, and E. C. Trench. Fourteen meetings have been held, personal inspections have been made of all parts of the dome and its supports that were in any way accessible, the various reports previously made on the condition of this portion of the building have been considered, and the drawings, data, and details placed before the Commission by Mr. Mervyn Macartney have been examined.

The Commission state: The whole question of the dome and its supports will require more time for the completion of our investigations before a definite report can be made on this very complicated and intricate problem; we now beg to present an interim report on a matter which, in our opinion, is of urgent importance.

Trial holes have been sunk through the crypt floor to ascertain as far as possible the condition and nature of the foundations under the main piers. After a careful examination and much consideration of all the available information, we have unanimously come to the conclusion that there are no signs of recent settlement or movement in these foundations to cause anxiety. Although the ground would not be considered altogether satisfactory at the present time for a building of this character, it would be an exceedingly formidable task to attempt to strengthen the foundations, and in our opinion it is not necessary; provided always that no building or other operations are carried out below the level of these foundations in the neighbourhood of the Cathedral.

Considerable settlement has taken place in the piers and arches, but this happened largely during construction and was dealt with by Sir Christopher Wren as the building progressed. A certain amount of movement has, however, taken place since completion, involving repairs, some of which are still being carried out. We are of opinion that such work should be suspended as far as possible until our investigations have been completed and our further report submitted. The piers are formed with rubble cores and cased with ashlar, and the condition of the masonry leaves much to be desired. The whole question of the condition of the piers and the remedial measures we may have to suggest will be dealt with in a later report with as little delay as possible.

The urgent matter to which we wish at once to draw attention arises in this way. The settlement of the piers above referred to caused damage to the masonry, and many of the damaged parts were veneered with stone, and these parts, as well as various ornamental features, were secured by iron dowels and other means. Our investigations show this veneering to be very extensive, and through the rusting of the dowels portions are becoming loose. There are instances of flaking, due, we consider, to pressure concentrated on the outer edges of the joints owing largely to the way the stones were worked and the character of the original mortar used. The remedy for dealing with this problem of jointing is now under consideration.

In the meantime we are of opinion that for reasons of safety the piers and the arches they support should at once be examined in detail from adequate scaffolding, and all loose or defective pieces of stonework either refixed, replaced, or removed altogether. When the scaffolding has been erected we shall be in a better position to estimate the amount of work which is necessary, and the cost. We fear it will be a long and expensive process, but we feel it to be absolutely essential, and it is on this account we are making this interim report instead of waiting until we are in a position to report in full.

The R.I.B.A. Fund

The President of the R.I.B.A. has received the following letter from Canon S. A. Alexander, Treasurer of St. Paul's Cathedral:—

"Dear Sir,—I am writing on behalf of the Dean and Chapter of St. Paul's, to ask your attention to the papers enclosed with reference to the new appeal for the preservation of the cathedral. The Institute sent us, very kindly, a hundred guineas in 1914. And we hoped that it might be possible for you to give us some further support at this critical time.

S. A. Alexander,
Canon and Treasurer."

The Dean and Chapter of St. Paul's are asking for the sum of one hundred thousand pounds for the absolutely essential work of repair on the piers and arches supporting the dome of the cathedral which have been declared insecure by the special commission of architects and engineers appointed last autumn to examine the condition of the building. The cost of the work on the south trasept, now almost completed, has been defrayed by a fund raised by public subscription in 1914. This is now almost exhausted, and a further £100,000 is necessary to enable the repair of the defects recently disclosed by the commission's report to be carried out. The need is urgent; it has even been suggested that it may be necessary to close the cathedral for a long period. It is hoped to avoid this extreme course if a generous response is forthcoming to the appeal for fresh funds.

The Council of the Royal Institute have decided to establish a R.I.B.A. fund, and to appeal to members for subscriptions. The allied societies of the R.I.B.A. in the provinces have been invited to open subscription lists in their own districts and to forward collectively to the R.I.B.A. the amounts so received. The Council itself appeals especially to London architects to send subscriptions, however small, to the fund, so that a worthy contribution may be made by the architectural profession towards safeguarding the strength and permanence of the masterpiece created by the daring genius of Wren. There is no more fitting or sincere method in which architects can commemorate the approaching bicentenary of the death of one of the greatest of their number. The list will be closed at an early date, and members are therefore invited to forward their subscriptions to the Secretary, R.I.B.A., as soon as possible. A list of subscribers will be published.

Types of Modern Steam Laundries

THE power laundry as a commercial venture or as a private utility service is a phase of modern progress that has come to stay. Almost every town of any size in Great Britain possesses its commercial steam laundry as well as those forming part of the administration of public institutions, such as hospitals, infirmaries, asylums and convalescent homes. In addition laundry equipment is being found of great service in private spheres such as mansion houses, ocean going liners, and industrial establishments.

There are generally two distinct types of commercial laundry buildings, i.e., the small establishment doing a trade up to, say, £80 per week at current rates, and the larger concern with a weekly turnover up to £300 or £400. In the former case the building is sometimes long and narrow and in one bay. Although this type of building entails a long line of main shafting, it suits the progress of the work, which commences in the receiving room at one end of the building, and passes through the washhouse, drying-room, ironing and finishing-room, to the dispatch department at the opposite end.

This design is generally departed from in favour of the square shaped building where there are prospects of a big business being ultimately built up. In fact the majority of the laundry buildings nowadays are built on the two-bay principle, with supporting columns in the centre to which shaft brackets can be hung. The main walls of a laundry building are of 14 in. brick with intermediate walls of 4½ in. or 9 in., the inside face of the bricks being white glazed for light and handiness in cleaning. The roof may be either of wood or constructed with girders, but the former is more effective for hanging shafting. Louvre ventilating ducts should be provided along the ridge of the roof, and a bull's-eye for a fan on the gable end.

The floor in the washhouse should be of concrete, with a fall from the centre to open drain channels along each wall. In the other departments where no water is used wooden floors will suffice. In the interior of the laundry building a 9 in. brick drying-chamber is built 7 ft. high, with concrete roof, reinforced with steel girders, with provision of exhaust or ventilating ducts. The floor of this chamber is also of concrete. The only other section of the laundry for which the builder requires to make provision is the boiler-house, where in the event of a Cornish or Lancashire boiler being installed a brick setting is necessary and a brick chimney about 45 ft. high. The smaller laundries generally start with an upright vertical boiler which requires no particular setting. Doorways throughout the building should not be less than 4 ft. wide, to permit of the delivery and taking out of machinery.

Usually public institution laundries form part of the administrative block, and are built to architect's designs. Generally the principle adopted is similar to that embodied in a commercial laundry building as, of course, the equipment and the work required to be performed are exactly the same in both cases.

The accompanying reproductions show standard designs for commercial laundries and a public institution laundry.

The question of power is common to any plant, whether it be for a commercial or institution laundry, or for a private establishment, although usually the choice between a steam engine or motors for driving is determined by local conditions, such as the cost of electric current and the nature of the supply available. With modern laundry machines the adoption of motor drives to any section of the laundry, or to any particular machine, is quite practicable, and where line shafts and overhead driving belts are incovenient the practice of driving each machine with its own motor is quite common, and has much to recommend it on the basis of economy in power consumption. With one single prime mover, say a horizontal or vertical engine, the main line shaft is running all the time, even if only one or two machines are actually in use, whereas with a sytem of direct motor drives any unit can be run and only its own power absorbed. Against this it must be remembered that with a steam engine there are opportunities for economy by the utilization of the exhaust for a variety of purposes, such as for heating water for use in the washing machines and hand wash tubs, and for heating drying-rooms, blanket-rooms and airing chambers, which means a saving

A SMALL COMMERCIAL LAUNDRY.

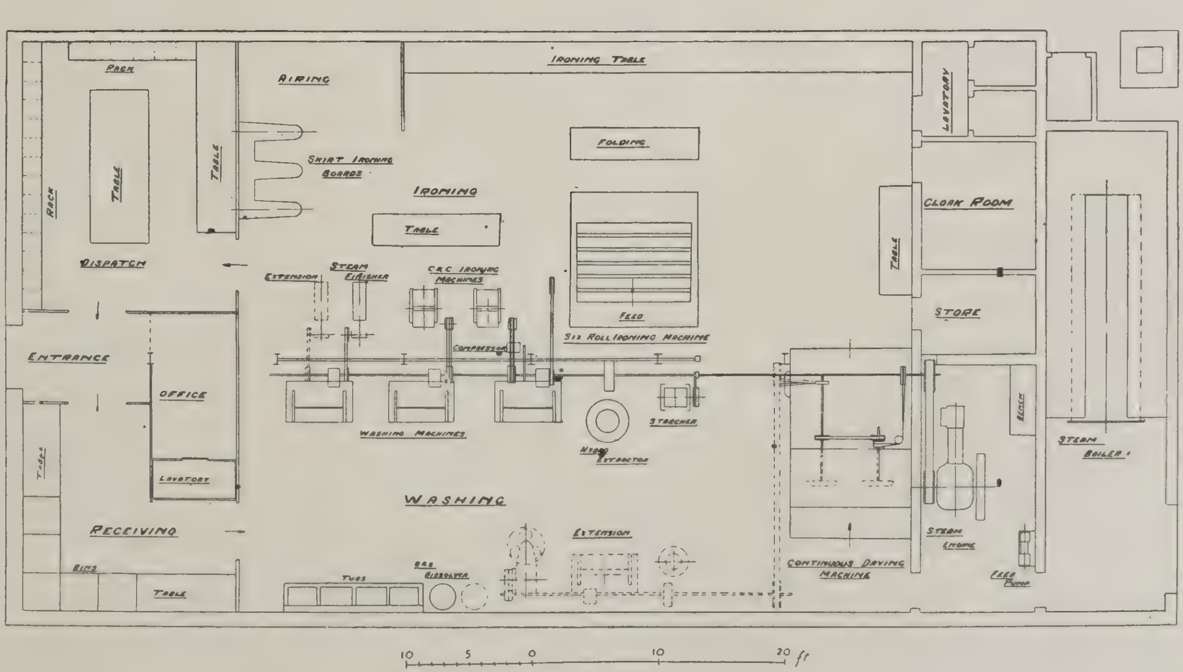
in live steam and a corresponding reduction in the coal bill. Usually the deciding factor between electric and steam engine drives is that of relative costs, and where current can be obtained at a reasonable rate and the supply is reliable, electricity is usually the cheapest. Whatever type of drive is adopted a constant steam supply at a pressure of not less than 70 lb. per square inch is essential, and therefore a steam boiler is necessary.

Smaller laundries usually have upright or vertical boilers, owing to their low cost and the fact that no brickwork setting is required, but as a rule the fuel consumption in this type is relatively high. In larger commercial laundries and public institutions the Cornish or Lancashire types are more suitable, and ought always to have a reserve of power to cope with additions to the plant from time to time. The customary steam pressures required in a laundry do not vary from 10 lb. in the washhouse to 70 or 80 lb. per square inch in the ironing-room.

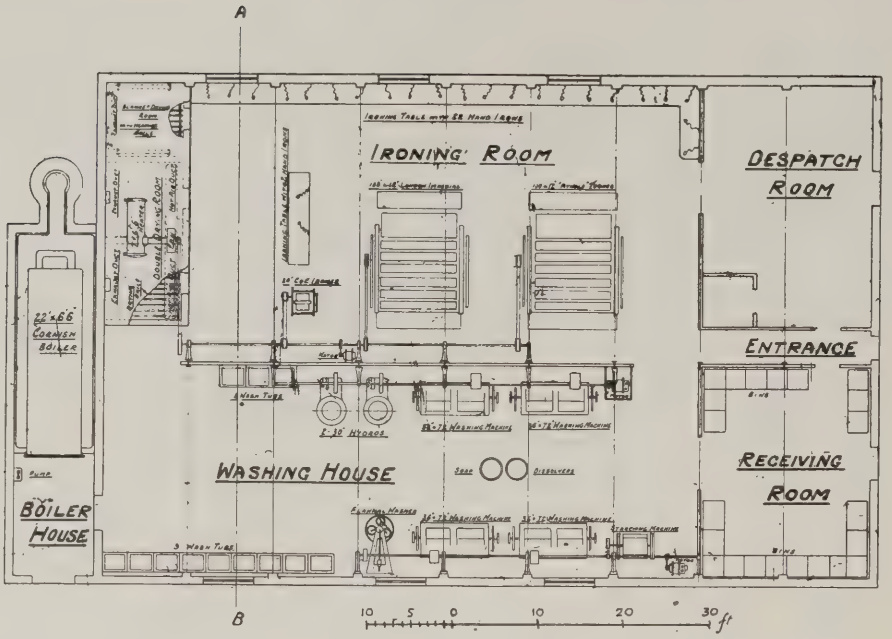
The types of machines do not differ materially in any laundry whether commercial, institution or private, except in regard to sizes. In the commercial establishments there are, of course, several machines performing subsidiary duties such as goffering, pressing, seam dampening, collar blocking and polishing, which are dispensed with in, say, a hospital equipment where the chief thing is to get through a large volume of plain washing, drying and ironing.

The nucleus of all plants is, one or more metal rotary washing machines, with perforated brass cylinders and steel outer casings; a hydro extractor, with a steel basket with outside casing of boiler plate; one of the many forms of drying chambers, and a multiple roller ironing and finishing machine, which may be of any size from two to eight rollers, and an auxiliary airing drum according to requirements. The general tendency now in all laundries with a fair turnover is to adopt the multiple roller ironing machine in preference to the single roller type, as it is suitable for a larger variety of work, and is better adaptable for use by unskilled labour. Some of those calenders are of enormous size, weighing as much as twelve tons and having an output of 10,000 pieces of flat work per day.

Laundry machinery design within recent years has all been in the direction of speeding up output, and saving hand labour wherever possible. The washing machine and hydro extractor are run much faster, and are designed to wash and rough dry the maximum number of loads per day. In ironing machines this tendency is even more pronounced, and the new public demand for a "semi-finished" family service will doubtless result in a general change over from slow-running ironing machines to the newer



A COMMERCIAL LAUNDRY, SHOWING ALLOWANCE FOR EXTENSION.



A LARGE LAUNDRY FOR HOTEL WORK.

" dried once through " types running at anything from thirty to fifty feet per minute.

In a private mechanical laundry, such as that fitted into large mansion houses, the arrangement and composition of the plant is exactly the same as in a town laundry except that everything is on a smaller scale. The usual fittings consist of a small vertical boiler, a motor, or engine about six to eight horse-power, a fifty shirt all-metal washing machine, a 20 in. hydro extractor, a brickbuilt drying chamber about 8 ft. by 6 ft., with steam coils and a ventilating fan, a single roller steam heated calender, say 72 in. wide, and three or four electric hand irons. The complete installation would probably cost about £700, but is very convenient in isolated country places where it is desired to deal with the household linen.

Usually the public works laundry is a primitive affair for washing waste rags, and consists of a washing machine and hydro extractor only, although in many large factories where the workers are garbed in overalls, and where there are large canteens and staff restaurants, a plant on the lines of a small commercial laundry is installed.

Sheffield and South Yorkshire Architects

The following officers and council were elected at the annual general meeting of the Sheffield, South Yorkshire and District Society of Architects and Surveyors : President, Mr. J. R. Wigfull, A.R.I.B.A. ; Vice-President, Mr. H. L. Paterson, A.R.I.B.A. ; Hon. Treasurer, Mr. R. W. Fowler, F.S.I. ; Hon. Secretary, Mr. H. B. S. Gibbs, A.R.I.B.A., 15 St. James Row, Sheffield. Council : Messrs. W. G. Buck, Licentiate R.I.B.A. ; F. E. P. Edwards, F.R.I.B.A. ; C. M. Hadfield, F.R.I.B.A. ; J. R. Hall, M.S.A. ; C. F. Innocent, A.R.I.B.A. ; J. M. Jenkinson, A.R.I.B.A. ; H. I. Potter, A.R.I.B.A. ; C. S. Sandford, F.S.I. ; F. W. Wrench, Licentiate R.I.B.A. The annual report and the statement of accounts were approved, and the outgoing president, Mr. C. B. Flockton, was congratulated on his election as a member of the Council of the R.I.B.A.

Glasgow Housing Exhibition

The Glasgow Corporation Housing and Health Exhibition will open on October 2 in Kelvin Hall, and will run for the full period of three weeks. At this early date the amount of space booked by firms anxious to display their ware is exceptionally good, and the exhibition gives every promise of being more outstanding than any of its three predecessors held in the same hall. Many new features will be introduced, which are certain to popularize the undertaking. It is admitted on all hands that trade generally, which has been at a low ebb for a considerable time, is on the mend, and that the opportunity is extremely fitting for an exhibition such as housing and health. The provision of housing accommodation is notoriously inadequate, particularly in all large towns, and there is every prospect now of an immediate effort to cater for the existing necessities. This will create a demand for the various trades closely identified with building.

The classification of exhibits in the building section will include reinforced concrete, brickwork, concrete slabs and blocks, asphalt, asbestos slabs, tiles, marbles and mosaics, casements, cements, chimney pots, cowls, etc., roofing materials, doors, door and window fittings, flooring, glazing, and timber of all kinds, art metal work, mouldings, plaster, chimney pieces (metal and wooden), stone. The band of the Scots Guards has been engaged to provide the musical programme during the run of the exhibition. There are still a number of spaces available for stands, but early application to Mr. C. P. Hainsworth, the General Manager, Kelvin Hall, is advisable.

Correspondence

" Cubic Content Estimates "

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Mr. H. E. Rolley, in his letter to you on the subject of my article "Cubic Content Estimates," states that "it has recently become the custom to deride the old-established method of arriving at an approximate cost of a proposed building." Although I am not aware of any such custom, I should not be surprised to find that the old method is regarded as not altogether satisfactory. He gives us as an instance (to prove the existence of the custom I suppose) the Government Committee report on Housing, which states "that cubic content is not in direct relation to cost"; but why the unimaginative rows of cottages should be one result of this, I am unable to follow.

In the second paragraph of his letter he apparently thinks the two quotations he has taken from the article apply to the same thing. He will find this is not so; the one applies to a proposed building, and the other to a completed one.

Further, your correspondent is not quite correct in concluding that I have "merely devised a method for arriving at relative values for different constructions. . . ." This is one view of the matter, but not, to my mind, the only one or the most useful. I have not, strictly speaking, "devised a method," but suggested an improvement on the existing method whereby its fluctuating element is eliminated. The view I take is, that this improvement would give architects a better conception of the unit cost of buildings than is obtainable to-day under the old system.

Nothing Mr. Rolley has written disputes what I set out to show, viz., that the present system is mathematically unsound.

Meanwhile, any cost data that he or any of your correspondents can supply of post-war buildings would be of value and, I am sure, appreciated by others besides myself. W. PARRY JONES.

Parliamentary Notes

BY OUR SPECIAL REPRESENTATIVE.

Housing Progress.

Before Parliament rose for the summer recess, Sir A. Mond, in reply to Sir Wm. Davison, said that the number of houses completed under State-aided schemes by local authorities and public utility societies was 122,807, and by private builders under the Government subsidy scheme, 36,803. Under the latter heading further claims had since been received in respect of 1,832 houses completed by June 23. There were 35,971 houses under construction by local authorities and public utility societies, and there were 17,222 houses remaining to be built by local authorities. The total capital cost of the assisted housing schemes, when completed, was estimated at £190,000,000. In addition, the total sum paid or in course of payment in subsidy to private builders was £9,300,000.

Enquiries Answered

The Editors cordially invite enquiries from readers who require information on architectural, constructional, or legal matters. Answers to enquiries are in all cases the work of experts ; and while every care is taken to make the replies thoroughly reliable, the Editors cannot hold themselves responsible for any inaccuracies that may inadvertently occur. Correspondents whose difficulties involve possible legal proceedings are strongly urged to consult their solicitors before taking action on any advice that may be given. Examination questions cannot be answered. It must be understood that, as a rule, both question and answer will be published in these columns. The name and address of the querist must always be given, not necessarily for publication. Correspondents are requested to be as brief as possible, and to write on one side of the paper only.

Dry Rot in Dancing Floor.

"A." writes : "I am advising in the case of the floor of a dancing-hall which is undoubtedly affected with dry rot through lack of ventilation beneath. I am suggesting taking out parts of floor and joist, etc., below affected ; arranging for free current of air, and covering whole of joists and underside of floor and stonework and brickwork in connection with floor with a solution of corrosive sublimate. What strength should this be applied, and would one coating suffice ? I have heard of boiling tar being used in such cases, and would like to hear the opinion of anyone who has dealt with similar work as to best method to employ."

—When a floor is affected by dry rot the parts attacked generally require cutting out entirely and the surrounding parts—timber, stone, or brickwork—to be well scraped and painted over with a strong solution of sulphate of copper (blue vitriol), or with bichloride of mercury (corrosive sublimate) ; but it must be remembered that the latter is highly poisonous, and is therefore seldom used. Tar is not recommended for indoor work. The greatest care should be taken in removing the parts affected with dry rot, as the germs of the fungi producing it are carried easily in all directions, and may infect good timber. Good ventilation may prevent further spreading, but a floor that has once been attacked is always doubtful.

Rights of Light.

H. writes : "Please give me your opinion on the following point with regard to rights of light and air. There is in existence a line of buildings about 45 ft. high, having shops upon the ground floor about 12 ft. high, projecting 16 ft. in advance of the main portions of the buildings. Recently the whole of my client's building has been demolished, and consent has been obtained from the L.C.C. for the erection of a new building about 50 ft. high in line with the old shop front. The buildings face north-east, and the road is about 80 ft. wide. Can the adjoining owners claim a right to light in the front of the upper portions of their buildings ? I enclose sketch plan and section [reproduced] showing the positions of the windows in question."

—I understand that the present buildings are all about 45 ft. high, but are set back 16 ft. so far as the upper floors are concerned—and that it is proposed to carry forward a portion (in the centre) to a height of 50 ft.—an alteration which naturally must be detrimental to the property on either side unless that be similarly treated. If I thus correctly understand the facts, there is no doubt whatever that the proposed building will injuriously affect the light of the windows near the new side walls, but it will be a "question of degree" as to whether those owners can maintain an action for damages against the owner of the new buildings. The loss of light must be material and substantial before a Court will recognize it. Why not consult the owners and occupiers on either side before a start is made and compromise the matter by white bricks or cash payment ? F.S.I.

Property Questions.

J. C. writes, "Can you tell me (1) What is meant by the term 'Economic Rent' ? (2) What is the basis for assessment on property : (*a*) dwelling houses, (*b*) shop or business premises, (*c*) factories ; and (3) What is the advantage of raising the assessment of property ? To get money instead of raising the rates ?"

—Your questions are rather more theoretical than practical in character, but I will endeavour to answer them on broad principles.

—(1) The meaning of the term "economic rent" is that rent which a particular property is worth in the free and open market, presupposing the existence of a willing landlord and a willing tenant, and taking into consideration all the existing circumstances which enable a landlord to let his property for that money and which permit a tenant to pay the rent.

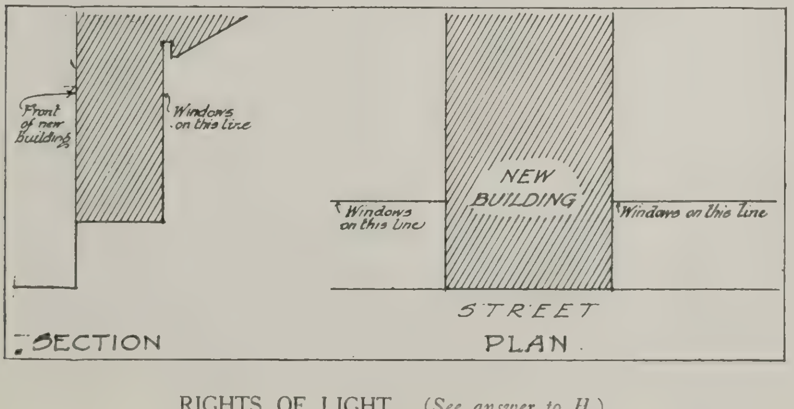
(2) The basis of assessment is always "the rent at which the hereditament might reasonably be expected to let from year to year."

(3) Yes, if the valuations of all the properties in a parish are raised fairly and equally it does not matter at all to the ratepayer—the same amount of money must be raised for the public services. The drawback to such a raising of assessments is that the spending bodies are apt to think they have more money to spend—perhaps extravagantly —if the poundage becomes lowered by reason of a higher basis on which to charge. F.S.I.

Cast and Milled Lead.

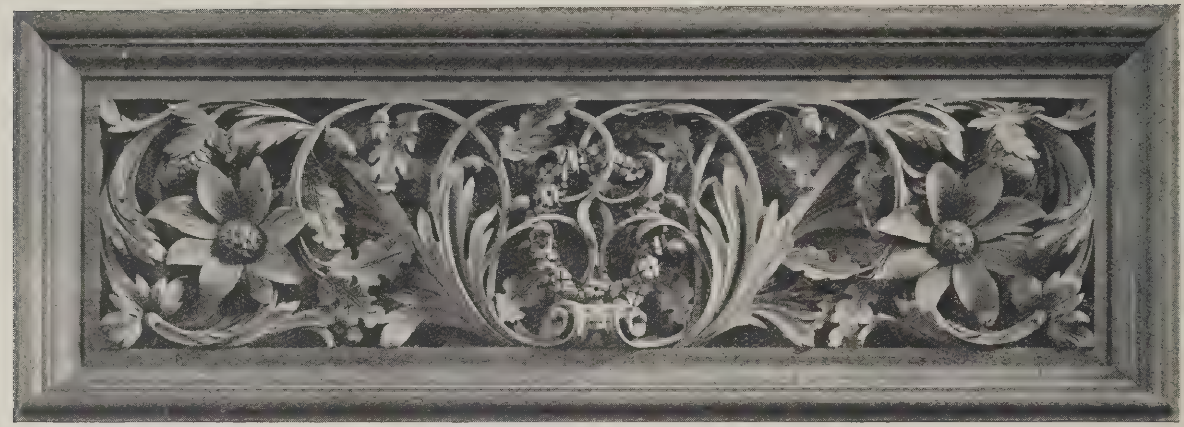
F. J. L. writes : "Is there any practical reason, apart from sentiment and weathering appearance, why cast lead is used in preference to milled on buildings of historical and other value ? I am concerned in a roof which is of low pitch with a high parapet, and is consequently hidden. It has no traffic upon it. Cast lead was specified, but the above question was put by a practical-minded member of the committee, who rather favours milled, and we find it difficult to refute the undoubted good qualities of the latter as regards wear."

—Cast lead is thicker and heavier than milled lead, and has a harder surface. It is, however, liable to flaws and sand-holes, and is irregular in thickness, on account of which it should not be used of a lighter substance than 6 lb. per sq. ft. Cast lead is often made by the plumber himself out of the old lead waste pieces and clippings that accumulate in the course of his work. For this reason, and because he is not an expert in casting, it may at times be very unreliable. Milled lead is more uniform in thickness, bends easily, but appears to be more liable to crack when exposed on a roof. The bias in favour of cast lead is probably a survival of the time when there was no milled lead, and no one at the present time could reasonably object to the use of milled lead of the proper thickness, according to the purpose for which it is to be used. HENRY ADAMS.

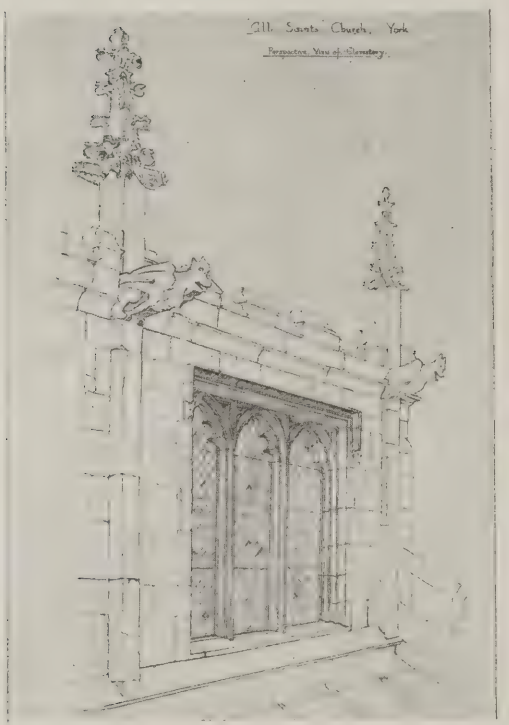


RIGHTS OF LIGHT. (*See answer to H.*)

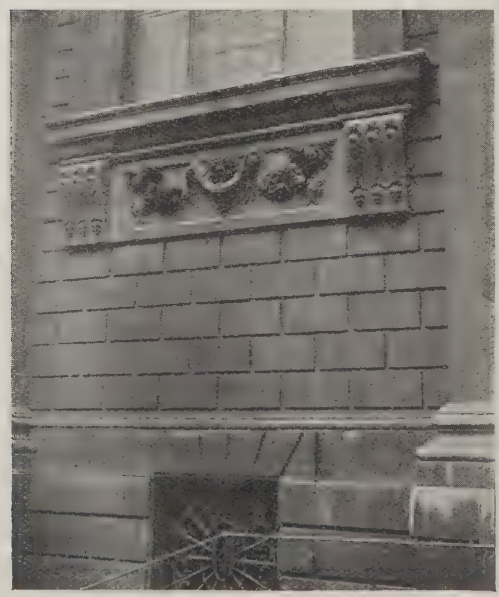
A Pictorial Review



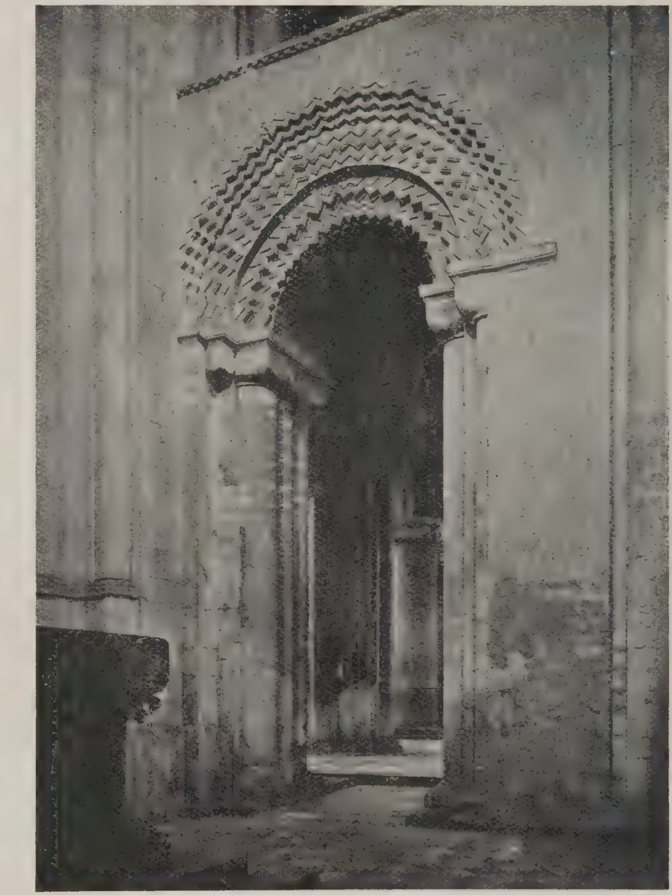
This is a detail of a carved panel in the library of Queen's College, Oxford. It is attributed to Grinling Gibbons. Deeply pierced, it is a superbly strong and vigorous example of the naturalistic carving of the period.—H.S.



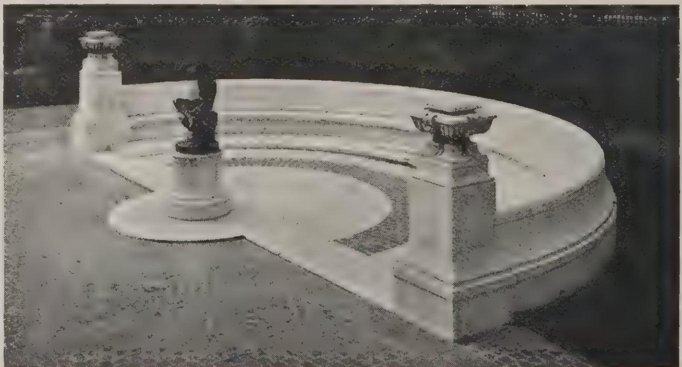
As an example of Perpendicular Gothic architecture, the above pencil sketch, of the clerestory of All Saints' Church, Pavement, Yorks, should be of interest to students.—W. O. N.



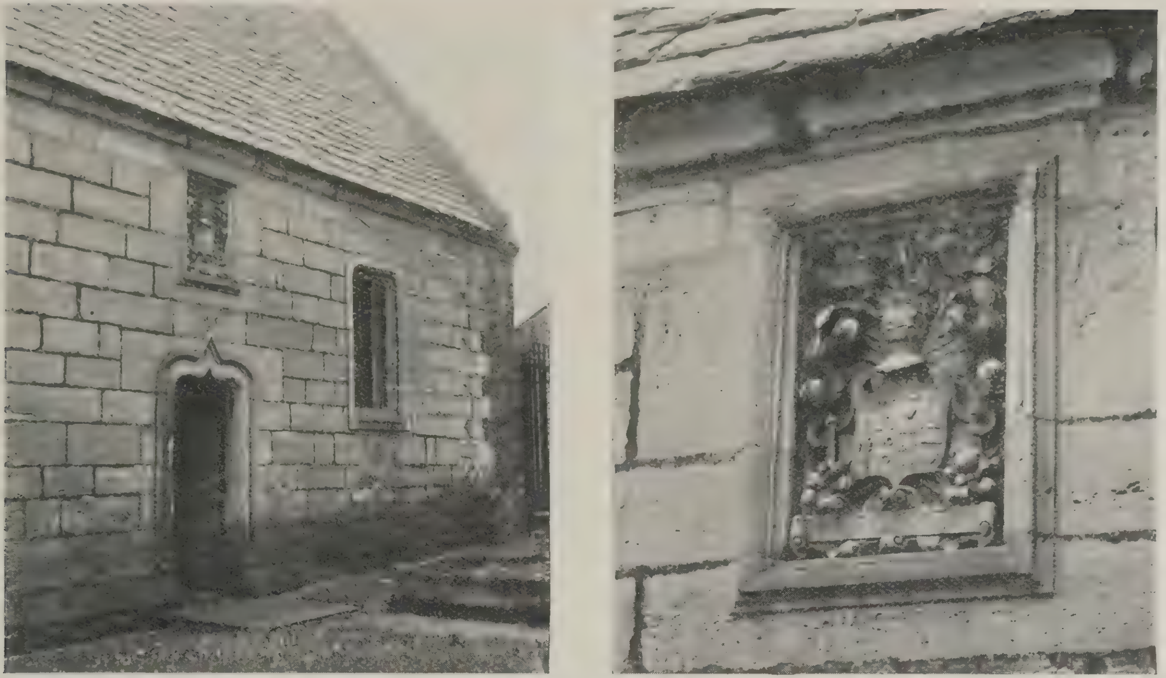
This snapshot of a detail of St. Paul's Cathedral is interesting for what it shows of Wren's treatment of an ornamental cill in conjunction with rustication.—G. P. R.



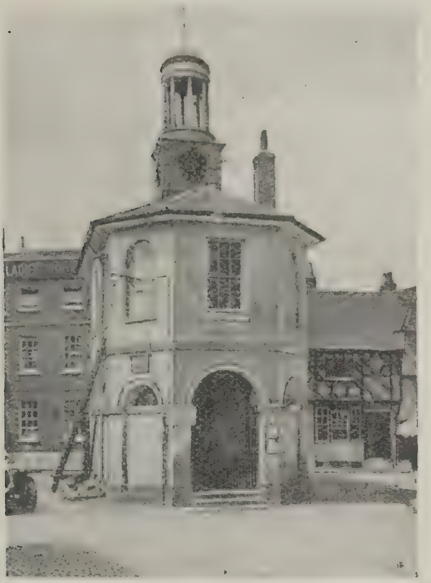
I send you a photograph of an arch at the west end of the south side of the nave of Ely Cathedral. It is a splendid specimen of late Norman work, the dog-tooth ornament being particularly fine.—W. R.



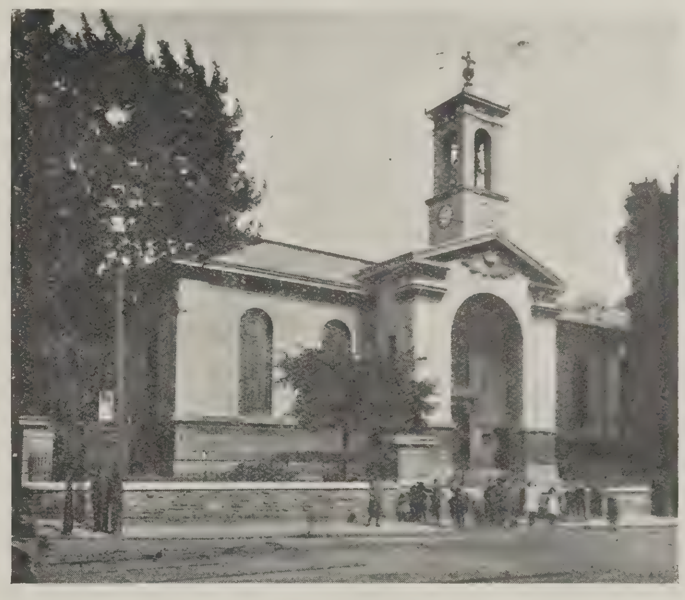
I send you a view of the semi-circular seat in the garden of the Musée Galliera, Paris, which was erected from the designs of Léon Ginain between the years 1878 and 1894. It is, I think, a charming as well as a useful adornment.—H. B. C.



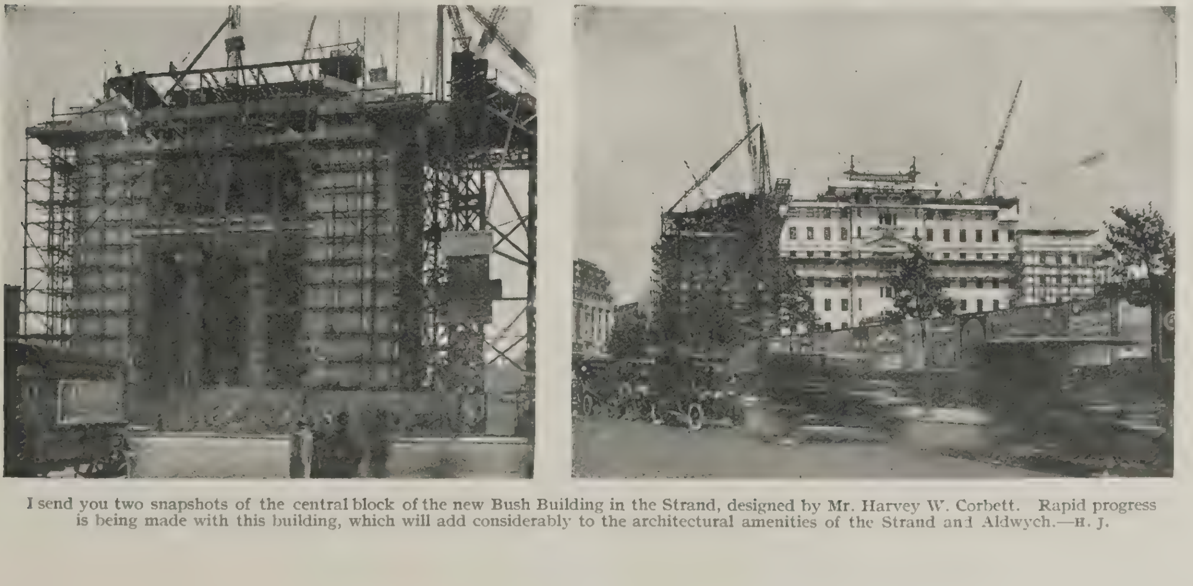
The first illustration shows part of the front of Skelmorlie Mausoleum, at Largs, built by Sir Robert Montgomerie in 1636. The second is a detail of the coat of arms of Montgomerie and Eglinton over the door. The scroll bears the words "The Lord only is my support," and, "Only to God be Laud and Gloir," while underneath the shield are the date and initials of Sir Robt. Montgomerie and his wife.—J. T. G.



The Market House at Godalming, a diminutive little structure, was built just over a century ago. Note its unique shape, generous eaves, and dainty cupola.—ANON.



Trinity Church, Hotwells, Bristol, was designed, in 1829, by Professor C. R. Cockerell, who persuaded the donor to accept a simple scheme, Tuscan in character. The pediment is enriched with a crush of sculptured ornament, executed by the sculptor Tyley. The cupola above the pediment foils the solidity of the building and gives a sense of grace.—ANON.



I send you two snapshots of the central block of the new Bush Building in the Strand, designed by Mr. Harvey W. Corbett. Rapid progress is being made with this building, which will add considerably to the architectural amenities of the Strand and Aldwych.—H. J.

Tests on Ranges and Cooking Appliances

Conducted by A. H. Barker, Whit.Sch., B.A., B.Sc.

THE combination of functions in a cooking range is a very wasteful feature. This is one of the many important conclusions reached by Mr. A. H. Barker, Whitworth Scholar, B.A., B.Sc. (Lecturer on Heating and Ventilating Engineering at University College, London), in his report, just issued, on his "investigation into the relative merits of various kitchen ranges with a view to determining types which might be standardized for use in housing schemes." It is pointed out that in so far as a cooking range is suitable for one purpose, it is almost of necessity extravagant for others. The essential principle of economy in the use of heat is that the heat developed shall not be allowed to escape in any other direction than the desired one. Where a range is used for warming a room, for instance, it is obvious that the ready escape of heat into the room is an essential feature of the apparatus. It cannot, therefore, be economical for other purposes such as boiler or oven heating, for which it is necessary that the heat shall not readily escape.

It must be recognized, however, that a deep rooted prejudice undoubtedly exists in various parts of the country, particularly in the North, in favour of certain old-fashioned types of open range, and this is a factor which cannot be ignored. The Yorkshire range, for example, which is to be found in most working-class cottages in mining districts in the North is designed to fulfil the following functions :—

(i) To throw out a considerable amount of radiant heat for heating and roasting purposes.
(ii) To provide an open fire for general cookery, boiling, etc.
(iii) To dry clothes.
(iv) To bake bread and serve for other oven-heating operations.
(v) To heat water for baths.

This strong prejudice in favour of an open-fronted fire appears to be peculiar to this country. In most other countries a cooking range fire is usually closed. In an up-to-date French range the fire cannot be seen unless the top covering is removed. The fire is enclosed to such an extent that only sufficient air is allowed to enter to create the necessary combustion.

Mr. Barker defines the kitchen range as "a combination of several different apparatus, such as a fire-heated oven, fire-heated hot plate, fire-heated hot-water supply boiler. It is frequently also intended, especially in small houses, to serve as a means for warming the room in which it is fixed. It has to serve for such purposes as boiling kettles, toasting bread, drying clothes, warming plates, and similar duties. All this work is designed to be accomplished by one fire." In the course of his reports he says: The technical "efficiency" of a range is difficult to determine definitely because it is shown to depend to a large extent on the kind of fuel used, the way in which the fuel is burnt, and other factors, also on the conception adopted of the meaning of the expression "efficiency."

Two complete series of experiments were made on each range, which may be generally described as (1) physical tests, (2) practical trials. The efficiency observed in the experiments under series (1) was the ratio between the work done and the amount of heat in the fuel consumed. The fuel was burnt on an artificial system so as to secure as far as possible constant thermal conditions in the plant itself, the "work done" being also reckoned on a similarly arbitrary and artificial basis, e.g., the heat communicated to certain vessels of specified size under certain arbitrary conditions which were made to resemble as nearly as possible the actual conditions prevailing when the appliance is used in practice. The efficiency of the hot-water supply was calculated as the ratio between the heat communicated to the water and that in the fuel consumed. All these were observed at several different rates of fuel consumption.

In each case, the plant tested consisted of the several different functions or parts of a range combined in one appliance. For the purposes of the test, it was necessary to assume that each such function was a separate appliance. It was assumed, for instance, that during the hot-water supply tests the range was required for no other purpose than that of hot-water supply. All the heat escaping into the other parts of the apparatus was regarded as lost for the purpose of this experiment. Similar observations were made in respect of each separate function. The total gross efficiency of the entire plant was taken to be the sum of the separate efficiencies taken when the appliance was used in one particular manner corresponding as nearly as possible to practical conditions.

Each range was so erected that any rate of draught could be exactly maintained by artificial means. Instruments were designed and constructed for observing the various quantities dealt with, such as the quantity of coal burnt and ashes produced, the intensity of the draught, the quantity of flue gas, the chemical analysis of the same, the quantity of hot water produced, the "temperature" or rate of transmission to vessels placed in the oven, the heat communicated to the separate hot-water supply and to vessels placed on the hot plate, and the like. Each delivery of fuel used was tested in the calorimeter. It was necessary, in order to obtain a sound basis for the experimental results, to make preliminary investigations of certain highly technical questions bearing on the efficiency.

One difficult question having an important bearing on the result was how to deal with apparatus having ovens of different size. After considerable investigation it was found that in two apparatus of the same design, but of different size, the consumption of fuel for equal effect varied in proportion to the surface area of the flues surrounding the oven on the one hand, and the surface area of the hot plate and the surface of the hot-water supply boiler on the other, and that two such appliances could be reduced to a common denominator by estimating the fuel consumption per square foot of such surfaces. This was done in all cases. It introduces great complication of calculation. It was shown by experiment that the rate of heat transmission to vessels of different size placed in the same oven varied as the superficial area of such vessel for small surfaces only : in other words, that both the consumption and the transmission varied as the square of any one linear dimension. For larger vessel surfaces the rate of transmission per square foot of surface decreases as the surface of the vessel increases. This question was investigated experimentally.

A series of experiments was made in order to determine the relative economy of open ranges of the type known as "Yorkshire," and closed ranges of the ordinary type. The extravagance of the Yorkshire type is obviously due to the great excess of air inevitably used for combustion in an appliance of this type.

Extended investigations were made of the degree to which losses were caused by the excessive aeration of the products of combustion. This was proved to be the principal cause of loss in a range. It arises through leakage into the furnace chamber and flues of cold air from the kitchen. The more perfectly this leakage can be prevented the greater is the economy. Apparatus were tested in their original form, and were so altered as to reduce the excess of air employed, and the differences in consumption noted. Prevention of leakage of cold air also has a most important effect on the draught induced by the chimney. A condition of air-tightness was shown to be inconsistent with some of the facilities usually demanded by the cook, such, for instance, as the ability to toast bread at the front of the range. It was proved that one condition of maximum economy is that the fire should be so completely enclosed that air cannot obtain access to the furnace or chamber flues otherwise than through the incandescent fuel. The thickness of the fuel should be adequate to carbonize as much as possible the air used for combustion. The composition of the flue gases is a reliable criterion of this effect.

In no case of an ordinary range did the analysis of the flue gases, which was made continuously throughout all the later tests, show more than 2 per cent. of CO_2, indicating that at least six to ten times as much air for combustion as is necessary is commonly used. The most economical results in general boiler practice are secured when the proportion of CO_2 in the flue gases is about 12 per cent., but no figure even approximating to this value was ever obtained throughout the whole experiments. Those ranges in which the fire is totally enclosed in some cases rose as high as 7 per cent., and showed a correspondingly high efficiency.

It was found that in two ranges of similar general construction, as the efficiency of the hot-water supply and of the hot plate rises, that of the oven decreases almost in proportion, the total efficiency of the appliance considered as a whole being roughly constant for apparatus of the same general construction. This proves the great influence which the hot-water supply portion of the plant has on the efficiency of the oven.

In order to investigate this matter two of the appliances were tested in the following way: continuous observations were taken for several weeks of the apparatus provided with the usual back boiler. The latter was then removed and replaced by firebrick blocks, and the same appliance then tested without the boiler. It was found in both cases that the total consumption was reduced by from 50 per cent. to 66 per cent. when the boiler was removed. This proved that the presence of a boiler in a range is a very extravagant feature considered in relation to the use of the apparatus as an oven. On calculating the total efficiencies by adding together the individual ones taken in one arbitrary condition, it was found that there was a surprising measure of uniformity between most of the ranges of the same general type. Some few of them of unusual type were widely different from the bulk, but in the main it may be said that the ordinary efficiency of such an appliance when all the functions are in use simultaneously for cooking purposes, with the oven regarded as the principal function, is in the neighbourhood of 7 per cent.

An investigation was made of the relative advantages and disadvantages of different positions of the oven in regard to the fire. It was found in all cases that those ovens which were placed immediately over the fire so that the fire played on the bottom of the oven before reaching the top were very much more efficient in direct transmission than in the opposite case. But it must not be lost sight of that for many oven purposes, the effect of what is called "top heat" is very different from that of "bottom heat." In some cases "top heat" is very necessary to produce crisp baking effects and the like. Also the arrangement of the fire below the oven hinders its effective use for hot plate and boiling purposes, and the simultaneous cooking in the same oven of articles requiring widely different treatment, e.g., baking bread and milk puddings. This difference again raises the question of the operation of radiated and convected heat in the interior of an oven, a scientific question of great difficulty. The result of the practical investigation shows that "top heat" is much more expensive in fuel than is "bottom heat," and this cost is rendered all the greater by the common practice of using the top part of the flue above the top of the oven as a hot plate, thereby producing heavy cooling effects.

The effect of hot plate was also investigated by clothing the hot plate in several of the appliances with a heavy asbestos mattress, which to a large extent diminished the heat lost from the hot plate. The effect on the oven economy was most marked. This device alone decreased the fuel consumption for a given effect by some 35 per cent., varying at different rates of consumption to some 20 per cent.

The general conclusions arrived at are that the combination of several different functions in one range renders each such function excessively extravagant when considered alone. The combination is only relatively economical when all the functions are in use simultaneously. Even in that case existing designs cannot be called really economical, because of the circumstance that the consideration kept in view in making such designs has been the convenience, compactness, and cheapness of the whole device, and not the conditions which would lead to a maximum of economy, which latter are in many or most cases inconsistent with the foregoing. Further, it is open to question to what extent all the parts of a cooking appliance are actually required simultaneously in ordinary practice. It is only rarely that this combination is required in a small house. No doubt during the preparation of a big dinner of several courses all parts of the plant might be required simultaneously, but generally in a small household only one part of the appliance is wanted at one time.

For instance, in a working man's house at breakfast time the hot plate is the only part of the appliance needed. All the operations necessary for the preparation of a working man's breakfast can be easily conducted on the hot plate only. If, therefore, the apparatus is such that the hot plate cannot be heated without simultaneously heating the oven and the hot-water supply, it necessarily involves great extravagance in fuel. Similarly, it may be that in a working-class family the children receive only a weekly bath, and that for the purposes of saving fuel they are all bathed on one particular night, generally Saturday night. On that occasion the hot-water supply portion of the plant only is needed, and any heating of the oven and hot plate is unnecessary, and even in summer very undesirable. A separate hot-water supply apparatus of simple character uses only one quarter of the fuel required by a range boiler. Several of these have been tested.

Thus, in the interests of economy, each portion of the plant should be designed for maximum economy separately. Whether or not this condition may be secured with only one fire is one of the principal practical questions raised by this investigation. The disadvantage—amounting to impossibility in many cases—of supplying more than one fire for a very small apparatus is, of course, recognized.

The diagrams and tables accompanying the report give generally the results of all the experiments made, each graph representing the results of about three or more weeks' experiment on the one apparatus. The varying shape of the graphs in some cases is noteworthy, and is fully discussed and explained in the report.

Physical Tests.

Of all the ranges tested the lowest efficiency recorded in oven transmission was 1 per cent., that is to say, that the ratio between the amount of heat communicated to the standard vessel in the oven and that in the coal consumed was in this proportion. The highest such efficiency was 5 per cent., except in specially designed appliances in which it rose to 17 per cent., the average of all commercial ranges being about 2½ per cent.

In all the apparatus submitted the lowest efficiency of the hot-water supply portion of the plant was 8 per cent., while the highest was 18 per cent. to 20 per cent. The latter figure was only reached in one case. The great majority of the ranges tested have an efficiency of 11 per cent. to 12 per cent. Special ranges designed by ourselves reached 45 per cent.

The efficiency of the hot plate varied between 1 per cent. and 5 per cent. 12 to 20 per cent. can easily be secured in specially designed appliances.

Considering the apparatus as a whole, the total amount of heat usefully employed when all the apparatus was in use together for cooking purposes was calculated in each case against the total heat in the fuel consumed. These efficiencies in all cases varied with the consumption. Generally it was found that the higher the consumption the greater was the efficiency, a somewhat surprising fact.

The lowest efficiency was about 5 per cent., the highest about 11 per cent., and the great majority about 7 per cent. 30 per cent. was easily obtained in apparatus of special design.

Practical Tests.

These tests were designed with the object of investigating the economy of the various appliances as they would be used in practice in the cottage of a working-class occupant. A standard menu was drawn up in consultation with a body of experts, consisting of Dr. Janet Lane-Claypon, Mr. Herman Senn, and Mr. M. T. E. Jackson. This standard menu was designed to test the capacity of the appliance for stewing, baking, casserole cookery, and light cooking, also for supplying definite quantities of hot water at definite times of the day. The standard menu was carried out on each of the ranges tested, and comparison made between the fuel required in each case.

It was found in all cases that the result of the physical tests described above was a very sound guide to the economy of the appliance in practice. A carefully detailed report on the performance of each range was drawn up at the conclusion of the experiments, based on the practical convenience, durability, rapidity, and economy of the appliance as appearing to the experimenters after a test, which in each case extended over about three weeks. Though it is possible that some of these criticisms may be to some extent matters of opinion, they were drawn up after very careful consideration being given to the matter by the members of the Building Materials Research Committee, whose opinion was in all important matters unanimous.

The Committee have arrived at the following conclusions as to the principles which should guide the construction of cooking ranges to secure fuel economy, so far as these may be applied consistently with convenience and other considerations.

(A) *Resulting from Physical Tests.*
  (i) Air should only have access to the fire through the grate bars; the fire should therefore be as completely enclosed as possible.
    (*a*) The furnace should be lined with non-conducting material except at any part where heat is required to be directly transmitted;

(*b*) The fire should have a minimum thickness of about 5 in.

(ii) In-leakage of air into the flues and oven should be prevented, hence

(*a*) loose rings in the hot plate and cleaning door should be reduced to a minimum;

(*b*) the cleaning doors, rings, and other parts of the range where leakage of air could take place should fit with as air-tight joints as practically possible;

(*c*) the fit of the oven door should be as good as practicable.

(iii) Loss of heat through surface radiation should be prevented whenever such surface is not required for cooking or heating purposes, hence

(*a*) the oven door and iron plates on the top and front of the stove should be lagged with non-conducting material;

(*b*) the flues adjacent to the faces of the grate, other than the hot plate, should likewise be lined with non-conducting material;

(*c*) only such area of hot plate as is required for cooking purposes should be exposed to direct heat.

(iv) For economy the hot gases should impinge on the bottom of the oven as soon as possible after leaving the fire, hence

(*a*) the fire is better placed relatively low to the oven;

(*b*) flues should be arranged so that the gases first pass under the oven and subsequently over it; top heat, however, is preferable for certain kinds of cookery; this may be provided for, though it should be borne in mind that top heat is relatively expensive in fuel.

(v) The fire should be immediately under, and able to radiate directly up to, that part of the hot plate where the strongest cookery or boiling effect is required.

(vi) Ranges should be designed to burn coke efficiently as an alternative to coal.

(vii) Appliances which combine several functions use considerably more fuel than would be required if each function were performed by a separate appliance.

(viii) The rising grate effects economy mainly by excluding cold air from the top of the fire when the grate is raised.

(B) *Conclusions derived from Practical Tests.*

(i) High rates of oven transmission are rarely necessary; they make the oven too hot for ordinary cooking.

(ii) The practice of using the interior of the oven as a hot plate and conducting therein many of the operations commonly done on the hot plate, is sound and economical.

(iii) Transmission of heat is facilitated by placing the vessel on the bottom of the oven; there is a danger, however, of the food burning.

(iv) An advantage of the movable grate is that it allows cooking to be conducted economically with the grate on the top notch, and, by lowering the grate, enables a toasting effect to be obtained, but at a great cost in fuel.

(v) Uniform oven temperature for a considerable period is desirable for certain operations, but a sharp rise in temperature is necessary for others, and a difference between top and bottom heat is very desirable.

(vi) Small ovens are generally much more economical in practice than large ovens, but skilful management is necessary to cook a large meal on a small range.

(vii) The height of the oven should be such that it is possible to examine the contents of dishes without removing them. The fireplace and the hot plate should be at a convenient height. An inner door to an oven having transparent panels is a great advantage.

(viii) A hot plate should provide a wide range of temperatures and only sufficient space to accommodate all the vessels ordinarily required during the preparation of a dinner.

(ix) Contact of the cold surface of a boiler with incandescent fuel is undesirable.

The report—"Fuel Research Board, Special Report No. 4"—is published by H.M. Stationery Office, price 2s. 6d. net.

Abstract Published.

181424.—Casting columns in situ. — Raskin, S., 1432 Montclair Avenue, St. Louis, U.S.A.—Shuttering for columns and the like is made adjustable so as to vary the diameter, and the sections telescope into each other to reduce the diameter as the height increases. The base section A, Fig. 4, is formed of substantially channel-shaped sections with upstanding flanges 7*a*, the ends interfitting to form a rectangular mould and the flanges preventing spreading under internal forces. Lugs 8 may be fitted at one end of each section to receive an end flange 8*a* on the intermediate or top sections, which are also provided with outstanding flanges 11 to interengage with the top flange 6 of the adjacent lower section, Fig. 1. Alternatively, a wedge cover 113, Fig. 5, may engage these abutting flanges and bind the sections together. Bolts 10 hold the sections in adjusted positions.

Rayner & Co., of 5 Chancery Lane, London, W.C. 2, Registered Patent Agents, from whom readers of the Journal may obtain all information free relating to patents, trade-marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

List of Competitions Open

Date of Delivery.	Competition.
Aug. 31	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
Sept. 16	Nurses' Home, Chelsea Hospital for Women. Premiums: £150, £100, and £50. Assessor, Mr. H. V. Ashley, F.R.I.B.A. Names by above date to Mr. H. H. Jennings, Secretary, Chelsea Hospital for Women, Arthur Street, Chelsea, S.W. 3.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8,000 francs.
Nov. 1	Labour-saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C. 4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Jan. 31, 1923	Labour-Saving Flats, Hampstead Garden Suburb. Premiums £500, £300, and £200. Assessors: L. Rome Guthrie, F.R.I.B.A., J. C. S. Soutar, Lic.R.I.B.A., and E. J. Cooper, Secretary, Second Hampstead Tenants, Ltd., to whom, at Temple Fortune House, Hampstead Way, N.W. 11, applications had to be made by August 11.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.

Competition News

Ideal Bungalow Competition.

The conditions of entry in connection with the "Daily Mail" Ideal Bungalow Competition have just been issued. Mr. E. Guy Dawber, F.S.A., F.R.I.B.A., and Professor A. E. Richardson, F.R.I.B.A., are the assessors, and prizes of £300, £125, and £75 are offered for the designs placed first, second, and third respectively.

Appended are extracts from the conditions :—

The bungalow is to have the following accommodation, which is to be provided on one floor: dining-room, drawing-room, kitchen (not to exceed 7 ft. by 8 ft.), four bedrooms, larder or pantry, bathroom, and one w.c. There should also be a maid's sitting-room adjoining the kitchen. The bungalow is to be suited to the country or to suburbs of a large city or town. The total floor area of the bungalow must not exceed 1,500 sq. ft., including walls. Competitors may by close planning get below this figure if so desired. The area of rooms, with the exception of the kitchen is left to the competitor.

Drawings to be in ink on unmounted white paper 30 in. by 22 in. to a scale of 8 ft. to an inch, within plain black border line, ¾ in. from all edges, the longest dimension being horizontal. All printing thereon to be in plain lettering. A scale to be drawn on the plan. The design to be shown on one sheet of paper and to be illustrated by: (*a*) A pen-and-ink perspective of the bungalow; (*b*) In bedrooms, 4 ft. 6 in. by 6 ft. 6 in. beds (double) or 3 ft. by 6 ft. 6 in. beds; dressing tables 1 ft. 8 in. by 3 ft. 6 in.; in dining-room the dresser or sideboard, table and chairs, and no other furniture to be indicated—all drawn to true scale in proper location on the plans. (*c*) Ground floor and elevations of principal front and of back, and one end of bungalow; a cross section from foundations to roof. (*d*) In a space within the border lines give a computation of the total area of the floor, including walls and the cubage based on these areas, and measured from bottom of foundations to one-half of height of roof, measured from plate to ridge. (*e*) A sheet, 30 in. by 22 in., of half-inch scale sketches of all novel suggestions or arrangements to be sent in to supplement this drawing, and all drawings and papers to be securely fastened together. (*f*) Not more than two sheets (30 in. by 22 in.) in all to be submitted. No name or mark or sign shall be placed on the drawings or on the package containing them, by which the author may be identified. Drawings to be packed flat, to avoid any creasing or crushing, in a sealed package, including an opaque envelope containing the name and address of the author, stating that the design is his or her own personal original work, and that the drawings have been prepared under his or her own personal supervision.

All packages to be addressed so as to be delivered to the Secretary, "Daily Mail" Ideal Bungalow Competition, 130 Fleet Street, London, E.C.4, *on or before* November 1, 1922.

Attached to the sheet of drawings must be a concise specification of materials to be used, the equipment of the bungalow, and explanation of suggested novelties, these not to exceed one sheet of foolscap, written on one side of the paper only. A water, electric and gas supply may be assumed, and no drainage need be shown.

Competitors may not enter more than one design. A high architectural standard of design is expected, but each design will first be considered from the point of view of labour-saving and economy of construction. An architect sending one entry of his own can collaborate with another (not an architect) in another entry.

"The Daily Mail" reserves the right to publish any design entered in the competition, with the name and address of the architect, also to erect bungalows or individual rooms according to any of the designs submitted; but, in the latter event, the author of the selected designs will be employed to superintend the erections, and will be paid for his services in accordance with the schedule of charges laid down by the R.I.B.A.

Any questions must be addressed to the Secretary, Ideal Bungalow Competition, 130 Fleet Street, London, E.C.4, on or before September 14, 1922.

Society of Architects' Design Competition.

Twenty-six, or about 75 per cent. of the provincial entrants, submitted designs in the preliminary test in connection with the Society of Architects' Second Half-yearly Design Competition, 1922, which closed on August 8, the subject being "A Memorial Tablet." The drawings were numbered as received, and the jury of assessors, Messrs. Percy B. Tubbs, L. Sylvester Sullivan, H. M. Robertson, and Thomas Wallis, after long and careful examination of the designs, selected the authors of the drawings marked 5, 8, 9, 10, 11, 17, 18, 20, and 24 to compete in part II of the competition. These were afterwards identified as follows :—

Licentiates: Arnold Taylor, of Bishop Auckland (11); Edward E. Bridge, of Liverpool (17).

Students: J. C. H. Bawcutt, of Oxford (5); Leo. E. McMullen, of Manchester (8); K. F. Harris, of Linton, near Maidstone (9); H. G. Avery, of Leeds (10); V. C. L. Saunders, of Ventnor (18); P. E. Tirley, of Warrington, Lancs. (20); W. J. Werry, of London (23); H. C. Wilkinson, of Nelson, Lancs. (24).

The final result of the competition, which is of the value of £40, will be published in the "Journal" in due course.

Improvement of Insanitary Areas in Scotland

The Scottish Board of Health have just issued a new leaflet with regard to the improvement of insanitary areas. As indicated in a previous circular issued by the Board, the Government have decided to give a grant of £30,000 per annum in aid of expenditure incurred by local authorities in respect of the improvement of insanitary areas. It is the intention that this sum will be available each year during the period of repayment of the loans, by way of contribution toward the annual expenditure of local authorities on these improvement schemes.

The proposed State contribution towards the improvement of insanitary areas is quite apart from the existing State scheme of financial assistance under which the liability of local authorities is limited to the annual produce of a rate of four-fifths of a penny in the £. If the local authority decide to formulate a scheme for the improvement of insanitary areas in accordance with the principles set forth in the circular, the annual State contribution will be a limited one and the local authority will be required to contribute out of the rates the remainder of the approved cost.

The usual procedure for the improvement of insanitary areas is that set forth in Parts I and II of the Housing of the Working Classes Act, 1890. Under Part I of that Act, which is applicable to Burghs, but which may be applied to districts other than Burghs by virtue of the terms of Section 28 of the Housing, Town Planning, etc. (Scotland), Act, 1919, a local authority may prepare what is termed an "Improvement Scheme" for the improvement or clearance of insanitary areas. Under Part II a "Reconstruction Scheme" may be prepared for a similar area, but which is too small to be dealt with by means of an improvement scheme under Part I. Under these schemes a local authority may be required to provide alternative accommodation for persons dispossessed of their houses in consequence of the scheme. In addition, therefore, to the cost of providing this alternative accommodation, local authorities may have to incur considerable capital expenditure in clearing the insanitary areas.

The object of the Government in giving the annual grant of £30,000 is to secure that, as far as practicable, the conditions under which dwellers in these slum areas live will be immediately improved. Slums will be cleared away, and existing houses repaired.

The Week's News

New Telephone Exchanges for Croydon.

Telephone exchanges are to be built at Thornton Heath and Addiscombe.

Wood Houses for Greenock.

Thirteen blocks of wooden houses, each containing four residences, are to be built by the Greenock Corporation.

New Baths for Birmingham.

Work has begun on the new swimming and private baths at Harborne and King's Heath. The cost is estimated at £43,000.

Herne Bay Improvements.

Herne Bay is considering a new sea wall, bathing pool, and roof promenade scheme.

Proposed New Library for Gateshead.

Gateshead Town Council are considering plans for a new, one-storey, library building.

More Houses for Jersey.

In Jersey Sir Jesse Boot is building an unlimited number of houses, and Mr. T. R. Mathews, forty.

Otley Parish Church.

Otley Church Council have inaugurated a scheme by which it is hoped to raise £1,250 to re-hang the bells and renovate the Parish Church and school buildings.

New Baptist Church for Clacton.

A new church is to be erected at Clacton by the members of the Pier Avenue Baptist Church. The cost is estimated at £15,000.

Stourbridge Consulting Engineer's Estate.

Mr. W. B. Collis, of Swinford House, Stourbridge, Worcs., consulting engineer, who died on April 24, aged 83 years, left £20,517, the net personalty being £18,749.

New Fleet Street Bank Premises.

New bank premises will shortly be erected in Fleet Street at the corner of Salisbury Court from the designs of Mr. C. J. Dawson, architect.

Restoration of Westminster Hall Roof.

It is expected that the restoration of the fourteenth century roof of Westminster Hall will be completed by March. The cost is estimated at slightly over £100,000.

Open-air Baths for Rhyl.

Rhyl Urban District Council have decided to proceed with an open-air baths scheme, estimated to cost £18,000, subject to the Government making a 50 per cent. grant.

Brussels Architectural Congress.

The Society of Architects will be officially represented at the Brussels Architectural Congress by its honorary secretary, Mr. L. Sylvester Sullivan, F.S.Arc., A.R.I.B.A.

New Church Hall for Merthyr.

The foundation stone has been laid of a new parish hall which is being erected in connection with the Cyfarthfa Church, Merthyr. Mr. E. W. G. Richards, of Merthyr, is the architect.

Forty-two Houses for Blaydon.

The Blaydon Urban District Council have approved a block plan, submitted on behalf of Messrs. W. & G. Gowland, showing the lay out for forty-two houses at High Horse, Close Wood, Rowlands Hill.

Hebburn Housing Scheme.

Hebburn Urban District Council have decided to seek the sanction of the Ministry of Health to build an additional twenty-five four-roomed houses, and seventy-five three-roomed houses.

Margate's New Houses.

The Town Council is about to erect twenty-two houses at Garlinge to £797 10s. per pair. About 100 houses have already been built by the Corporation in the southern part of the town.

University College : South-west of England.

The President of the R.I.B.A. has appointed Mr. G. C. Lawrence (President of the Bristol Society of Architects) as representative of the Royal Institute on the Court of Governors of the University College of the South-west of England.

The late Mr. Charles Trumper.

Mr. Charles Trumper, of the firm of Charles Trumper & Sons, Birmingham, a well-known figure in Midland building trade circles and a member of the Birmingham Builders' Exchange, has died at Sparkhill, at the age of 67.

Old Enfield Building in Danger.

The ancient building at Enfield known as the Palace, or Manor House, with its remains of Tudor domestic architecture and its historic associations, is in danger of being pulled down to provide a site for a picture theatre.

Sussex Church Tower in Danger.

Funds are being raised to repair a serious crack which is threatening the tower of Sompting Parish Church, Sussex. The tower was probably built in the early part of the tenth century, and is said to be the only Saxon-spired one in the country.

New Houses for Oswestry.

Oswestry Town Council have decided to make application to the Ministry of Health for a loan to erect pulveriser works to deal with the town refuse. The Council have received the consent of the Ministry of Health to erect twenty-five additional houses.

Bolton War Memorial Hall.

The foundation stone has been laid of a new war memorial hall at Bolton (Cumberland). Mr. A. Knewstubb is the architect. The building will have a main hall and be so arranged that a billiard room and reading room can be conveniently added.

Airdrie War Memorial.

The war memorial for Airdrie is to be erected at the west end of the burgh on ground given by Sir James Wilson. The memorial which will take the form of a cenotaph, was designed by Mr. J. Maurice Arthur, C.M.G., D.S.O., F.R.I.B.A., and selected by Sir John Burnet, A.R.A., in a limited competition.

New Bridge for Hendon.

One of the improvements which the Hendon District Council is undertaking this autumn is the rebuilding of the bridge over the River Brent at Decoy, near Temple Fortune. The old structure, which is more than a hundred years old, is altogether inadequate for the present traffic.

Mr. J. R. Wigfull, A.R.I.B.A.

Mr. J. R. Wigfull, A.R.I.B.A., has retired from the honorary secretaryship of the Sheffield, South Yorkshire and District Society of Architects and Surveyors, after a period of not less than seventeen years of service in this capacity. So long a term of office must be nearly, if not quite, a record in the history of the allied societies.

The Bournemouth Pavilion.

There is a controversy in Bournemouth about the new £100,000 pavilion scheme. A number of financiers want to float a company locally to build the pavilion at once on lines similar to those already proposed by the Bournemouth Borough Council, but the Corporation are anxious that it should be a municipal enterprise, and have already offered prizes for the best designs.

International Congress of Architects.

Mr. George Oakley Totten has been appointed representative of the American Institute of Architects to the International Congress of Architects to be held at Brussels in September. Mr. Totten will carry with him an invitation from the American Institute of Architects for the eleventh International Congress of Architects to be held at Washington in 1926, to which representatives of all nations are invited.

The late Prof. H. C. Butler.

We regret to record the death at Neuilly of Professor H. C. Butler, archæologist, of Princetown University, New Jersey. Professor Butler, who was 50 years of age, was a member of many scientific bodies in England as well as in America. He wrote a long work on "Scotland's Ruined Abbeys," and several books on archæology and ancient architecture. He organized many archæological expeditions, more particularly in Syria.

Staple Inn Hall.

Staple Inn Hall, Holborn, is in the hands of the builders. Recently it was discovered that the roof was on the point of collapsing. The damage is due to the ravages of some wood-eating insect, although the architect responsible for the work does not think the culprit is the "death-watch beetle," which did so much harm at Westminster Hall and Hampton Court Palace. By providing iron shoes for the feet of the roof-principals, and by replacing the affected woodwork, it is hoped to save the building and to preserve much of the original timber.

Housing in Scotland.

Large houses in the best-class districts of Edinburgh are being subdivided into three houses. Building in Edinburgh and Glasgow is being proceeded with, and the more important contracts include public baths at Govan, to cost £42,110, and an

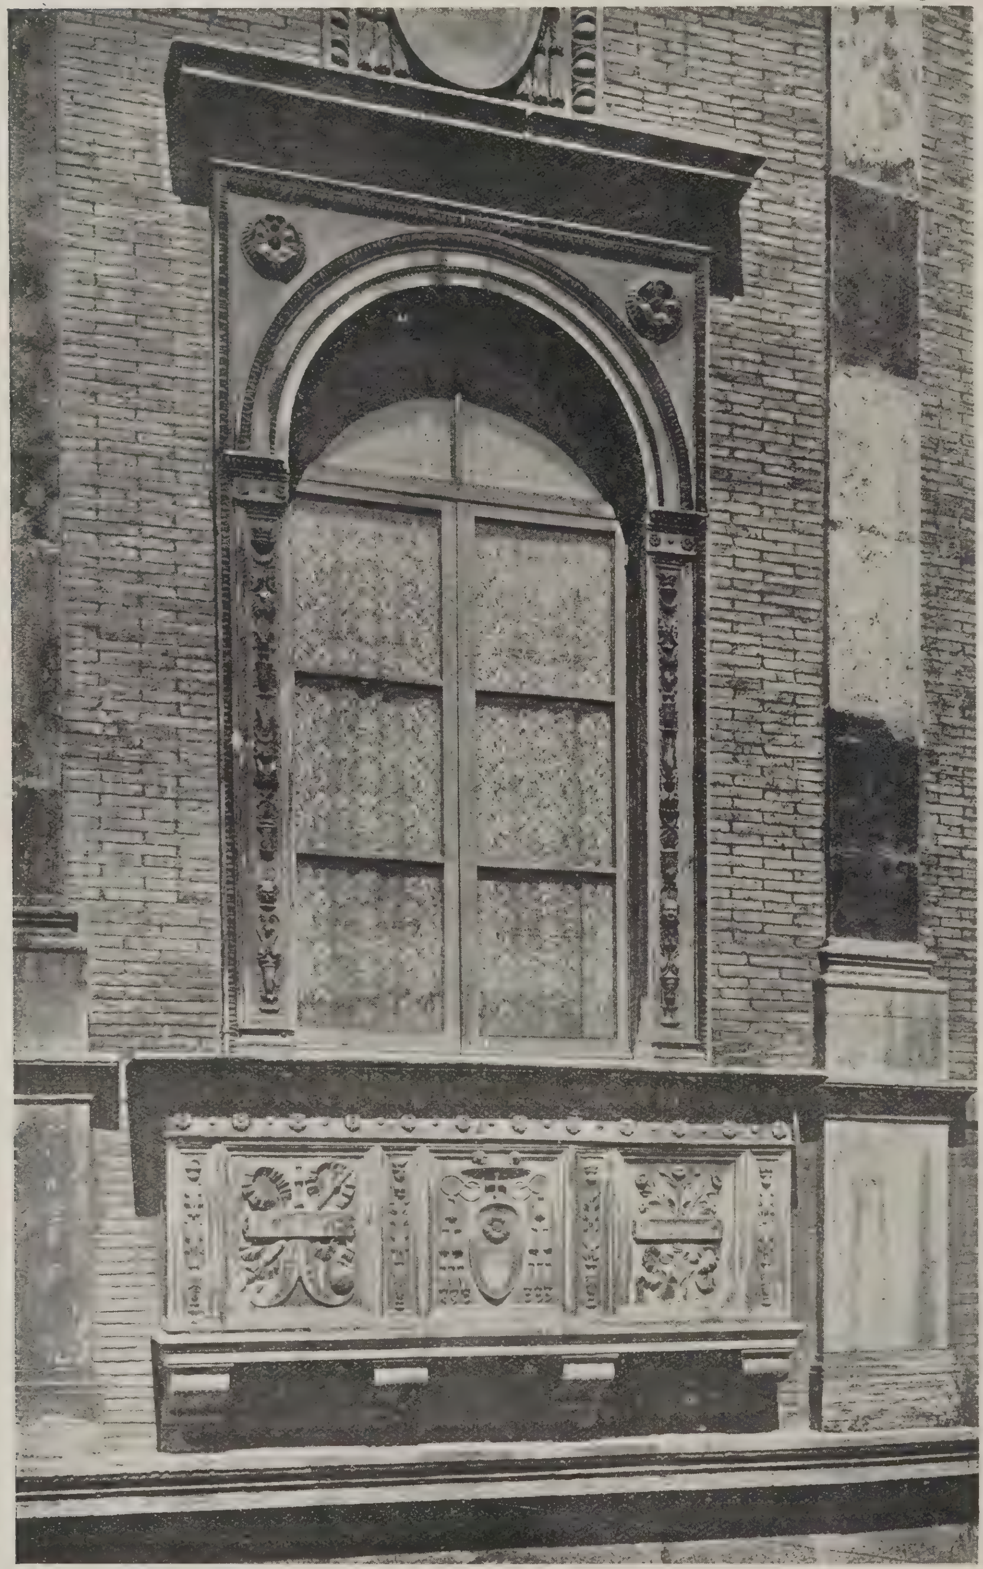
Architectural Details. 32.—A Window and Balcony, The Palazzo della Cancelleria, Rome

Bramante, Architect



Cancelleria means a chancery or the residence of a chancellor, and this building was so named because the papal vice-chancellor's offices were here established soon after its erection. Although the Cancelleria Palace was built at the beginning of the culminating period in Rome, the detail, as this window shows, is distinctly primitive. Bramante had been working in the terra-cotta district of Lombardy, and here he introdued his terra-cotta ornament into the detail of a Roman building. Both the windows and the balcony are of marble.

Regional Planning

MANY of those local authorities whose population is such that it is incumbent upon them to produce a town-planning scheme by the summer of next year will already have begun their task; others, perhaps, not realizing the seriousness or the scope of the undertaking, may be deferring action until the conclusion of the holiday months. It may, however, be presumed that by the autumn work will have begun up and down the country on the preparation of schemes for the future development and improvement of various populated areas. The responsibility which rests with all authorities concerned is very great, and the future amenity of their districts is largely in their hands. But the task is a difficult one. Just as the alteration or adaptation of an existing building to meet new requirements is often a more severe tax on the skill and resources of the architect than the designing of a new building, so, too, to town-plan an existing area calls for even greater knowledge and forethought than the scheming of a new garden city on virgin soil.

In the first flush of its enthusiasm the Ministry of Health published a very useful manual on unhealthy areas which, although dealing with only one aspect of a vast subject, might well be consulted by every local authority which is engaged upon a scheme. During the last few years there has been a marked spread of enlightenment and a constant questioning as to the necessity for the dirt, squalor, and discomfort which exist in and around most of our manufacturing towns, but planning, in its accepted sense, is only partly responsible for the state of affairs. The recent report by the Committee on Smoke and Noxious Vapours Abatement shows conclusively how great are the ills that we endure through our wasteful habit of burning soft coal in the domestic grate. There are many alternatives, and now is the opportunity for local authorities to do all in their power to suppress smoke. Similarly, matters relating to water, railways, canals, drainage, mine pumping, and the like all come within the scope of a comprehensive undertaking in an industrial area.

For the purpose of developing extensive areas on comprehensive lines it is essential for several local authorities to combine and to work together, or at least to collate their activities. Unrestricted private enterprise produces chaos, as we know, since the amenities of life receive scant consideration in such matters as the placing or working of factories, but unrestricted municipal enterprise will not produce harmony or cohesion unless several authorities combine with the determination to seek their joint welfare. The result is a regional scheme prepared by a regional committee. The preparation of the scheme, as we have already indicated, is a work of immense labour covering, as it must, every department of social life, and requiring the co-operation of the medical, surveying, and engineering staffs of the municipalities concerned. The preparation of the scheme, however, is only the beginning of the difficulty; its execution presents an altogether new problem in local government, whose implication is, perhaps, scarcely realized.

According to the present organization of local government, the committee can prepare and recommend what, in its opinion and according to the advice of its technical experts, is the most suitable scheme for the future development of its joint area. But it is without jurisdiction or statutory power to enforce or execute the scheme, which then reverts for its accomplishment to the control of the separate authorities, who will be free to amend, alter, and, perhaps, ultimately to wreck the scheme, by failing to keep in sight the ultimate objective—the welfare of a large area—by concentrating too exclusively upon their own parochial affairs.

It would therefore seem that the existing machinery of local government is inadequate for the carrying out of comprehensive regional development schemes. It is possible that some slight readjustment would meet the case, but if it be decided to set up an authoritative body over the heads of the local authorities concerned, it is essential that it be made to operate under popular control. We know that popular control often succeeds in wrecking schemes devised for the general benefit, nevertheless, an uncontrolled spending department of such magnitude could not, either in theory or practice, be allowed to exist.

The patience of many local authorities has already been taxed to the utmost by the exasperating behaviour of the government in connection with housing. At one moment authorities were hustled and worried to prepare enormous schemes, and at the next were informed that even their most modest requirements could not be fulfilled. Meanwhile the town clerk's table was littered with diverse and contradictory instructions, and his waiting room filled with the importunities of harassing officials. With such experiences recently in their minds it may well be that a certain perfunctoriness will characterize the manner in which some authorities will undertake their new obligations. It is to be hoped, however, that their sense of obligation to the future will exceed their sense of irritation at the past. It is to be hoped, too, that the government will have learned from its recent experience, and that its method will be less hectic and more tactful, and that it will do all in its power to utilize to the full this stupendous opportunity for rectifying some of the mistakes and alleviating some of the misery and discomfort made during the nineteenth century.

There is evidence that certain districts are giving the matter their most serious attention. In the West Riding nine local authorities, including the West Riding County Council and the Doncaster Town Council, have appointed a joint Regional Committee, who, after exhaustive preparation and labour, have prepared, under the supervision of Professor Abercrombie, a comprehensive scheme of development for the whole district. Both in the method of approach and in the result, the labour of this committee may serve as an example and encouragement to other authorities, for not only would these appear to be exemplary, but the area which is the subject of the report is in itself one of unusual interest on account of its scope and diversity. Doncaster is already a town of some importance owing to the presence of the Great Northern Railway Engineering Works, and it is soon likely to become more so as the centre of a new coal mining area. Already the character of the surrounding rural districts is undergoing change as the inhabitants are drawn more and more for their employment to the growing industrialism. Never was there a more opportune moment, therefore, for the skilful application of town planning methods. The existing town, not yet very large, must be redeemed, and new areas must be allocated for specific activities; but this is no mere paper problem, for it depends upon the position of the coal which is to be worked. Yet some segregation of mining activities is essential. Open spaces and tracts of unsullied countryside must be preserved to compensate for the unavoidable ugliness inherent in mining enterprise. Residential districts—and in these we include the homes of workers and masters—must be so placed that the inhabitants receive adequate protection from aggressive sounds, sights, smells, and fumes, and they should be in easy juxtaposition to open spaces, the countryside, shops, and amusements. And alongside these considerations such matters as road, rail, water, and drainage, require equal attention.

Such, then, is the subject of Professor Abercrombie's report, and we hope that it will give encouragement and cause emulation to other municipalities, awakening them alike to their responsibilities and their opportunities, and above all to the necessity of retaining expert technical advice.

The Lower Cost of Building

Is a heavy fall in the cost of building imminent? According to Sir Charles Ruthen, Director General of Housing at the Ministry of Health, the tenders now being submitted for the erection of parlour and non-parlour houses show a great reduction in price when compared with those of a year ago. In June of last year the average tenders approved by the Ministry were: non-parlour, £693, and parlour, £792, and the prices have steadily declined to £379 and £422 respectively for June of this year. In Nottingham and Leicester houses of the non-parlour type are being built for less than £300 each, the average price for a similar house in April last year being £816. The price of each of the Nottingham houses including the cost of land, roads and sewers is a little over £349. The main factors which have been responsible for the decrease are stated by Sir Charles Ruthen to be the increase in the output of the workers, the reductions in wages and materials, and the smaller profits accepted by the builders. The reductions in wages and materials are responsible for one-third of the saving and the increased output for the overwhelming part of the remainder. Although Sir Charles Ruthen is of opinion that the prices still have a downward tendency it is difficult to see how they will become much lower for a very considerable time. Reasons are not far to seek. In June last the building operatives agreed to a reduction of wages of 2d. per hour all round on the definite understanding that the wages should remain stabilized until March 1 next; the markets for building materials are in many cases in a most unsatisfactory condition both for the producer and the consumer; and it is a well-known fact that the foremost builders have done their utmost to keep costs down by giving the very highest class of work at the very lowest possible figure. With regard to the cost of materials, many manufacturers are trading at a loss owing to the unprecedented slump, and in future the goods will have to be manufactured at a more profitable figure.

A section of the public are withholding work from the market under the impression that a still more remarkable decrease in the cost of building will take place shortly. This in view of present conditions is very unlikely, and it is not impossible that the future tendency may be for the cost to increase. Trade is beginning to revive but an immense amount of work is being held up intentionally, and there is still a great shortage of houses in all parts of the country. Now unquestionably is the time to build.

"Bungalow Town"

Efforts are being made to exterminate "Bungalow Town" on the Wirral peninsula near Manchester. It consists apparently of every kind of temporary residence, including caravans, and has a population which runs into thousands. "Bungalow Town" is a good instance of what has occurred in numberless seaside places since the war. Ramshackle colonies of tin sheds, wooden huts, caravans, and railway coaches, which formerly acted as summer camps, are now occupied permanently by householders without homes; but though these camps may be serviceable during a housing shortage, they have no legitimate claim to permanence. Their sanitary conveniences are of the most primitive, their protection of the flimsiest, and their contribution to the beauty of the seaside less than nothing. This is a pity because with a little forethought and arrangement, these colonies, put to their right use as summer camps, could easily become delightful both to look at and to live in.

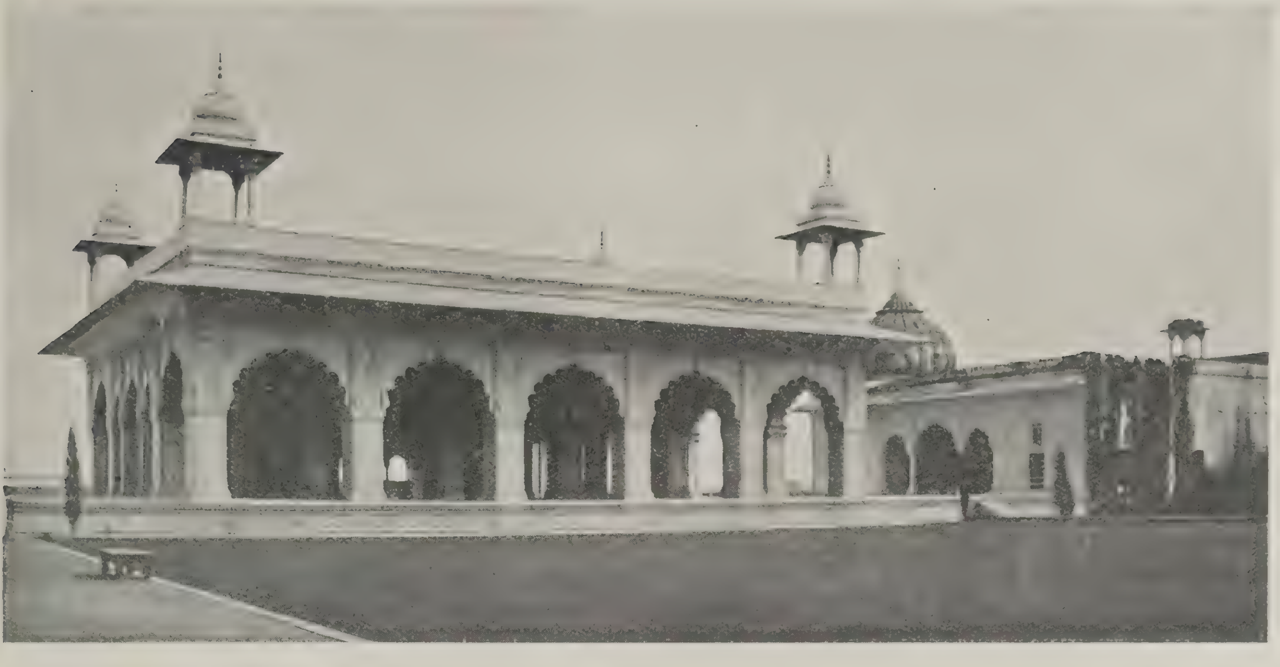
Seaside Resorts

The English seaside town to-day is nothing less than a scandal, as all who love the sea, the country, or the town, are bound to admit. The Marine Parade, the super-pier with its palace, the nigger minstrels, the pleasure places-de-luxe—of these we will say no more than that they are at least the genuine expression of an age which is vulgar but honest, and not ashamed of its vulgarity. But the hopelessly pretentious and hideous white-and-red summer-residences with their gables and verandahs, which scatter themselves across the countryside, provoke everybody's disgust. This is the only bad type of building which appears not to be dying out. Every year more "homes" of the same calibre spread across the cliffs and along the beach, and every year their small sisters, the seaside bungalows, multiply about them. The poor relations, too, come flocking round in the shape of Bungalow Town with its tin sheds and caravans. If you add to this a factory chimney belching smoke, a gas works, and the usual litter of refuse and of those half-finished schemes associated with suburbs, you get a life-like picture of the modern English holiday "Resort"—the sea road from Worthing to Brighton is an excellent example.

This cannot go on much longer. The public as well as the cultured are getting tired of ugly places; they are getting rapidly more critical. Gas works satisfy them no longer. Every town council must realize that the first essential in a holiday resort is that it shall be a beautiful place.

Piccadilly Circus

An article by W. Harding Thompson on the re-planning of Piccadilly Circus, in which Norman Shaw's ideas are discussed, will be found later in this issue. It is perhaps interesting in this connection to draw attention to the schemes which the Soviet Government of Russia are preparing for the development of Petrograd. According to "Garden Cities and Town-Planning" a Municipal Office for the consideration of new town plans has been instituted in Petrograd, and has already prepared plans which will cover the development of the city for a century, or until the time when the population of the city numbers ten million. The schemes include a new port, a new canal, and the electrification of the whole railway system. Here the Bolsheviks have set us an example in imaginative foresight which we should do well to follow. If Russia in her present condition can prepare great schemes for a century's development, surely England can prepare a scheme for a small square in the centre of her largest city. The plea of economy is surely too absurd even for an official to put forward. It does not cost a penny to *prepare* a scheme.

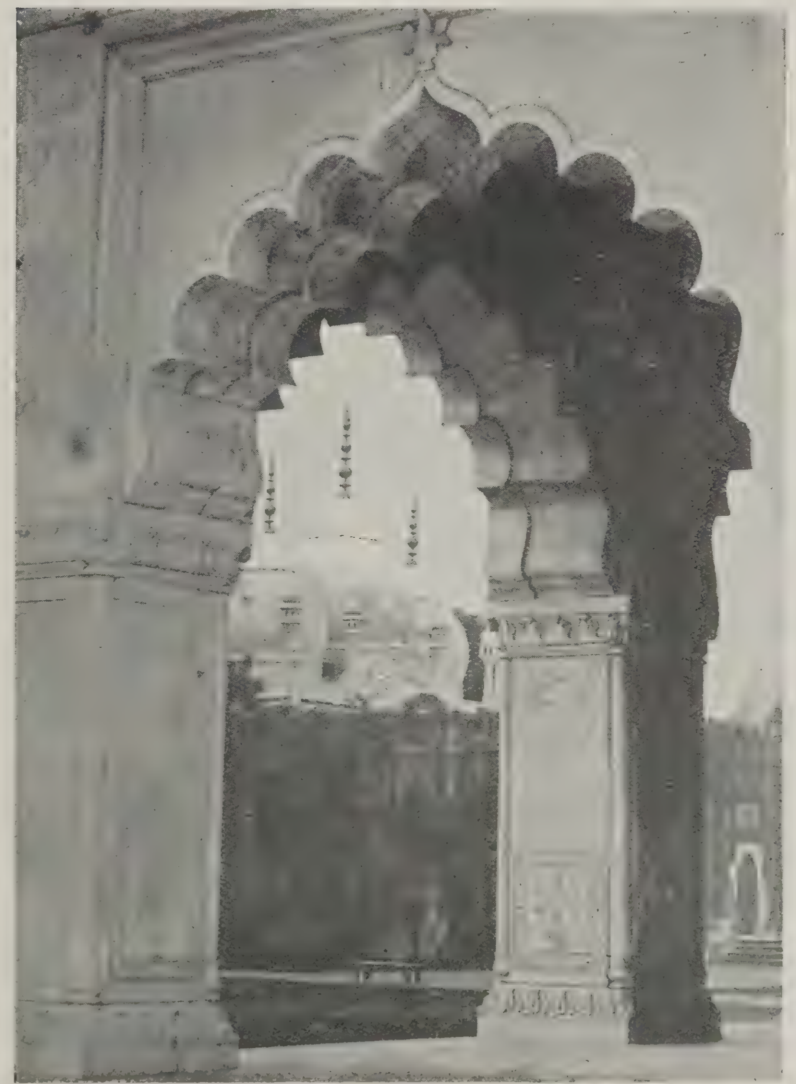


THE DIWAN-I-KHAS OR PRIVY COUNCIL CHAMBER, DELHI FORT. (1638–1648.)

Impressions of Delhi Fort

By H. O. LEE

ANY amateur visiting the famous Indian buildings must at once be struck by two basic differences between Indian and Western architecture. The first is that when you leave a cathedral or a town hall you remember a place or an architect, but when you leave an Indian palace, or tomb, or religious building, you remember a deity or a potentate. The Indian builder did not build to express himself or his people; his object was to express his patron or his patron's divine patron. To us it seems contrary to the course of nature that an artist should overcome egoism; to them it seemed quite obvious, and from the earliest times Indian architecture has been psychological and in the subtlest sense pictorial. This is not merely a result of the Moslem invasion. It is not true that owing to the Islamic prejudice against painting the architects of the Moguls were suddenly forced to express in stone what should have been expressed in paint. The Hindus had already been masters of painting for centuries, but they preferred to express divine or human characteristics in stone.



THE PEARL MOSQUE: A DETAIL

The archæologists are now beginning to explain to us the infinite symbolism of the old Hindu temples. We now know that when the architects of Humayun's tomb, of Fatehpur, of the Delhi fort, and of the Taj, made stone symbols of a bold and rather stolid invader, of a magnificent and intellectual prince, and of a monarch in his pride and in his lyric sorrow, they were doing nothing without precedent; they had already been talking about their own gods in the same language for hundreds of years. In an English building it is irritating to be told constantly, "This is the place where . . . . ." But in Delhi fort it is of the essence of the artist's purpose that you should be told it without remission. This, then, is the place where Shahjahan lived in his glory, among his women, his courtiers, and his flowers, and in the words of the very familiar inscription: "If there is a paradise on the face of the earth, it is this, it is this, it is this." "How comely it is and how reviving!"

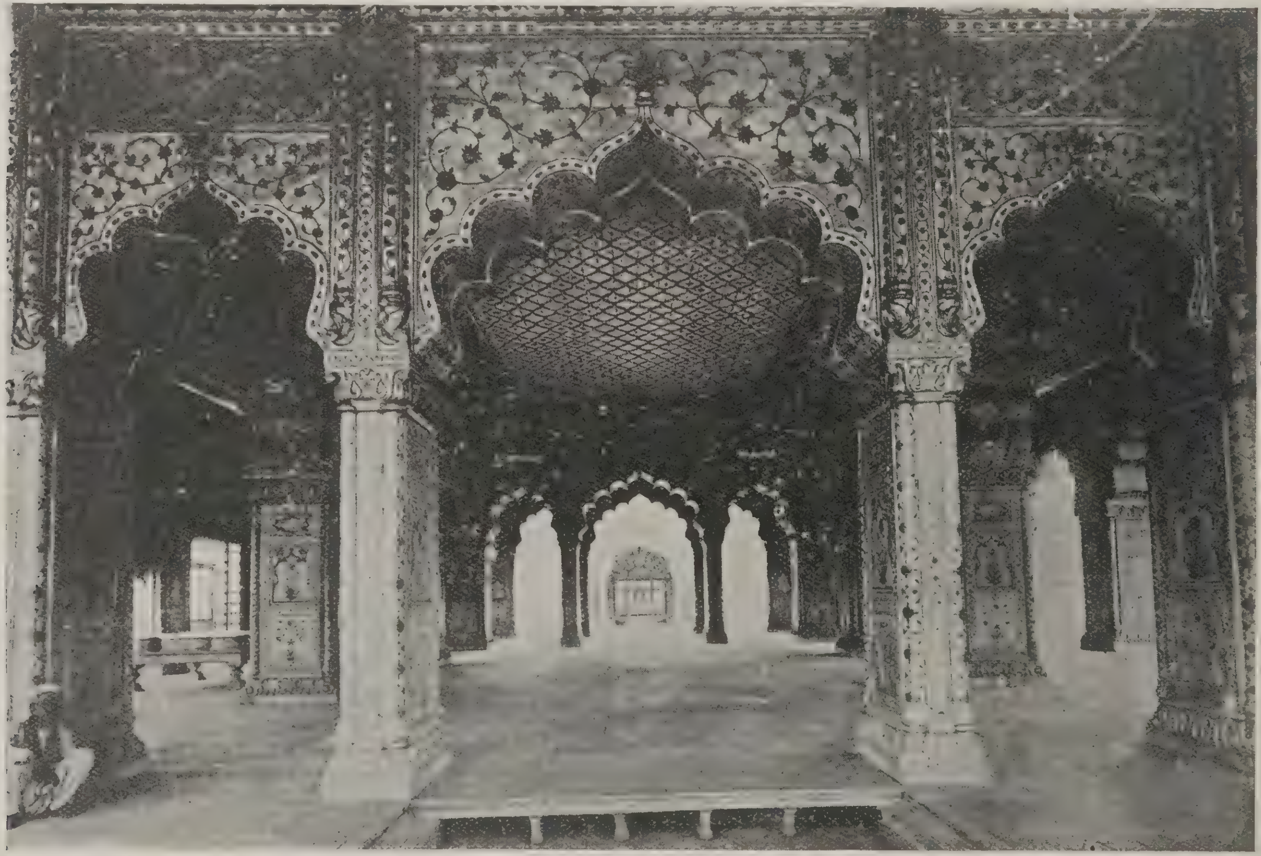
The splendour of Delhi fort still survives, though it is no longer the dream-like city castle of Shahjahan. The Peacock Throne has gone, the copper domes of the Pearl Mosque have been stolen, the silver has been taken from the ceilings, semi-precious stones have been prised out of the walls; in fact, everything that was portable and could be sold has disappeared, and the British *raj*, in a Cromwellian mood, pulled down many lovely buildings to make way for barracks and sergeants' latrines, and knocked about one of the remaining buildings to make it more suitable for a messroom. The enlightened *raj* of this century, led by Lord Curzon, has been extremely anxious to repair the damage and to prevent any new outbreaks, but the harm is largely irreparable, and the latrines and barracks are still there.

The fort is yet a very wonderful thing. Shahjahan's splendour and voluptuousness are still visible in his almost effeminately graceful pavilions. In the famous Diwan-i-khas, or privy council chamber, it is impossible not to feel his gaudy presence. The coloured lights and the costumes of his nobles were reflected in a canal which runs down the middle of the hall. Outside were the flowers and the Jumna. The coloured hangings and the jewelled and enamelled walls must have given the last touch to a scene designed to give effect to the inscription on the ceiling, and reproduce the Islamic conception of paradise. Feminine influence is very clear throughout the fort. The Hellenistic grace, the peep-hole constructed to satisfy the harem's curiosity, the phantasmal prospects, and the importance of the gardens, all denote the monarch who loved his women. Some of the glimpses of the gardens are so extraordinarily charming that it seems as if the pavilions had been made for the gardens and not the gardens for the pavilions. This relationship between palace and garden is a special characteristic of the uxorious fort, and is also to be seen at the Taj, and at Tahangor's tomb at Lahore. It constitutes the second difference between Indian and Western architecture which, at once attracts an observer.

THE PEARL MOSQUE, DELHI FORT

In England a garden is a desert for several months of the year, and across the windows of the house winter curtains are drawn. In the Indian light and heat the flowers and grass are as beautiful as any building can be, and doors and windows, except for a few weeks, are not discoloured with rain. The garden is therefore the better part of the house, and in architecture the Indian love of gardening comes out strongly. The only really delightful spot in the obscure station where I live is the garden in the station gaol.

The big Delhi mosque was built by Shahjahan. The size is tremendous, and the effect of size still more so. If there is a symbolical motive here too, it is to represent God as an immense and merciful void, a contrast in idea to the triumphant worldliness of the great fort.



AN INTERIOR IN THE DIWAN-I-KHAS THE HALL OF PRIVATE AUDIENCE.

The Reconstruction of Piccadilly Circus

By W. HARDING THOMPSON, A.R.I.B.A.

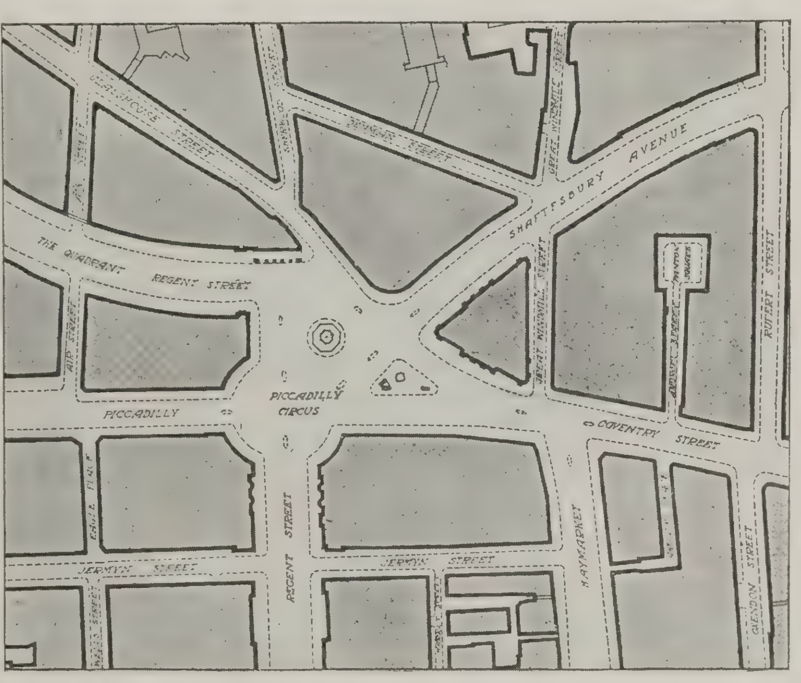
IT was but a few years after John Nash had completed his scheme for building Regent Street in a manner worthy of a great city that London began to suffer from the chronic disease of congested arteries due to a sudden growth in population and consequent increase in traffic difficulties. The pleasant little circular place in the new shopping area, with its roads intersecting at right angles, became no more than a street-crossing treated architecturally.

Compared with the traffic centres at the Bank and Trafalgar Square, the volume of traffic was still comparatively little, but with the advent of the Railway Age came those convulsive "growing pains" which affected the plans of Paris, Berlin, and Vienna no less than London.

Regent Street had been cut through dilapidated property by Nash to form what was and still is one of the most popular shopping streets in Europe.

Subsequent new streets leading to Piccadilly Circus were constructed primarily for a different purpose; they formed a part of London's growing system of arteries. Old Coventry Street, after passing through "Leicester Field," was soon connected directly with Long Acre and Covent Garden by a new street, and it became a valuable east and west traffic thoroughfare.

Bloomsbury, still growing and fashionable in the early nineteenth century, required a better connection with the West End, and this was accomplished about 1850 by Lord Shaftesbury's scheme for cutting a new street through slums direct to Piccadilly. Hence Shaftesbury Avenue, although necessary as a traffic connection between the Northern Railway termini and the West End, may be said to have created the main difficulty in the future architectural treatment of Piccadilly Circus, now a traffic centre of the first importance.



PICCADILLY CIRCUS AS IT EXISTS TO-DAY

It would appear highly improbable that Nash, when he conceived the idea of making a small circular place, had any conception that his shopping centre would have to deal with an immense volume of traffic, or be the amusement centre for every English and foreign visitor to the metropolis. The old Circus, therefore, in its restricted form, has to go, and the problem before Londoners now is to provide an open space large enough to deal with the future pressure of traffic, and, equally important, possessing an architectural unity and dignity in place of the existing muddle and frenzied exhibition of blatant advertisements. Let it be gay if you will, but the result must refute the statement that we are but a nation of shopkeepers.

If the ground were in the hands of a great number of owners, the problem of co-ordinating the different building enterprises would be extremely difficult; but when only two powerful authorities are concerned, H.M. Office of Woods and Forests and the L.C.C., it is surely possible to obtain that control of building operations which will ensure a readjustment of building lines and treatment of the façades as an architectural entity. We hope so.

At least two carefully considered schemes for remodelling the Circus have been before the public during the last twenty years; one by the late Mr. Norman Shaw, R.A., in 1906, and one by Mr. John Murray, of H.M. Office of Woods and Forests, a few years later. There have also from time to time been other suggestions for dealing with portions of the whole.

With regard to Mr. Shaw's scheme, although we may not agree with the heavy-handed modelling of the façades, it must be admitted that the new frontage lines he suggested would provide an open space of suitable shape as a traffic centre and capable of dignified architectural treatment.

As will be seen in Mr. Shaw's plan, his chief proposals were as follows :—

(i) The original Circus shape to be abandoned and replaced by square recessed façades at the north end of Lower Regent Street; the whole of the island site between Air Street and the Circus being rebuilt on its new building lines.

(ii) The County Fire Office, rebuilt, still to close the vista from Lower Regent Street.

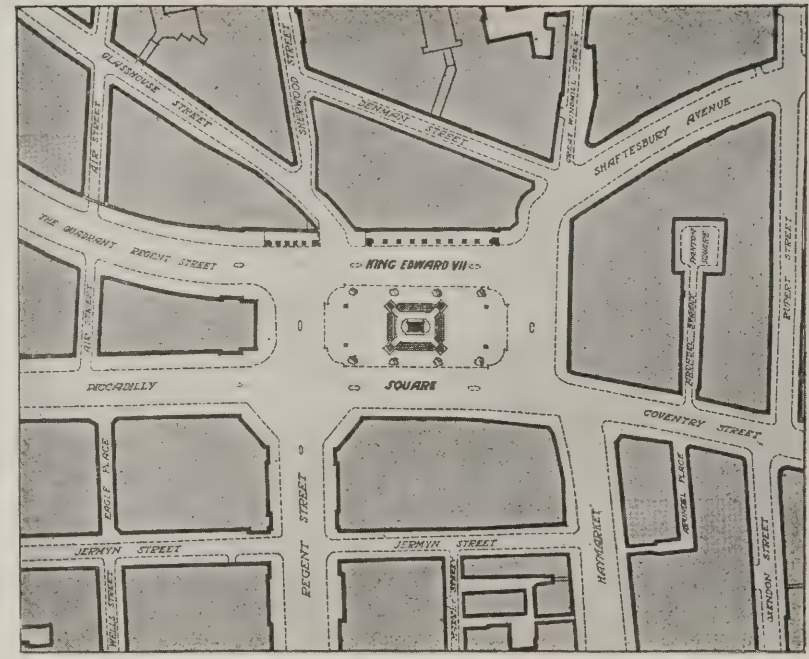
(iii) Glasshouse Street to be diverted just before entering Piccadilly Circus under an archway. (This would ensure a continuous façade to the north side of the new square.)

(iv) Shaftesbury Avenue to be diverted where it enters the Circus so that its northern side conforms with the proposed new façade to the Fire Office.

(v) The London Pavilion to have a new western façade to face "Swan and Edgar's corner."

In reviewing this scheme it should be noted that Mr. Shaw adhered to two sound principles in town planning, viz., that the greatest effect in open spaces can be obtained only by the use of simple shapes; and, secondly, that in a congested traffic centre it would be folly to build on what is already open space merely in order to give the "place" a definite architectural shape; consequently, with the exception of the proposed Pavilion portico, he refrained from encroaching on the present open space available, and he boldly proposed to pull down the Café Monico corner, thus making the new "square" approximately a rectangle 300 ft by 250 ft.

This then would represent a nett loss in ground area to the L.C.C., but on the other hand the scheme would entail (with the exception of the Café Monico) merely property ripe for reconstruction and potentially of great value. These particular buildings have already been abandoned in favour of spluttering night signs. Although one may criticize the twisted entrance of Glasshouse Street into the



PICCADILLY CIRCUS: JOHN MURRAY'S SCHEME

new Square, it must be admitted that the County Fire Office, whether rebuilt or not, forms a fitting climax to Lower Regent Street, which would not be provided by any building behind it.

Mr. Murray's scheme was bigger and more drastic, for he proposed to pull down the whole of the London Pavilion island property, so that the east side of Great Windmill Street would become the east side of the new Piccadilly Square ("Edward VII Square," as was suggested in 1909).

Although Mr. Murray's new square would undoubtedly provide a magnificent open space of good proportion, it would probably present a problem quite beyond the power of the present L.C.C. to grapple with, as the Pavilion site value cannot be disregarded lightly under post-war conditions. Again, the whole of the east side of Great Windmill Street would have to be rebuilt to obtain the architectural unity required; this would involve at least two large restaurants and St. Peter's Parish Church.

One objection may be raised to clearing the Pavilion site, and that is that Great Windmill Street serves a very definite function as a relief road for traffic making a short cut from Shaftesbury Avenue to the Haymarket without going through Piccadilly Circus. This cannot be regarded as a serious obstacle to the execution of Mr. Murray's plan; in fact, we may even find that Mr. Shaw's proposed square will prove inadequate in twenty-five years' time, in which case it would be necessary to clear the Pavilion site, thus providing a total open space about equal to Hanover Square.

It is difficult to estimate even approximately the expense incurred in compensation for unexpired leases without the necessary figures, but whatever the obstacles may be in the path of the L.C.C., two essentials must be provided to ensure that the new "Piccadilly Square" is a success: (*a*) rigid control over the design of the façades (taking our lesson from Parisian discipline in this matter); and (*b*) a simplified form of traffic circulation (gyratory or otherwise).

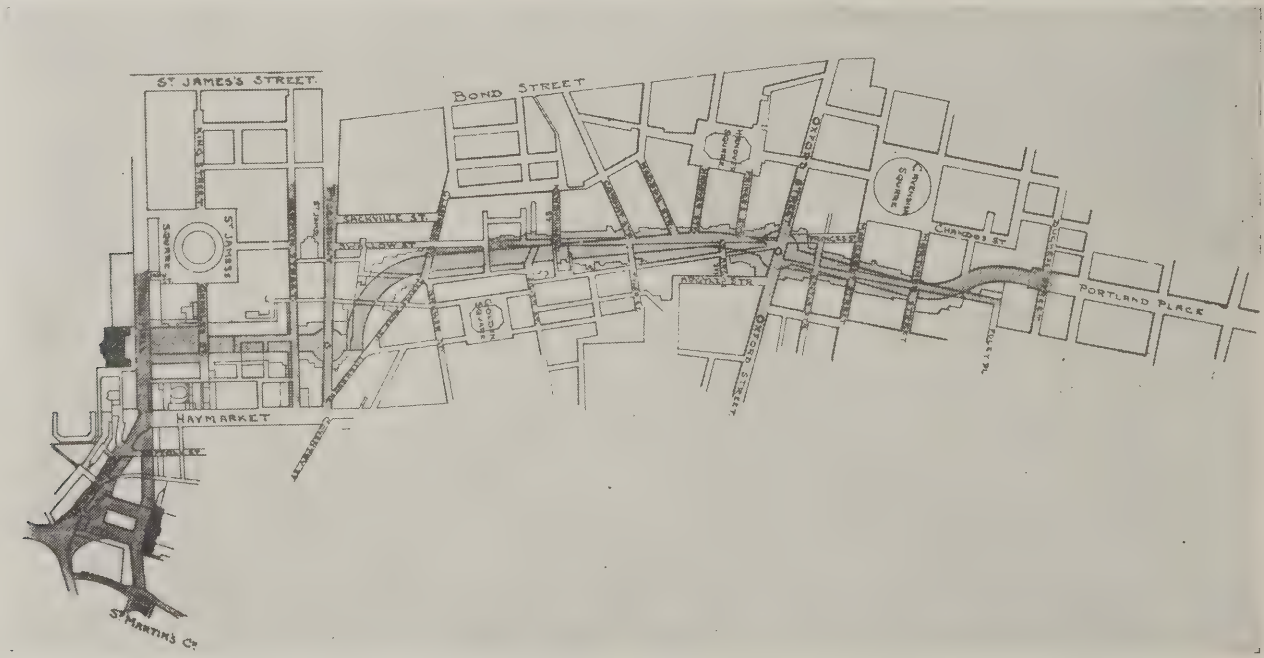
The reconstruction scheme now in progress by H.M. Office of Woods and Forests, under the skilful guidance of Sir Aston Webb and Sir Reginald Blomfield, hardly touches the fringe of the big problem, as it merely deals with the alteration of shape in Nash's original Circus, but it has nevertheless set the architectural standard to which the remaining façades of the "Place" must conform as soon as the L.C.C. carry out their portion of the scheme.

In conclusion, it should be possible, on the ground of economy, to carry out the complete scheme in sections, provided there is a preconceived plan of the whole; and it is hoped that, in connection with the pathetic disappearance of old Regent Street, we may take to heart the lesson it taught us, namely, that street architecture at its best is merely a restrained and rhythmic background to the street scene, with its exciting crowds and gaily coloured vehicles. This undoubtedly is the secret of that charm which was bequeathed to us by the eighteenth century architecture.

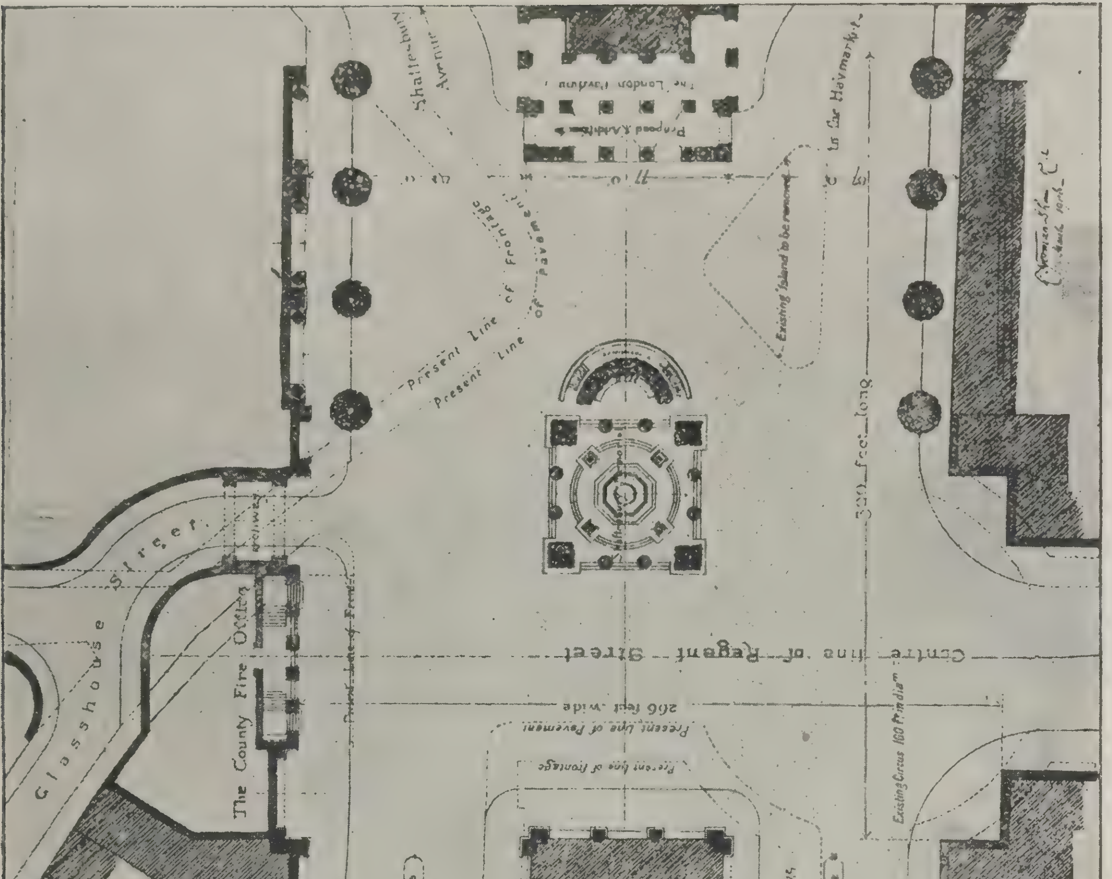
That precious virtue, the subordination of the parts to the whole, is the A.B.C. of Civic Design.

Will the L.C.C. or some superior authority pass on that lesson to the next generation?

Piccadilly Circus should be one of the Focal Points to which European culture can turn. It is worth the heavy drain on our coffers to make it a lasting example of how order may be achieved from the existing chaos.



NASH'S SCHEME FOR PICCADILLY CIRCUS AND REGENT STREET



NORMAN SHAW'S SCHEME FOR THE RE-PLANNING OF PICCADILLY CIRCUS.

The Late Sir Thomas Brock, R.A.

IT is with deep regret that we record the death in London of Sir Thomas Brock, R.A., the sculptor, at the age of seventy-five. Born in Worcester, the son of William Brock, a decorator, he was educated at the Government School of Design in that city, and later entered the studio of Mr. J. H. Foley, R.A., the sculptor, first as student and then as assistant.

In 1869 he secured a gold medal at the Royal Academy, in 1883 he was elected an A.R.A., and in 1891 an R.A., and in 1911 he received the honour of a K.C.B. He was also an honorary member of the Royal Scottish Academy, an honorary associate of the R.I.B.A., a D.C.L. of Oxford, and an honorary member of the Société des Artistes Français.

Sir Thomas is best remembered by the public for the Queen Victoria Memorial in front of Buckingham Palace, the Lord Leighton memorial in St. Paul's Cathedral, and the statue of Sir Henry Irving at the foot of Charing Cross Road.

From the year in which Foley died (1874) until 1901, when Sir Thomas was commissioned to execute the Queen Victoria Memoria', which took him nine years to complete, he carried out an enormous amount of work, and it was estimated at the time of his death that he had commissions to occupy him for about ten years.

One of his earliest portrait statues was that of Richard Baxter, which he executed in 1876 for the town of

Kidderminster, and in 1882 he modelled a statue of Rowland Hill for the same town.

London can claim much of his work. Of his portrait statues there are Sir Bartle Frere and Robert Raikes on the Thames Embankment, Gladstone in Westminster Abbey, Gainsborough at Millbank, Captain Cook in the Mall, Lord Russell of Killowen at the Law Courts; and of his monumental effigies there is that of Lord Leighton in St. Paul's Cathedral.

Of his busts, the best known are those of the Marchioness of Westminster; that of Longfellow for the Poets' Corner; of Sir Isaac Pitman; the famous bust of Leighton, which Brock deposited as his diploma work in the gallery at the Royal Academy; his bust of Sir Richard Owen; that of Queen Victoria, exhibited in 1901—one of the best portraits and most satisfactory representations of Her Majesty; and a bust of Sir Henry Tate, shown in the same year. He also executed a fine bust of King Edward VII, one on Lord Lister for the College of Surgeons, and one of Edwin Abbey, R.A., for the British School at Rome.

In addition Sir Thomas executed portrait statues of Sir Richard Temple and of Lord Sydenham for Bombay, and Brigadier-General John Nicholson for Delhi, and a seated figure of Dr. Phillpott for Worcester Cathedral.

He also modelled a colossal figure of the Black Prince for Leeds; and the " Moment of Peril "—an Indian warrior confronted by a huge serpent, now in the Tate Gallery. His charming figure of conventional " Eve " is also housed in the " Tate."

The equestrian statue of King Edward VII at Delhi and many memorial statues of Queen Victoria are by Sir Thomas, and his design for the head of Queen Victoria on the coinage was accepted in 1891.

Sir Thomas leaves a widow and several children.

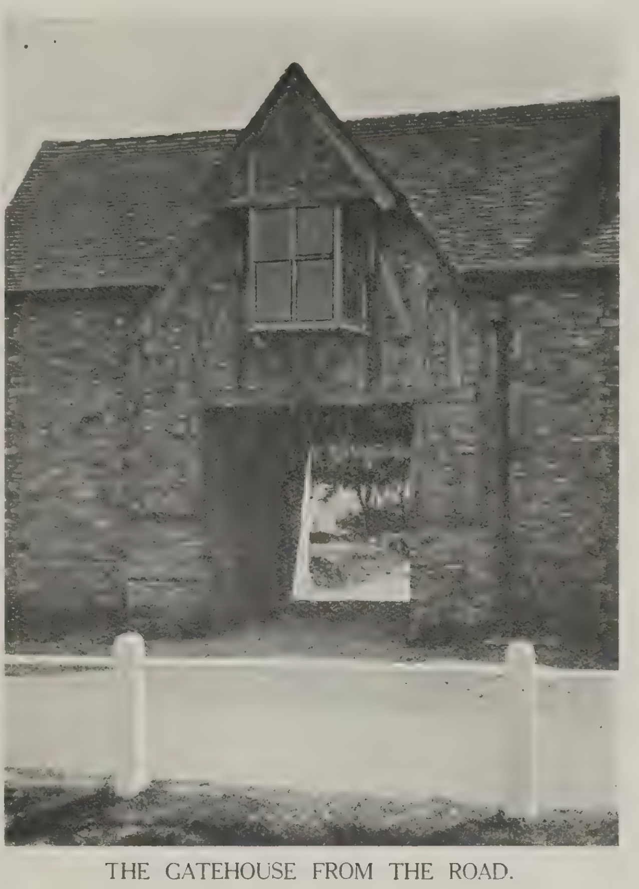
Little Garth, Syresham

By C. H. Biddulph Pinchard, F.R.I.B.A.

THIS house stands in the old village of Syresham, near Brackley in Buckinghamshire. Mr. Pinchard designed its rather unusual L-shaped plan with a special purpose, for one of the village roads runs flush against the house, which is screened neither by hedges nor by trees, with the result that very little privacy would have been obtained by the owner had the house been built on a square plan. The architect's solution is rather interesting. He has made the house itself act as a screen by running the arm of the L plan along the border of the road, thus obtaining, with the added help of a high bank, complete privacy for the garden and grounds. The entrance is reached through a gatehouse which faces the road, the front door itself opening upon the courtyard within. The opening of the gatehouse goes only to the height of one storey, and is flanked on the ground floor by a servants' sitting-room and a hall. This hall has a staircase which leads up to the great feature of the house—the long room—which runs over the gateway and connects on the first floor with the main landing and various bedrooms. It is thirty feet in length.



THE GATEHOUSE FROM THE ROAD.

There existed originally on the site of the house some old stone barns and a brewhouse. These have been pulled down, and their materials used in the construction of the new building. A quantity of old oak timbering and oak flooring was also discovered, and these have been put to good use as well as the old stones and tiles. With the old tiles, therefore, and the oak half-timbering, and the rich and mellow colour of the stone, the whole building has assumed the appearance of great age. But there is no faking of materials.

The interior is finished with rather rough plastered and distempered walls, and stone mantlepieces which are founded on the work of the late seventeenth century.

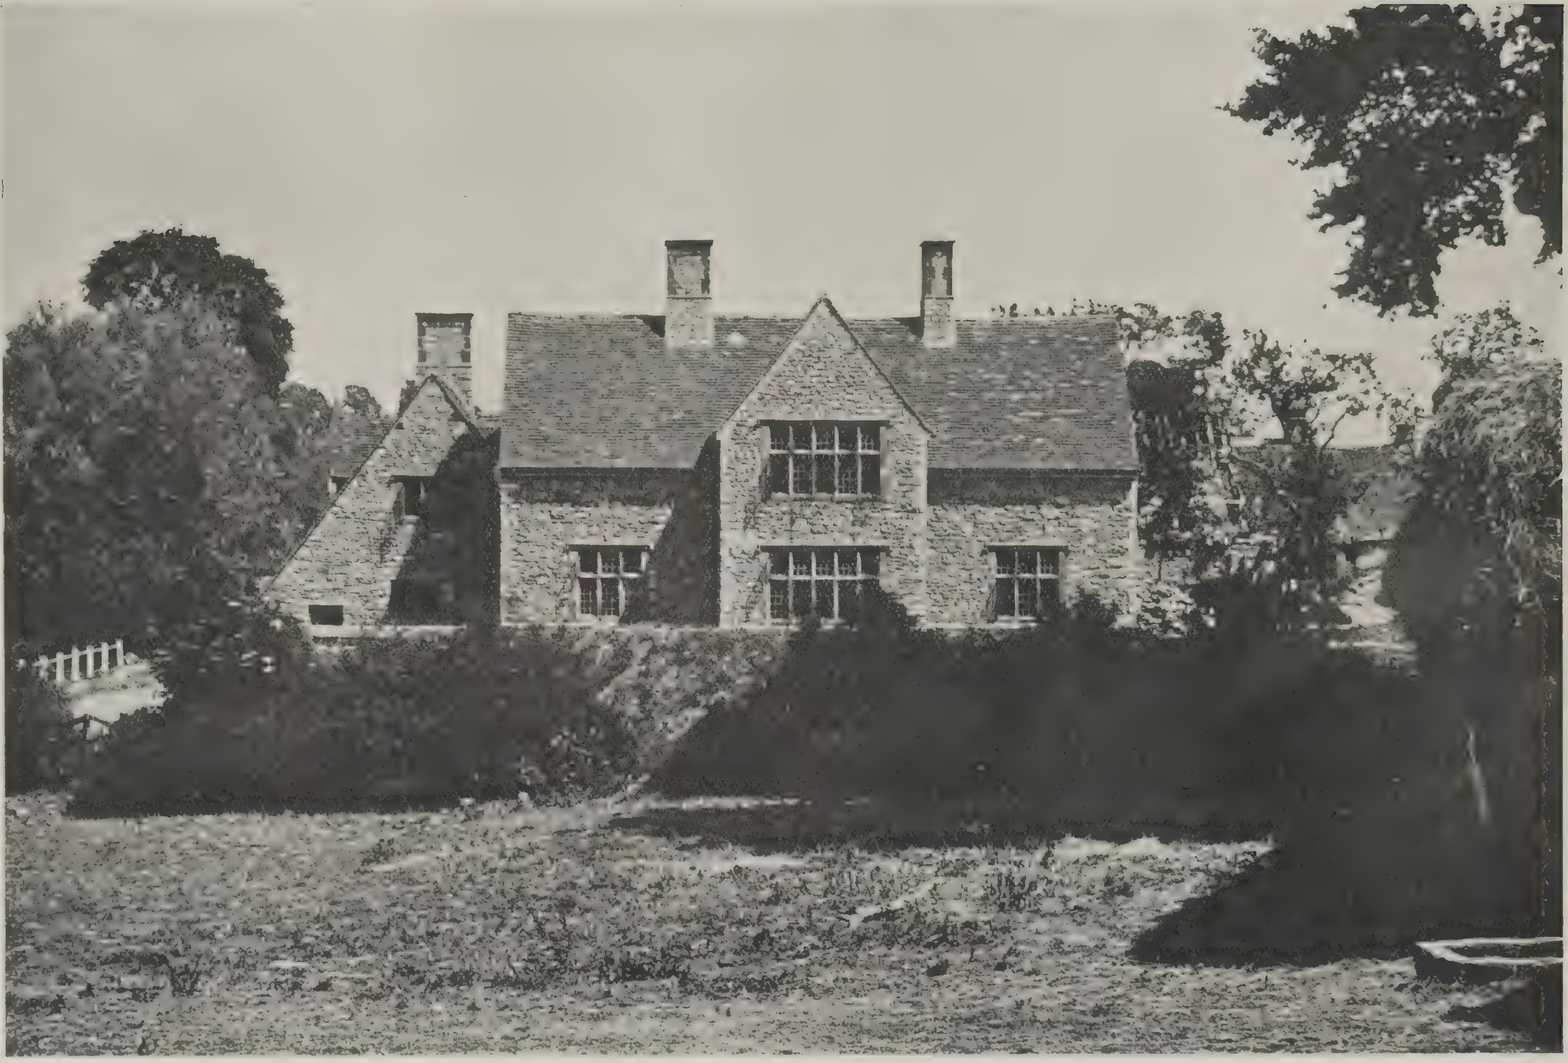
Modern Domestic Architecture. 46.—Little Garth, Syresham, Buckinghamshire.

C. H. Biddulph Pinchard, F.R.I.B.A. Architect.



The planning of this house in the shape of an **L** has afforded the architect opportunities of obtaining various quaint and picturesque effects. The site was originally occupied by several old stone barns, which were pulled down, and their stones and tiles used in the construction of the building. Thus no crude appearance of newness spoils either the house or the charming village to which it belongs. The above view is taken from the south; the windows belong to the kitchen, dining-room, parlour, and bedrooms.

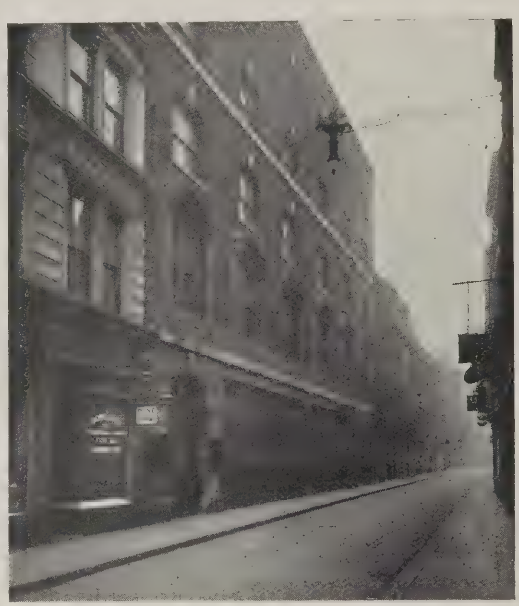
The Commercial Cable Company's Offices

By Edward Maufe, M.A., F.R.I.B.A.

ONE of the most important remodelling schemes carried out in London recently is that which has just been completed in Wormwood Street for the Commercial Cable Company. The building, originally an old warehouse, has been "gutted" by the architect, Mr. Edward Maufe, M.A., F.R.I.B.A., and converted into a modern head office for the executive and operating staffs of the company for the United Kingdom.



THE OLD BUILDING.

The first floor forms the instrument room, which will place London in instantaneous communication with New York without manual relay.

By comparing the accompanying exterior view of the old building with that of the new, it will be seen that the architect has entirely transformed the appearance of the building while retaining the principal outlines of the façade. Thus the main entrance and the windows occupy their old positions, although the building assumes a new character. Many desirable improvements have also been made. On the ground floor the window space has been given good proportions, the upper windows have been fitted with casement and pivot-hung sashes, and a clock in a case of cedar finished in black and gold has been added.

The rooms are well lighted, and the whole interior has been designed, planned, and equipped with a view to securing the highest efficiency in the running of a huge trans-Atlantic cable company, owning five cables connecting the United States, Canada, and Great Britain. The instrument room is one of the finest possessed by any cable company in any part of the world.

Messrs. Walter Lawrence and Son, Ltd., were the general contractors, the sub-contractors being as follows: Messrs. Smith, Walker, Ltd. (steel construction); Art Pavements and Decorations, Ltd. (wall and floor tiles and mosaic flooring); Henry Hope and Sons, Ltd. (casements and casement fittings); Luxfer Co. (patent glazing and fittings); Bratt, Colbran & Co., and G. Matthews, Ltd. (stoves, grates, and mantels); H. Pontifex and Sons, Ltd. (sanitary ware and fittings); Hollis Bros. & Co., Ltd. (wood block parquet flooring); F. G. Edey & Co., Ltd. (electric wiring); John Tanner and Son (Atlas cement and stuc work); Joseph Armitage (clock case in cedar, finished black and gold); Crittall Freeman Bronze, Ltd. (bronze doors and grilles); F. Geere Howard, Ltd. (electric light fixtures); James Gibbons and Sons, Ltd. (door furniture); Haywards, Ltd. (bronze and wrought iron handrails, balusters, folding gates, shutters, etc.); Waygood-Otis, Ltd. (lifts); Young, Austen and Young (heating and ventilating); Reliance Telephone Co., Ltd. (telephones); Hobbs, Hart & Co. (strong-room doors, safes, etc.); Standard Time Co. (clock); James Gibbons, Ltd. (cloak-room fixtures); Heal and Son and D. Maclean (furnishing); Walter Lawrence and Son, Ltd. (instrument-room fittings, etc.).

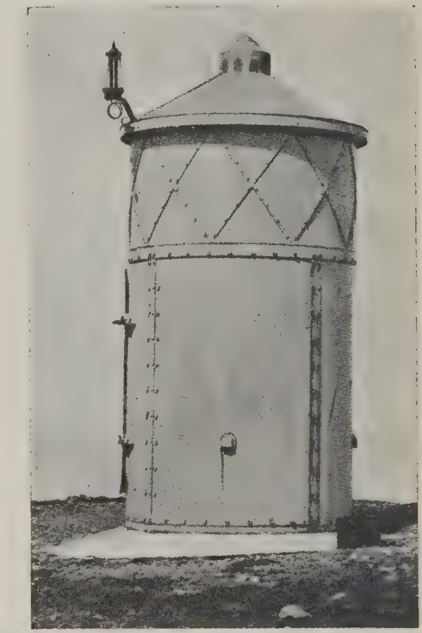
Magazines of the Month*

A Literary and Pictorial Digest

THE CORNHILL MAGAZINE for August contains an article by A. C. Benson on Winchelsea. Winchelsea, says the writer, " is consecrated to recollection and repose, and lost in pleasant reverie; the presiding spirit of the place would seem to be given up to meditation, and to be engaged in recalling, neither regretfully nor complacently, a glorious and active past "—like a retired admiral with an adventurous career behind him. " Anyone who went to Winchelsea expecting something romantic and forlorn would be disappointed; what he will find is a place most picturesquely situated, with enchanting views and prospects in every direction, a noble fragment of a church, leafy avenues and steep-sloping copses, an engaging assemblage of very decorous and comely houses, and a pair of crumbling mediæval gateways which seem almost out of harmony with the trim security of the place." Winchelsea suffered much in early days from attacks by the French, so much indeed that her old prosperity was ruined. In 1538 Henry VIII built the great castle of Camber in the marsh to protect Rye and Winchelsea, but there was then little of Winchelsea left to protect. A pleasant characteristic of this little town is its wealth of curious names. " Bear Square recalls the popular amusements of the age; more innocent is Ballad Singers' Plat. Paradise is the agreeable title of an old house and garden. Trojan's Hall has a high romantic flavour, while Tinker's Garden comes at the other end of the scale. As to the meaning of Grind-pepper Well, the mind loses itself in fond conjecture. Pewes and Holly Rood are innocent meadows lying under Great Gallows Hill. Fryers Orchard and Saffron Garden have the true mediæval flavour. The Firebrand is an uncomfortable name for a house, but The Salutation is an excellent sign for an inn." Finally, there is St. Leonard's Well, which has a tradition that if anyone drinks of its cool waters he cannot cast the memory of Winchelsea out of his mind " but is bound to return to it some time, however far he may wander. That is a delicate allegory of the charm which Winchelsea, and places like Winchelsea, exert on the human mind and heart."



A LIGHTHOUSE IN THE BRISTOL CHANNEL.
(*From " Everyday Science.*")

The August issue of EVERYDAY SCIENCE contains an illustration of a remarkable lighthouse just erected at Barry Holmes, Gower, in the Bristol Channel. This lighthouse lights itself at dusk and extinguishes itself at dawn, and, except that the chemicals which supply the light have to be renewed every two years, it needs no keeper and no attention. The power which operates the lamp is selenium. When the daylight falls below a certain strength the main lamp is electrically switched on; and it does not go out until the daylight returns in sufficient strength to switch the lamp off. Thus the lighthouse becomes illuminated in fog as well as at night time.

The August ARCHITECTURAL REVIEW contains articles on American Architecture, Modern Dutch Architecture, the sculpture of Bernini, and illustrations of work by Walter Cave, C. H. Reilly, C. F. W. Dening, E. B. Musman, and Messrs. Wood, Sarvis, and Muir.

There are certain characteristics, says H. M. Fletcher, writing on American architecture, which may be recognized as American—lucidity, courage, certainty. The great thing we can learn from America is lucidity of expression—the excision of the superfluous. Many American buildings "are reduced to the bare bones of wall, doors, windows, and roof, and in most the proportion of mouldings and features to the square foot of wall-space is absurdly small, judged by our standard. But how clear and emphatic is the statement, and how much the rare features gain in value by contrast with the surrounding spaces! It is no easy matter to attain such economy without crudity and ungracefulness."

Of external influences the most important is the French. The teaching of the

A HOUSING SCHEME IN POTSDAM. HANS KAISER, ARCHITECT.
(*From "Moderne Bauformen."*)

Ecole des Beaux-Arts has fundamentally affected American planning. But turning from plan to treatment, we find English and Italian influences predominant, while the last few years have shown signs of a renewed study of the Greek originals. The Massachusetts Institute of Technology, and the Temple of the Scottish Rite at Washington, are both examples of the recent Greek revival. Notwithstanding their close study of European architecture, however, the American architects of to-day are probably "paving the way to an independent homogeneous national architecture."

Totally different, yet in its way equally interesting, is the modern Dutch movement, to which, says Howard Robertson in his article on modern Dutch architecture, it is impossible for us to remain indifferent. For better or worse, the Dutch movement is bound to have its reaction in this country. "Abundant vitality and intense individualism are the foremost characteristics of the modern Dutch expression in design." The buildings illustrated "are typical of the new Dutch school, wilfully breaking with tradition, contemptuous of all attempts to carry on an architectural expression which, in the eyes of these modern disciples, has already worked itself out to a final and somewhat effete conclusion." The founder of the modern school is Berlage, whose followers form the group of "Moderate Modernists." Inspired by Berlage, but much more extreme in their expression, are the younger men like de Klerk, Kramer, La Croix, and Wijdeveld. De Klerk is perhaps the brightest star in the constellation. The two most striking characteristics of his buildings are their magnificent breadth of handling, and their extraordinarily fine brickwork, which is laid with perfect craftsmanship. "Broad swept curves, tiny apsidal turrets, chevron arrises and string-courses, bricks in chequer, wave, herringbone, and vertical pattern, all are conceived and executed with a perfection which places the modern Dutch builder in the forefront of technicians and craftsmen. Many may quarrel with the fantasy so lavishly run riot; and certainly there are questionable features. The projecting balconies, oddly reminiscent of a man-of-war, with parapet and soffit of brick laid on end, are entirely unstructural . . . but the fact remains that the supreme gift of imagination is present throughout the work. Such designs must have been visualized in both form and colour; the latter is magnificent, the bricks and tiles having a depth and richness of coloration which is enhanced by the surface texture possible with narrow bricks. De Klerk certainly knows and feels his materials, and is no mere paper draughtsman."

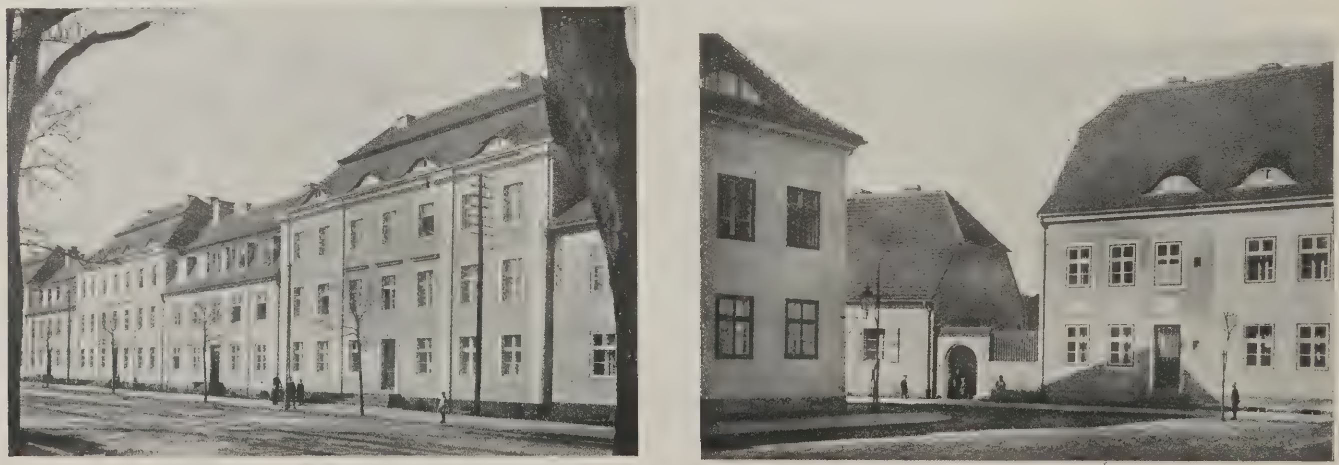
The monument on the preceding page has been designed by C. H. Reilly, for the Accrington War Memorial. The sculptor is H. Tyson Smith.

The Journal of the R.I.B.A. for August contains a full account of Dr. Thomas Ashby's address on "Recent Excavations in Rome," and some "Further Notes on the Composition of Ancient Mortars; and Mortar and Plaster from St. Paul's Cathedral."

The Architectural Association Journal includes a "Report on Architectural Training in Holland," by Howard Robertson, a "Report on the Architectural Profession in Holland," by F. R. Yerbury, and a criticism of the annual exhibition of A.A. students' work, by H. S. Goodhart-Rendel. There are also illustrations of some of the students' work now on exhibition.

Moderne Bauformen, Stuttgart, contains illustrations of an interesting housing scheme carried out at Potsdam by the architect, Hans Kaiser. Three views of the scheme are illustrated on this page. The architect's method of gaining variety by means of his roofs is particularly worthy of study.

Garden Cities and Town-Planning, the journal of the Town-Planning Association, contains an important review of "Town-Planning in Russia," by Etienne de Groër. During the Middle Ages the development of Russian towns did not differ from that of other European cities, says the writer. But with the foundation of Petersburg in 1703, town-planning in Russia entered upon a new phase. The chess-board plan became fashionable. You find it in most Russian towns of the eighteenth century—for instance, in Odessa, Taganrog, Ekaterinoslav, Rostov, and in many others. Some towns, however, were arranged fanwise, as Kostroma on the Volga. There was a universal effort to secure regularity. In the nineteenth century there was a tendency in the principal towns towards the creation of vast ornamental centres, such as the place of the Winter Palace at Petersburg. Several of these centres are masterpieces of the monumental and grandiose style. The twentieth century saw the division of towns into districts, the classification of the streets, the establishment of civic, administrative, and com-



TWO VIEWS OF A HOUSING SCHEME IN POTSDAM. HANS KAISER, ARCHITECT

TWO VIEWS OF THE NEW ILLINOIS STATE PENITENTIARY.
ZIMMERMAN, SAXE, AND ZIMMERMAN, ARCHITECTS.
(From "The American Architect.")

mercial centres, and the founding of the Russian Garden Cities Society. The English garden city movement was reflected in all parts of the Russian Empire. A similar society was formed in Poland. Garden cities were established at Warsaw, Riga, Helsingfors, Kief, Odessa, Petrograd, and Moscow. Even to-day, however, 60 per cent. of the population of Petrograd live in flats with at most two rooms. In the poor quarters some rooms have as many as ten occupants, while at Moscow "corner lodgers" (that is to say, people who occupy one quarter of a room) number 200,000. Consequently death-rate and disease are enormously high. Since the revolution Municipal Offices for the consideration of new town plans have been founded both at Moscow and Petrograd. At Petrograd the work of planning has been considered on a scale which will cover development for a century, or until the time when the population of the city numbers ten million. The schemes include a new port, a new canal, and the electrification of the whole railway system. But it is a significant fact that while in 1916, before the revolution, the population of Petrograd numbered 2,600,000, at the end of 1920 it had sunk to 750,000.

The August ARCHITECTURAL RECORD, of New York, contains articles on "The Early Architecture of Pennsylvania," a new housing scheme by the Metropolitan Life Assurance Company, "Mosaic Designs by Frank Brangwyn," "The Law of Squares" (a study of proportion), and "The Church of St. Sophia." In its portfolio of plates it also includes the Thornton-Smith Company Store in Toronto, by J. M. Lyle, which is illustrated on page 292. The gaiety of this building is pleasing and apposite to its purpose. It is to be hoped that the store sells frivolous articles.

The July ARCHITECTURAL FORUM, of Boston, contains, besides its usual features on decoration and furniture, engineering, etc., articles on "The Boston Architectural Club," and on some "Recent Printing and Publishing Buildings."

THE AMERICAN ARCHITECT, of New York, contains in its issue for August 2 two illustrations of the New Illinois State Penitentiary, illustrated above, but as there is no reference to the building in the number, we know no more about it than that it has architecturally a fine monumental simplicity both inside and out, and is a better piece of architecture than many buildings put to better purposes.

In the same issue are articles on the housing project of the Metropolitan Life Assurance Company, on "Cardboard Models," and on the "Decorative Possibilities of Stained Glass."

"L'ARCHITECTURE," of Paris, devotes most of its August number to the Congress of French Architects at Strasbourg, which took place between June 19 and 23. There are in this issue a great many delightful views of that city.

The Tenth International Congress at Brussels

The Tenth International Congress of Architects will be held under the auspices of the Société Centrale d'Architecture de Belgique in Brussels from September 4 to 11, and will be accompanied by an International and a National Retrospective Architectural Exhibition.

It will be remembered that the outbreak of the war interrupted the preparations for the Tenth Congress of the regular series, which was to have been held in Petrograd in May 1915 under the patronage of the late Tsar.

The Société Centrale de Belgique will be celebrating the fiftieth anniversary of its foundation at the time of the Congress, and the architects of Belgium extend a cordial invitation to their foreign colleagues to join them in the celebration.

The Congress will include delegates from many foreign countries. The Belgian Committee is under the chairmanship of M. J. J. Caluwaers, with M. R. Moenaert as secretary.

Programme.

September 4, Morning.—Meeting of the Permanent Committee of the International Congress of Architects. 2 p.m.: Formal opening in the Palais des Academies. Evening: Reception.

September 5, 10 a.m.—Opening of the Architectural Exhibition in the Palais d'Egmont. 2–6 p.m.: Conferences. Evening: Receptions.

September 6, 9 a.m. to Noon.—Visits to buildings of interest in Brussels. 2–6 p.m.: Conferences. Evening: Receptions.

September 7.—Visits to the devastated zone, stopping at Ypres, and spending the night at Bruges.

September 8.—Visits about Bruges, returning to Brussels in the evening.

September 9.—Excursion to Antwerp, visits about the city and up the Scheldt. 2–5 p.m.: Conferences, returning to Brussels in the evening.

September 10, 9 a.m. to Noon.—Visits to the Exposition. 2–6 p.m.: Conferences. Evening: Receptions.

September 11, 10 a.m.—Closing exercises.

Subjects for Discussion.

1. The responsibilities of the architect.
2. Schedule of charges.
3. The appointing of State and Municipal architects.
4. The rights of authorship of the architect.
5. The profession of architecture: its aims and its rights.
6. Women architects.
7. Public, national, and international competitions. The position of the winning architect in an international competition or of one working in a foreign country.
8. Town planning.
9. Small houses.
10. The influence of locality on architecture.
11. The preservation of historic monuments: with consideration of their economic, hygienic, and social aspects.

An Architectural Exhibition will open September 5 in the Palais d'Egmont, lasting two weeks.

It will be divided in two general classes: (*a*) Belgian—1 Retrospective, 2 Contemporaneous; Jury, Messrs. Maukels, Mercenier, and Van Montfort. (*b*) Foreign—there will be as many sections as there are countries represented.

The dues for members will be 50 francs; for ladies accompanying members (wives and daughters only), 30 francs, which will give them the privilege of visits, excursions, and receptions.

Official delegates may address the meetings in their own language. The official language of the Congress will be French, though any other language may be used provided a résumé in French is submitted at the same time.

All British architects are cordially invited to take part in the Congress.

All those desiring to attend or to receive further information should communicate with The Secretary, R.I.B.A., 9 Conduit Street, W.1.

The President and Mr. Edward P. Warren have been appointed delegates of the Institute.

Correspondence

Our Knowledge of Acoustics

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—With reference to the article on the above subject in your issue for August 2, and the letter by Mr. Bagenal in your issue of August 16, it may interest you to know the following facts.

Having seen the letters of Sir W. J. Pope and Sir Joseph Larmor, in "The Times," I wrote to the editor, pointing out that these letters seemed to be written under a misapprehension as to the amount of work that has already been done, and I gave references to the publications where the ascertained facts could be found. This letter "The Times" acknowledged, but did not publish, although Professor Turner and Sir W. J. Pope had subsequent letters on the subject which appeared.

The result of the whole correspondence is undoubtedly to give the public an entirely erroneous view of the present state of knowledge. Any of your readers who wish to satisfy themselves on this point will find an admirable summary, with bibliography, in the current number of "Science Progress."

ALEX. WOOD,
Emmanuel College, Cambridge.

Sham Gothic

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Had Mr. Clutton Brock kept strictly to the lines of his able address reported in your issue for August 16, one would not feel compelled to object. But one feels it developed into a subtle and covert attack on a style it is now so fashionable to deride. I would hold no brief for any particular style; fashion would be a better word in these restless times.

I must agree that imitative architecture of any style whatsoever is bad; but the imitative style, lacking any logical and consistent development, is a modern fashion. It had its beginning in the revulsion from Gothic which marked the end of historical development, leaving the pointed arch as its highest constructional achievement and the spire as its crown.

How well the story of that critical period is to be read in stone. When began that rise of commercialism that has brought us relentlessly to the sordid materialism of the present era? Can we wonder that our architecture lacks life and spirit in an age that has been full of shams and pretences?

Nay, was not the Gothic Revival, synchronizing as it did with the other movements, religious and social as well as artistic, of the same period—all equally abortive—an eager attempt of a few sensitive souls to bring back something of the Sacred Past in which men were more important than machines, and Art was the vital expression of a living faith?

The march of materialism was too strong, and now in a weak acquiescence with the spirit of the age, we continue to seek its expression in the continuous revival of pagan forms.

Architects are not constructing to-day. The engineers, themselves the product of the age and finding their full development in it, are leading us by the nose. They are the real architects in their logical, if ruthless development of the materials with which science provides them. Our buildings are simply decorative engineering, for which reason meaningless pagan symbols of material splendour are more suitable than the true principles of constructive Gothic.

Now I will quote the particular passage in Mr. Brock's address that provoked me: "Gothic leads nowhere. It cuts the architect off from the whole of that future which he might enter into. Gothic, I am convinced, is now simply a bad habit, and it is a bad habit encouraged by the clergy because they think it religious. They have identified the Gothic style with the Christian religion in some mysterious way—perhaps they suppose the early Christians built in Gothic—and they do not realize that nothing can be less religious that a style which is mere imitation."

On which I beg respectfully to comment as follows:—

(1) "Gothic is now simply a bad habit." He does not say "Sham Gothic." It is a bad habit to imitate Gothic. It is, I protest, not a bad habit to build, so far as one can, in an age antagonistic to it, in the spirit of those true and inspiring principles that developed the style, though it would be absurd to expect these principles to evolve the forms that distinguished the style in the past.

(2) Not only the clergy, but all who retain a modicum of the faith and principles of traditional Christianity must encourage the consistent evolution of these principles, because their Christian culture is the very basis of them.

There is nothing mysterious in this connection. It is actual historical fact that the style was developed in the Christian Era and fell with the break from tradition. Christian culture must continue to foster its principles because it has remained, and must remain, antagonistic to the onslaught of materialism that progresses by the rejection of these same principles. It is natural to expect that the re-action is bound to produce some "sham." But if the age fosters pretence, it is better to strive to revive the real than to imitate the false. One has no other alternative.

I will conclude by quoting another passage which is a ready definition of what "Gothic" means to Mr. Brock: "If you can grasp the fact that Gothic is original architecture in which men were really expressing themselves, and really solving the structural problems of their time; that it has the thrill in it of people making discoveries, a thrill which nobody can imitate, then you will not try to imitate it."

It is very good indeed. Pagan forms may be suitable to the commercial buildings of to-day; but if men are to begin "to express themselves, and really solve the structural problems of our time, and so have the thrill of making discoveries" (instead, I would interject, of leaving these to the engineer), surely, according to Mr. Brock's above statement, they will be working essentially in the Gothic spirit. Which is what is required.

Certainly, so long as traditional Christian churches continue to be built, I trust they will be inspired and fostered by that same spirit of Protestant Gothic—and risk the sham.

In the light of the above statement I cannot understand what Mr. Brock means by his statement that "Modern Gothic is more Gothic than the real." I presume he is thinking of, and protesting against the imitation of the forms.

My whole contention is that the spirit that evolved the Gothic style is a more vital and inspiring one than the spirit, also appropriate to its own era, that evolved the Pagan style.

JAMES O'HANLON HUGHES, M.S.A.

Architectural Education

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Referring to the recent discussion in your columns on Architectural Education, I am a strong supporter of the "Articles" System. It produces an intelligent architect well versed in modern economic and commercial designing; and whenever a proposal is made to erect a large and impressive public building we invariably have an open competition, so that if competitors are turned down for lack of designing, there is no harm done to the community or anybody concerned. It really comes to this: that no architect can force a design on the public, nor can he build unless the design satisfies his client; and even where an architect brings out a good sound architectural design, in nine cases out of ten his client will turn it down because he refuses to pay for matter which will not serve his commercial ends.

This country to-day is crying out for practical architects who can design on modern lines, who can design a building on economic and useful lines. Again, in nine cases out of ten we have such buildings to design, and the odd chance of a town hall or architectural edifice can be tackled by such men who specialize in artistic design.

I think we are practically the only country where an architect is required to master so varied a course of subjects. In this respect this country has always been at fault; the average Britisher practises every known craft and ultimately is sure of nothing at all. To tackle one subject well is to be a master of one's profession, and the examinations as set down by the R.I.B.A. do not give fair play to an articled pupil. They expect in so short a time what it is impossible to produce, for modern building, with its scientific modern principles, gives no time for the minute study of doorways and pretty mouldings, etc., which our forefathers so revelled in.

The articled pupil is a practical proposition. He it is who will erect the hundreds of buildings to suit the modern commercial world; he will rebuild the world, or that part effected by the late war.

In the majority of cases a man between twenty and twenty-five, brought up under articles, is an infinitely cleverer and more up-to-date all-round practical architect than the student of a university. The former is the man for whom the public are calling, and yet, because a university man can dazzle the world with a majestic design for an art gallery or world centre, approached by many thousands of steps in all directions, and descending to the water edge of a huge lake (and the whole costing many millions which modern exchequers could never produce), he can thus obtain his degree against the student who, though a thoroughly trained architect, has not developed that transcendently glorious conception of design which is practically the only sure point on the part of the university man.

To sum up briefly: the articled student is barred recognition because he has not had the training in design of a university student. This latter can fully qualify in design, having been exempted in various subjects, and can turn out into the world fully armed to fight against the very existence of the office-trained practical man.

To quote the intermediate examinations, there are many students who, given reasonable time, could efficiently design a feature equal to any university man. Because one man is less rapid in design than another, it does not mean for a moment that he is no good as an architect. It is not fair so to judge him. I sincerely trust that matters may be adjusted and given careful consideration because, financially, architectural education is a large item, and it does not seem fair that architectural students should be tossed about unmercifully and have to bear the hardships consequent on an overcrowded profession. They should be advised in the first place as to their efficiency or their prospects instead of being treated as school children until thirty years of age. I should like to see genuine fair play. Many of the powers who enforce these stringent examinations entered the profession through this side door, or, even earlier still, through the large door where no examinations at all existed as barriers.

"FAIRPLAY."

Details of Science and Technical Buildings

On our double-page plate we illustrate a rising gallery suitable for a lecture theatre providing accommodation for 104 students. The timber-framed construction of the staging is also indicated. The seats are tip-up, and a book-rest and small shelf are also provided as illustrated in the large scale detail. Care should be taken to enable each member of the audience to receive a direct and uninterrupted wave of sound, and an equally uninterrupted view of the lecturer. The first published description of the way in which it was desirable that seats in any large hall should be arranged so that the occupant could both hear and see the speaker was given by Mr. Scott-Russell in a paper published in 1839. The seats were to be arranged not as tangents to a straight line, but on a concave curve determined as follows (see diagram below): A line was drawn from the position of the speaker's mouth touching the point where the auditor's head in the front row would come, and, at a suitable distance behind, the seat for the second auditor was marked, and on the line indicating the back of this seat a height of 18 in. or less was set upwards from the point where the ray from the speaker's mouth touched, this marked the position of the head of the second auditor. By repeating this process points were found all ranged in a curve, which is known as the "isacoustic" curve. Each seat is placed about 2 ft. 9 in. below the mark indicating the top of the head of its occupant. The degree of steepness required will, of course, vary in different circumstances according to the nature of the lecture or demonstration. These illustrations form the fifteenth of the series of drawings of science and technical buildings specially prepared for the JOURNAL. By Messrs. A. W. S. Cross, M.A., F.R.I.B.A., and Kenneth M. B. Cross, M.A., Architects.

Destruction of an Old Wooden Church

Mr. A. R. Powys, Secretary of the Society for the Protection of Ancient Buildings, in a letter to "The Times," says:

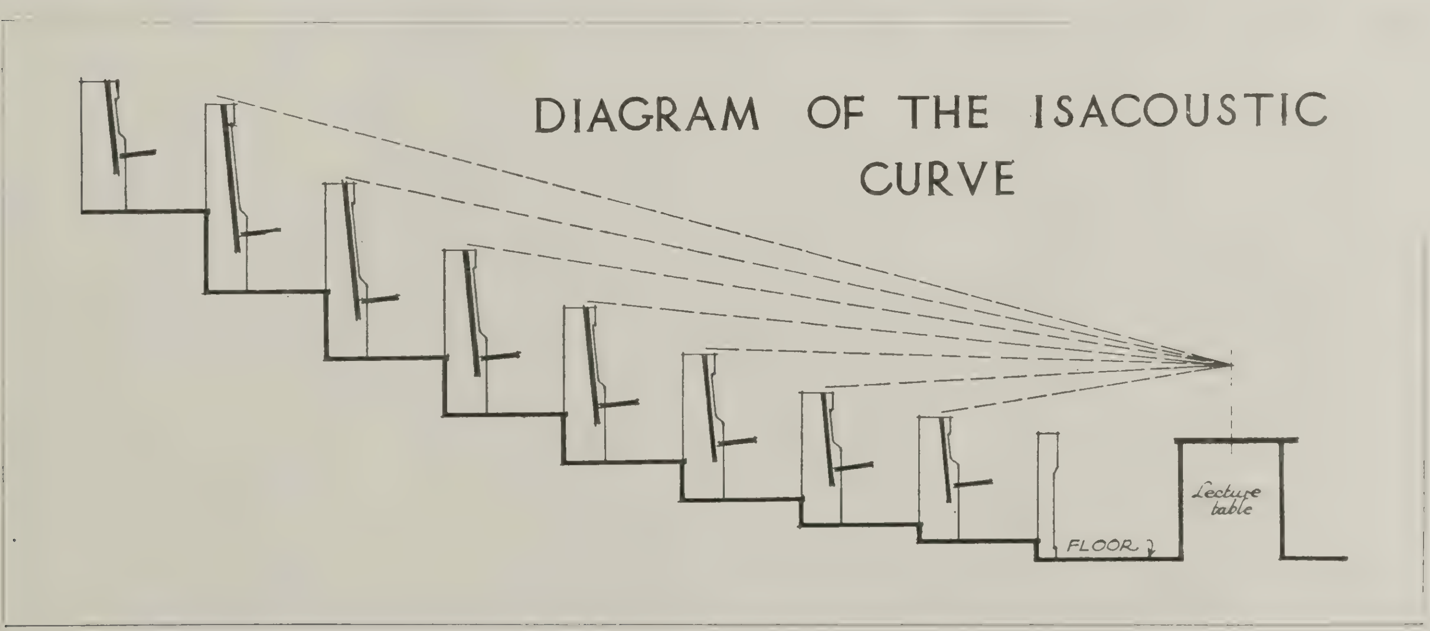
It does not seem generally known that the curious old wooden church of Hazeleigh, or Haseley, in Essex, near Maldon, is to be pulled down to save expense of upkeep. It is true it is remote from the village, and has long been disused save for funerals.

It is a building of real value, extraordinarily quaint and interesting. We have few wooden churches in England of any kind, and few parish churches of such diminutive size. There was a church here before 1390. This building is said, and in fact appears, to be Elizabethan, but it was considerably repaired in the eighteenth century. Elizabethan churches are exceedingly rare. It follows the traditional local plan of a small church, having chancel, nave, south porch, western bell-cot, the whole framework being of wood plastered inside and out.

It is utterly wrong that a Parochial Church Council can decide, as we understand has been done in this case, to hand a valuable little building like this over to a contractor in Maldon for destruction before anyone can intervene to stop it. The instructed public will wish to know whether the Diocesan Advisory Committee of Chelmsford consented, or whether it was arranged behind their backs.

If the former, before advising the Chancellor to grant a faculty for pulling down an old church, the Diocesan Committee would have been well advised to have referred such a case, which concerns the continued existence of an old church, to the Central Committee. Many parishes do not realize the existence of these committees: some try to evade them. Their influence will prevail in time.

Meanwhile we hear that destruction has actually begun. I venture to appeal to you to give the matter publicity in the hope that even at the last minute what seems to be a public scandal may be averted.



METHOD OF SETTING OUT THE SEATS IN A RISING GALLERY FOR A LECTURE THEATRE

List of Competitions Open

Date of Delivery.	COMPETITION.
Aug 31	Lay-out of Land at West Cliff, fronting the sea, in Promenades, Recreation Ground, Roads, and Building Plots. Premiums £300, £200, and £100. Apply Mr. A. Blasdale Clarke, Town Clerk, Albion House, Ramsgate.
Sept. 16	Nurses' Home, Chelsea Hospital for Women. Premiums: £150, £100, and £50. Assessor, Mr. H. V. Ashley, F.R.I.B.A. Names by above date to Mr. H. H. Jennings, Secretary, Chelsea Hospital for Women, Arthur Street, Chelsea, S.W. 3.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8,000 francs.
Nov. 1	Labour saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C. 4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Jan. 31, 1923	Labour-Saving Flats, Hampstead Garden Suburb. Premiums £500, £300, and £200. Assessors: L. Rome Guthrie, F.R.I.B.A., J. C. S. Soutar, Lic.R.I.B.A., and E. J. Cooper, Secretary, Second Hampstead Tenants Ltd., to whom, at Temple Fortune House, Hampstead Way, N.W. 11. applications had to be made by August 11 last.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.

Competition News

Society of Architects' Victory Scholarship.

The Society of Architects' Victory Scholarship was founded in 1919 to commemorate the war service of its members and to perpetuate the memory of those who fell during 1914–18. It is awarded annually for competition in architectural composition and design and is of the value of £100, which must be used by the winner in advancing his or her professional education. The competition is open to any British subject, man or woman, under thirty-five years of age, without any fee, and is divided into two sections: Part I, the open eliminating competition, and Part II, the final competition restricted to ten competitors selected by the jury of assessors.

The jury of assessors is composed of the Patron of each of the Royal Academy Ateliers, two representatives of the Society of Architects, and a representative of each of the architectural schools entering two or more candidates for the competition.

Part I consists of an *esquisse* prepared "*en loge*" at various centres within twelve hours, and Part II of a large *projet* for which an *esquisse* is prepared under similar conditions at the First Atelier of Architecture in London, the competitors afterwards being given a month in which to complete their final designs, which must not depart from the general lines of the twelve-hour final *esquisse*. These final designs are developed at any place convenient to the competitors.

This year (1922) there were sixty-six entries, including a woman architect, for Part I of the competition, which was held in co-operation with the Architectural Schools in London (two centres), Glasgow, Leeds, Cambridge, Liverpool, and Sheffield on June 10.

The subject was a ceremonial staircase, and fifty-six of the candidates prepared *esquisses*. The jury selected the following ten candidates to compete in Part II in London on July 15:—

J. A. Jellicoe (London), J. C. Shepherd (London), N. C. Mackey (London), D. Brooke (Liverpool), G. F. Shanks (Glasgow), E. N. Channon (London), H. St. John Harrison (London), A. S. Knott (London), Keith D. P. Murray (London), P. Hardy (London).

The subject for Part II was "A Stadium for Olympic Games." Each of the ten selected competitors prepared final *esquisses* and eight afterwards developed their designs, which were adjudicated upon by the jury in London on August 23. The following award has been made, subject to confirmation by the Council of the Society of Architects:—

No. 97. H. St. John Harrison (London), £60 and the Gold Medal.
No. 68. N. C. Mackey (London), £20.
No. 107. K. D. P. Murray (London) £20.

The report of the jury states that while the general standard is much higher than in previous years there is no design of outstanding merit beyond those of other competitors. The jury therefore has felt bound to divide the prize again. Mr. Robert Atkinson on behalf of the jury of assessors will shortly give a public criticism of the designs.

The record number of entries received, and the assistance so freely given to the Society by the architectural schools in organizing and holding local centres is evidence of the value set upon the competition from the educational standpoint and of the soundness of the conditions and system under which it is conducted.

The competition drawings and *esquisses*, which are an object lesson not only in the skill of the competitors in architectural composition and design, but also in their ability to grasp and delineate in a few hours the essential features of a complicated and unusual programme, will be on view at the Society's rooms, 28 Bedford Square, W.C.1, from 10 a.m. to 5 p.m. between September 4 and October 13 inclusive, except on Thursdays and Saturdays, and will afterwards be at the disposal of the schools of architecture in the provinces for exhibition purposes.

Cape Institute of Architects

The many ways in which the Cape Institute of Architects are protecting the interests and uplifting the status of the profession in South Africa are shown in a convincing manner in the year book of the Institute, a copy of which has just come to hand. As in this country, great efforts are being made to secure registration. Valuable assistance is being rendered to the R.I.B.A. by the Institute, who have appointed the following Board to conduct the Royal Institute examinations in Cape Town: W. J. Delbridge, A.R.I.B.A.; W. A. Ritchie - Fallon, A.R.I.B.A.; F. Kendall, F.R.I.B.A.; Arthur H. Reid, F.R.I.B.A.; and C. P. Walgate, A.R.I.B.A. Prince Arthur of Connaught is patron of the Institute, and the office bearers and council for 1922–23 are as follows: President: W. A. Ritchie-Fallon, A.R.I.B.A. Vice-President: W. J. Delbridge, A.R.I.B.A. Council — Fellows: H. J. Brownlee, A.R.I.B.A.; F. K. Kendall, F.R.I.B.A.; J. Perry; A. J. Thompson, F.R.I.B.A. Associates: L. A. Elsworth, A.R.I.B.A.; F. W. M. Glennie, Hon. Sec. and Treasurer; C. P. Walgate, A.R.I.B.A. Hon. Auditor: W. G. Fagg, Licentiate R.I.B.A. Secretary: T. A. Dalgleish, Markham's Buildings, Cape Town.

New Inventions

Latest Patent Applications.

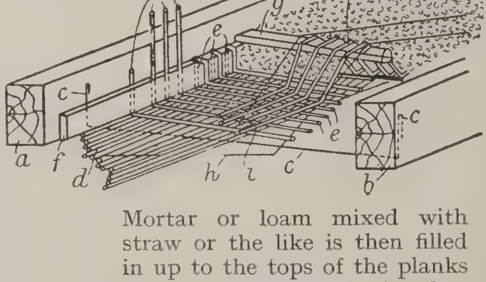
21908.—Cantley, H. S.—Casement windows, etc. August 11.
21803.—Lutz, C. T.—Erecting masonry constructions. August 10.
21991.—Selwood, V. G.—Wall ties. August 12.
21375.—Wilkins, R. F.—Composition for facing walls, etc. August 4.

Specifications Published.

183506.—McArtney, J.—Method of securing a cement or plaster facing to building slabs or the like, troughings, and to the coverings of girders, boilers, and the like.
183509.—Malcolm, A. J.—Blocks for building and constructional purposes.
183530.—Griffiths, W. H.—Roof and the like coverings.
183615.—Morton, B. — Revetments, groynes, foundations, and walls, or the like.
183640.—Holcroft, C. W. — Kinema theatres and other structures.
183737.—Anderson, T.—Means for binding hollow walls.
183743.—White, J. S., and White, J. P.—Doors, shutters, or the like.
183753.—Frankfurter, H., and Jansen, E. A.—Process for the manufacture of coverings for floors and walls.

Abstract Published.

182016.—Ceilings.—Hartmann, J., 38 Schlachthofstrasse, Cassel, Germany.—Reeds *d* are supported by wires *c* secured to the beams *a*, *b* and by wires *h* passed under the wires *c* and over planks *g*; transverse straws *e* are laid over the reeds and secured by laths *f*, and longitudinal straws *i* are laid over the straws *e* and planks *g*.



Mortar or loam mixed with straw or the like is then filled in up to the tops of the planks *g* and the underside is plastered. The usual coke filling may be placed above the loam.

The above particulars are specially prepared by Messrs. Rayner & Co., Registered Patent Agents, of 5 Chancery Lane, London, W.C. 2, from whom readers of the Journal may obtain all information free relating to patents, trade marks, and designs. Messrs. Rayner & Co. will obtain printed copies of the published specifications and forward on post free for the official price of 1/- each.

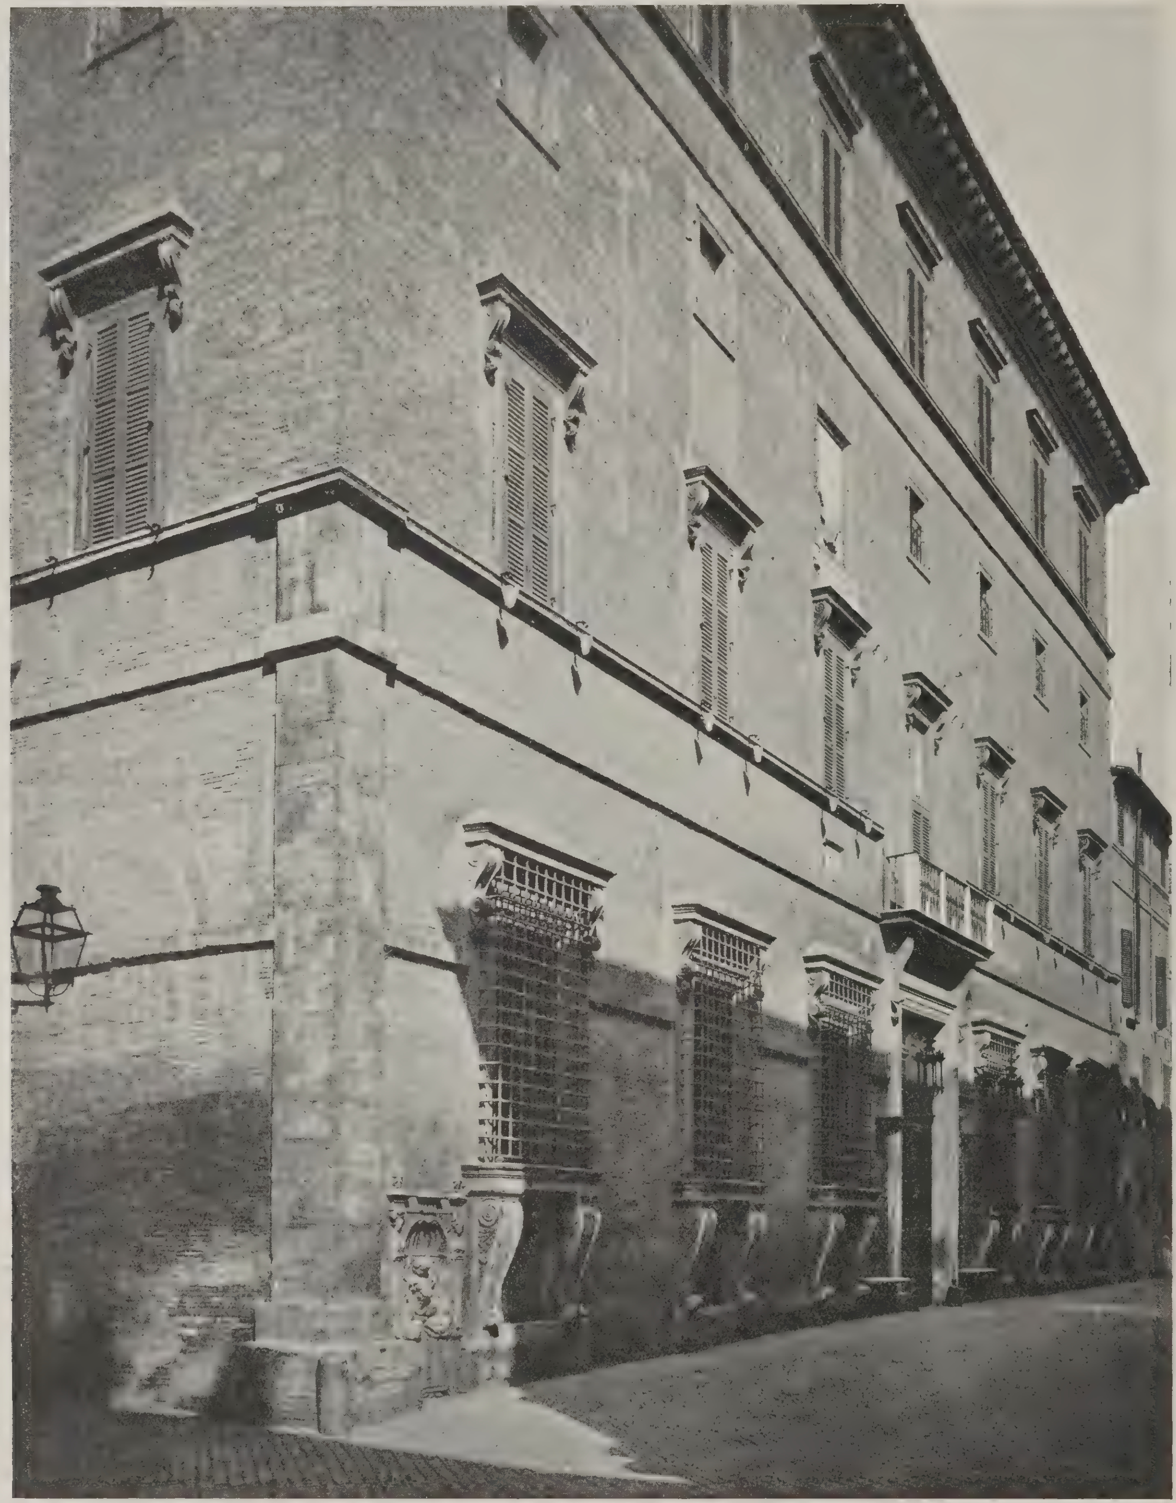
Architecture of the Italian Renaissance. 19.—The Palazzo Sacchetti, Rome

Antonio San Gallo, Architect



Though designed in the most reticent manner of which the architects of the fifteenth century were capable, the Sacchetti Palace, by its great scale and fine proportions of wall and window area, retains that air of magnificence which is the only quality common to all Italian architecture. At the corner of the building in the above illustration a small and charming street fountain can be seen.

Professional Prospects

THE war hit architects, in common with many other professional men, very hard. During the feverish boom that followed the armistice many architects became very busy, partly in carrying out building schemes deferred from pre-war days and partly in the preparation of new work, a good deal of which unfortunately did not get beyond the drawing-board stage. At the close of the war assistance was very difficult to obtain, and the salaries of trained and capable assistants rose to double and treble the pre-war rates. The wastage of war had played terrible havoc in the ranks of the younger men, and architectural education was from 1914 to the end of 1918 practically at a standstill. For the last year or more the profession has been experiencing a somewhat severe slump, and though there are signs of improvement it will probably be some time yet before architects generally become really busy.

One result of this rather depressing state of affairs is that those students who have just finished their course at one or other of the architectural schools are finding a difficulty in getting into suitable offices, and a still greater difficulty with regard to remuneration. Many of these students are of a greater age than the average architectural student was when he had finished his course in pre-war days.

A great number are ex-Service men who took advantage of the Government's offer to pay their fees at a recognized institution in order that they might study for a profession when they returned to civil life. Many of them are ex-officers, who, in spite of their youth, enjoyed comparatively high rank in one or other of the Services, with a corresponding income, and they were initiated into a scale of life in which they did not in all cases have to consider expense too carefully. Every architect feels the deepest sympathy for the ex-Service man, and would do anything in reason, sometimes even a little out of reason, to help him, but we are all, and architects perhaps more than other men, bound by the hard economic facts of the moment.

The way of the young architect is not an easy one. The fortunate few who are endowed with sufficient of this world's goods to make the question of earnings of a secondary importance, and those who have fathers before them in the profession, may be excepted from our considerations, but for the majority the effort to establish themselves in practice is generally a long and difficult business.

Architecture as a profession, or perhaps it would be better to say as an art, holds out many rewards and compensations to its devotees, but these rewards are not conspicuously of a financial nature. It is probably easier to earn a moderate income, not to speak of a fortune, in any other walk of life.

The architect's chief reward always has been, and must always be, in the interest of his work. We are afraid that all who enter the profession do not fully realize what they are doing. Those who imagine it is a nice, soft job, with a certain amount of social distinction, and with rich rewards for little effort, will be bitterly disillusioned. The right man will always win through, but not without his times of trial and tribulation, some of which he might have been spared had he understood more clearly the difficulties in his way.

Under the old system of articled pupils it was much easier for the pupil to pass into the successive stages of improver, paid assistant, and eventually practising architect, than it is under the system of education at the schools which obtains to-day.

The practising architect, unless his practice is so small that he can do all the work himself, must have assistants, and it is only right that he should pay them a proper salary, but this salary can only be proportionate to the services rendered.

Now what are these services? They are first and foremost the preparation of working-drawings, the interpretation of sketches and notes into legible instructions for the builder. This is what the ordinary architect expects of his assistant, and this is what he is prepared to pay for.

Of course, any reputable architectural school includes such subjects as building construction and the making of working-drawings in its curriculum, but it does not, cannot, in fact, give that hard and intensive training in the preparation of working-drawings which can only be acquired in an architect's office. Even the most brilliant of students will, on leaving the schools, have to go through a period of some six months or more before he is worth even a very modest salary.

To the enthusiastic young architect who has just finished a long and expensive training at an architectural school it is a sufficiently chilling experience to pass from the full life of the school, with its varied interests and rich associations, into the work-a-day world of an average office, with its regularity of hours and what at first must seem its monotony of work; but when, in addition, he is told that he must spend some further period in the gaining of experience before he can hope to earn a salary, it is little wonder if he begins to doubt the wisdom of his choice of a vocation. Or he will begin to question the training that the school has given him, and to wonder whether it could not better have combined the practical with the theoretical.

It is only when he is established in practice himself that he will realize to the full what his early training has done for him and how much he owes to it; that its purpose was not to equip him for the immediate earning of his bread-and-butter as soon as he left the portals of his school or university, but to fit him for that much more important part he will have to play as an independent architect. The nearer the bread-and-butter line one starts, as a rule, the nearer one finishes. The wages of the average labourer are much the same for the man of twenty as the man in the prime of life.

And if the young architect is unduly depressed with the difficulty of establishing himself in his profession let him ask himself whether it is much easier for a lawyer, doctor, or even a divine to establish himself in his. But what is wanted is that he should realize all the difficulties that lie in his way and then make up his mind to overcome them or quit architecture. For his difficulties, even when he has successfully established himself, are by no means over.

The successful doctor or lawyer, once having secured his clients, may reasonably hope to keep at any rate a great majority of them throughout his and their lives; but the architect is, as it were, always making a new beginning. The average man does not as a rule continue building for ever; he builds one house or one factory and then he has finished, and the architect must seek a new client. One of our most successful architects confessed in an expansive moment that many of his jobs came apparently out of the blue—when things were looking their blackest something turned up!

Mr. Micawber's spirit of waiting is not to be despised if one is ready and qualified to take advantage of the mysterious something when it does turn up. Just at the present time things are looking a little dull in the architectural world, but as Monsieur Coué would say, "this will pass."

Our present troubles are mainly political and industrial, and when these have been overcome, as they must be, then architects should reap a royal harvest. Building owners have been putting off the time of building for many and varied reasons—they have been waiting for the price of materials and labour to come down, they are awaiting a revival of trade and a stabilizing of conditions—but they cannot put off building indefinitely.

And the life of the nation is being starved for the want of adequate buildings. Whether it is factories, houses, places of amusement, hotels, and the like—we hear the same demand on every hand for more and more buildings. Whole areas in the centres of our great cities are decayed and derelict, and await rebuilding, the housing problem has only just been touched, and factories and business premises are wanted everywhere, whilst the provisions of the compulsory Town Planning Act should provide a fruitful field for architects. One of the most hopeful of signs is the increasing number of private individuals who are at the present time contemplating or are in process of building their own homes.

Domestic architecture is a very good barometer to gauge the position of the profession. Always the first kind of building to feel the effects of a slump, it is usually the last to recover, so that if there is a prospect of our domestic architects becoming busy, the rest of the profession may take heart for the future.

We do not mean to infer that there are no difficulties in front of us, but what we do say, unhesitatingly, is that the worst is over and that the prospects for the future are brighter than they have been for some considerable time.

A Question of Foresight

The new Southwark Bridge, opened with much ceremony but a few months ago, is already "up"—not because the roadway is prematurely worn out, but because the necessity for an electric cable was overlooked while the bridge was in course of construction. How essentially English! We pride ourselves on our efficiency in "practical matters," and overlook a little detail like an electric cable. We lay magnificent macadam roads and asphalt pavements, and promptly pull them up to put in gas mains and supply pipes. How many miles of suburban paving must have been spoiled in this way alone! But apart from the unsightliness that results from repeated "breaking-up" and "making-good," there is the not unimportant item of cost to be considered. No matter by whom this is ostensibly borne—whether by local authority or private supply company—it must ultimately come back upon the suffering ratepayer, either in the form of heavier rates or increased supply charges. What is the remedy? Foresight: a little more imagination on the part of our civic representatives and those who work under their direction. Very few of our most pressing "problems" would exist to-day if a little foresight had been exercised in the past: there would be no Piccadilly Circus problem; no St. Paul's or Charing Cross Bridge controversy; no street widening questions; and—Southwark Bridge would not be "up." Much is heard nowadays about "Adult Education" and "Continuation Classes." Why not rope in our mayors, aldermen, and town councillors? A short course in Civics and Economics would do them a world of good.

Obsolete By-laws

At last the nuisance of obstructive by-laws seems to be engaging the active attention of the Ministry of Health. It is true that the Local Government Board, in 1918, urged the repeal of all by-laws made before 1900, and at least the examination and amendment of those of later date; but it is one thing to recommend a course of action and quite another to ensure its being put into effect. We learn that Sir Alfred Mond has now sent out a circular to all local authorities strongly urging them to revise all by-laws which are in any way restrictive of building and development, irrespective of the date when the by-laws were made. This is a move in the right direction, and we hope that Sir Alfred will see to it that the recommendation is no longer evaded. Too long has Bumbledom been allowed to stand in the way of the legitimate development of the building industry.

No. 10 Downing Street

No. 10 Downing Street, the foundations of which have lately become so insecure that the Office of Works have been called in to strengthen them, is one of a number of houses built during the latter part of the seventeenth century by Sir George Downing, after whom the street is named. Downing had no idea of the official character that it was eventually to assume, for it was not until the reign of George II, when the premiership was inaugurated, that No. 10 became, as it has since remained, the official London residence of the Prime Minister. It had been occupied previously by the first Earl of Lichfield, but it went to the Crown as a result of the Earl's adherence to the fortunes of the exiled Stuarts, and in 1731 Sir Robert Walpole persuaded George II to attach it to the office of the First Lord of the Treasury. The description of Downing Street in Seymour's "Stow" no longer applies. Writing in 1735 he describes it as "a pretty open space, especially at the upper end, where are four or five very large well-built houses . . . . each having a pleasant prospect into St. James's Park, with a Terras Walk." These houses have been swept away, and with them the "Terras Walk," which has been succeeded by the flight of steps that now terminates the street towards the park. If Sir Gilbert Scott had had his way Nos. 10 and 11 would also have disappeared, for his public offices, which form the southern side of Downing Street, were intended to be extended northwards, across the western or park end of the street. So much is to be gathered from the unfinished arches on the north front of the Foreign Office. No. 10 Downing Street is not so much a house as a unit in a very complex mass of buildings forming the Treasury, and including the Court of Judicial Committee on the south-east, the old Treasury of Cardinal Wolsey on the north-east, the Treasury buildings on the northern front, the Cockpit on the western side, and, finally, 10 Downing Street. There is no external evidence to show that these are all part of one and the same building; and there is great difficulty in identifying the several parts, all of which are closely connected. Here, within the space of a few square yards, may be found the handiwork of Wolsey, Wren, Kent, Vardy, Adam, Soane, and Barry. There has been a great deal of controversy about the position of the Cockpit; but the late Mr. Loftie, after much research, was convinced that it stood on the site of what is now the Old Council Chamber, a small but handsome apartment within the Treasury buildings.

Chinese Wall-Papers

By W. STEWART-GREENE

THE history of wall-paper, the most perishable of all wall hangings, is hampered by the insufficiency of records, and scarcity of early examples. The first reference I can find is that a patent was granted by Charles I in May 1634 to Jerome Lanyer for printing paper hangings in block upon linen, leather, etc., and that a Mr. Jackson, a manufacturer of paper hangings, published in 1734 a book on a new method of printing classical subjects for paper hangings. About 1770 we had a considerable export trade in paper hangings to America.

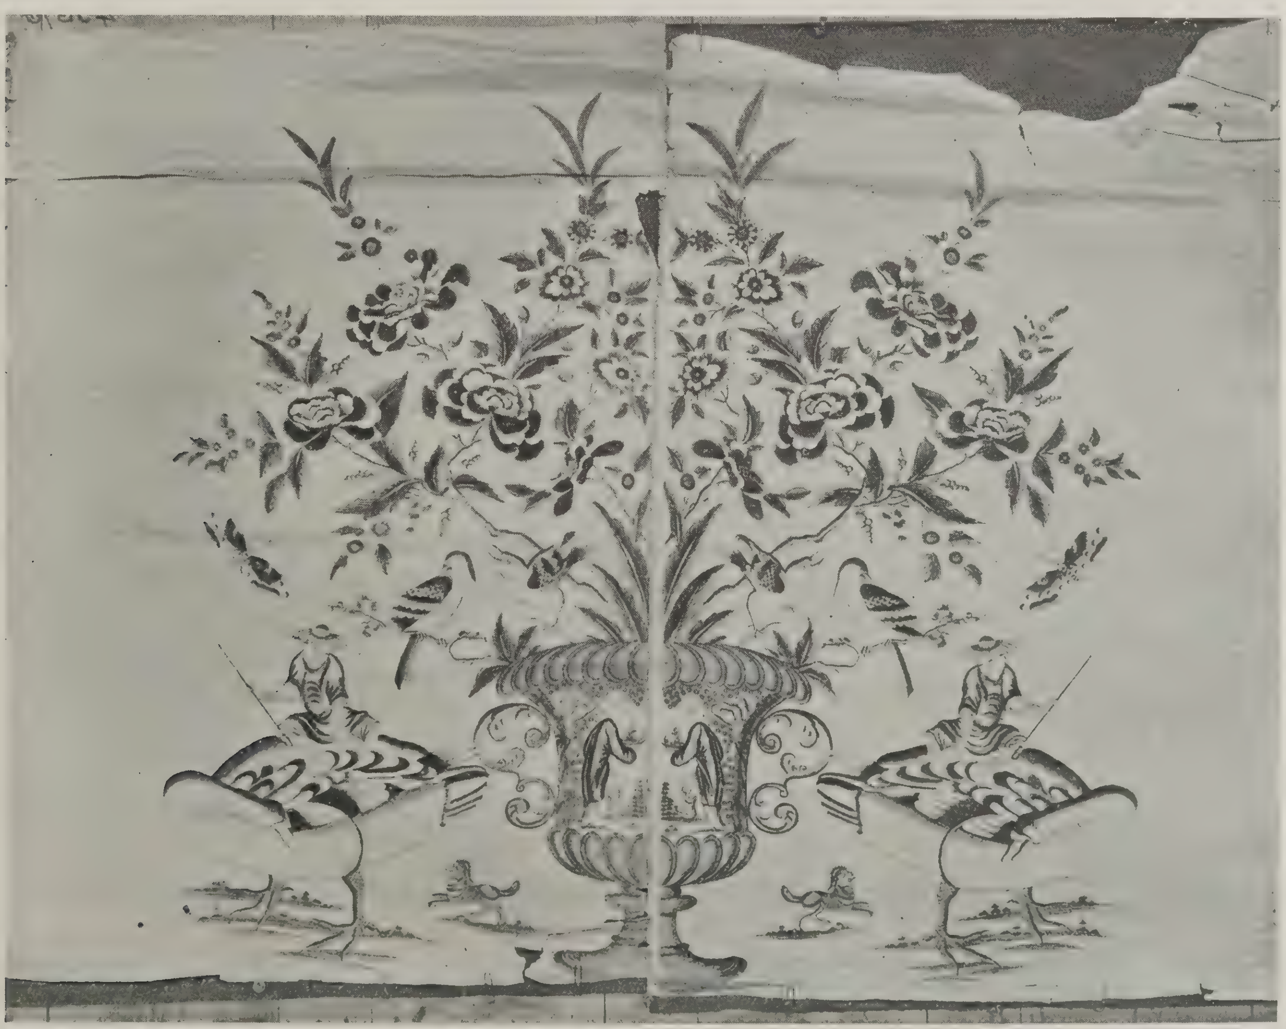
In 1786 George and Frederick Eckhardt started at Chelsea a manufactory of paper hangings in which they used copper plates as well as wood blocks, and the designs were partially finished by artists. They also printed on silk and linen as well as on paper. Just about the same time a Mr. Sherringham started in Soho; and William Bayley was granted a patent for making paper hangings. It is interesting to note that until about the nineteenth century, paper hangings were printed on sheets of paper about 28 in. by 22 in.

I believe that an extremely interesting old block paper can be seen at Penshurst in Kent, dated about the end of the Stuart or possibly William and Mary period, executed in block in two colours upon a gilt leather ground; there are also one or two block papers at Hampton Court dating from about the time of George I. I believe the Victoria and Albert Museum have a good many examples which they have collected from time to time from old houses, and on some of them the duty stamp is shown, as there was a tax on all paper hangings at that time; and the London Museum have some very interesting samples of old paper hangings printed both from copper and wood blocks and coloured by hand. On reference I find that Mr. J. Gregory Grace read a paper in 1839 at the Institute of British Architects in which he refers to an advertisement in the " Postman " of 1702 by a firm of the City of London recommending their wall papers.

The influence of Chinese ornament was very marked, and it is one of the English imitation Chinese paper hangings that is referred to in a wall-paper order given in 1737 to one Dunbar of Aldermanbury (whom I have not heard of before as a manufacturer of paper hangings), by Thomas Hancock, of Boston, U.S.A.

" Sir," said Mr. Hancock, " Inclosed you have the Dimensions of a Room for a Shaded Hanging to be done after the same pattern I have sent per Captain Tanner, who will deliver it to you. It is for my own House and entreat the favour of you to get it done for me to come Early in the Spring, or as soon as the nature of the thing will admitt.

" The pattern is all was Left of a Room lately Come over here, and it takes much in ye Town and will be the only paper-hanging for Sale which I am of opinion may answer well. Therefore desire you by all means to get mine well done and as cheap as possible, and if they can make it more beautiful by adding more Birds flying here and there, with some Landskips at the bottom, should



A CHINESE WALL-PAPER OF FORMAL DESIGN

like it well. Let the ground be the same colour as the pattern. At the top and bottom was a narrow border of about 12 in. wide which would have to mine. About three or four years ago, my friend Francis Wilks, Esq., had a hanging done in the same manner but much handsomer, sent over here from Mr. Sam Waldon of this place, made by one Dunbar in Aldermanbury, where no doubt he, or some of his successors may be found. In the other part of these Hangings are Great Variety of different sorts of birds, Peacocks, Macoys, Squirril, Monkys, Fruit, Flowers, etc.

"But a greater Variety in the above mentioned of Mr. Waldon's and should be fond of having mine done by the same hand if to be met with. I design if this pleases me to have two rooms more done for myself. I think they are handsomer and better than Painted Hangings done in Oyle, so I beg your particular care in procuring this for me, and that the patterns may be taken care of and returned with my goods."

It was with the idea of introducing paper hangings of a different type to this that a Mr. Jackson, of Battersea, who was printing wall papers at that period, urged the reproduction of the most celebrated classic subjects, statues, and landscapes, in preference to imitations of Chinese papers. To quote Mr. Grace, "He published a little work in 1734 which throws some light on the use of wall papers at that time. He gives reduced copies of his designs, mostly taken from Italian pictures or antique sculpture during his residence in Venice. Instead of flowing patterns covering the wall, his designs are all pictures, landscapes, architectural scenes or statues treated on panels with plain paper or painting between. They are all printed in oil with wooden blocks worked by a rolling press, apparently an invention of his own. They are all in the worst possible taste and yet are offered as a great improvement on the Chinese papers which he says were then in fashion." To quote Mr. Jackson's words, he says that by the use of his paper hangings "the person who cannot purchase the status themselves may have these prints in their places, and thus effectually show his taste. 'Tis the choice and not the price which discovers the true taste of the possessor and thus the Apollo Belvedere, the Medeccean Venus, or the Dying Gladiator, may be disposed of in niches or surrounded with a mosaic work in imitation of frames, or with festoons and garlands of flowers, with great taste and elegance, or, if preferred, landscapes after the most famous masters may be introduced into the paper."

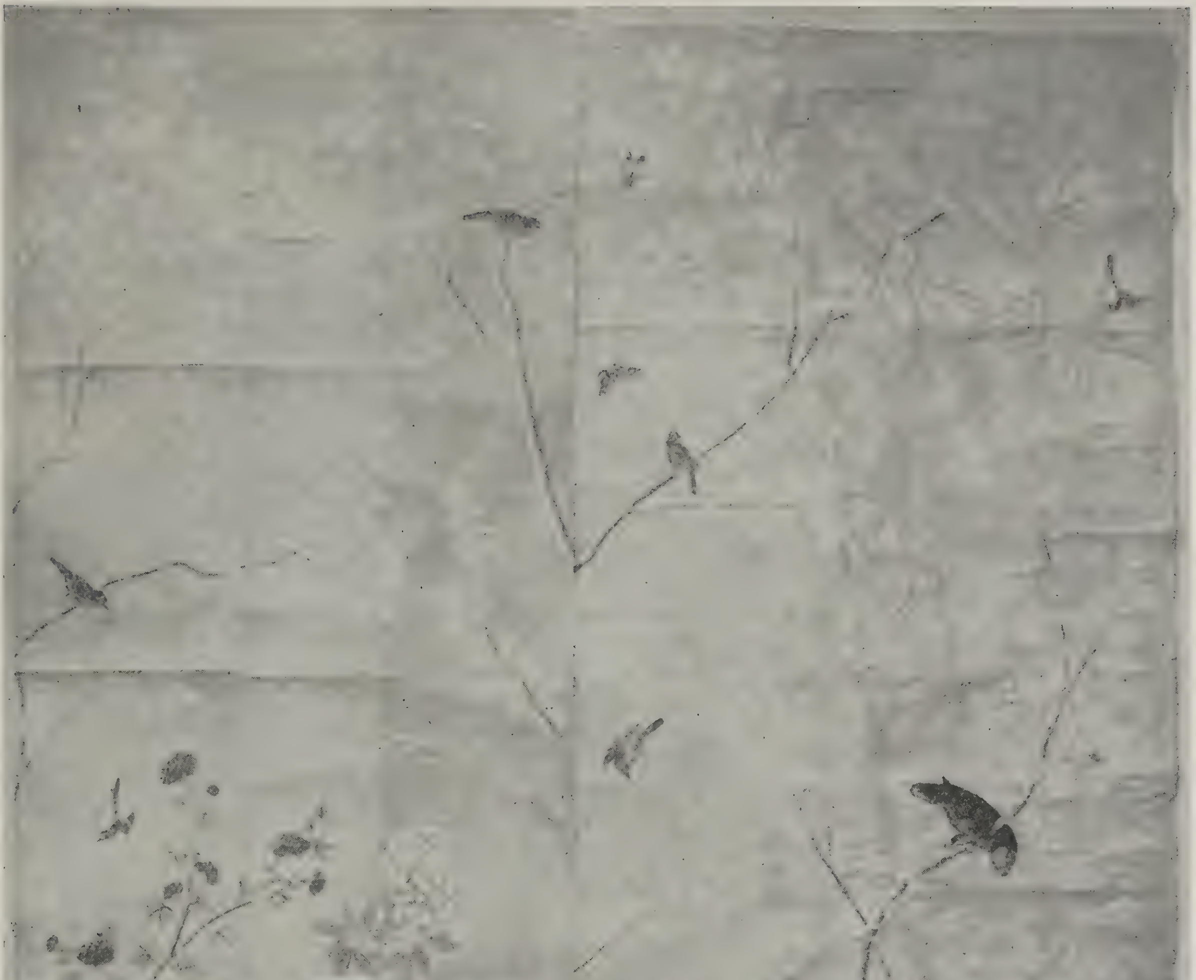
A CHINESE WALL-PAPER.

A CHINESE WALL-PAPER.

Notwithstanding all Mr. Jackson's efforts to counteract the tendency to Chinese design, it continued to have a great influence, for I find that the author of the "Handmaid of the Arts," published in 1768, writes that "The Chinese, who intermix printing and painting much more than we do, seem to make a very advantageous use of the engraving on wood, in the execution of which they doubtless exceed what we have any conception of here, and produce very fine outline sketches which greatly assist in the painting even in very large pieces by means of wooden prints. It were to be wished, therefore, that the engraving on wood was more encouraged and cultivated here, especially as paper hangings, to the manufacture of which it is greatly subservient, is becoming now a very considerable article of trade, and at present possessed by ourselves alone." We had at that time an extensive export trade in paper-hangings with America and other foreign parts. And we are informed by Mr. Grace that a Mr. Taylor, who at that time was an eminent manufacturer of paper hangings and who visited France, reported on his return that he found the French paper hangings very inferior to our own both as to execution and beauty of design.

I find mention of Chinese wall papers being imported to England about 1712; they were very much the vogue about this date. The palace of Wanstead, built by Sir Richard Child, possessed a parlour finely adorned with a Chinese paper, and according to Mackay the figures, birds, and flowers were the loveliest he had ever seen. Lady Mary Montagu had also one.

The bedroom at Badminster is one of the most perfect

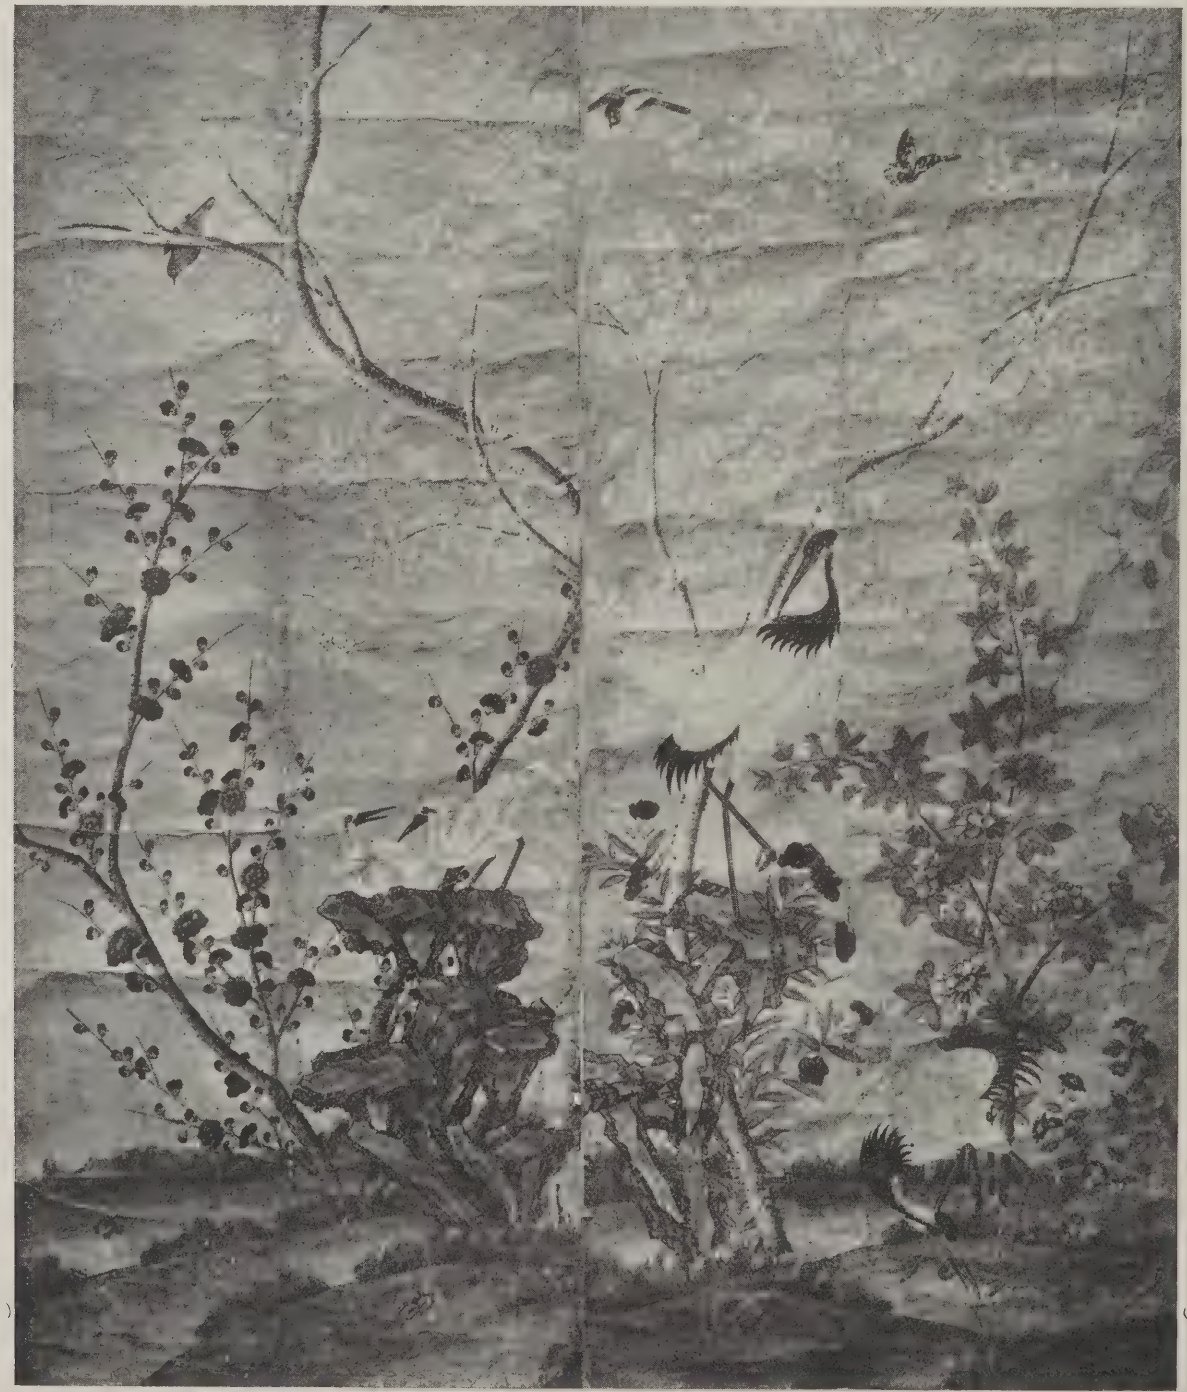


A RICH CHINESE WALL-PAPER, SHOWING A STRONG NATURALISTIC TENDENCY.

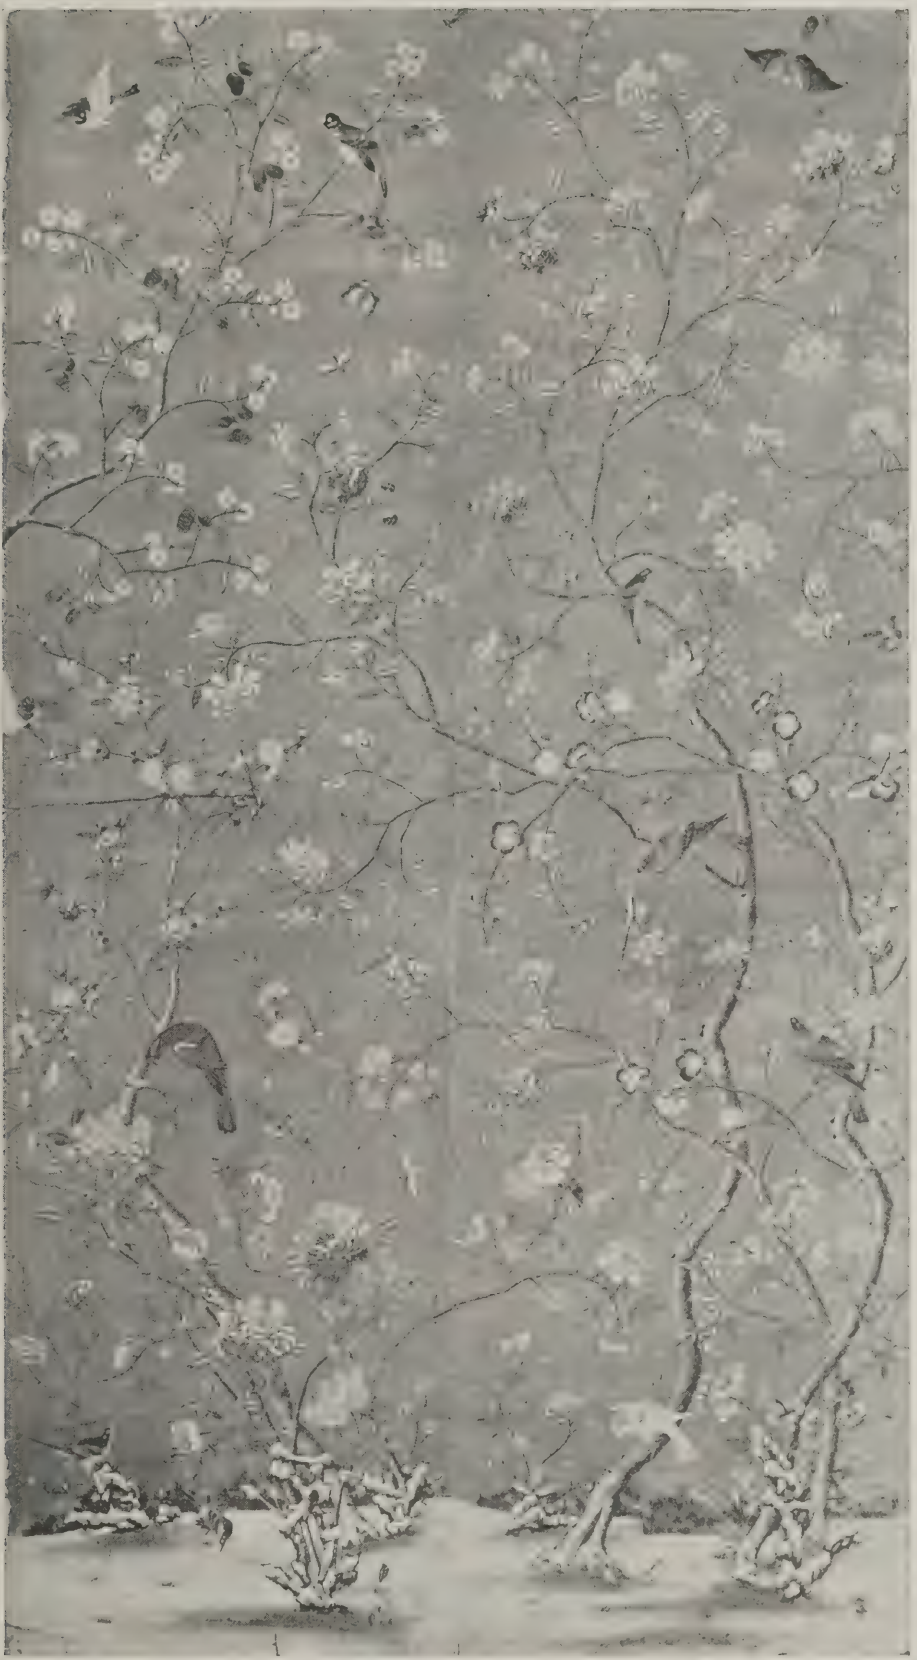
survivals, and there are good ones at Wotton-under-Edge in Gloucestershire, Cobham, Ightham Mote, and Ramsbury. The Duke of Atholl has a very fine set which he informed me was found in the Carpenter's Shop at Blair Atholl Castle quite recently. There is no doubt it was brought over from China 150 to 200 years ago and never used. One of these days, I hope to get a photograph of this most interesting example of Chinese paperhanging.

Some three or four years ago I found a very fine set of twenty-six old panels. Sixteen of these are being used in Mr. McLaren's new house in South Street, Mayfair. One of the themes used in the old wall papers is the cultivation of tea, weaving, etc. An example of this belongs to the Hon. Mrs. Heneage, of Coker Court, Yeovil. Recently I have seen three old sets of Chinese papers taken down from Beaudesert, which are at the moment for sale in London.

In London there is one of the finest examples of Chinese paper hangings in existence. It was brought over to England by Lord Macartney, the first British Ambassador in China, who returned to England in 1792. He took many presents with him and brought many back, and among them was this set of painted papers, which he presented to Mr. Coutts, the banker; and they remained as the decoration of the drawing-room at Coutts Bank, in the Strand, until 1905, when they were taken down and placed in the new buildings opposite Charing Cross Station. The space covered by the decoration is about 20 ft. by 30 ft. and 12 ft. high. The base of each breadth of paper commences with figures and objects of fair size representing streets and waterways; these gradually diminish in scale until they reach the mountain tops near the cornice of the room. There must be hundreds of figures introduced into the scenery, the manners, customs, and industries of the Chinese being portrayed in every possible manner. Not merely are the industries, such as silk spinning, tea cultivating, and fig drying, depicted, but there is also the daily life of the bazaar—marketing, pig driving, horse slaughtering, and endless subjects painted with the utmost care and detail.



A FORMAL COMPOSITION WITH A VARIETY OF MOTIVES.



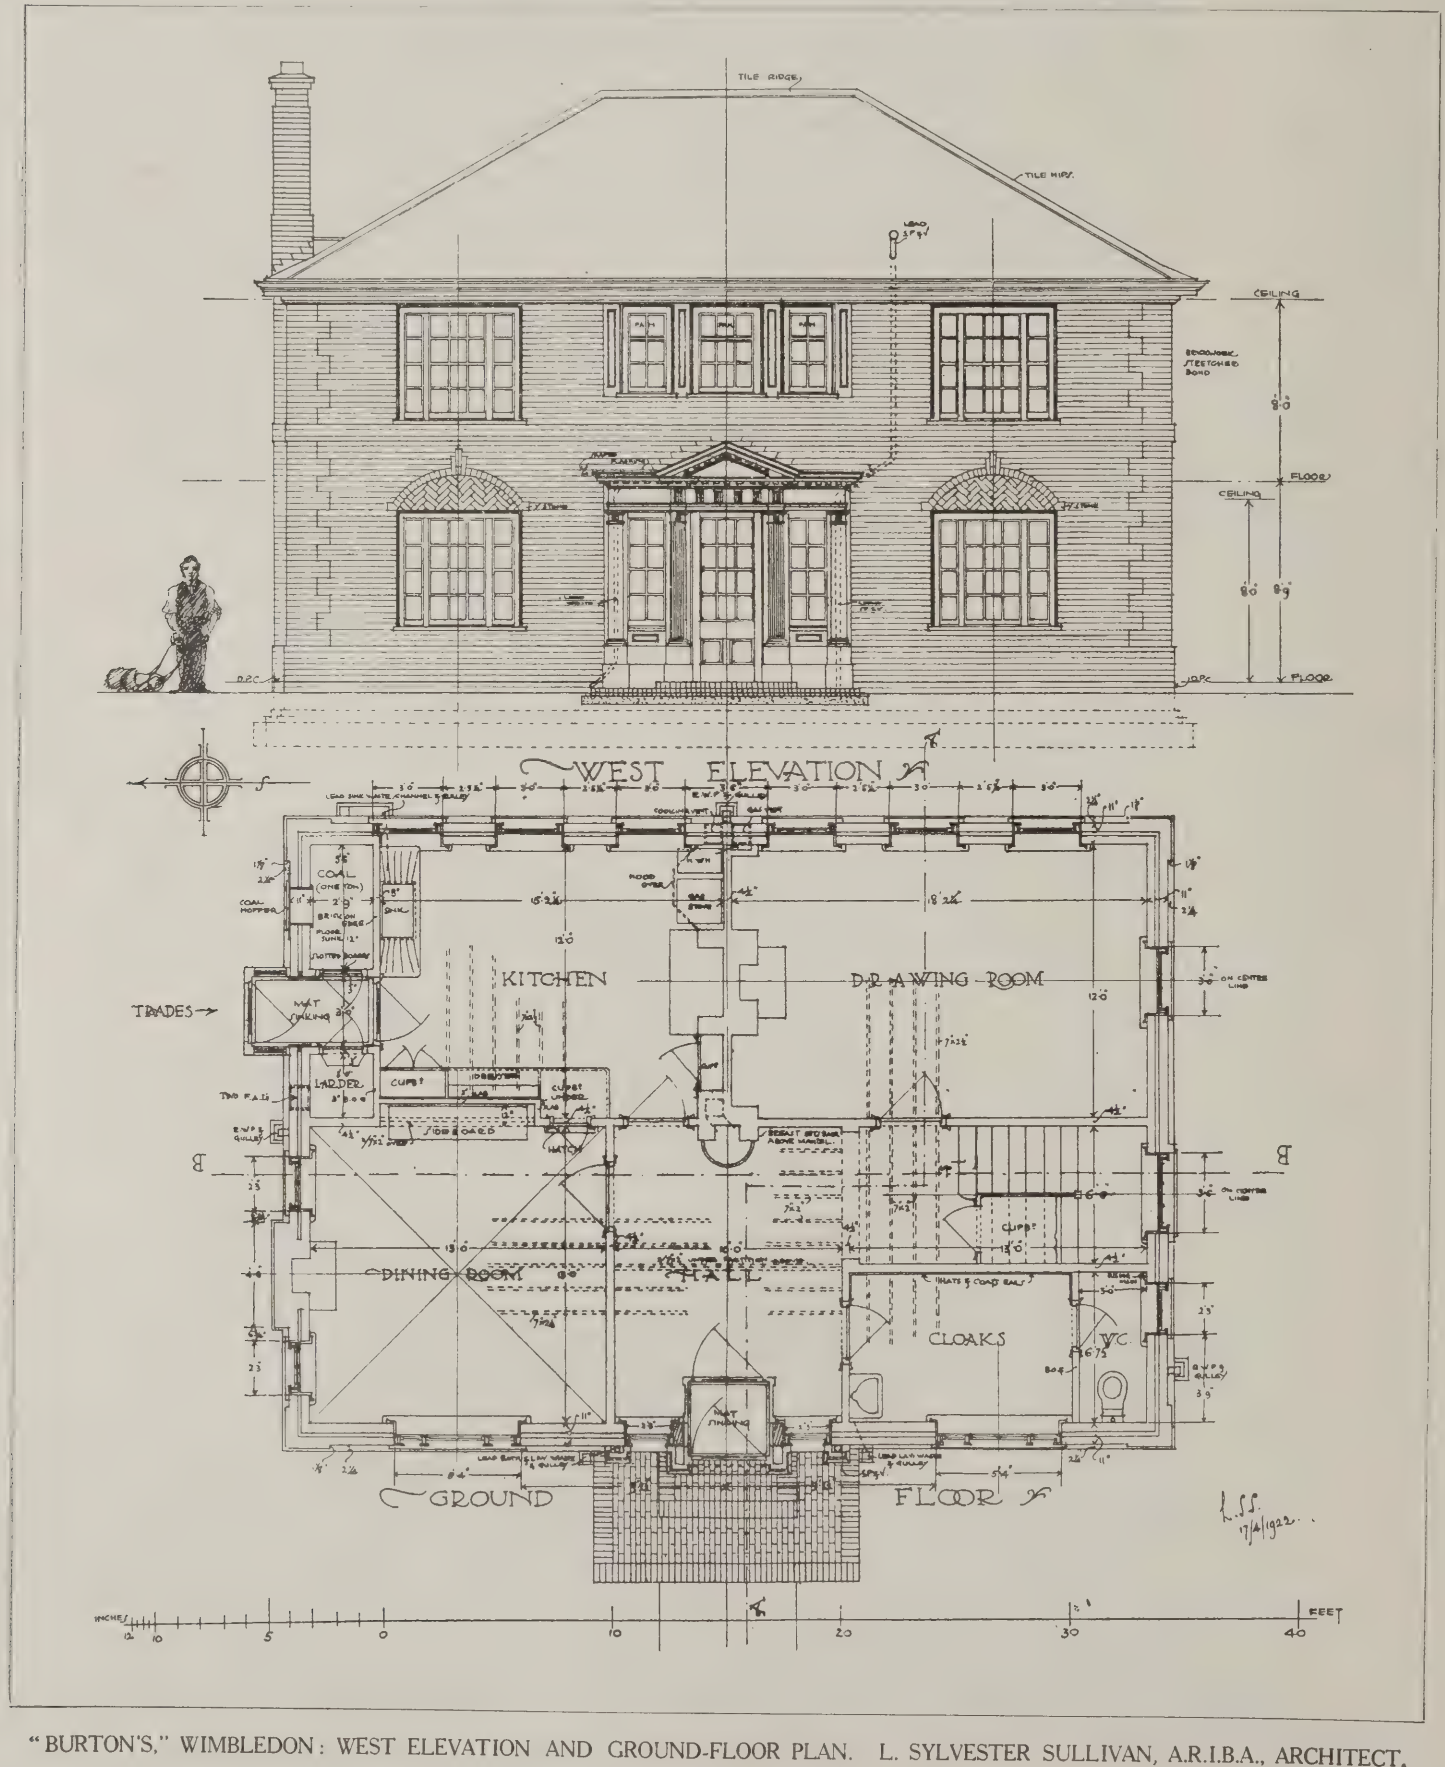
A DECORATIVE WALL-PAPER TREATMENT OF FLOWERING TREES.

"Burton's," Wimbledon

By L. SYLVESTER SULLIVAN, A.R.I.B.A.

THE especial requirements in connection with this house were that it should be planned on two floors only, and should be capable of being run, if necessary, in these times of difficulty, without maids. The bedrooms were not to project into the roof and were to have square ceilings, while the maids' bedroom was to be of fair size and made pleasant for leisure moments.

The scullery and kitchen is combined in one apartment for ease of work. The dining and drawing rooms are being



"BURTON'S," WIMBLEDON: WEST ELEVATION AND GROUND-FLOOR PLAN. L. SYLVESTER SULLIVAN, A.R.I.B.A., ARCHITECT.

panelled in oak with oak floors, the hall and staircase panelled in white. The ceilings are of Adam design, in anaglypta.

The general contractors are A. and F. J. Leather, of Victoria Street, S.W. Bricks were supplied by T. L. Lawrence, of Bracknell; green Welsh roofing slates, stoves, mantels, grates, and sanitary fittings and electric light fittings by Messrs. Geo. Wright (London), Ltd., of Newman Street, W.; oak panellings by Venesta, Ltd.; built-in gas fires by The Davis Gas Co., of Oxford Street, W.; R.W. goods by Elsley, Ltd. The hot-water service is heated dually from the kitchen range and from a Potterton hot-water circulator; the cast-iron electric light standards at the entrance are by Macfarlane's, of Glasgow.

Some Recent War Memorials

A War Memorial Chapel for the Royal Sussex Regiment in Chichester Cathedral

By EDWARD WARREN, F.R.I.B.A.

THE Dean and Chapter have made over to the Royal Sussex Regiment the chapel of St. George, in the south aisle of Chichester Cathedral, to be dedicated to the use of the regiment, in perpetuity, as a Memorial Chapel. The names, amounting to a total of over 7,000, of its officers, warrant and non-commissioned officers and men who fell in the war are now recorded therein, and the chapel has been enclosed by wrought-iron screens, and provided with an altar and hangings.

Further to confirm the identity and military character of the chapel, a number of regimental "colours," old and modern, have been placed upon its walls.

The difficult problem of recording the immense number of the names of the fallen upon the small amount of wall space available has been solved by quadruplicating that space by means of oaken record cases, ranged along the southern and western walls, and each containing four panels, three hinged and one fixed, upon which, under numbered battalion headings—gold and blue—the names are painted in alphabetical order in dark grey letters upon white, official ranks and decorations being in red. When the doors of these cases are closed the appearance of a quietly panelled chapel is maintained.

Over the centre of the western range of record cases is a grouped trophy of regimental colours rising from a colours stand, whose carved and decorated front shows the well-known and singularly handsome badge of the regiment, the single plume rising behind and curving over the Star of the Garter, above a pair of crossed swords surrounded

by a wreath of bays. This rests upon a tablet bearing in gold upon blue the battle honours of the regiment.

Upon the cornice of this range of records are carved and coloured bosses, amongst them the initials and crest of General J. C. Young, Colonel of the regiment, and of Colonel G. L. Courthope, who gave, from timber grown upon his estate at Whiligh, a considerable portion of the oak employed in the chapel, and notably in the oaken altar and its dais, and the triptych and retable.

This triptych has for its centre panel the slaying of the Dragon by St. George, mounted and in armour, carved in oak in low relief and partly coloured and gilded.

Upon the wings of the triptych are shields bearing emblems of the Passion, while above, on the fixed panelling of the reredos, are the arms of the Bishop of Chichester on the right hand, and the badge of the regiment on the left.

On either hand of the altar are " riddels " or low hangings of blue plush, with fringes of red, white and blue, supported by octagonal oak posts, each surmounted by carved and gilded lions supporting the shield of St. George, with its red cross upon a white field.

On the wall spaces at the sides are, on the left hand, a pair of old regimental colours, war-worn, tattered, and charming in the faded tones of their honourable decay, and on the right hand the blue banner of Mons with the badge and the date 1914.

On the retable are a pair of gilded candlesticks and a carved cross, all in oak.

The wrought-iron screens with their central gates, bearing, one the shield of St. George, and the other the regimental badge enclosed in gilded wreaths, terminate in a battlemented head or cornice, coloured and gilded. Along the external face of this, towards the aisle, runs the following inscription, in large gilt letters upon a dull blue ground :—

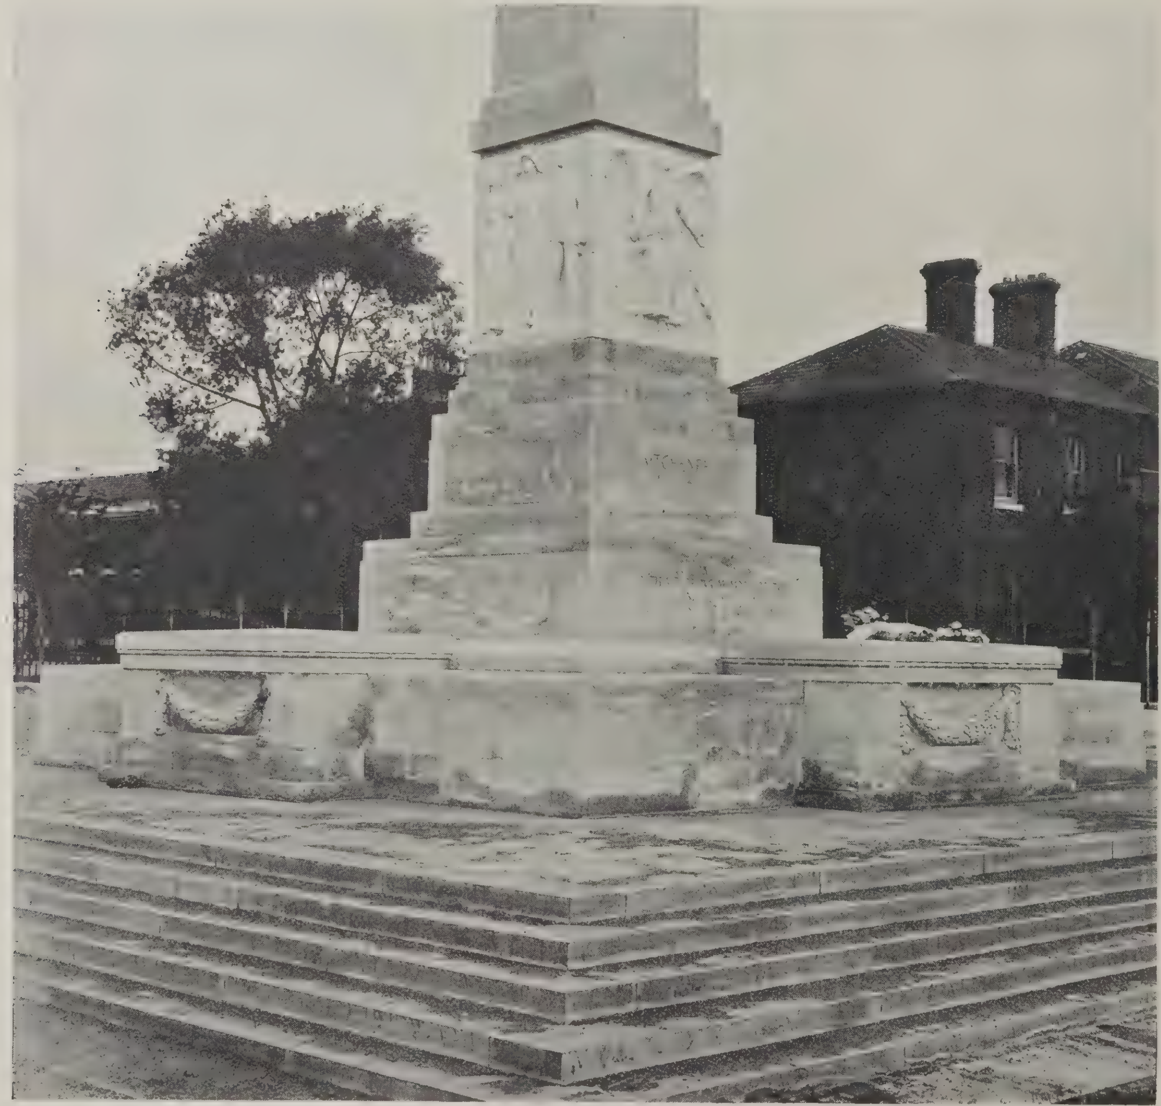
> "THIS CHAPEL OF ST. GEORGE IS DEDICATED TO THE PERPETUAL MEMORY OF THE OFFICERS, WARRANT AND NON-COMMISSIONED OFFICERS AND MEN OF THE R. SUSSEX REGIMENT, WHO LAID DOWN THEIR LIVES IN THE EUROPEAN WAR OF 1914–1919."

Along the inside are ranged at intervals the badges of the Cinque Ports and Yeomanry battalions, the regimental badge, and the crowned red and white roses of England, which a Royal regiment is entitled to display.

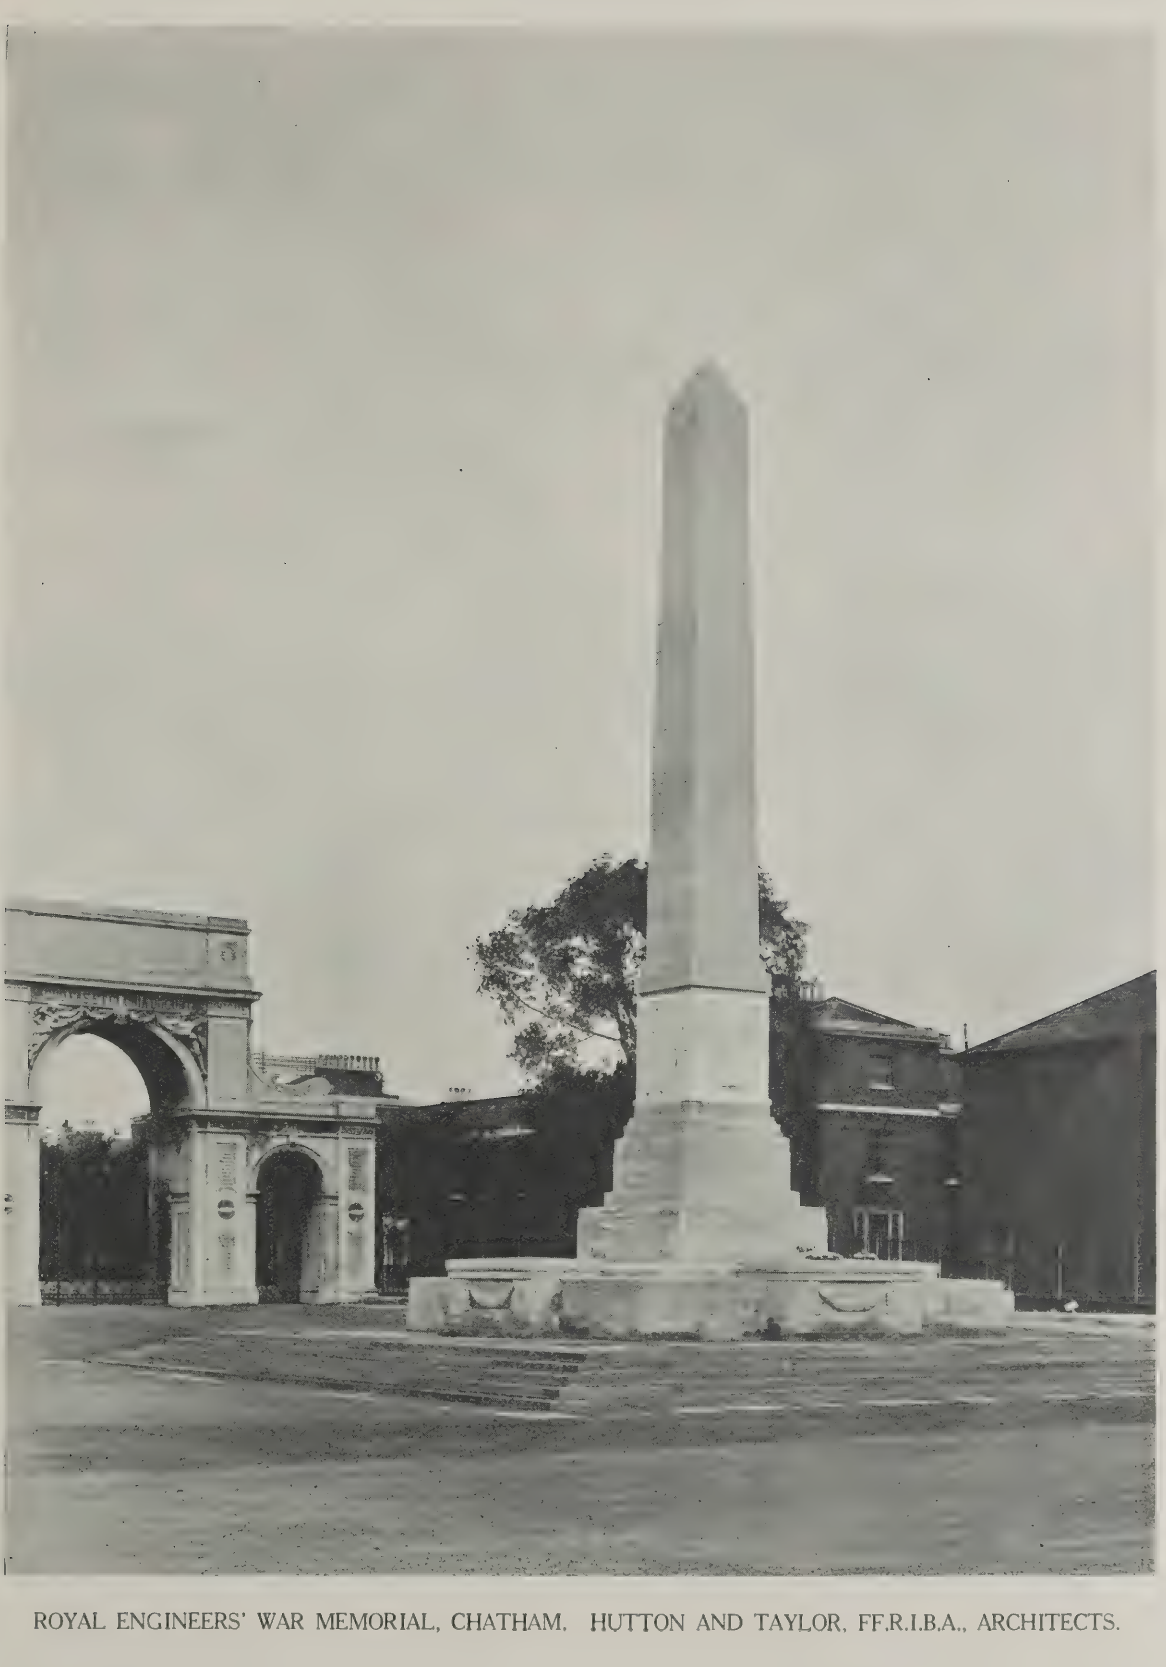
The work has been carried out from the designs, and under the direction, of Mr. Edward Warren, F.R.I.B.A., as follows : All work in stone and oak, the record cases, panelling, altar and reredos, and all carving except the centre panel of the last, as well as all painting and decorative work, other than lettering, by Messrs. Norman & Burt, of Burgess Hill.

The carved centre panel of St. George was modelled and carved by Mr. P. G. Bentham, sculptor, of Stamford Bridge Studios, Chelsea.

The wrought-iron screens and decorative ironwork were by Messrs. G. Hobbs & Son, of Hampstead Road, London ; the lettering of names, and of inscriptions, etc., by Mr. H. J. Manwaring, of Percy Street, London ; the altar hangings and upholstery by Mr. J. Barbour, of London, and the carved altar cross by Mr. Laurence Turner, also of London.



ROYAL ENGINEERS' WAR MEMORIAL, CHATHAM. HUTTON AND TAYLOR, FF.R.I.B.A., ARCHITECTS.



ROYAL ENGINEERS' WAR MEMORIAL, CHATHAM. HUTTON AND TAYLOR, FF.R.I.B.A., ARCHITECTS.

The Rolls-Royce, Royal Engineers', Calcutta Memorials, and Others.

THE illustration on this page shows a large war memorial which has been executed in bronze for Messrs. Rolls-Royce, Ltd. The design and models of the figure, crest, etc., are the work of Mr. W. Reid Dick, R.A., sculptor, whilst all the lettering has been modelled by Messrs. Singer & Sons, Ltd., of Frome, who also carried out the memorial. The tablet, which is approximately 11 ft. square, has several thousand letters on it, each of which had to be separately modelled by hand and subsequently chased by hand.

The memorial is erected at the London offices of Messrs. Rolls-Royce, and a second copy of it, also cast in bronze, is being erected at their works at Derby.

The Royal Engineers' War Memorial, at Chatham (pages 316-317), has been erected from the designs of Messrs. Hutton & Taylor, FF.R.I.B.A., who won the commission in open competition. It takes the form of an obelisk, and is one of the most successful designs of its kind erected in commemoration of the European War. The treatment of the base as a succession of diminishing stages, with sculptured panels on the four sides, is excellent.

The Calcutta War Memorial, illustrated on the opposite page, has been erected from the designs of Mr. John Greaves. It takes the form of a cenotaph, and bears the inscription "The Glorious Dead." It is executed in Portland stone and stands upon a wide stone platform.

The centre panel on page 320 was designed by Mr. F. T. Bush, A.R.I.B.A., and carried out by Messrs. E. J. and A. T. Bradford, of London; while those on either side of it are from the design of Mr. Godfrey Pinkerton, F.R.I.B.A., and executed by Mr. Joseph Armitage. They are of Portland stone, afterwards coloured and gilded.

The two mural panels illustrated on page 321 are by the Bromsgrove Guild. They deserve careful study for the excellence of their lettering.

Green Arbour House, London

By Arthur F. Usher, F.R.I.B.A.

THIS building has been erected from the designs of Mr. Arthur F. Usher, F.R.I.B.A., of Messrs. Yetts, Sturdy, and Usher, Architects, on a site at the Holborn end of Old Bailey, London. The elevations to the front block are faced with Portland stone, the front roof is covered with Westmorland slates, the dormers are of copper, and the floors, roof, and flats are of concrete and expanded metal. The major part of the ground floor, together with a portion of the basement and first floor, are occupied by the parcels department of the South Eastern and Chatham Railway Company. Owing to a large unobstructed space being required on the ground floor the building has been constructed on the steel framed principle.

The general contractors were Ford and Dalton, Ltd., and the sub-contractors as follows: The Val de Travers and Metropolitan Asphalt Co. (asphalt lining work); United Stone Firms, Ltd. (stone); Messrs. Seale & Co. (sculpture and stone carved work); The Expanded Metal Co. (ferro-concrete construction); Dorman, Long & Co. (steel work); Rust & Co. (tiles); Crittall Manufacturing Co. (casements and casement fittings); Haywards, Ltd. (pavement lights); Tylors, Ltd. (sanitary ware and fittings); Speedy, Eynon & Co. (electric wiring); Harold Cooper (grilles); Amos Fenn (entrance door); M. T. Allen & Co. (roof railings); Charles Smith and Sons (door furniture); Swanser & Co. (handrails); The Bostwick Gate Co. (folding gates, shutters, etc.); Fenning & Co. (marble work, halls, floors, and hydrants); The Patent Victoria Stone Co. (stair treads); Hammond Bros., Champneys, Waygood-Otis, A. and P. Steven (lifts and cranes); Benham & Co. (heating apparatus); Fredk. Braby & Co. (copperwork to roof).

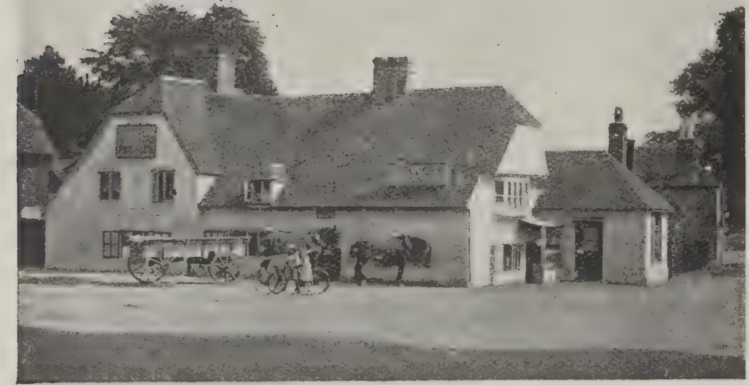
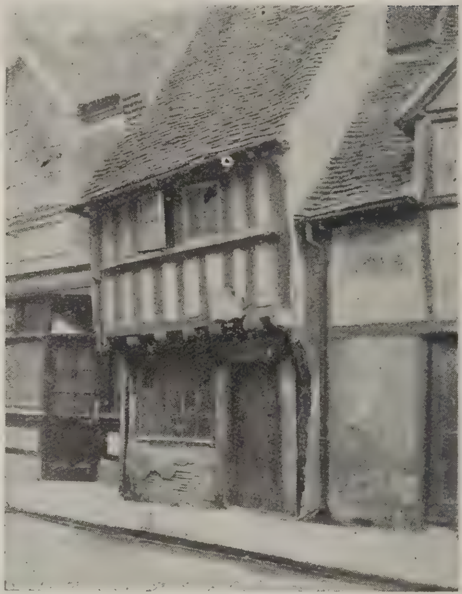
A Pictorial Review

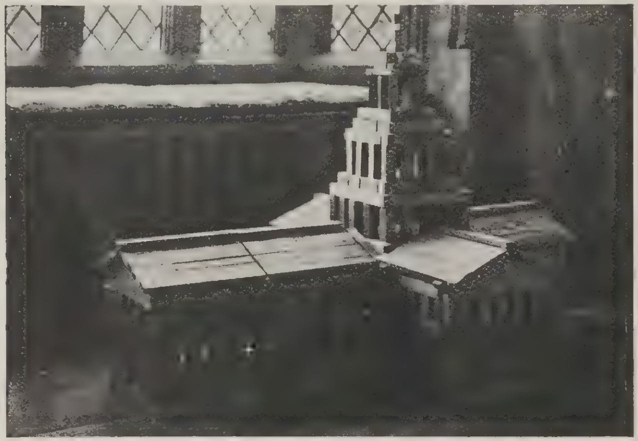
Illustrations of Topical, Practical, or Curious Interest



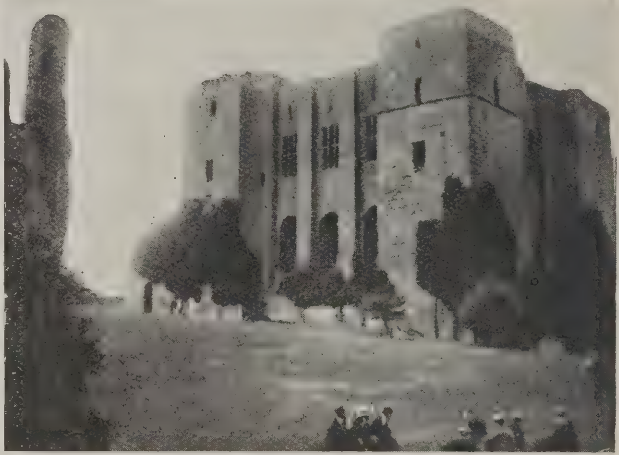
Here is a perfect example of the old English inn—"The Chequers" at Doddington The point about this building is its simplicity. The architect, whoever he was, has got an astonishing amount of articulation into his roof. He has contrived a fine piece of architecture by a masterly handling of roof shapes.—C. V. R. WHITTIER.



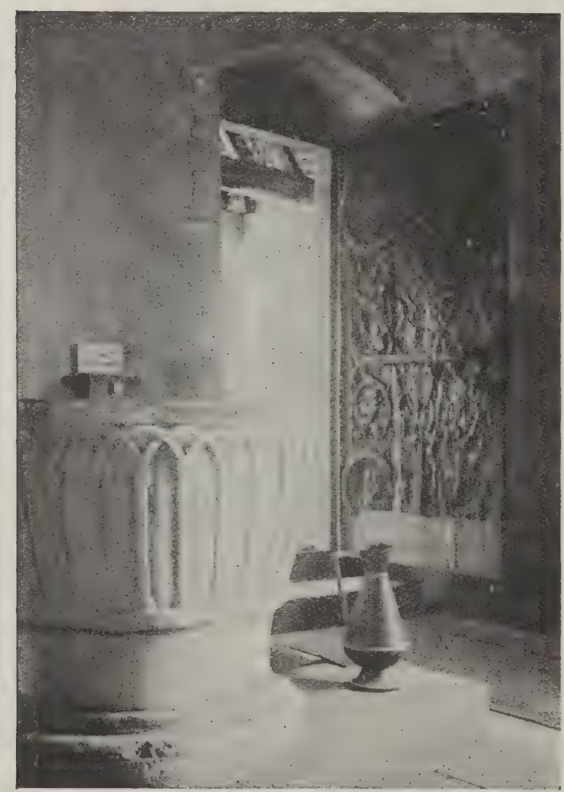
The house in All Saints' Street, Hastings, in which the mother of Sir Cloudesley Shovell lived. It was built in 1570, and partly demolished in 1838. Sir Cloudesley was apprenticed to a shoemaker, but ran away to sea, rose from cabin boy to admiral, and took active part in the battles of Beachy Head, La Hogue, and in the storming of Gibraltar. In 1707 he was drowned off the Scilly Isles, when his ship was lost with all hands. He spent his early life at this house.—M. R. H. READ.

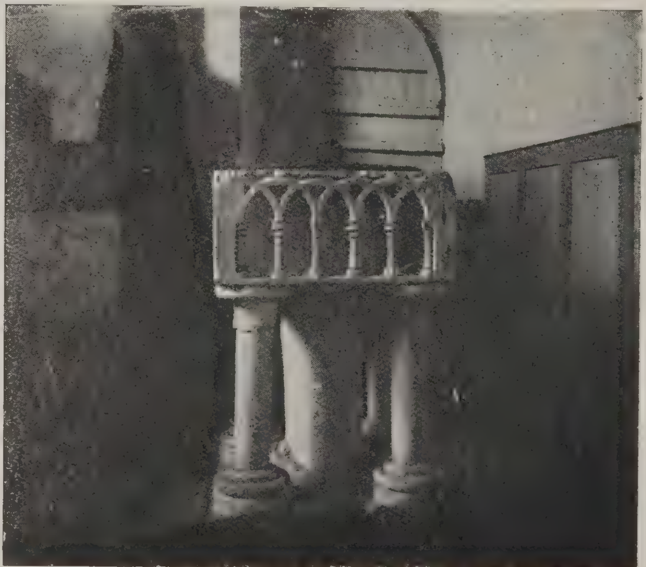


Young architects proverbially incline towards the most ambitious subjects, and the efforts of my third boy, Patrick Lloyd, are always directed towards the monumental. This photograph of a building erected of wooden blocks is entirely his own conception and putting together. He had neither suggestion nor assistance. He is nine years of age.—NATHANIEL LLOYD.



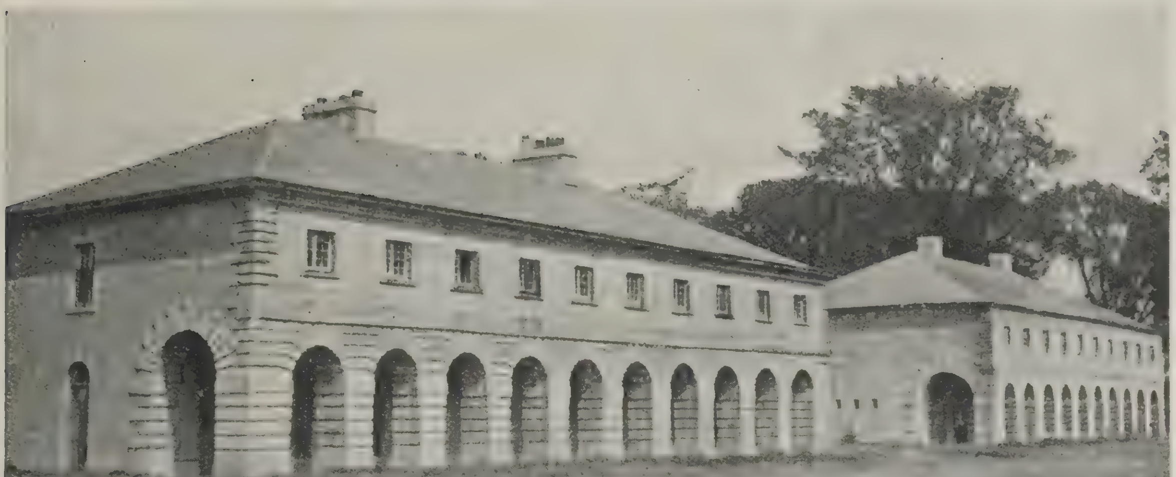
This elevation of Kenilworth Castle has a curious resemblance to an ultra-modern style of factory building. The heavy angles and tall unbroken piers with close fenestration in between, typical of a certain class of factory elevation, have their replica in this old castle front.—F. CLARK.





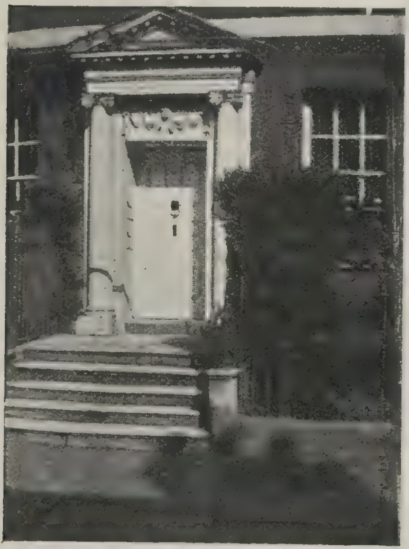
The font of Eastwood Church, Essex (on the left), and the font of Shopland Church, Essex. The decoration of each font is a very fine example of interlaced arcading, the one at Eastwood being the older. The oak door on the right of Eastwood font is an excellent piece of English wood-carving.—C. W. EASTICK.

A Pictorial Review

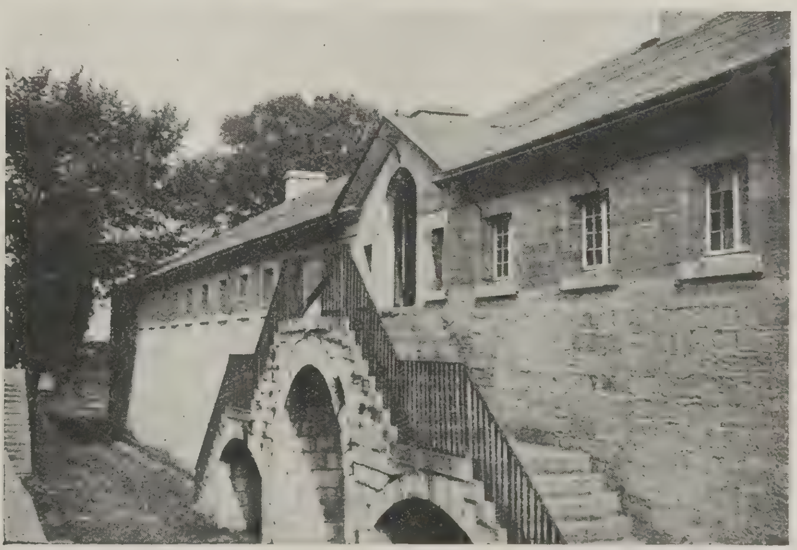


This photograph and the three below illustrate Fort Lennox on Isle aux Noix, Quebec. Isle aux Noix is a small island holding an important strategic position on the Richelieu River, and the present buildings were erected by the engineers of the British Garrison in the early 19th century. The fort consists of earthworks which screen the buildings from the outside, and it has a large moat surrounding it. P. J. TURNER.

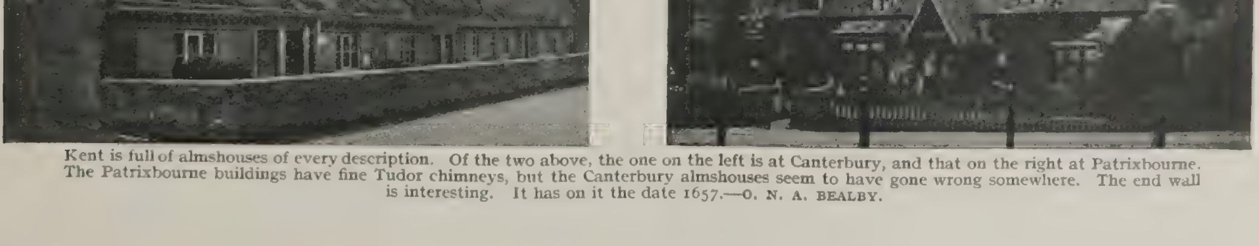
General views of Fort Lennox, showing the architectural disposition of the buildings. Behind them can be seen the bank which surrounds and screens the Fort.



This doorway at Abingdon is a fine example of Georgian work. The carved capitals and the decorations under the entablature give it an effect of weight and richness. The proportions, too, are very good indeed.—E. L. G.



The outside stairs to the men's quarters in Fort Lennox—a curious treatment. The Government has only recently taken steps to preserve this building. It is important that it should be preserved, as there are few buildings of this age and historic interest in Canada.—P. J. T.



Kent is full of almshouses of every description. Of the two above, the one on the left is at Canterbury, and that on the right at Patrixbourne. The Patrixbourne buildings have fine Tudor chimneys, but the Canterbury almshouses seem to have gone wrong somewhere. The end wall is interesting. It has on it the date 1657.—O. N. A. BEALBY.

The Rood Screen and Altars, Glasgow Cathedral.

The photographs of the rood screen and altars in Glasgow Cathedral, published on pages 220 and 223 of our issue for August 16, were taken by Mr. Arthur Ling.

New London Memorial.

Work is to begin upon the City memorial of the Royal Fusiliers. The site is at Holborn Bar Within, near to the Elizabethan houses of Staple Inn.

New Tube Extension.

Tenders have been invited for the extension of the Piccadilly Tube from Hammersmith, its present terminus, to Turnham Green.

The Queen's Dolls' H

Princess Marie Louise, of Princess Christian, is assisti dwin Lutyens in his work of ng and making the dolls' house, to be given shortly to the Queen.

More Houses for Risca.

The Risca (Mon.) Urban District Council have received the sanction of the Ministry of Health to the erection of a further twelve houses under the Government scheme.

Cassiobury Estate.

The greater part of the Cassiobury estate, including the mansion, has been purchased by a local syndicate at a price said to be £55,000. It is their intention to develop the land for building purposes.

Versailles Palace.

Fungus has caused the rotting away of the oak beams of that part of Versailles Palace built in 1624. The architects in charge of the palace propose that all the affected woodwork be removed as soon as possible.

Protection of Isle of Wight.

The Ministry of Transport have decided to make a grant towards the cost of the works needed for preventing the sea breaking through at Freshwater Bay and isolating the western end of the Isle of Wight.

The Concrete Institute.

An ordinary meeting of the Concrete Institute will be held at the offices of the Institute, 296 Vauxhall Bridge Road, S.W.1, on Thursday, September 7, at 5.30 p.m., for the purpose of electing members. No paper will be read and no other business will be transacted.

The National ors' and Firemen's Union have comp ted negotiations for taking over the Cat holic Boys' Home in Westminster Bridge Road, adjoining the premises at presen t occupied. The two buildings are to be amalgamated, and will form the large st trade union building in England.

Hants and Dorset A. & S.A.P.U.

On Saturday, September 9, the members of the Hants and Dorset (E.W.16) Branch of the Architects' and Surveyors' Assistants Professional Union are holding an "At Home" at the "Y Round Table Tea Shoppe," High Street, Winchester, following a tour of Winchester Cathedral. The tour commences at 2.30 p.m.

Beckenham War Memorial.

The Committee of the Beckenham Cottage Hospital have secured the services of Messrs. William A. Pite, Son and Fairweather, architects, to design and superintend the extension to the institution. The work has been commenced, and will cost £17,000, of which £12,500 has been secured.

New Institute at Pengam.

A new working men's institute erected at Cefn Forest, Pengam, by the local branch of the National Building Guild from the plans of Mr. John Jones, architect, Cefn Forest, has been officially opened. The building is of one story and is divided by a refreshment bar into a reading room and a billiard hall accommodating four tables.

Welsh National War Memorial.

One of the last tasks upon which the late Sir Thomas Brock, R.A., was engaged was that of preparing a design for the Welsh National War Memorial, which was to be erected at Cardiff. The cost of the design submitted, however, was £56,000, a sum in excess of the committee's resources. It is understood that another attempt is to be made to carry out the work.

Mr. Goodhue in London.

Mr. Bertram Grosvenor Goodhue, of New York, one of the most distinguished American architects of our time, is paying a short visit to London with his family before sailing for New York on September 9. Mr. Goodhue has recently been successful in the competition for the Nebraska State Capitol Building. His design, which was illustrated in the Journal for June 21, has excited the greatest interest and admiration in architectural circles in the United States.

Architects' Fees for State-aided Housing Schemes.

In view of the terms of Clause E (4) of General Housing Memorandum No. 61, issued by the Ministry of Health, the question of the setting up by the R.I.B.A. of a tribunal to deal with applications is under consideration. All architects who wish to obtain the support of the Royal Institute under this clause are requested to write at once to the Secretary, R.I.B.A., 9 Conduit Street, London, W.1, stating whether they are members of the R.I.B.A. or of one of its allied societies or of the Society of Architects, or whether they are unattached to any architectural organization, and giving brief particulars of the cases in which they desire to be supported. All applicants will be informed in due course if it is found to be necessary to require the payment of any fees to the tribunal.

Nos. 10 and 11 Downing Street.

In the work of strengthening the foundations of the official residences of the Prime Minister and the Leader of the Commons, 10 and 11 Downing Street, which is proceeding rapidly, a novel method of underpinning is being resorted to. The original footings are not regarded as sufficiently good to place new foundations upon, and the plan adopted has the effect of discarding them for weight-carrying purposes and substituting entirely new bases. Excavations are made on each side of the original wall, near its base, and steel girders are laid parallel to it and about a foot away. These are firmly bedded in reinforced concrete, and when this has solidified the wall will be pierced and short cross girders will be laid so that the walls will ultimately be supported on a kind of steel grid, resting upon the parallel girders. Having regard to the thickness of the walls, the width of the parallel girders, and their distance from the original masonry, the new foundation will be approximately 6 ft. in width, so that the superstructure will henceforth rest upon a greatly widened basis, and one, moreover, of exceptional strength.

List of Competitions Open

Date of Delivery.	COMPETITION.
Sept. 16	Nurses' Home, Chelsea Hospital for Women. Premiums: £150, £100, and £50. Assessor, Mr. H. V. Ashley, F.R.I.B.A. Names by above date to Mr. H. H. Jennings, Secretary, Chelsea Hospital for Women, Arthur Street, Chelsea, S.W.3.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8.000 francs.
Nov. 1	Labour saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C.4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100. 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.

Rates of Wage s in the Building Tra

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, mas joiners, woodcutting machinists, slaters plumbers,* plasterers, pa inters †) and labourers in the building industry. The labour rates for London are of Current Prices on pages xvii, xviii.

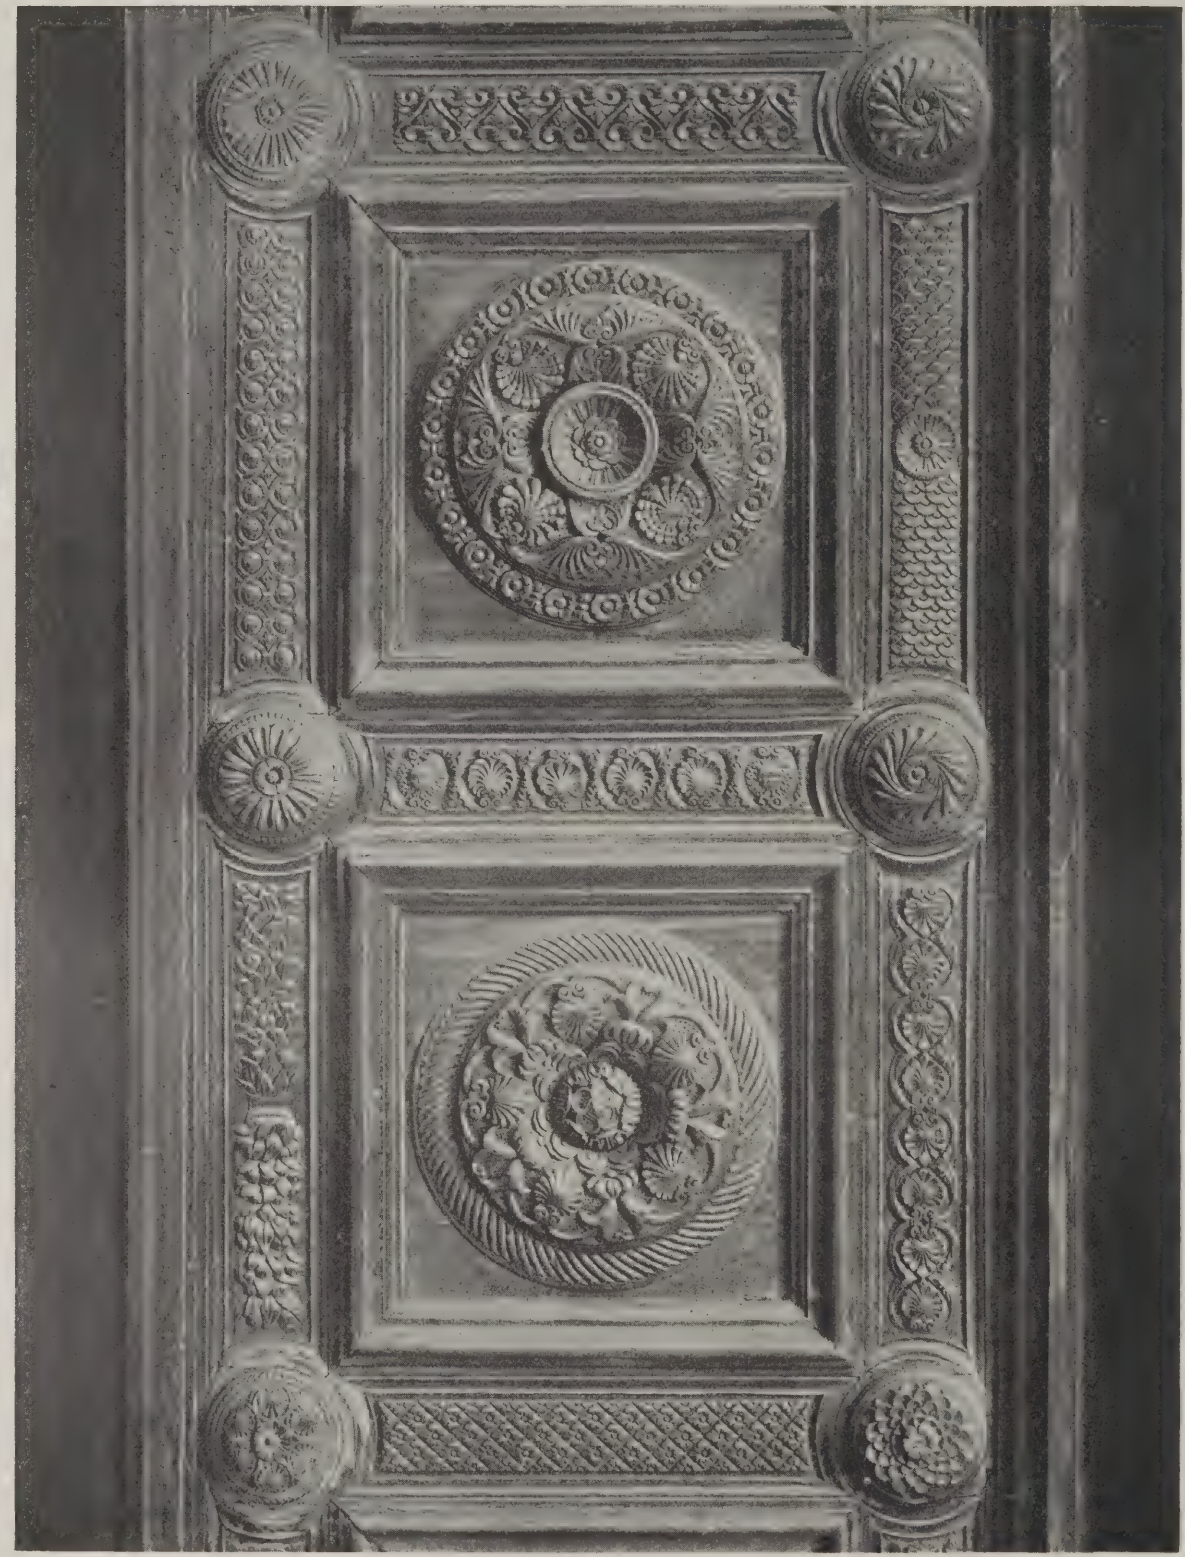
Architectural Details. 33.—The Door of the Capella dei Pazzi, Florence.

Brunelleschi, Architect



The Pazzi Chapel is generally believed to be Brunelleschi's first work, and is at the same time the earliest ecclesiastical building of Renaissance character in Italy. It stands in the cloisters of the Church of Santa Croce at Florence. The carving of its door illustrated above is exquisite, but there is almost too much variety of detail. Brunelleschi was born in Florence in 1377, and died in 1446. His great works were the Pazzi Chapel, the Dome of Florence Cathedral, and the Pitti Palace. He was a goldsmith, and his attention was originally turned towards architecture through his defeat by Ghiberti in the famous competition for the bronze doors of the Baptistry at Florence.

The Labour Congress and the "Broader View"

SOUTHPORT boasts "the finest street in Europe." Several other towns, British and foreign, advance the same claim, and that fact detracts nothing from the courage of Miss Hartley in advancing it in the speech in which, as mayoress of the town, she welcomed the delegates to the Trades Union Congress, which was opened there on September 4.

Her speech was courageous in other items; for, greatly daring, she did not hesitate to remind the delegates that the workers have duties as well as rights—a doctrine that is too seldom preached to them within their own assemblies—and that they have much for which they should be thankful. Doubtless they are, only they are such adepts at dissembling this engaging trait in their rather complex character that one might almost imagine that they regarded gratitude as a weakness, if not a positive crime.

Great changes, Miss Hartley said, had taken place since last the Congress visited Southport. Hours of work were shorter, better wages were paid, there were longer and more frequent holidays, the status of women in every walk of life had materially improved, the duration of life was longer, and the death-rate of children under one year had gone down by half. And all this under "the capitalistic regime"! Remembering these and other improvements, why, Miss Hartley asked, is there so much unrest? There is, she said, in her spirited and direct manner, "too much selfishness—we are asking for the impossible. The Trades Union Congress," she added in her peroration, "had great power, but power carried with it responsibility and opportunity, and she prayed that the delegates might be so guided that the Congress would tend to the betterment of the people of England and of the world, both industrially and nationally." One can heartily say "Amen" to that prayer.

Miss Hartley's was a speech that should have infused the right spirit into the Congress—a sorely needed spirit of amity and unity; but the debates were marked by but little less than the customary amount of acrimony and unreason that is rarely absent from such meetings. Even the presidential address was not entirely innocent of those bad qualities, although certainly Mr. Walker advanced no very violent views, nor yet, be it said, any ideas that were at all helpful towards a solution of the economic difficulties with which the nation—all Europe, indeed—is now engaged in a desperate, but by no means hopeless, struggle. There was the usual diatribe against capitalists. "Employers," said Mr. Walker, "seizing as an excuse the general economic situation—which they all admitted was bad enough, and which grew worse daily—had sought and were still seeking to reduce wages, to increase hours, and to deny the right of the worker to have any voice whatever in the control of the industry in which they were engaged. Over the whole business, like a sword suspended by a thread, hung the eternal menace of unemployment. It was this that gave the capitalists their advantage, and they were straining every nerve to push it to its fullest limits." Can nothing be done to educate labour to a truer perception of the economic facts?

To what extent these charges are untrue with respect to industry as a whole we do not pretend to say, but it is certainly unfair to impute such sinister and sordid motives to employers in the building industry. Building trades employers pay good wages, and do not always get an adequate return for them. "Ca' canny," however, is an old and a painful story which need not be revived as a counterblast to Mr. Walker's unfair accusations. To bandy words, incessantly to impute bad faith and rebut the charge is merely to darken counsel with profitless personalities and, by perpetuating quite unnecessary ill-feeling, to postpone "the betterment of the people of England and of the world," for which, like the Mayoress of Southport, we are all praying. Mr. Walker himself deprecated this froward spirit—as manifested among trades unionists themselves.

One has heard much of "sympathetic strikes," but it would seem that they have in them less of sympathetic feeling than of rather vindictive animus against the employer, actuated by the instinctive fear of being defeated in detail. And if the employed have no real sympathy among themselves, how can they be expected to extend any towards the employer in his economic difficulties? Yet the workers must be very well aware that employing builders of the better sort had the courage and the benevolence to refrain from passing on their hardships to the workers, who were kept together at considerable loss to their employers during the long period when building was at a complete standstill. Men for whom work had to be devised because the ordinary channels through which it should have flowed had gone completely dry were kept on out of pure kindly feeling.

Of such acts of generosity and self-sacrifice on the part of employers the public hear little or nothing, and are, consequently, the more prone to hearken to public utterances, such as that by Mr. Walker, about the "meanness" of employers, who, in Mr. Walker's own words (applied, however, to his own order, which he seems to regard as the sole repository of virtue), "must be prepared to face the misunderstanding and misrepresentation which seem the lot of all honest people." Sauce for the goose is sauce for the gander! And the proverb holds good for this fine-sounding passage: "We are warring not against a set of people, but against wrong ideas, and we need to carry on that war with courage and resolution. By that means alone shall we be able to rally our members and charge our movement again with new enthusiasm." Fine phrasing and excellent philosophizing, which will admit of general application; and so will the telling passage with which Mr. Walker concluded his by no means truculent address: "The world to-day is not big enough to quarrel in. Common sense and political experience are uniting to convince the world that it is an essential unity, and of the fact that no part can suffer and leave the rest unscathed." It would really seem that the trades unions are, by slow degrees, recovering their sanity.

Mr. Walker meant, by essential unity, the solidarity of the workers; but he should be reminded of an excellent phrase in his own speech: "We must keep a watch on ourselves, and preserve at all costs the broader view." Exactly: and the broader view of capital and labour is that, the one being indispensable to the other, there is an essential unity between employer and employed, who should both cease to act as if the essential thing were not unity but ceaseless, relentless, and senseless antagonism.

The tragedy is that this patent truth is realized but imperfectly, or not at all, even by Mr. Walker, who said, in the course of his address, "Certainly the full force of organization among the workers will never make itself felt, and the will inside our movement will never get its true expression, till the workers as a body can meet the employers as a body." They are to meet, it would seem from this, not to promote art, and craftsmanship, and harmony, and business prosperity, but to express the will inside the trade union movement! If the workers as a body can meet the employers as a body to no better purpose than that, Mr. Walker's aspiration is worse than futile. Has he considered the miserable failure of the alleged "Builders' Parliament"?

Brussels International Congress

The tenth International Congress of Architects was opened at Brussels on September 3, under the presidency of M. Jean de Win. Proceedings on the first day naturally went but little beyond the usual polite formalities and complimentary speeches, but the agenda comprises many interesting subjects for discussion when the real business meetings begin. In the supplementary exposition which the Société Centrale d'Architecture has arranged in celebration of its fifth anniversary our American cousins are said to figure very prominently, but their exhibits, according to a Belgian contemporary, are more remarkable for constructive ingenuity than for delicate artistry. They are, however, impressive by their mere number, and we should be glad to learn, from the further reports which we are awaiting, that the British exhibits are well up to the mark. For the honour of British art, even if there is no more material object to serve, it is important that Great Britain should be adequately represented on such occasions.

Architecture in the Lay Press

Architectural subjects find increasing favour with the editors of lay newspapers. Last Wednesday "The Evening News" had a delightful article on "Better-looking Houses," by Sir Lawrence Weaver, and next morning "The Daily Chronicle" published a rhapsody by Mr. Philip Cameron on the architectural amenities of Gidea Park. Sir Lawrence simply cannot help blossoming into frequent epigram. For instance, he knows, he says, that there are still people who believe that beauty lurks in bargeboards, and little oriel windows, and the quirks and tricks of the speculative builder which can be catalogued as quaint. To-day, however, sounder preferences prevail. "The public taste has happily set steadily in a return to eighteenth century traditions, and we have a right to be Georgian in our houses as in our loyalties." Again, with the Gothic Revival of the nineteenth century, "people wanted their houses served up like little abbeys on toast, and enthusiasts feared for their salvation if their kitchen windows lacked a pointed head." There has been one good result of "the tragic cost of building." For, says Sir Lawrence, "economy has brought us back, by the elimination of inessentials, to an art of common sense," and "at the same time the best of our architects have put the best of their skill into planning for comfort and health and not for appearances. They have taken counsel with the makers of grates and baths and sanitary dodges, so that economy and efficiency might be allied with seemly forms." But "that is not to say that simple houses are easy to do. The plainer the house, the more need for those subtle differences which give a plain building that elusive quality that we call style for want of a better word." An exact characterization of Sir Lawrence's delightful *obiter dicta*.

A City Church Redecorated

The custodians of the church of St. Nicholas Cole Abbey, in Queen Victoria Street, are evidently confident that it is immune from the fate with which so many City churches have been threatened. These courageous custodians have just spent about £500 on the repair and redecoration of St. Nicholas; not an heroic sum, truly, but any example of expenditure on building work of any kind is particularly welcome as an act of faith "encouraging the others." At one time there were in the City of London three churches dedicated to St. Nicholas—namely, St. Nicholas Acon, St. Nicholas Olave, and St. Nicholas Cole Abbey. Where several churches within a small area like that of the City of London were dedicated to the same saint it was necessary to distinguish each by a surname—usually it was an alluringly quaint one—lest there should be failure to identify any of the four St. Margarets, the seven St. Michaels, or the fourteen St. Marys. Only one of the three churches dedicated to St. Nicholas was rebuilt after the Great Fire, and its name of Cole Abbey is thought to be a corruption of Colby, possibly a founder or restorer. On the site there was a church of sufficient age to need restoration several years before the Great Fire, in which it was completely destroyed. St. Nicholas Cole Abbey is reputedly the first to be rebuilt after that fire, and was of course designed by Wren; and, with its stone parapet, its flaming urns at the angles of the four-story tower, its rows of ample windows on the north and east, and its dignified proportions, is sufficiently characteristic of his work to warrant the attribution.

Sunshine and Shop Windows

The Rev. H. Neville Hutchinson, writing from the Royal Societies Club, St. James's Street, protests that "if we valued sunlight as we ought to value it, we should not be so foolish and ignorant as deliberately to shut it out from our houses and shop windows." He adds that many shops are darkened because the shop window is piled up with goods. "I often speak of it to proprietors of shops," he says, "but they seem unwilling to take any steps to improve matters." They do but follow the too common habit of disregarding outside opinion. "You cannot teach me my own business," is too often the impatient and scornful comment with which suggestions from the architect, for instance, are met. Although the art of window-dressing is much more generally understood than it was, there are still many shopkeepers who have no better idea about it than to pack into the window as much as it will hold, and to keep it dark in order to preserve the freshness and colouring of the goods, thus harassing the eye and mind of the beholder, who goes away with very confused notions of the character and substance of the heterogeneous display. It happens that the writer of this note, remonstrating with a shopkeeper on the impolicy of overcrowding his shop window, was told, "The more I can show, the more I can sell. If people do not see in the window what they want, they conclude I haven't got it, and go elsewhere, so that I lose a sale and perhaps a customer." That is no doubt the crux of the matter, and the main reason why shopkeepers overcrowd their windows and darken their shops, and why shop fronts have been evolved on the show-case principle. "Little and often" might be a relevant motto for the local shopkeeper, whose customers live around him: he could change his display every day, and every change would bring fresh visits; but the system would hardly meet the case of the casual passer-by or of the visitor from a distance, who would not have the opportunity to follow kaleidoscopic changes. Overcrowding, however, is overdone, and is fatal to artistic display, and, *a fortiori*, to artistic shop-front design.

Joking Apart

(A Monthly Causerie)

Some Unmoulded Opinions

IT must gratify a profession whose business it is to build in beauty to notice that the arch enemy of Beauty—Industry—has at last perceived the error of his ways and incontinently changed sides. Before the middle of the eighteenth century our towns were things of beauty and were so esteemed; it was only after the death of George II that the so-called "Industrial Revolution" gradually transformed those beautiful towns into the agglomeration of unnecessary ugliness we now find them; and it has been reserved for us, after nearly two hundred years, to see a group of the leading spirits in commerce organizing to beautify and brighten London.

The inspiring motive of the Brighter London Campaign, which burst into blossom in the spring like a flower, has, however, like a flower, withered away at the approach of autumn. This is very sad, but, whatever the reason, it is not due to want of success; for like most of the new movements, new books, new plays, and new inventions of these times, the Brighter London Campaign was a success almost before it was born, and its success, as we know (from the papers), was never in doubt for a single day. Do we not see on all sides its benign and gladdening influence? The Executive Committee claims that London has been made a "City of light"; "the West End at night is," it points out, "ablaze with light," and this is certainly true. The variety and brilliance of the beautiful animated illuminated signs which burst upon us every evening transform the sinister gloom of night into a veritable fairy-land, engage our fancy with fascinating concepts, and enrich our minds with a wealth of curious information. Wheels go round, a thousand fireworks explode and re-form beneath our gaze, and delightful kaleidoscopic magic-lantern pictures challenge our attention on all sides in a lavish repetition which cheers us with its redundant lesson of perseverance. The shops flash coloured lights upon us as we pass, and with a thousand ingenious devices compete to capture our attention and banish thought; while at night their searchlights lie athwart the sky like glorious comets in a magnificence that pales the moon and shames the stars out of existence—for will not to-morrow's sun rise on a special bargain line in men's braces? Who, then, can rebut the claim that London has been brightened?

We are not to suppose, however, that the movement has confined itself to augmenting the number, brilliance, and liveliness of illuminated advertisements. It has done much more than this. It has extended the licensing hours into the early morning and made it possible for us to sup in the presence of a band of ecstatic pierrots who caper around our table and thus banish the boredom incidental to supping after an evening at the theatre. Music, too, has responded to the call for more brightness, and members of popular orchestras now prance in time with the tune and even distribute themselves among their audience, finally resuming their places only for the concluding phrase. The railways also have lent their aid. They advertise, on special illuminated signs under the heading "Brighter London," the most compelling attractions of the town—"Special illuminations at Poodle and Pippet's"; "Phenomenal sale of gloves at Mobbet's," and so on. They encourage us to visit Barnes by a picture of a barge, and Barnet (is it?) to see a countryman in a smock-frock and a top hat, with a basket of carrots on his arm. The retail traders have supported the movement and, in order to engage our minds, have called upon the resources of engineering science to make an entire shop front in Piccadilly revolve bodily like a meat-jack; and if they have but a pair of "snake-skin" slippers to dispose of at ten and six, or an unmounted briar pipe at two guineas, display them on velvet cushions under beautifully shaded and tinted lights in a setting far surpassing in splendour that of the regalia at the Tower. The theatres, in the words of the Executive Committee, "have played their part in brightening the City with some of the brightest shows that have ever been staged"; or, if our taste is for drama, we can enjoy the smell of actual live camels and experience the authentic dust of the African desert blown by real wind into our hair and ears. By following the sound principle of reproducing only what has already passed the test of success, and by avoiding new ideas, the theatres are able to secure their patrons against boredom and mental fatigue. The Press also has nobly lent its weight to the campaign. Even the children have not been forgotten, and a "Great Daily" has sought to brighten their little lives by devising delightful competitive games for them during their holidays, encouraging them with handsome prizes and teaching them the useful lesson that the game best worth playing is the game with money in it.

It might be supposed that such unity of purpose among activities, in which the pocket is generally supposed to be the throne of the conscience, has been due to some motive other than philanthropy; but this, it appears, is not the case. The Brighter London Society has definitely stated that the campaign has been organized in what it believes to be the best interests of London, and with the object of developing an increase of good-will towards London and of "moulding," in other countries, a higher opinion of London as a social and business centre. As has been pointed out, much has already been done to effect this high purpose; but more is readily possible. By a simple adjustment of the escapement of the clockwork the illuminated wheels could be made to go round faster and increased vigour given to the firework effects. Why, we may reasonably ask, are not *all* shop fronts made to revolve, and why do we hear so little of the stentorphone? The resources of that wonderful magnifying power-gramophone would remain almost unknown to us had not a "Great Daily" used it to brighten up the pensive crowd which gathers at St. Paul's at midnight on the last day of the old year, with vociferations of "Stop yer tickling, Jock," or other ditties appropriate to the occasion. The power of the stentorphone to brighten London is enormous, for, unlike our moving signs, it is not dependent on darkness. It could be kept going in our public squares and central thoroughfares day and night without intermission, and, supported by the revolving shop fronts, animated illuminations and flashing signs, might be the means of converting London into a scene of gaiety and brightness comparable to ten thousand Mitcham Fairs rolled into one, and be the means of making old England indisputably a land fit for shopkeepers to live in.

Perhaps another occasion will give opportunity to display in this page the direct bearing this hocus-pocus and hypocritical claptrap of "moulding" opinion, and Brightening London, has on architecture and the ideas, tastes, and aspirations by which architecture lives. Every member of any corporation or town council of any of our leading pleasure resorts knows that the element of shoddy popularity and jigging gaiety—so esteemed in the Brighter London Campaign—is one which, for their own well-being, they are obliged to discourage; and that the principle which is to brighten London and raise her reputation as a social and business centre would wreck Bournemouth and Eastbourne and Torquay in three years.

KARSISH.

Rebuilding Soviet Russia

By HUNTLY CARTER

1.–Ambitious Soviet Plans

Since the Revolution Mr. Huntly Carter has travelled a great deal in Russia. He has become familiar with the famine areas, and has studied the various problems with which the country is faced. In this and the following articles he will deal with the Revolution from the point of view of its effect upon Russian architecture and art, including the art of the theatre. At the same time he will try to draw a true picture of the Modern Russia of to-day.

DURING my visits to Soviet Russia since the Revolution I have been much impressed by one fact at least. I have noticed that it is one thing to read about Russia and another, and vastly different one, to see it with one's own eyes. Before entering Soviet Russia I had read a great deal in current books and periodicals and newspapers about the Communist experiment, and in this way I accumulated quite a lot of information about the political, economic, and industrial situation. I believed, in fact, that I knew all there was to be known about the new mysterious and incorrigible Russia, and had formed a really illuminating picture of its actual conditions.

But I had not been five minutes in Russia before I realized that with all my reading I knew practically nothing about its actual conditions. The picture I had formed of the situation in Soviet Russia was as far from the truth as the average film drama is. I found indeed that I had no picture in my mind of what life in Russia really was; and it was no wonder that I came to the conclusion that the situation and the prevailing conditions cannot be wholly realized by those who read about them in distant countries. The conditions must be observed and, as far as possible, actually experienced. Failing an opportunity to see, feel, and live the life, for it is neither easy nor cheap to enter Russia to-day, the only thing left is the account by the witness who has entered Russia not as a guest of the Soviet Government, but as an independent observer, and is in a position to observe facts for himself and is capable of doing so honestly.

THE RED PLACE, MOSCOW.

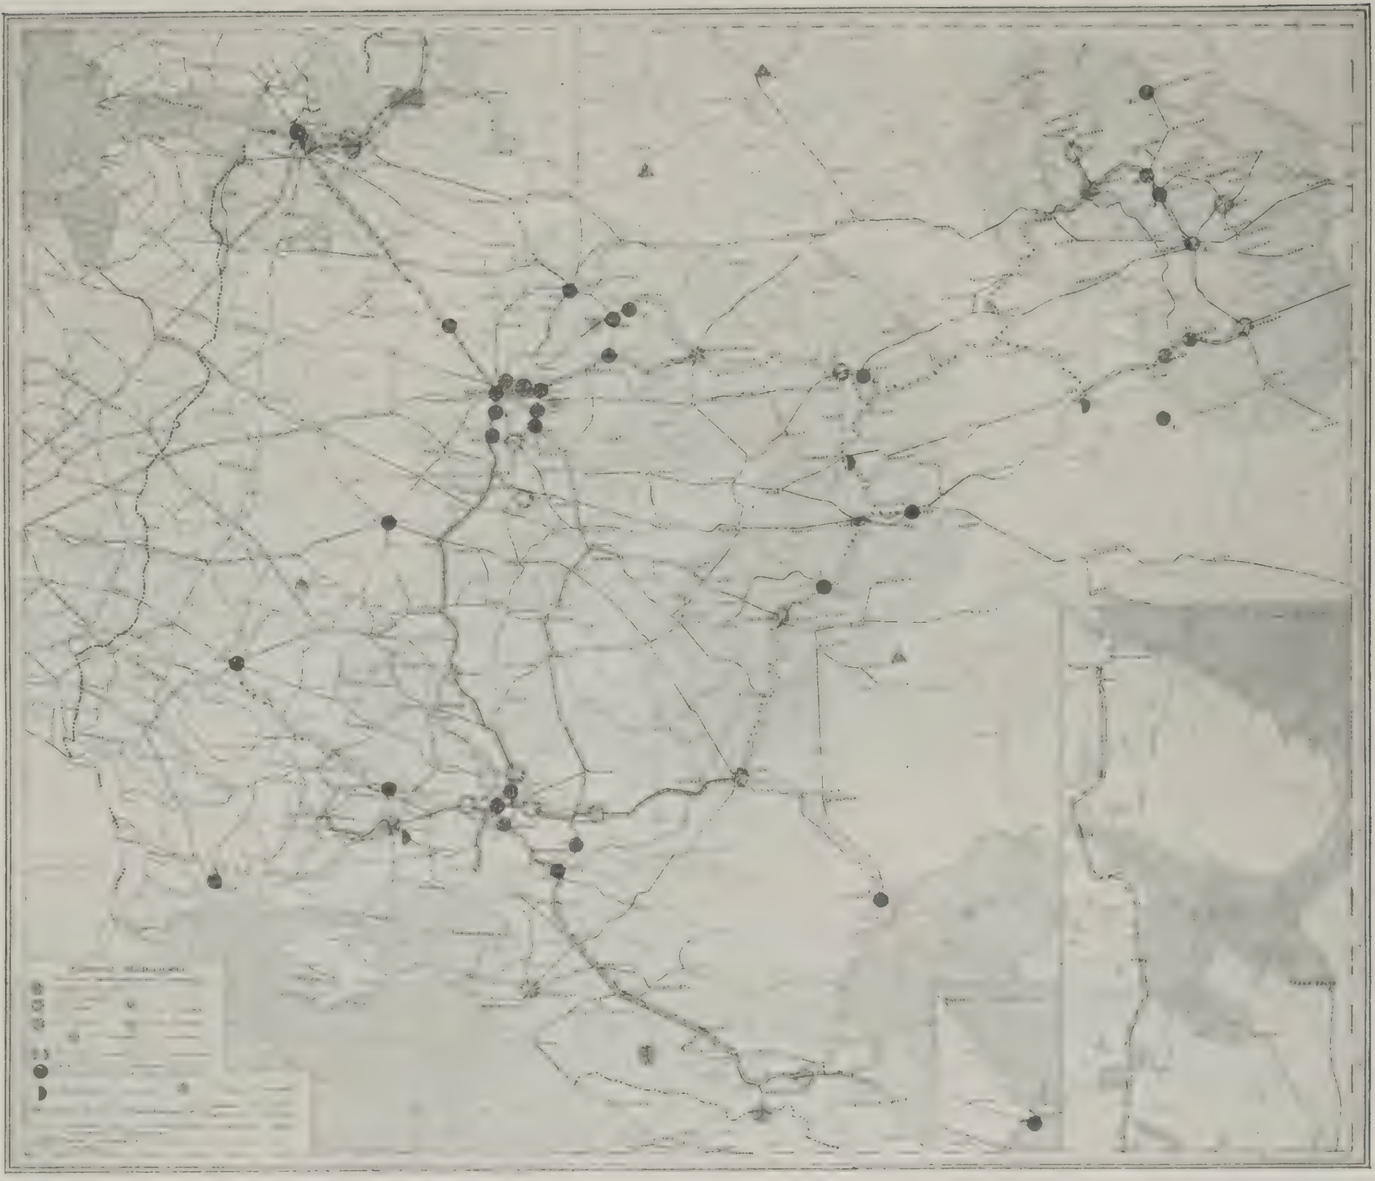
A year ago it was not possible for observers to enter Russia and roam about at will. Every visitor was a guest of the Government and was treated accordingly. Since then the Government have changed their policy. Free trade has been re-established, shops and markets have been opened, and to-day the visitor is left to himself to behave much as he does in other countries, provided he is able to pay his way—a very dear one—and keep his opinion of the programme of the Third International or the Communists to himself. Though Soviet Russia permits free trading it does not permit free opinion.

Of course, all this implies that not only must the observer go to Russia to see things as they really are, but he must go periodically. To prove this I have only to enumerate the many and varied changes that in my experience have taken place during the past twelvemonth. But there is not space for that. Moreover, I am not concerned in this and the following article with tracing the historical course of events. I am concerned with the question of rebuilding Soviet Russia, and the appalling conditions that must be overcome before such work can be carried out.

Since my previous visit to Russia I have been greatly interested in the reconstruction of this country. Indeed, I have been writing on the subject, as the article I contributed to THE ARCHITECTS' JOURNAL some months ago shows. It is no news to some people that reconstruction plans of a very ambitious character have been formed by the Soviet Government, and their intentions with regard to the rebuilding of Russia, when economic and other circumstances permit, are pretty well known by this time. It will have been noticed that quite a lot has been said, and is being said, in the daily papers on the subject of rebuilding Russia; and this and that country, especially Germany, are credited with the intention to collar the building trade, and in this and other ways to subject Russia to their own aims of recovery. A day or two ago it was stated by the "Westminster Gazette" that Germany, in the person of

RUSSIAN ARCHITECTURE OF PRE-REVOLUTION DAYS: TWO VIEWS IN MOSCOW.

Two Hundred Experts for the Electrification of the Whole of Russia



The dark spots indicate existing electric work, the light spots indicate the presence of water-power, and the rings the presence of coal power. The dotted lines indicate proposed waterways with electric tracks, and the thick lines and lines of dashes electrified stations.

In the centre of this poster stands an electric power station which is connected with every form of industry. Reading from left to right, the first vignette says: "It (electricity) will till the soil and yield bread"; the second, "It will illuminate town and village"; the third, "It will make goods accessible to all parts of the country." Of the two lower vignettes, that on the left says, "It will bring the coal to the surface," and that on the right, "It will provide water in time of drought and irrigate fields and orchards." Under the drawing of the power station are the words, "On the peat marshes, on river banks, at the coal mines, we will build great power stations, and by copper cables the power will run to all corners of our Motherland." At the bottom in huge letters are the words, "Electricity is the Great Force."

A SOVIET POSTER ADVERTISING THE SCHEME FOR THE ELECTRIFICATION OF RUSSIA.

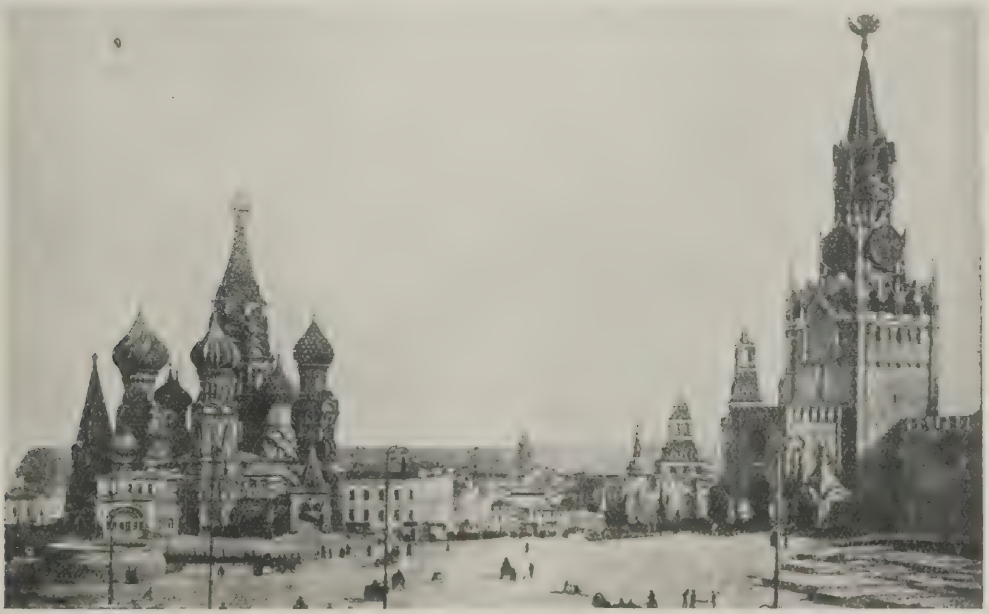
Herr Stinnes, had already arranged to rebuild Petrograd, and a political turn was given to the matter by the statement that Petrograd occupies a strategic position favourable to German economic and military aims. More recently there appeared in the "Daily Express," and subsequently in "The Times," a prophecy by Mr. Leslie Urquhart, a gentleman who controls vast business interests and who has more than once come into conflict with the Soviet Government over the question of trading possibilities. Mr. Urquhart now foresees an early resumption of business with Russia, which he believes is made possible by the confidence to be placed in the Soviet Government when presently they put pen to paper. He declares the Government are honest in their intentions, and therefore to be trusted. All of which must be of interest to British architects who wish to take part in the greatest rebuilding undertaking the world has ever known.

THE KREMLIN, MOSCOW.

So when I re-entered Russia this May for a prolonged stay I had a fairly clear idea of the vast rebuilding schemes upon which the Soviet Government wished to embark. These included the electrification of the whole of Russia; the rebuilding of towns and cities and villages according to an "electric city" model; road making and repairing on an immense scale; and the reconstruction and extension of railways. Any one of these projects was sufficient to set a whole army of experts and technicians to work.

I knew, too, that plans had been carefully drawn up. For instance, in view of the urgent necessity of electrifying Russia a plan of electrification had recently been prepared. The work was undertaken by more than 200 experts, nearly all of whom were opposed to the Soviet régime, yet were, nevertheless, sufficiently convinced of the importance of the proposed electrification to the economic regeneration of their country to set aside their opposition. The report of the Commission, which received the unanimous approval and the enthusiastic consent of the Eighth Party Convention, provides for the establishment during the next two years of a series of central overland stations, most of them for heating purposes, for the building of vast electricity transmitters and nets of distribution, for the electrification of the railways and industries, and for the extension of the use of electrical power in agriculture, in the institutions of public health and welfare, and for domestic use. This gigantic plan now awaits money and foreign experts and technicians to carry it out. There were also important town-planning and garden city plans—ambitious plans for the erection of workmen's dwellings, for converting villages into garden "cities," and for town improvement and embellishment of all kinds, including the beautification of municipal parks, open spaces, and so on. These might be studied at the Soviet Department for Architecture under the enlightened direction of Joltowskoi.

I was also aware that the Soviet Government had done something by way of preparation. I knew they had expressed willingness to co-operate, as far as the principles they stood for would allow, with outside forces to secure a new "architectural" Russia. They were willing to recall Capitalism, to re-invite experts and technicians, including those they had banished, to give large concessions to private capital, in short, to pawn their own country for the sake of realizing ambitious schemes for which there was no money in Russia. Such, briefly, were the facts which I had gathered outside Soviet Russia. There were other, and perhaps more important facts, which could be gathered only inside Soviet Russia. There were, for instance, facts on the actual condition of Russia. I will come to these in my next article.



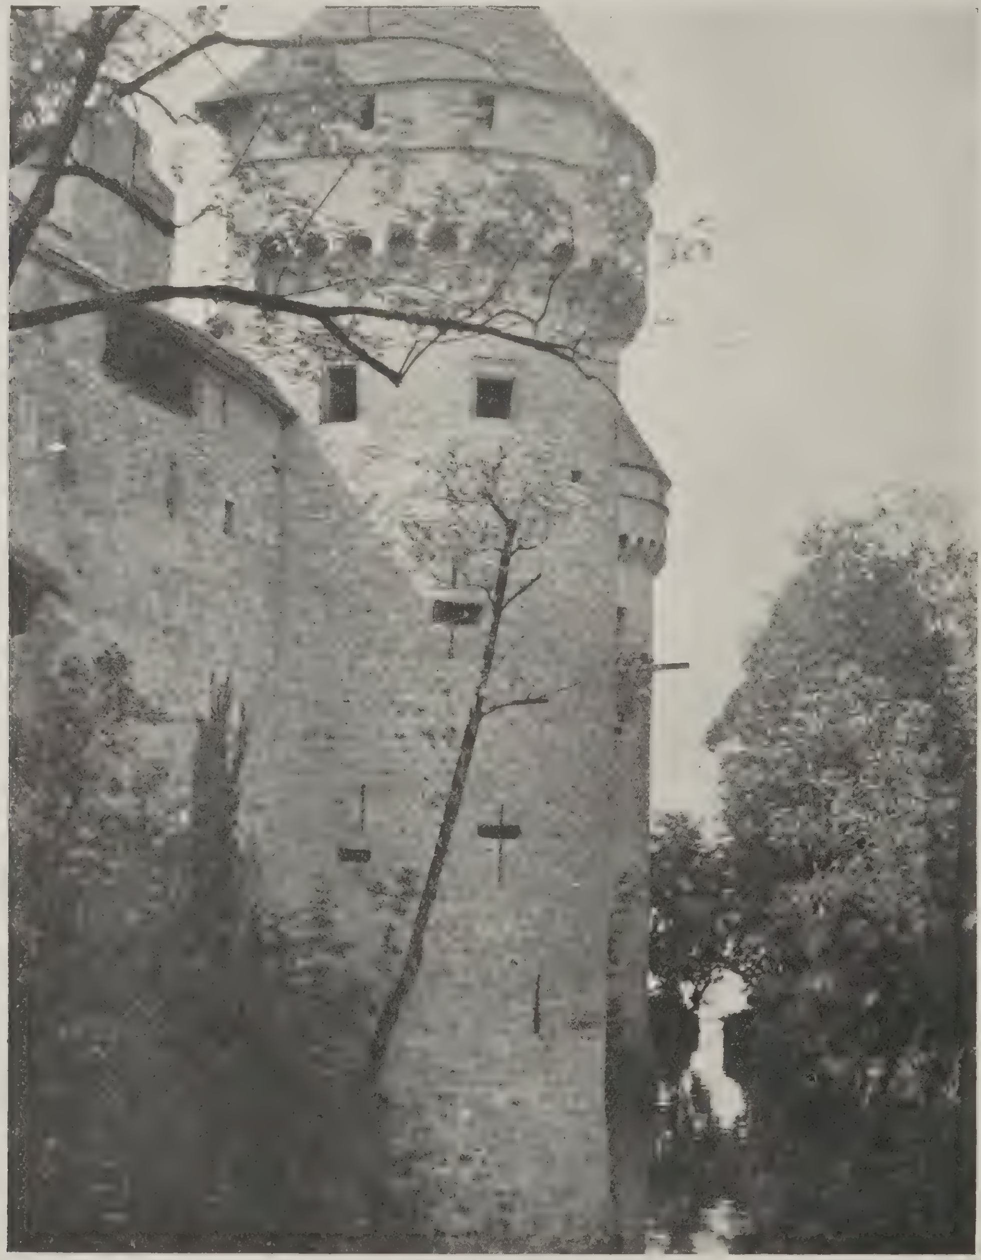
TYPICAL RUSSIAN MONUMENTAL ARCHITECTURE IN THE RED PLACE, MOSCOW, NOW THE SCENE OF HUGE SOVIET MEETINGS.

The Château de Chillon

By H. A. J. LAMB, A.R.I.B.A.

THIS famous and well-preserved old castle is situated on the north side of the Lake of Geneva and separated from the mainland by a narrow moat—also close to Villeneuve at the mouth of the Rhone. It can be reached by tramway from Vevey; or better still by steamboat to Territet or Villeneuve. It is from the lake that one sees the beautiful picture it makes, surrounded by magnificent scenery with a glimpse of the snow-capped Dents du Midi in the distance; one can the more easily realize why it has been the subject of so many paintings.

It is, however, curious to note that Charles Dickens was evidently not very impressed by it, for in a letter he writes: "The insupportable solitude and dreariness of the white walls and towers, the sluggish moat and drawbridge and the lonely ramparts, I never saw the like of."

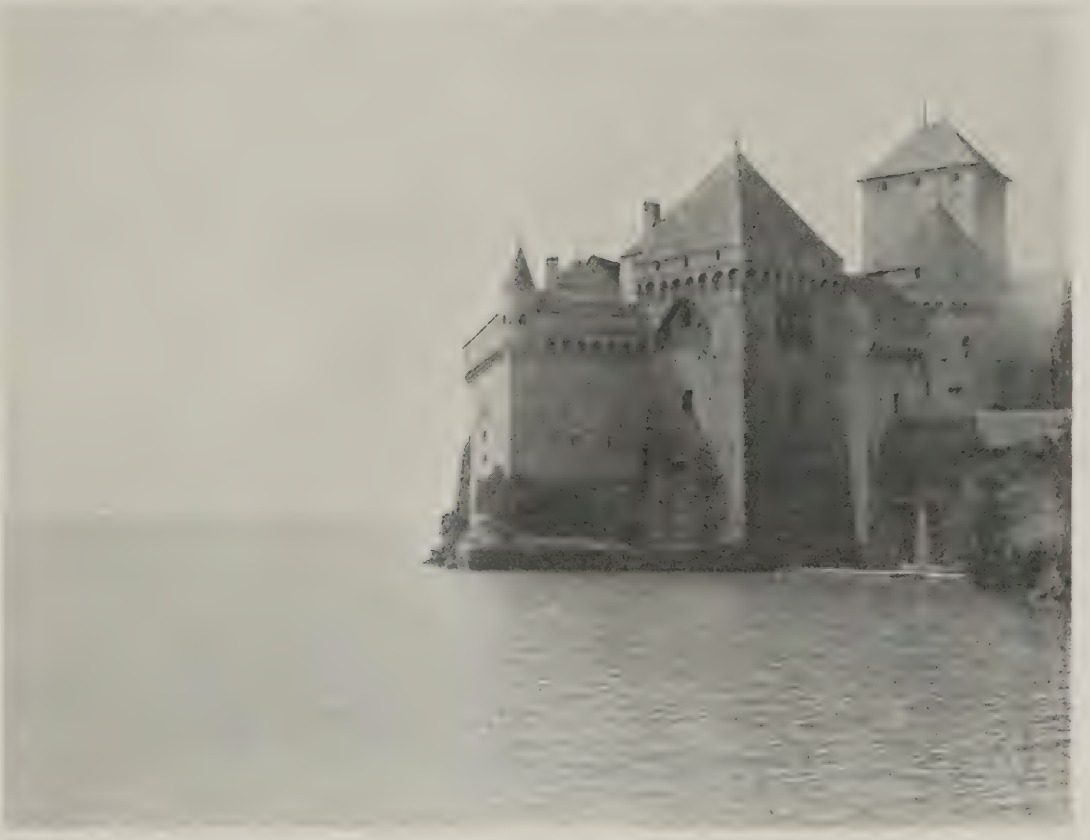


A DEFENCE TOWER.

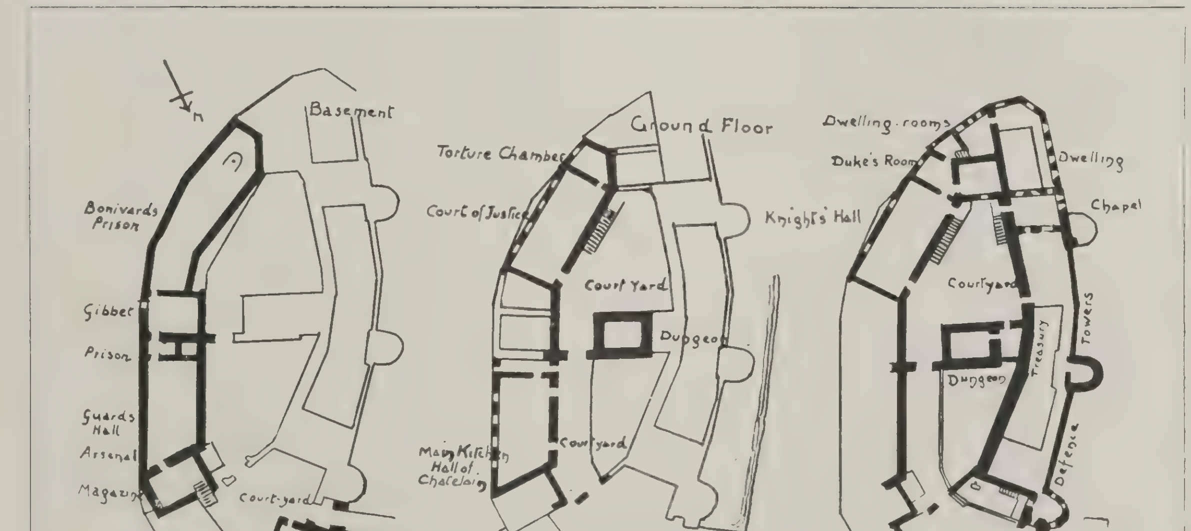
The Château was probably altered and enlarged considerably by Count Pierre II, of Savoy, in 1256–1263, and continued by his successors up to the fifteenth century, though in all probability something in the nature of a small garrison existed in the eighth or ninth centuries. The keep, which is of great height, is believed to date back to the eleventh century.

The first written record of the Castle refers to 1005, when it belonged to the Bishop of Sion. Chillon remained in the hands of the Savoyards until the year 1536, when it was captured by the Bernese. In 1798 it changed hands again, and was seized without bloodshed by the people of Vevey, who thus freed it from the dominion of Berne.

From the land side, entrance was originally gained over a drawbridge, which is guarded by a square tower of the



VIEW FROM LAKE GENEVA.

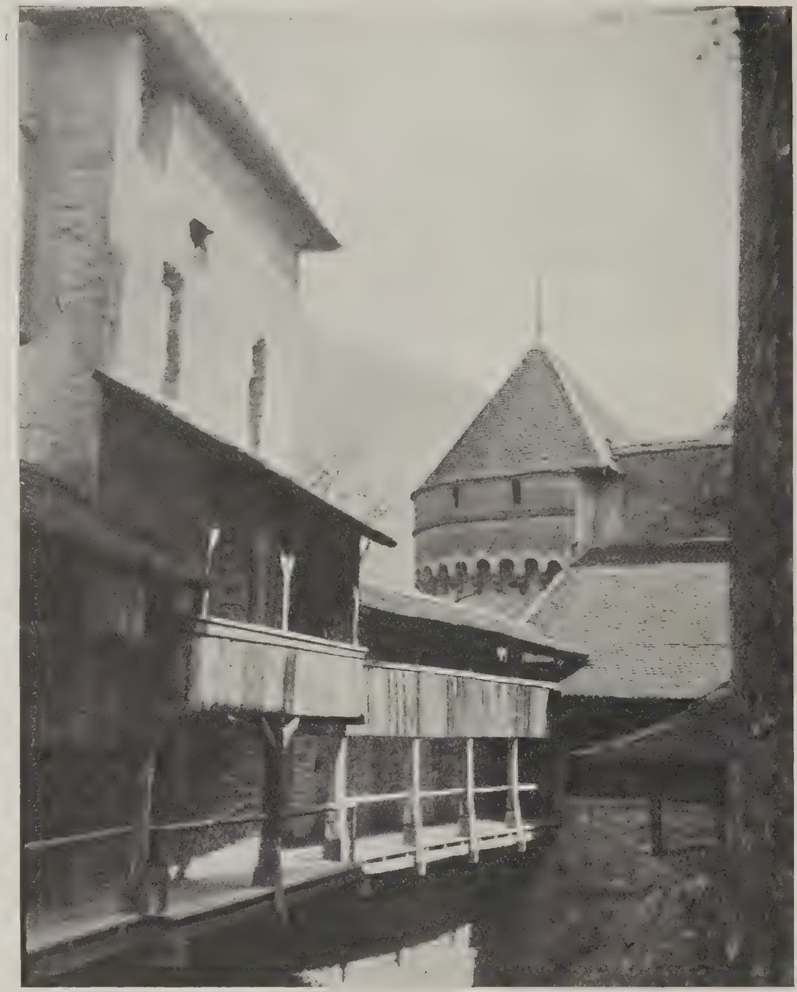


PLANS OF BASEMENT, GROUND FLOOR AND FIRST FLOOR.

THE CHÂTEAU DE CHILLON.

thirteenth and fourteenth centuries. On the right of this are three tall towers, pierced by numerous loopholes and crowned by machicolations, behind which lie extensive patrol galleries. These stone machicolations were constructed in 1376, to replace former rough wooden walling which, however, still remains at the top of the rectangular tower at the entrance.

Entering the main gateway, one emerges into the first of the five courtyards, round which the buildings are ranged. On the left is the guards' lodge, and a few steps farther on one passes into the guards' hall, prison and dungeons, which are under the main building, and just above lake level. These were constructed between 1254 and 1264 and consist of a series of communicating chambers, which include the condemned cell and execution chamber, in which the gallows beam may still be seen to-day.



PATROL GALLERIES IN THE CHÂTEAU DE CHILLON.

At the end of the main dungeon is the spot where Bonivard was chained to one of the round columns supporting the vaulted roof. Byron, in his well-known poem "The Prisoner of Chillon," in which he gives an imaginative account of the political prisoner Bonivard, who was confined there from 1530–1536, says :—

> " There are seven pillars of Gothic mould
> In Chillon's dungeons deep and old."

This particular dungeon is long and narrow, with walls hewn out of the solid rock, from which the floor too has been roughly levelled. For windows there are narrow slits opening into round arched embrasures.

Opening directly on to the lake from the execution chamber is a doorway through which, one imagines, the bodies of unfortunate victims were cast. Nowadays, however, it is fascinating to stand here and gaze down into the clear blue depths of the lake, and watch the multitudes of fish which can be clearly seen far below the surface of the water. Above the dungeons and facing the lake is the Great Hall, a magnificent room, with four fine Gothic windows, in which there are window seats of great depth. Massive columns of chestnut wood with boldly carved capitals support the ceiling.

Practically adjoining the Great Hall is the Court of Justice, another imposing apartment, with black marble pillars, whose capitals still bear traces of colour, supporting a ceiling of coffered squares. This was carried out in 1437 by the architect Aymonet Corniaux. The walls are decorated in squares of grey and white with red joints. Leading out of this is the torture chamber, which was used as such in the seventeenth century. Instead of being grim and forbidding, it is really a most cheerful room, with a handsome thirteenth century window, and walls decorated in courses of red and white with black joints. This squared treatment of decoration, formed of oblique rectangular bands, is typical of the period, 1256–1259.

The ceiling is elaborately painted in green, scarlet, and white. In the centre of the room is a tall, roughly painted wooden post up which the unfortunates were hoisted by means of ropes, whilst hot irons were applied to their feet. The base of the pillar is much charred and worn away.

From the courtyard one must now ascend a long flight of steps, picturesquely roofed in, to gain access to the Knights' Hall, another fine room with two large windows, paintings on the walls, and an enormous fireplace. The room also contains several beautifully carved oak chests and many other fine pieces of furniture.

Leading out of this is the Duke's bedroom, with vivid red walls ; out of this again is a smaller room, probably a sitting room. On the opposite side of the courtyard, another flight of steps leads up to the beautiful little chapel of St. George, built in the middle of the thirteenth century, with finely decorated Gothic ceiling and four lancet windows. The paintings on the walls and vaulting belong to two periods—1259 and 1314. In 1314 Count Amédée V, who was then living at Chillon, had the chapel redecorated. The paintings depict biblical scenes and heraldic designs, whilst the embrasures of the slender thirteenth century windows are almost covered with curiously executed figures.

There are many other rooms, planned in a rambling manner, with echoing corridors and numerous staircases. Here and there the walls are tremendously thick, and occasionally one finds curious loopholes and heavily barred windows.

Parts of the castle are closed to visitors, being used as quarters for the caretakers and guides.

Further details which it is impossible to give in these short notes will be found in a small book issued by the "Association pour la Restoration du Château de Chillon," in whose hands is the necessary upkeep and restoration of the Castle.

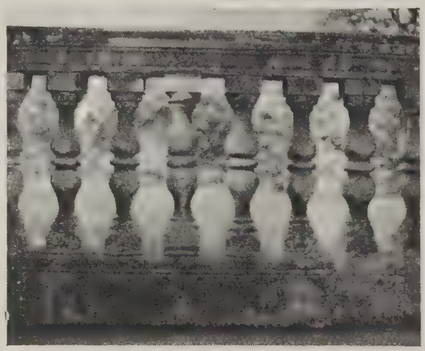
THE BRIDGE.

The Palladian Bridge, Wilton House, Wilts

Measured and Drawn by C. J. W. Lindley



DETAIL OF BALUSTRADING.

THE original Wilton House was largely destroyed by fire in 1648, and Inigo Jones was employed to rebuild it. His designs show a strong Italian influence—an influence which is reflected in the Italian gardens before the house, which were designed by Isaac de Caus in 1640. It is often said that Inigo Jones designed the Palladian Bridge at the same time, but as a matter of fact this bridge was built during the eighteenth century by Robert Morris, who was an architect of some originality, and built also Inverary Castle (1745–61, his first work); the lodge in Richmond Park; Brandenburgh House, Hammersmith (destroyed); a house for Lady Suffolk at Twickenham; Coom Bank in Kent; Wimbledon House (destroyed), and Kirby Hall in Yorkshire. The bridge at Wilton has become a classic—so much so that various imitations of it have been erected at different times, including two at Prior Park and Stow. Its proportions are almost perfect, and the motive of the wide central arch and small side arches, the projecting wings and the colonnade, is the most satisfactory that has been evolved for a bridge treatment of this nature. The river runs parallel to the front of the house, so that the bridge stands at right angles; the archway of its end pavilion closes the vista at the bottom of the broad pathway which forms a connection between the two features. Wilton House is the home of the Earls of Pembroke.

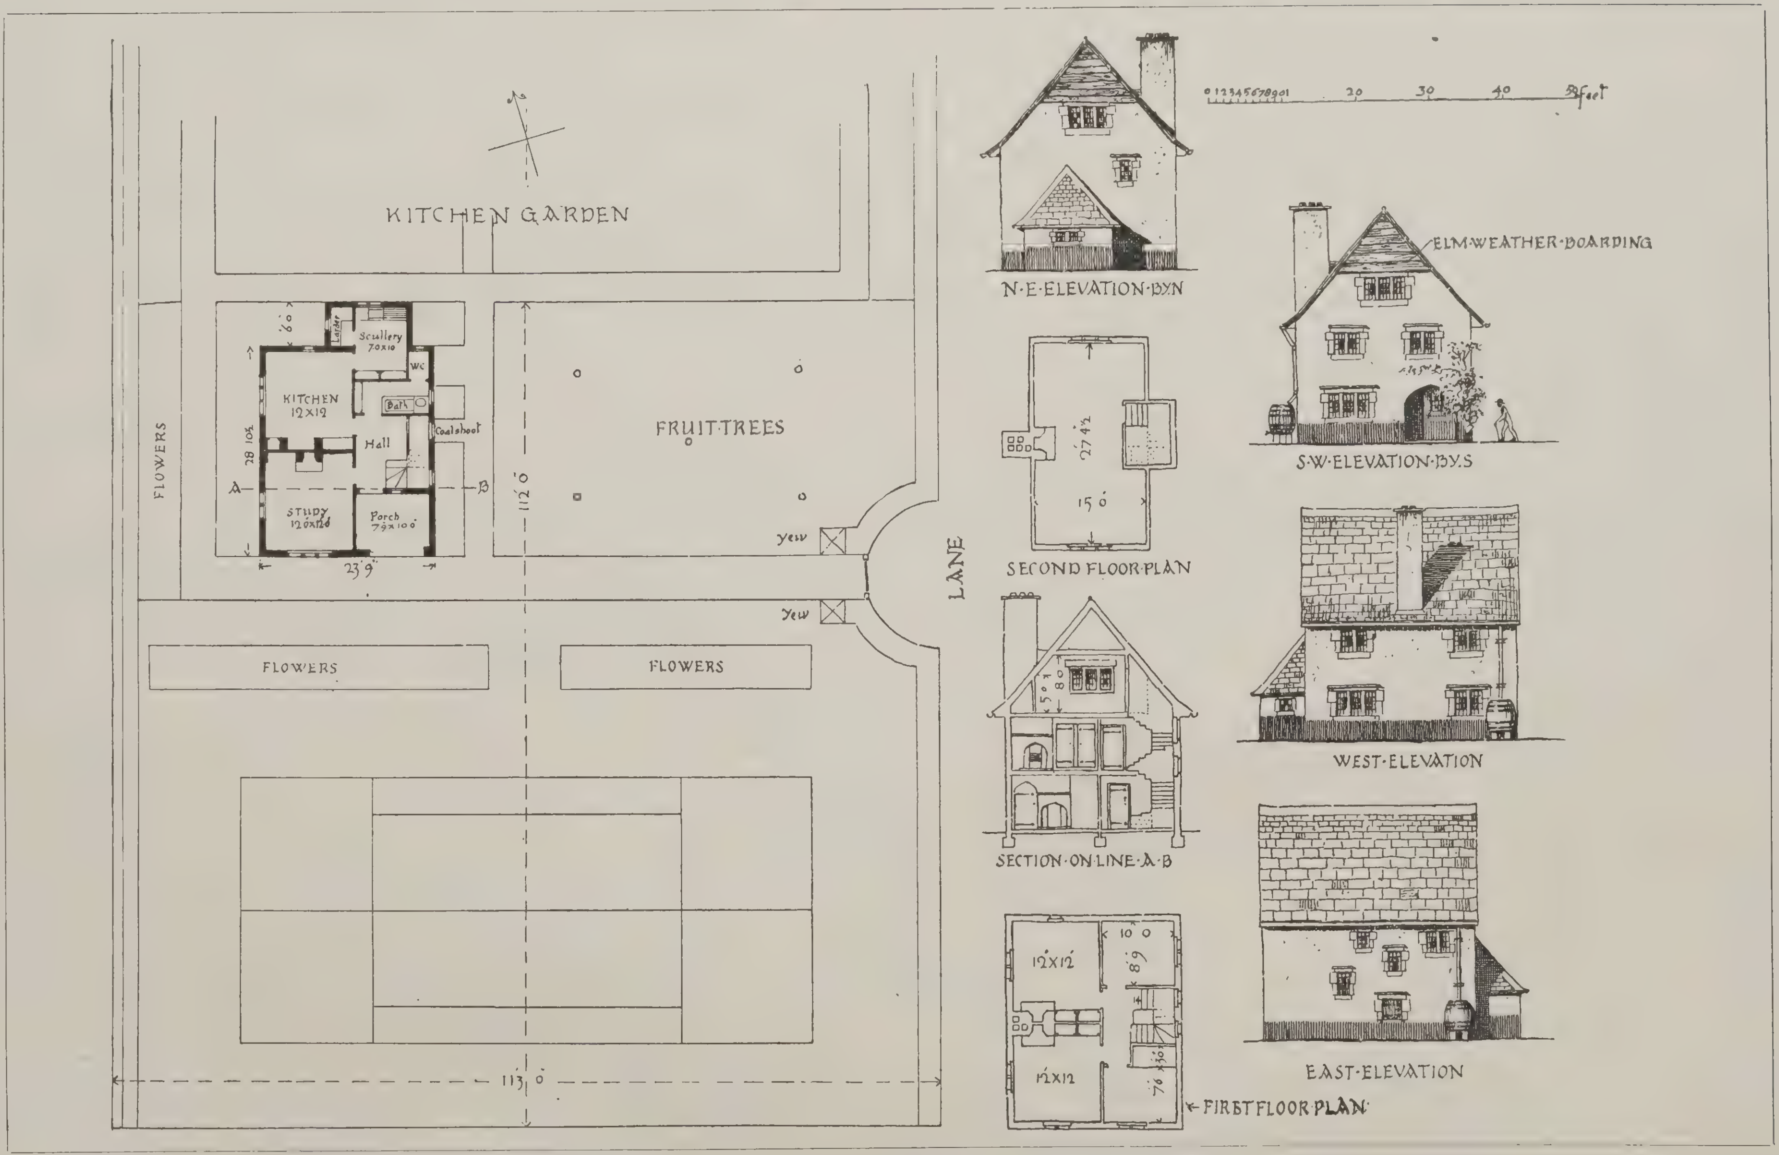
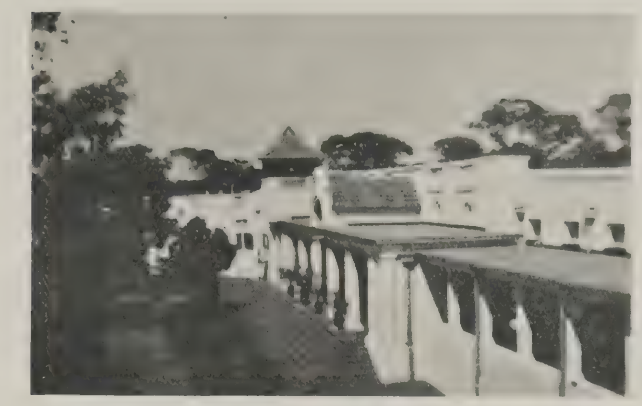
A House at St. Nicholas, at Wade, Isle of Thanet

C. F. A. Voysey, Architect



This house is now in course of erection. It is being built of one-inch cement rough-cast, with stone windows, iron casements, lead glazing, and hand-made dark local roofing tiles. All joinery is of English Oak. In the rooms there is a green glazed tile skirting flush with the plaster, and green glazed tile window sills. Hard coarse plaster is being used for the walls without wood linings or architraves, and Delabole Slate paving for the hall, porch, kitchen, and offices.



A BIRD'S-EYE VIEW OF THE FRONTAGE TO THE FALLS.

A New Hotel at Victoria Falls, Rhodesia

By FRANK SCOTT, M.S.A.

THIS hotel has been erected from the designs of Mr. Frank Scott, M.S.A., at the Victoria Falls, Rhodesia. The building is a flat-roofed, fireproof, skeleton-framed building constructed of reinforced concrete with an external "fill in" of brickwork, all plastered and creamed with a tint just less than white. The internal divisions are generally in Hy-rib partitions. Mr. Scott has produced an architectural effect suitable to the tropics by a free interpretation of such Portuguese work as one sees on the East Coast of Africa.

No comprehensive view of the whole building by means of an actual photograph is obtainable on account of its enormous length, but some interesting views of the more important details are reproduced on this and the succeeding pages.

The erection of the building presented a problem of some intricacy owing to the position of the site, which is remotely situated from any town. Labour was hard to obtain, and materials were transported only with great difficulty.

As will be seen from the accompanying illustrations, Mr. Scott has taken advantage of the nature of the climate. Nearly all his effects are obtained in a simple way by a bold treatment of lights and shadows. The deep shadows thrown by the veranda and main entrance serve to attach to the square wings of the building a contrasting solidity and simplicity.

The importance of the main entrance is stressed by the use of columns, pilasters, and entablature. On either side of the main loggia is a veranda, which carries on cleverly the architectural treatment of the entrance. Great prominence has been given to the main loggia and the verandas owing to the fact that they face the Victoria Falls. At the end of each of the verandas is a tower, from which some fine views may be obtained of the falls and the surrounding country.

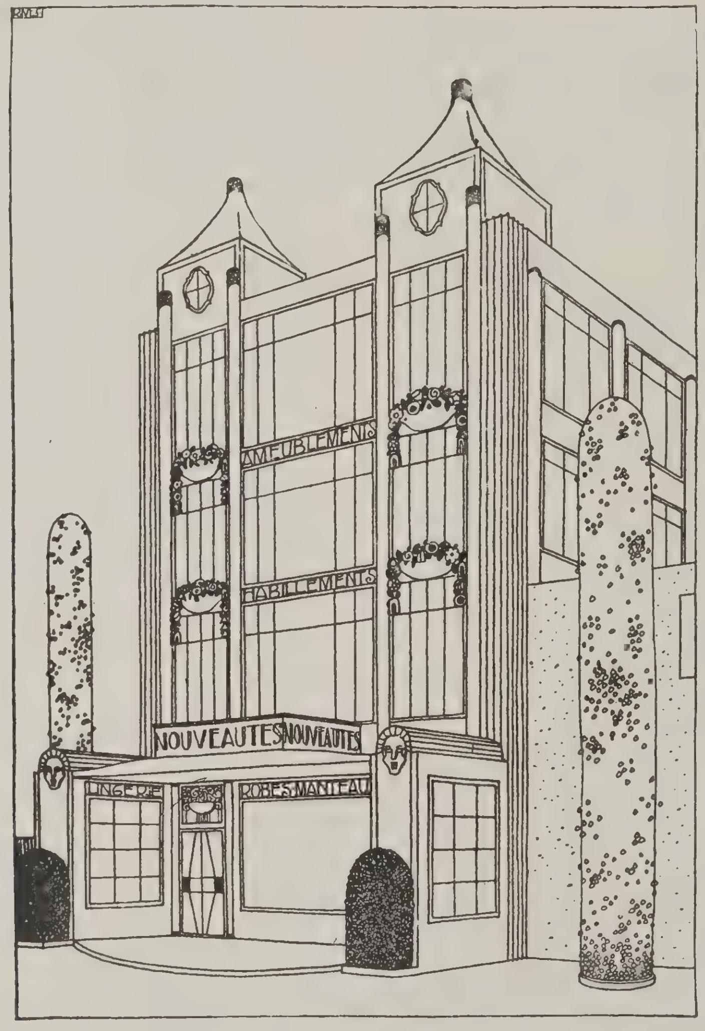
"A Modern City"[*]

A LAUDABLE enthusiasm for suggesting new civic forms has carried Mr. Mallet-Stevens such a long way in his rapid ascent towards ultra-modernism that, with this present volume of heterogeneous designs, he has brought himself under the cold light of criticism which spares in its function neither the heart's impulses nor the head's elucubrations.

It is one thing to be dissatisfied with the architectural forms at present obtaining in any city, quite another to replace them by new and better ones. The process of bettering buildings or blocks of buildings may be radical in the extreme, but it should be based upon enlightened convictions. Convictions which should be arrived at after long and thoughtful considerations of many problems. The importance and extent and position of civic centres; the claims of traffic; the activities of commerce and industries; the storing and showing off of goods of all kinds; the housing of the population; the extent and quality of its amusements; its need of open spaces—these and a hundred other aspects of such a huge problem should be very carefully considered before committing to paper and giving out to the public any scheme whatever. But such problems as have just been adumbrated Mr. Mallet-Stevens does not appear to consider at all. Some of his designs are quaint, simple, and occasionally rather agreeable, but taking them as a whole they seem to us to display a paucity of cohesion, a lack of scale, which no veneer of unusual shapes or draughtsmanship could seriously hide.

The fact is that the title of the book is a misnomer. Inside you will find none of those visionary, but thought-alluring general views or bird's-eye perspectives that show new ordinances or town-planning ideals. Each plate consists of an ink-line perspective drawing of various types of buildings: a town hall, a stores, a museum, a theatre, workmen's dwellings, and so on. To heighten the effect, a single wash has been introduced, so that the eye is disturbed away from the general design by red woodwork, purple or blue roofs, and yellow doorways. It is all rather arbitrary and superficially thought out, and the sense of scale throughout is unsatisfying. How far from those generous, considered, and architectural conceptions of Hébrard, Tony Garnier, Ludovicini, or of the Wagner school. However utopian, theirs were architectural entities. The life of the city was then analysed and given expression; its vast possibilities studied, and much skill shown in both conception and execution.



A STORES.

Not one plan or section is given in Mr. Mallet-Stevens' book. Further, if no sense of co-ordination pervades the whole, none does duty with the parts thereof, and the net result of all those thirty-two plates is consequently meagre and carries no weight. It would therefore be advisable for Mr. Mallet-Stevens to go more seriously into the heart of this problem, to consider it in a more practical and architectural spirit, and then to present the fruit of his labour in a more winning way. The flippancy displayed in some of these drawings suggests that they are not taken in earnest. One finds it difficult to believe that as an architect he considers them seriously. The drawings, as such, seem too full of the "arty" and slick tricks of draughtsmanship of modern French magazine work to commend them over here. Something solider and more technical is required. And if the author evinces in his designs a nodding acquaintance with the atmosphere of the German modern movement, it cannot be said that he does it justice. No serious Teutonic architect would ever be guilty of such "enfantillages" as the shower baths

which Mr. Mallet-Stevens insists are entrances to the theatre below, and the cubism grafted on the façade of the cinema (on the preceding page) would find but scanty favour even in those inviting by-streets of Vienna or Münich where such things do sometimes show up under a bolder and happier disguise.

It is rather a thankless task to have to review a portfolio of designs adversely, but, when all is said and done, the reviewer has certain definite duties to perform to the public, and it is not one of them to encourage the propagation of such "new" ideas.

The Tenth International Congress of Architects

THE formal opening of the Tenth International Congress of Architects took place on Monday of last week in the hall of the Brussels Academy. M. Jean de Win was in the chair, and MM. Charles Girault, of the French Institute, and Caluwaert were respectively honorary president and vice-president. King Albert was represented, and delegates from eleven countries were present.

After opening the conference M. de Win introduced M. Girault, who welcomed the delegates and outlined the programme of the Congress. He concluded by saying that since Belgium had been chosen as the scene of friendly intercourse among those engaged in constructional work, the Brussels Congress could not fail to be crowned with success.

M. J. B. de Win expressed his gratitude to the King for allowing himself to be represented by General de Moor. He then proceeded to discuss the function of the architect, both as craftsman and as apostle of beauty. He said that the domain of the architect was almost unlimited, including both the workman's cottage and the palace, and he would continue to inculcate to a still greater extent a universal taste for simplicity and beauty.

M. Monaert, secretary to the Congress, traced its history from the first session which should have taken place in St. Petersburg in 1915. He paid tribute to M. Caluwaert, the inspiring genius of the organizing committee, and said he was the first to be convinced that artistic isolation was no longer possible. The war had opened wider horizons, and had upset old convictions. It was important to collect and tabulate the results of this wealth of new influences, of unprecedented developments.

M. Arthur Daxhelet, speaking for the Director-General of Science and Art, said that he was paying particular attention to the problem of houses suitable for the peculiar needs of the life of the period. It was in this way that architecture reflected the characteristics of a race and of a country. It must be adapted to daily necessities of life and thus become a social matter. M. Daxhelet then discussed the evolution of the working-class dwelling, and dwelt on the desire of designers to bring beauty into the daily life of the masses. Delegates from the following countries then spoke: England, Denmark, Spain, United States of America, France, Holland, Japan, Mexico, Luxemburg, Russia, Poland, Sweden, Switzerland, Uruguay.

Mr. Edward Warren, who, together with Mr. John Slater, represented the R.I.B.A., acknowledged the welcome given to the delegates, and expressed their cordial co-operation in the International Congress just inaugurated. He begged them to accept an expression of warm sympathy with the Société Centrale d'Architecture de Belgique, and for his own part wished to express his personal pleasure in being present in Brussels and meeting the president and members of the Congress.

He concluded by conveying on behalf of Mr. Paul Waterhouse his regret for his unavoidable absence, and his best wishes for the success of the Brussels Congress.

Discussing the photographs of American architecture now being exhibited in Brussels, "L'Independence Belge" says: All the work is powerful, often well-balanced, and it is always daring. It does not carry the hall-mark of originality, neither does it reveal any particular sensitiveness in its creators. American architects are constructional engineers rather than artists.

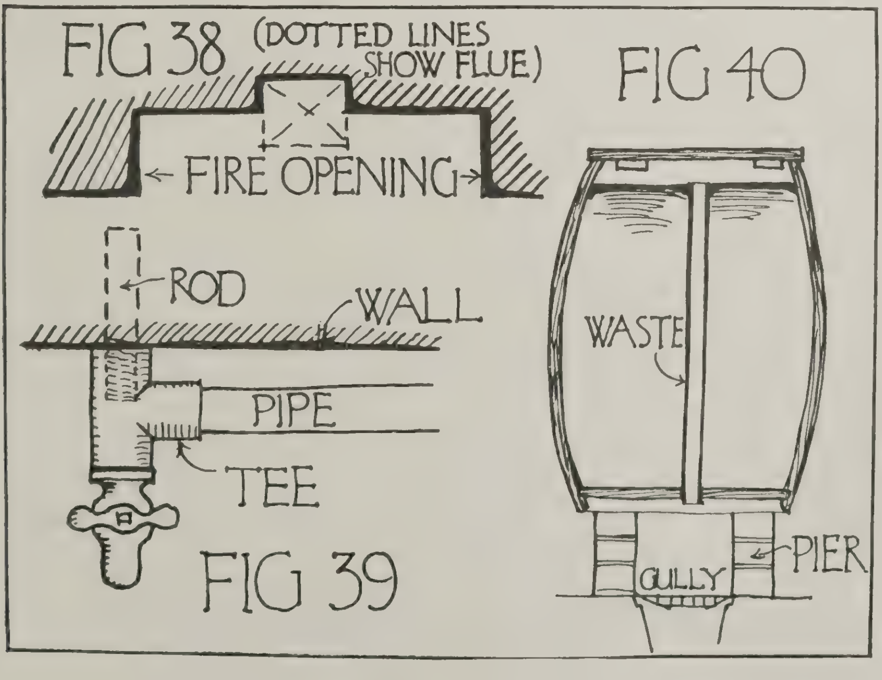
They are determined, also, in their boldness, but not often logical. Otherwise they would hardly design a school playground in the style of a mediæval cloister, a bank entrance like the portal of a Doric temple, or a station hall that might be taken for Roman baths.

Everything about this school of building seems abnormal as regards its æsthetic principles, but amazes and attracts by its size and solidity. Often indeed, the spectator is, as it were, challenged. . . But is there not a lesson for us, conservative and timid that we are, in these wonderful buildings, sometimes sheerly magnificent, always expressive of the personality of the most industrious race on earth ?

Little Things that Matter. XIV—Miscellaneous

By EDWIN GUNN, A.R.I.B.A.

Dog grates, hob grates and smoky chimneys.—It is sometimes necessary to fix grates of one or other of the above types, which although not conforming to the most approved modern principles in efficiency, are desired for their intrinsic beauty. In such cases that horror, the smoky chimney, is greatly to be feared; the cause being not so much "down-draught" in the generally accepted sense, but lack of quick definition in the initial momentum of the ascending hot air immediately above the fire. If a vertical chase, 4½ in. deep, and, say, 14 in. wide, is formed from the level of the fire back well into the gathering of the flue, the chance of a good draught will be greatly increased. I have cured existing smoky chimneys merely by forming such a chase by building up the angles of the opening from the hob level. See Fig. 38.



Fixing bibcocks over sinks.—The neatest and most effective way I know of fixing the hot and cold taps to iron barrel over the ordinary scullery sink is to use a tee instead of an elbow next the tap. The backward-looking arm of the tee is plugged by a 4 in. length of ¾ in. solid rod screwed in and pinned in cement to the brickwork, the shoulder formed by the greater diameter of the tee lying against the wall face. This makes a perfectly rigid job, and is very much neater than any arrangement of clips or holderbats. See Fig. 39.

Overflow from rain-water butt.—The customary methods of arranging this necessary adjunct are not wholly satisfactory. They are (1) a hole about 2 in. below the top of the butt, through which the water dribbles down the outside and finds its way (or perhaps not) into the drain below, and (2) a length of lead pipe down the side of the butt to direct the water to the drain. A better arrangement is an internal standing-waste, consisting of a length of iron barrel fitting in a hole bored in the bottom of the butt. This is invisible, and provides a means of emptying the barrel for periodical cleansing, merely by the removal of the waste pipe. See Fig. 40.

The Erection of Large Steel Towers

FREQUENTLY the erection of large steel structures calls for the exercise of very considerable ingenuity and skill on the part of the engineers responsible for the work. Often, indeed, the problem necessitates the employment of tackle of a costly and elaborate character that has been devised specially for the purpose.

Of more than usual interest is the solution found for an erection problem in connection with several large steel towers built some months ago in the South of England to the order of the British War Department, by Messrs. Braithwaite & Co. (Engineers), Ltd., Victoria Street, Westminster, S.W.1. For obvious reasons the purpose and exact location of these towers cannot be disclosed, but it is sufficient to state that the larger towers of the series are about 210 ft. in height, and weigh 40 tons apiece. Each tower is made up of four legs braced on all four sides, and fitted with internal diagonal bracing at intervals, all riveted together and secured to a massive concrete foundation by holding-down bolts. As these towers have to resist severe lateral pulls at varying distances from the top, they are further secured or stayed by guys of steel wire cables provided with adjusting gear.

In towers of this size and height it is customary to commence erection from the base, hoisting each section into position and riveting up each stage as the erection proceeds. This piecemeal method naturally is somewhat slow, and owing to the height, the risks to the workmen increase. Necessarily the workmanship tends to deteriorate as the distance from the ground increases. As first-class workmanship was essential and speedy erection desirable, eventually it was decided by the constructional engineers to assemble and to rivet up the towers complete on the ground and to lift each completed structure in one piece.

A small scale model of the towers and appliances first was made by the engineers at their works to demonstrate the practicability of this scheme of erection. This being accomplished, an accurate calculation of the position of the centre of gravity of a tower was made, to determine the best position for the trunnion or lifting point which was situated some distance above the actual centre of gravity so that the base end was heavier than the upper end. The trunnion consisted of a 5 in. diameter shaft passing through the tower, while the bay in which the trunnion was situated was strengthened temporarily by means of heavy bars and bracings.

A preliminary test was made at the makers' works, by lifting from the trunnion a tower that had been assembled temporarily in a horizontal position. This test removed any doubt as to the danger of excessive deflection of the upper end, or that any undue distortion or over-stressing of members would occur during lifting. The tower was assembled and riveted up complete in a horizontal position across the foundations, with the help of a steam locomotive crane.

The base of the tower was provided at the site with two wheels running in channel guides, to enable the base to move forward towards the derricks as the tower was lifted. The actual lifting was done by means of steam winches and two steel lattice derricks, these being part of the stock equipment of the engineers. These derricks are 104 ft. long and are capable of safely lifting a load of 24 tons each. The lifting tackle consisted of heavy blocks and wire ropes, the ropes being led to the two steam winches, which were situated behind the base end of the tower. The illustration on the opposite page shows one of the towers being raised.

We understand that the whole operation of raising each tower occupied a period of thirty minutes only, and was completed according to programme without a hitch. On reaching the vertical position, the whole weight of 40 tons was carried by the two derrick poles, the base being allowed to rise clear of the foundations. After the removal of the guide wheels, the tower was lowered gently over the holding-down bolts into its final position and bolted down. Subsequently the tackle and derrick were dismantled, preparatory to erecting the next tower.

The above particulars are from "Steel Structures," by the courtesy of whose publishers and that of Messrs. Braithwaite & Co. (Engineers), Ltd., the illustration on the opposite page is reproduced.

Book Reviews

Experimental Cottages

Under the title "Experimental Cottages" the Department of Scientific and Industrial Research have published a report, prepared by Mr. W. R. Jaggard, F.R.I.B.A., on the work of the department at Amesbury, Wilts, where experimental cottages were erected to test various methods of building with local materials and such new construction of floors, roofing, etc., as might be thought promising. When one pays five shillings for a technical report, one at least expects it to be authoritative—but in a prefatory note we are calmly told that "In publishing the report, the department expresses no opinion on the success or failure of any of the experimental features described, and does not accept responsibility for any opinions expressed." That is indeed cautious, but if the department has a little lost its nerve since it first embarked on its remarkable experiments it is scarcely to be wondered at.

Mr. Jaggard, the department's "Architectural Consultant," is named as (with the "Technical Officers") "responsible for the design of the cottages and their various experimental features." And he is also the author of the report.

Mr. Jaggard has clearly served his chiefs zealously, and has rendered his account of his stewardship as dispassionately as he can, but it is not in human nature to be vigilantly just and critical when it is our own actions that are up for trial before us. We become very merciful judges and see what we want to see. "Seek and ye shall find" is a terribly true saying that all investigators and experimenters should read as a solemn warning rather than as encouragement. It is unreasonable to blame an experiment for being a failure, as any operation assured of success is clearly no experiment.

One is apt to grow a little weary of a demonstrator who will insist on carrying out a tedious series of rather pretentious experiments to prove to us what we knew already, i.e., that certain materials used in certain ways will entail, if not indeed certain failure, at any rate poor results. Such success as the department has had appears to have been in its least experimental and most nearly normal constructions—whereby the practical excellence of traditional methods is confirmed and the wisdom of our ancestors vindicated. The report is embellished with nearly a hundred admirable diagrams and photographs, and it seems ungrateful to say that they are mostly quite unnecessary as illustrating either what is valueless or merely platitudinous in building construction or design. That the department has contributed nothing to the sum of our building knowledge is not for one moment suggested—we only wish that it had achieved more and written less.

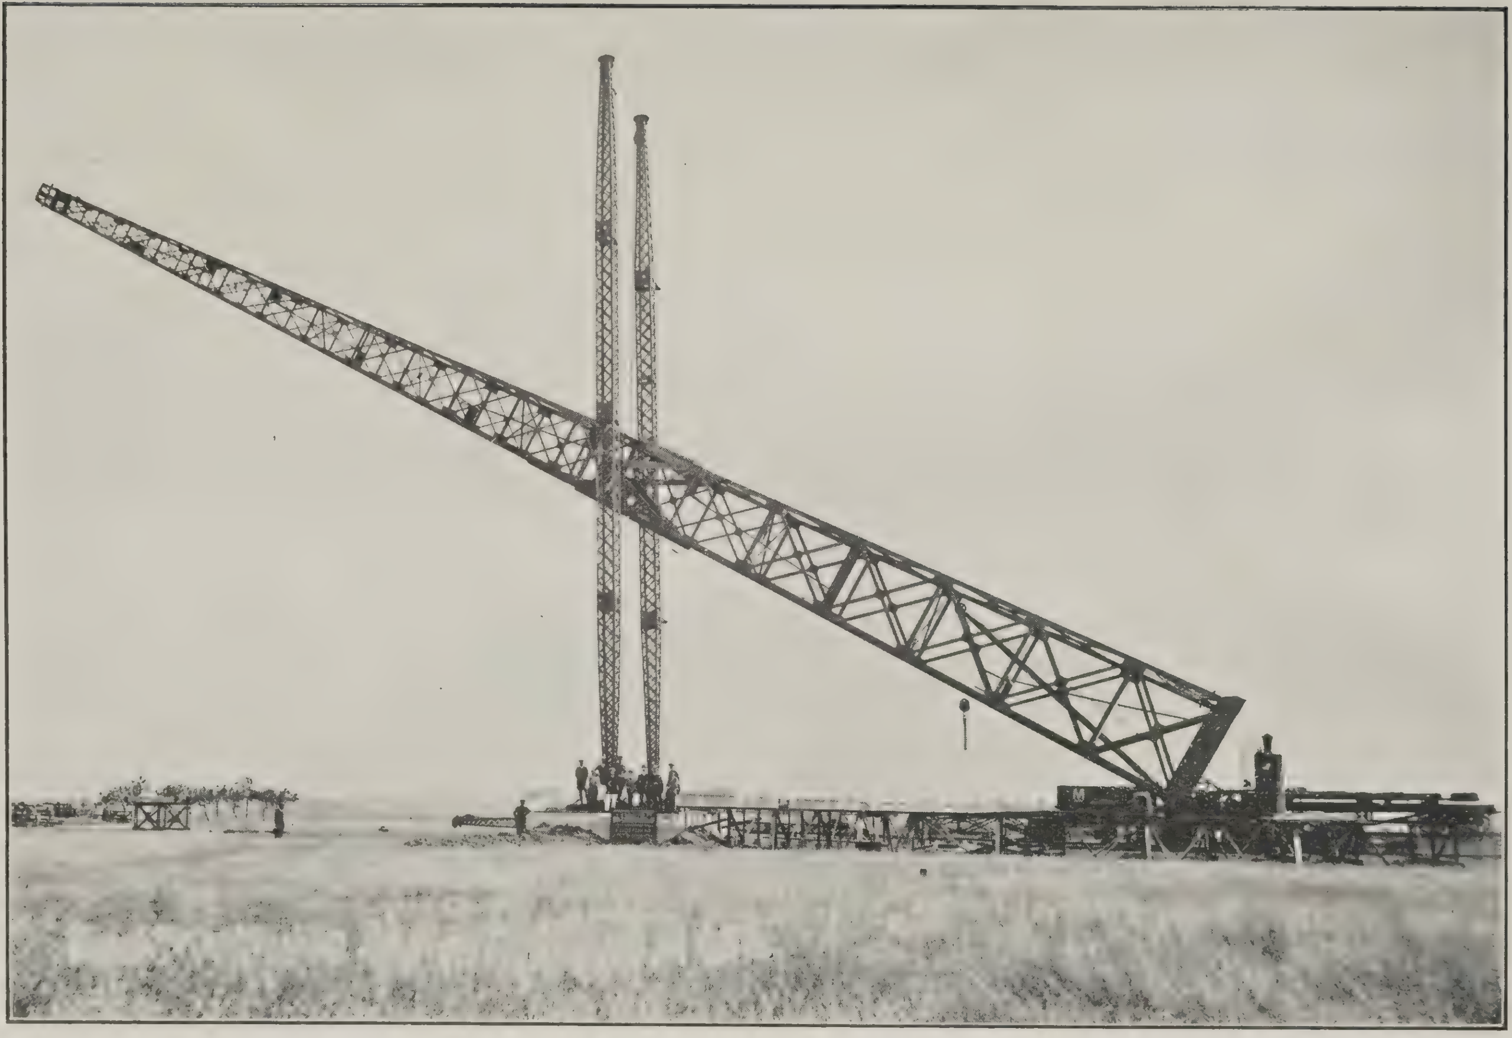
A single extract will serve to show the uneven quality of the report :—

"In most hollow walls, the outer half-brick wall is laid in stretching bond, and produces a somewhat monotonous effect. By selecting a number of 'flared' headers and using these as half bats in the wall, and by making no attempt to select facing bricks of uniform colour, a very pleasing texture was obtained. The effect was still further enhanced by using bright red bricks for the quoins and joggled brick lintels of the window openings.

"The window jambs were finished square without rebates, and were bonded solid with a vertical slate damp-proof course at the joint of the external wall with the inner wall. The two walls were tied together with galvanised iron wall-ties, laid zig-zag at 3 ft. centres on every fourth course for the ground floor, and at 4 ft. 6 in. centres in every third course for the upper floor walls.

"The window heads were formed with bricks on end, the upper part of the frog being cut away, the margins carefully jointed in 3 to 1 cement mortar, and the whole lintel grouted with thin cement grout. Pre-cast concrete lintels were used internally to the window openings, and the woodwork was protected with 4 lb. sheet lead aprons carried over the tops of the brick lintels (*see* detail, Fig. 37).

"The internal walls were built of brick in cement mortar, and were all either



RAISING A LARGE STEEL TOWER BY MEANS OF STEAM WINCHES AND STEEL LATTICE DERRICKS.

(See article on opposite page.)

4½ in. or 3 in. in thickness. The chimney breasts are gathered together into one stack, containing four flues and surrounded with 9-in. brick walls, instead of the usual 4½-in. walls, which are often the cause of smoky chimneys. . . .

"The actual time occupied by building brickwork was about nine weeks.

"In the building of this brickwork it was desired to show that it was not necessary to obtain special and expensive bricks for facings, since by careful watching and instructions, a pleasing effect could be obtained at little, if any, extra cost, by a reasonable selection from the ordinary stack of bricks. The appearance of the cottage has, it is hoped, been still further improved by the arrangement and treatment of the doors and windows, together with the eaves and roof.

"An analysis of the costs of the various types of walling, as carried out under the conditions prevailing at Amesbury, has produced the following interesting results. The comparison is made by establishing a unit cost, represented by the figure 10, for the brickwork of the 'control' cottage No. 14."

Comparative Costs of various Types of Walling per Unit Cube.

—	Materials.	No. of Cottage.	Costs taken as 1
1	Brickwork in mortar with 2-in. cavity and galvanized iron wall ties—11-in. work ..	14	10.0
2	Chalk and cement, 20 to 1, rammed between shuttering reinforced with wire netting every 3 ft. in height and rendered externally with 1 coat of lime slurry—15 in. work	10	8.1
3	Solid concrete, 8 to 1, rammed between shuttering — 9 in. work	12	8.095
4	Chalk and cement blocks, 12 to 1, with 2-in. cavity, and galvanized iron wall ties and rendered externally with one coat of slurry—10-in. work..	13	6.19
5	7-in. concrete blocks, external face rendered and set in cement	11	6.19
6	Wet chalk — "Winterslow" method—15 in. work ..	9	6.19
7	Rammed chalk pisé rendered externally—15-in. work ..	19	6.19
8	Do. do. do.	5, Ratfyn	5.95
9	Do. do. do.	26 and 27	5.476
10	Chalk and straw rammed between shuttering — 15-in. work	4, Ratfyn	5.0

The analysis of comparative costs is interesting enough and of some practical value, but is what goes before it really worth printing in a departmental report that is presumably chiefly addressed to architects ?

But perhaps its appeal is intended to be a "popular" one, as—unless it is a beginning of a "Brighter Blue Books" campaign—the following passage would seem to indicate : "More success attended our efforts in Wiltshire, and some exceedingly useful and suggestive information was obtained from Mr. Bundy an old 'Mud Waller,' who is now enjoying a well-earned leisure as 'Mine host' of the 'Plume of Feathers' at Shrewton." We had hopes that we should turn over and find a snapshot of this venerable artisan in a smock-frock surrounded by his descendants to the third generation, with perhaps a stanza from Gray's Elegy below it, but we can find no further reference to the obliging Mr. Bundy. It is a tantalizing glimpse—but perhaps the Scientific and Industrial Research Department decided that "Village Vignettes" hardly came within its terms of reference, and that any further gossip about even so engaging a character must be sternly excluded from a Government publication if only in deference to the taxpayer. CLOUGH WILLIAMS-ELLIS.

Experimental Cottages. A Report on the Work of the Department of Scientific and Industrial Research. By W. R. Jaggard, F.R.I.B.A. Price 5/- net. Published by H.M. Stationery Office.

Steam Heating

The demand for steam heat in institutions, business and industrial premises makes it essential that the architect and the heating engineer should become as fully acquainted with the subject as possible. Until the publication of this book practically no means were available for obtaining reliable information on the many different methods, such as steam, low pressure, vapour, vacuum, high pressure, reduced pressure, exhaust steam, which offer themselves for adoption. In this country the heating of water and cooking are the most popular uses to which steam is put, and the practical information put forward by Mr. Dye on these two important branches, together with the clear description of the method of calculating for cooking requirements—believed to be published for the first time—should alone make the book of great value. In heating water by steam there are some ingenious appliances and methods for getting special results. Over here the practice of steam heating is not developed to anything like the extent that it is in America and European States, largely because it is not favoured for domestic work. Mr. Dye, however, thinks it a matter for wonder that steam is not employed in warming places of worship. There are, he points out, two features requiring special consideration in such buildings, one being quick heating up from cold, the other being the effects of frost. He says that a steam heating apparatus becomes hot, and fully hot, long before a system of hot-water pipes and radiators, and except for the boiler a steam apparatus frees itself of water when cold. The book contains 212 pages, fully describing the general practice of steam heating, many useful hints on the method of calculating for radiating surface pipe sizes and boiler powers, and there are fifty-seven illustrations. The book should do much to promote the increased use of steam for heat whenever it can be employed with advantage.

Steam Heating. By Frederick W. Dye, Consulting Engineer, M.Inst. H. and V.E. Price 8s. 6d. net. E. and F. N. Spon, Ltd., 57 Haymarket, London, S.W. 1.

A Book about Sweden

Such is the title of a small volume, issued by the Swedish Traffic Association, of Stockholm, an organization whose principal object is to stimulate touring in Sweden. The book, however, covers a very much wider field than a guidebook of the predominant type. It provides an introduction to the history and politics, industrial conditions, scientific and literary activities and state of culture in general of the Swedish people, finishing up with an illustrated travellers' guide.

The main part of the book is divided into two chapters : "Economic Life and Industry," and "Through Sweden." In the first of these chapters the reader is made familiar with facts and figures relating to agriculture, forestry, and mining, with their adjuncts. Amongst the art industries, the manufactures of china and glassware, etched and engraved steel articles, etc., and the products of artistic handicraft are dealt with. The subjects are necessarily treated concisely, but the main object of the book is to encourage travelling to and in Sweden.

The chapter "Through Sweden" is treated more comprehensively, and the illustrations are more numerous. One finds that going to Sweden is both easy and comfortable, and that travelling in the country is exceptionally so. The reader is familiarized with the principal towns, the unique canal routes, and other features ; but besides this the book takes the reader to the wilds in Northern Sweden, which can be reached in comfort by rail. It is a characteristic of the book under review that it treats of many of these out-of-the-way places all over the country, and one gets a kaleidoscopic view of forest and field, river and lake, mountain and waterfall, in an almost bewildering variety. It must, however, be borne in mind that the walnut tree grows in the oak and beech region of the south, and that the country extends in a northerly direction to the region of the dwarf birch, which rises some six inches from the ground only. Hence this variety of landscape, of which a book can give a feeble idea only.

Cambridge Gate of Honour

During the recent restoration of the Gate of Honour of Gonville and Caius College, Cambridge, plaster casts were made of some of the more interesting details, and a set of these casts, twelve in number, has been presented to the Victoria and Albert Museum by the Master and Fellows of the College. This Gate, one of the most pleasing works of the early Renaissance in England, was erected in 1574, traditionally by an architect named Theodore Haveus, a native of Cleves, but more probably by Dr. Caius himself, who refounded the College and was responsible for the Court on to which the Gate of Honour opens.

The Restoration of Paisley Abbey

Sir Robert Lorimer, A.R.A., R.S.A., has been appointed architect for the restoration of Paisley Abbey. Ten years have elapsed since the present scheme of restoration was inaugurated, and during that time there have been many vicissitudes. The Chairman of Committee, Sir Chas. Bine Renshaw, Bart., the builder, Mr. Taylor, and the architect, Dr. P. MacGregor Chalmers, have all passed away, and operations on the fabric ceased under a Government order affecting the whole country, in January, 1918. Since that time all work has been in abeyance for, even when the Government order ceased to be effective, building costs were prohibitive. However, the committee will lose no time so soon as they are satisfied that their finances warrant them going on with the work. Sir Robert Lorimer's design was accepted in January last for the Paisley war memorial to be erected at the Cross. He has also carried out several church restoration schemes.

Correspondence

The International Theatre Exhibition

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—In your issue for August 16 you published an "autopsy" on The International Theatre Exhibition, but, in fact, this exhibition is not dead. On the contrary, it has started on a tour of the principal provincial cities, after which it is considered that its health will still be robust enough to allow of its crossing the Atlantic. This being so, may I have a few words on the still live topic ?

The writer of your obituary paragraph wishes to be taken seriously, I suppose, since he heads his causerie "Joking Apart," but I regret that he is not himself sufficiently serious when he complains that Mr. Gordon Craig's theory of the theatre was not anywhere explained at the exhibition, and suggests that it remains a secret in Mr. Craig's heart.

Mr. Craig's books on the theatre explain his theory clearly enough to those who will study them with as much patience as they have been written, and these books were all laid out on a table in the library at South Kensington Museum for the enlightenment of those who, joking apart, genuinely wished to learn. There were numerous notices calling attention to the availability of these and other writings.

In the opening chapter of "Towards a New Theatre," Mr. Craig gives a comprehensive view of the history of stage production, and remarks that three scenic methods have been used :—

The Architectural Open-air Scene.

The Architectural Indoor Scene of the Church stage.

The Indoor "Sceneries" aiming to imitate architecture and nature.

Mr. Craig's path has been steadily away from "Sceneries" towards the invention of yet another scene which shall fulfil the fundamental requirements for the enactment of the highest form of Drama, more fully than did the two great architectural scenes of the past, and which shall escape the weaknesses of "sceneries." His invention of the mobile screens, as shown in the three models at South Kensington, gave to me a sufficient hint of an instrument which is nothing in itself but which has infinite possibilities of use as a "part" of a dramatic presentation. A person seeing a musical instrument for the first time might well wonder at its form until music was drawn from it and he learned its purpose, and a visitor to the theatre exhibition with no grasp of Mr. Craig's writings would similarly fail to realize that this instrument of his is a thing to be played upon and that, moreover, as with a musical instrument, the performance will vary with the skill of the player. The function of this instrument, I imagine, is to move from shape to shape in accordance with the requirements of the action of the drama and without interruption of this action. The practical working of these screens was demonstrated in Mr. Craig's production of "Hamlet" at the Moscow Art Theatre, and but for the general "hold-up" of the war we should have seen their use in England ere now.

While your contributor imagines that Mr. Craig has become so *dematerialized* as to be "half-way to heaven," it is amusing to find Mr. St. John Ervine, in "The Observer" of the following Sunday, unhesitatingly assert that "There never was a man so obsessed by *materialism* in the theatre as Mr. Craig." These two critics cannot both be right. In my opinion they are both wrong. The first may well be reminded—or informed—that Mr. Craig spent some fifteen years in practice in the theatre before he began to theorize on its wider possibilities of expression, and he must be allowed to know what the problem of presenting a great play involves.

If more men of like courage and love of adventure would appear in the English theatre I should hope to see them convince even Mr. Ervine that the art of the theatre is the art of *presenting* a play (it may or may not involve the art of writing one), and it begins with the construction of a place perfectly adapted to this end ; it is necessarily rooted in the material, as is all art, but the spirit will inhabit the place when the material is mastered—not before.

L. K. S.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—The article by "Karsish"—"Joking Apart"—which appeared in your issue for August 16, provides a very unnecessary contrast to the helpful criticisms which you recently published of the International Theatre Exhibition.

In one sentence concerning this exhibition "Karsish" says that he finds Mr. Craig's designs "inexplicable," and in the next, contradicts himself by explaining that Mr. Craig is guilty of preciousness by "leaving everything to the imagination," and that, therefore, his designs involve "not the art of stage setting, but the art of explaining a theory" . . . how is it possible for anyone to criticize a thing which, to himself, is "inexplicable" ?

That your contributor should draw the attention of Messrs. Diaghlieff, Butt, Moss, and Cochran (I cannot recall any of their work being exhibited) to the problem of decorating stage-cloths, or rendering the floor of a stage inoffensive, is scarcely an intelligent suggestion. In your issue for July 12 you reproduced some designs in which this point is fully dealt with, and no doubt many of your readers have seen some of the decorative stage-cloths which Mr. Cochran uses in his productions.

Maybe I lack a sense of humour—I was never prepared for a series of comic criticisms in an architectural paper—but surely it is not desirable that men who devote their whole lives to the work of making the theatre a thing of beauty should be scoffed at by writers such as "Karsish."

DUNCAN MACPHERSON.

Sham Gothic

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Mr. Clutton Brock's address on "Sham Gothic," published in your issue for August 16, and the letters published subsequently, have greatly interested me. Will you, therefore, allow me space to give the views of an engineer-architect?

1. Not every town and village is fortunate enough to possess an ancient Gothic church.

2. Is there any style so adapted and inspiring to Christian devotion, of whatever school of thought it may be, as Gothic ?

We all make mistakes, even Gilbert Scott and Street did, but it is better to make mistakes than to revert to undevotional styles. Can genuine honest efforts be called sham ? If so, then it is quite as much a sham to copy the Classic orders in our public buildings. I fail to see why modern Gothic, with all its limitations and failings, should be called "sham." I admit that restoration work requires careful and reverent treatment, and, above all, the avoidance of incongruities. If Gothic is to be scrapped, then what is to take its place ?

Gothic is no mere fad of the clergy. It is the style of architecture that raises man's thoughts to higher things. In the words of Welby Pugin, "Why revert to dead Pagan styles, than to that which sprang up and grew with Christianity ?" While fully appreciating the use of Classic and Renaissance architecture for civic purposes, and while not denying that some fine buildings in those styles have been erected for Christian worship, yet in a sense of devotion there appears to be something lacking in them.

This is an age of engineering, iron, and concrete, an ugly one, perhaps, in some ways, but a progressive one in others, giving us many comforts and conveniences. But for worship an inspiring environment is needed, one that will lift the minds above the everyday rut. What is more impressive in Manchester than its Cathedral, or in Newcastle the magnificent Gothic church by Sir Gilbert Scott ?

Gothic should be used solely for religious and perhaps collegiate purposes. Adaptations for civic and domestic purposes are generally failures. Although the Gothic revival was led, in the early part of the nineteenth century, by Welby Pugin, a Roman Catholic, and Thomas Richman, a Quaker, two men of opposite extremes, the style draws men to worship, to whatever school of thought they may belong.

Why should engineering structures be necessarily ugly, though undoubtedly some are ? While in Durham I admired the noble viaduct of the N.E.Rly. There is something solid about it—a linking-up of civilization—and at the same time it is not ungraceful. Beyond it, on a rock, is set Durham Cathedral, a sermon in stone : "That, with all modern progress, man must look to higher things."

The Gothic revival brought many ludicrous shams and blunders, such as those of Horace Walpole and Wyatt, but even these faulty examples revived an interest in the past, and led to more useful research. In these days no earnest student undertaking research with the aid of literature and good examples, can be a total failure; true, he may make mistakes, but who does not make them some time or another?

Architecture, like the other arts, should convey its teaching. Classic architecture gives dignity and majesty to civic buildings, but in the environment of Gothic architecture good and noble lives have sprung up, and Gothic undoubtedly draws the mind of man nearer to the "Great Architect."

WALTER H. WHITAKER,
M.INST.M. & CY.E.

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—Mr. Hughes, in his letter published in your issue for August 30, contends that "the spirit that evolved the Gothic style is a more vital and inspiring one than the spirit, also appropriate to its own era, that evolved the Pagan style."

Surely the battle-cry of the Romanticists, that Gothic is Christian and Classic is Pagan, has been abandoned by now as being irrelevant to the true meaning of architecture. It was merely a coincidence that Gothic architecture was evolved during the greatest period of church building in Western Europe. This was a period of continual warfare, and the only people who had the time and means to build on a large scale were the Religious Orders.

For this reason Gothic architecture has come to be regarded as symbolical of Christianity. The spirit that evolved the actual style or method of building was almost entirely utilitarian. The great engineering skill of the Romans had been lost, and the art of building had to start again from the beginning, using for its materials small stones. The requirements were buildings which should be suitably planned and lighted for the services of the Christian Church, and which should also be fireproof in order to protect the greatest source of revenue, namely, the relics. This last requirement is very important, since from it arose the vault, itself the origin of the pointed arch and the buttress. Æsthetic effect was largely accidental, and the detail usually crude. Sentiment accounts for a large part of the appreciation of Mediæval Architecture. The beauty of a Gothic church can be compared to that of the Forth Bridge or of the express locomotive, namely, the successful solution of a mechanical problem.

Provided, as we are at the present day with an intimate knowledge of every period of architecture, we can learn something from each and apply the best in them without mere slavish imitation. From the Egyptians we can learn the beauty of massive simplicity; from the Greeks refinement, both of proportion and of detail; from the Romans the value of symmetrical planning and of vistas; and from the Renaissance, and more especially Baroque, the fact that architecture, while using the same methods of construction and the same language, can be independent of these in its search for beauty.

Architecture, as the mistress art, can stand alone unfettered by literary criticism which calls in religion, ethics, and mechanics to invent standards which have no connection with architecture as an art.

CANTAB.

Registration

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I am informed that in one of the States in Australia electricians have to be registered. Those engaged in this trade as a means of livelihood are given a third-class certificate and have to qualify by examination for the higher grades. Apprentices just entering the trade have to pass various set examinations before being registered. Could not the registration of architects be treated on similar lines and a Bill framed prohibiting councils from passing plans unless drawn by a registered architect?

W. LEVER.

The Replanning of Piccadilly Circus

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—As a provincial architect who loves London I was very interested in Mr. W. Harding Thompson's article on the reconstruction of Piccadilly Circus. In all the schemes I've seen they all retain the site of The County Fire Office (possibly for some reason unknown to me). When one sees the amount of traffic which enters and leaves Glasshouse Street and Sherwood Street one would think that this is a part which requires some alteration.

I enclose you a sketch plan (reproduced), frankly based on Mr. Norman Shaw's plan, of how it might be altered by taking away the fire offices and giving them another site as shown. The whole was just a fleeting impression which occurred to me while looking at the plans which accompany the article.

JOHN W. BOYD.

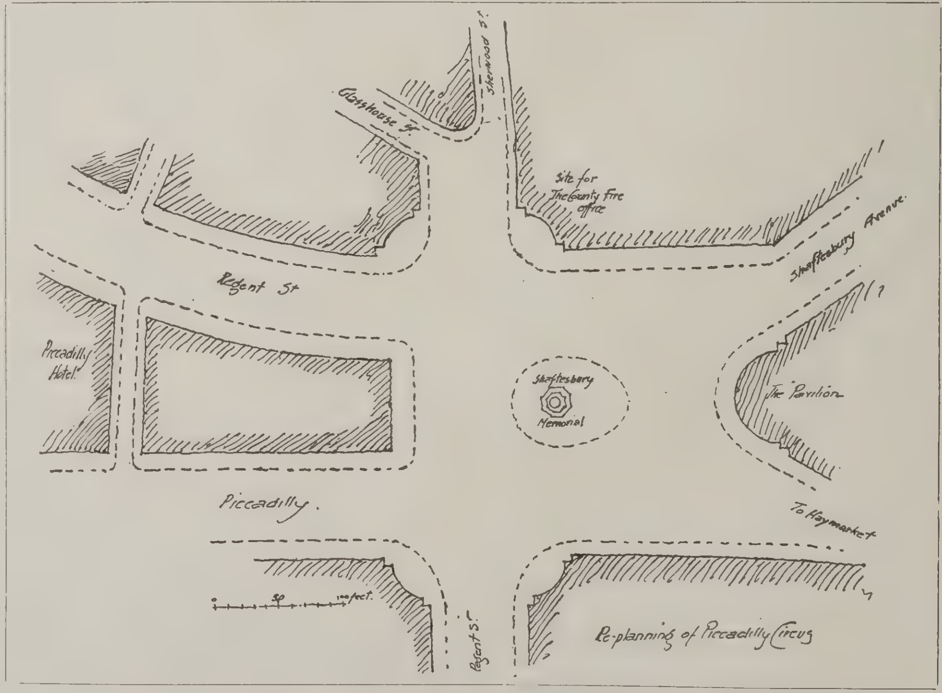
Courses in Architecture and Allied Subjects

Royal Sanitary Institute.

The courses of lectures and demonstrations of the Royal Sanitary Institute for sanitary officers commence on September 27. The course comprises the subjects scheduled for the examinations of the Institute and the Sanitary Inspectors' Examination Board, formed by the Institute and other bodies. Inspections and demonstrations are arranged, and include visits to public and private works illustrative of sanitary practice and administration. The lecturers include Messrs. Alan E. Munby, M.A., F.R.I.B.A., W. C. Tyndale, O.B.E., M.Inst.C.E., Edward Willis, M.Inst.C.E., F.S.I., A. J. Martin, M.Inst.C.E., F.G.S., Wm. Matthews, M.Inst.C.E., and W. R. Hicks, Assoc. M.Inst.C.E. A booklet may be obtained from Mr. E. White Wallis, F.S.S., 90 Buckingham Palace Road, S.W.1.

L.C.C. School of Arts and Crafts.

The Schools of Architecture and Building Crafts, of Painted and Sculptured Architectural Decoration, of Stained Glass and of Furniture at the London County Council School of Arts and Crafts, reopen on September 25. Mr. F. V. Burridge, R.E., is the principal of the school, and the educational staff is as follows: Architecture and building crafts, Messrs. E. S. Andrews, B.Sc., S. B. K. Caulfield, F.R.I.B.A., F. H. Mansfield, L.R.I.B.A., and B. Oliver, F.R.I.B.A.; painted and sculptured architectural decoration, Messrs. W. Askew, Richard Garbe, J. A. Grant, A. S. Hartrick, R.W.S., B. Meninsky, T. H. Paget, Noel Rooke, A.R.E., Alfred Turner, Mrs. M. Bacon, Miss M. Hindshaw, and Miss E. M. Willis, A.R.M.S.; stained glass, Messrs. Karl Parsons, V. J. Drury, and E. L. Armitage; furniture, Messrs. C. Spooner, F.R.I.B.A., J. H. Brandt, J. C. Chamberlain, E. L. Minihane, S. H. Owen, F. J. Rutherford, and F. Stuttig. A prospectus and time table of the courses may be obtained from the secretary, Mr. C. J. H. Tapping, B.A., Southampton Row, S.W.1.



MR. BOYD'S SCHEME FOR THE REPLANNING OF PICCADILLY CIRCUS.

Obituary

Mr. Robert Harvey Adams.

We regret to record the death of Mr. Robert Harvey Adams, one of the managing principals of the firm of Robert Adams, 3 and 5 Emerald Street, Holborn, W.C. For many years he had taken an important part in the business to which, with his brother, Mr. Sidney J. Adams, and the late Mr. Henry E. Adams (who died in France in 1916, from wounds received in action), he succeeded in 1914, on the death of their father the founder of the firm. He will be missed by a wide circle of friends who valued him for his upright, genial, and generous personality. Endowed in an eminent degree with those talents for mechanical invention for which his late father was so justly reputed, and thorough in all he undertook, he gave invaluable aid in carrying on the traditions of the firm for work of high quality, and in the development of new ideas and improvements in design and methods of manufacture. The recent types of "Victor" door springs, window fittings, panic bolts, and other specialities of the firm, demonstrate his technical ability and resource. He was fifty years of age, and leaves a widow and four children.

Among the recent contracts carried out under his supervision may be mentioned the bronze balustrade for the new Public Offices, Dublin, under Sir Aston Webb, P.R.A. and Sir Thomas Deane, architects. We reproduce an illustration of a portion of this balustrade, which stands among the best examples of its kind in its effective proportions and design, and fine craftsmanship.

The present managing principal of the firm is Mr. Sidney J. Adams, who has been for many years associated in its direction, and who will be assisted by his nephew, Mr. S. F. Adams, the son of the late partner.

The funeral service was held at Brixton, and at Streatham Park Cemetery, the Rev. John Darlington, D.D., M.A., of St. Mark's Church, Brixton, officiating, and was attended by a numerous company, including the employees of the firm, some of whom, of many years' service, acted as bearers for their late respected chief. The Rev. Dr. Darlington said that the firm had been like one large family, as the attendance there that day bore witness. It was a noble and splendid record that there had not been a strike or lock-out during the history of the firm—over fifty years.

Mr. Arthur Harrison.

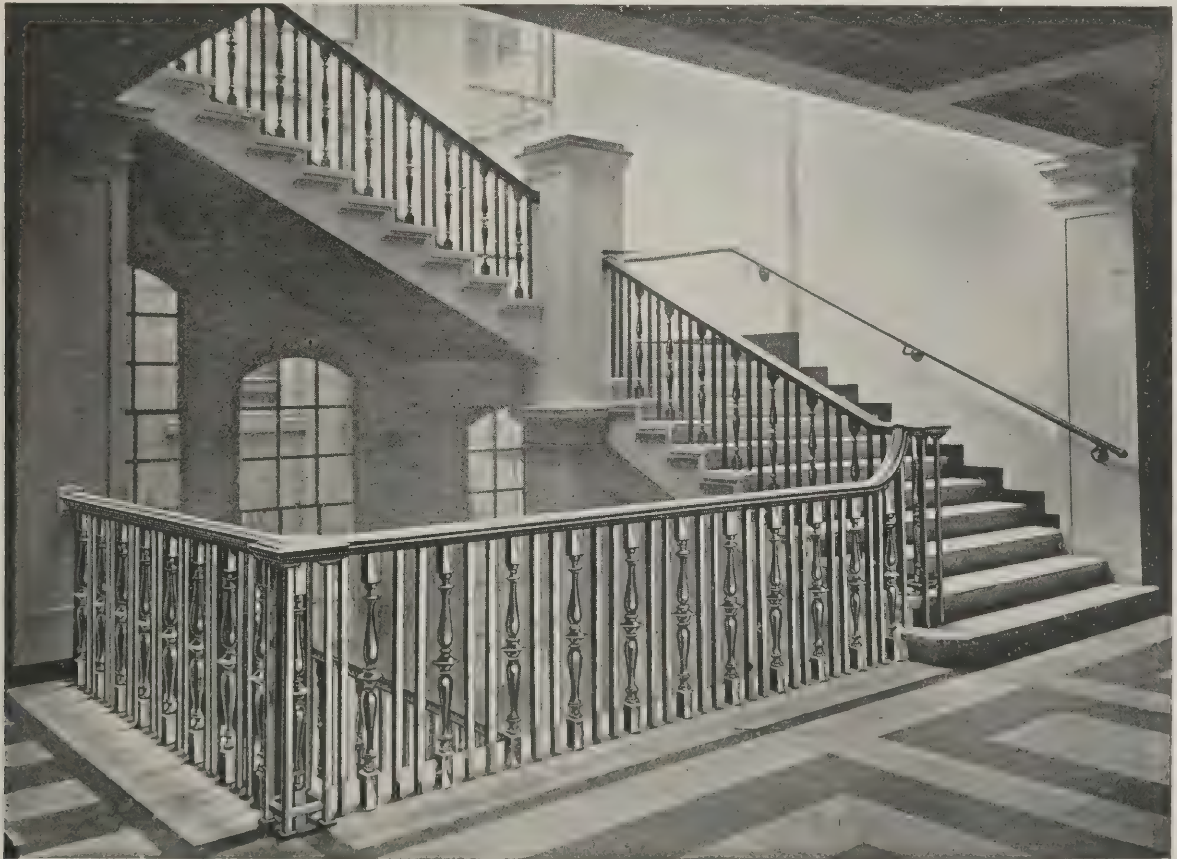
We regret to record the death of Mr. Arthur Harrison, F.R.I.B.A., a member of the firm of Messrs. Harrison and Cox of Birmingham. Born in Nottingham in 1861, he commenced practice on his own account in 1888, and was president of the Birmingham Architectural Association from 1892 to 1894. During his career Mr. Harrison was responsible for many municipal buildings, schools, and electrical sub-stations, and for much ecclesiastical and domestic work. Among his most important works were the Moseley Road Fire Station, and the Nechells Baths, Birmingham; elementary schools at Greet, Hall Green and Yardley; Wesleyan Church and Schools at Saltley; the Sparkhall Primitive Methodist Church Schools and Lecture Hall; the Sparkhill Institute and Wesleyan Schools; extensions to the National Schools at Bosbury and at Upton Bishop, Herefordshire; and the Town Hall at Newmilns, Ayrshire.

Mr. C. A. Hemingway.

We regret to record the death at Teddington of Mr. Charles Arthur Hemingway, one of the early pioneers of electrical contracting. In the early days of his career he was associated with Messrs. Drake & Gorham, and afterwards, with a partner, he commenced business under the style of Hemingway & Pritt, at Victoria Street, S.W., and Richmond. At a later stage he joined the staff of the General Electric Co., Ltd., where his ripe experience and genial personality made him a valued employee and a respected colleague.

Mr. A. R. Calvert.

We regret to record the death of Mr. A. R. Calvert, of Nottingham. Mr. Calvert was a son of a late Vicar of Huddersfield, and he had been in practice in Nottingham for most of his adult life. He was the architect of the Constitutional Club, in Market Street, of which institution he was secretary for many years.



THE BRONZE BALUSTRADE IN THE NEW PUBLIC OFFICES, DUBLIN.

The Week's News

Cardiff Castle.

The castle wall is being demolished rapidly, and is to be reconstructed along the line of the old Roman wall.

£40,000 Wesleyan Hall.

Foundation stones of Blackburn's new Wesleyan Hall, to cost £40,000, have been laid.

New Municipal Buildings for Gourock.

Plans have been passed for the erection of municipal buildings at Gourock. An early commencement is to be made with the work.

£20,000 for Railway Viaducts.

Contracts for over £20,000 for the construction of viaducts, bridges, and platforms for the Torrington-Halwill railway are reported to have been signed.

International Housing Congress.

Mr. G. Topham Forrest, F.R.I.B.A., has been appointed to represent the R.I.B.A. at the International Housing Congress, Rome, from September 21 to 26.

Sixteenth Century Mansion Destroyed.

Greatford Hall, near Stamford, has been totally destroyed by fire. The mansion was built in 1504 by John Fitzwilliam, an ancestor of the present owner, Major C. C. L. Fitzwilliam.

Dover Improvements.

The Dover Corporation has decided to complete the road along the face of the cliffs between the Castle and St. Margaret's Bay, at a cost of £43,000, to provide work for the local unemployed.

St. Peter's Church Site, Liverpool.

The Ministry of Health has decided to hold a public inquiry into the Liverpool Corporation's proposal to purchase the site of St. Peter's Church from the Ecclesiastical Commissioners for £235,000.

St. Nicholas Cole Abbey.

The Church of St. Nicholas Cole Abbey, in Queen Victoria Street, the first rebuilt after the Great Fire, has been reopened after redecoration and repair costing nearly £500.

Peterborough Cathedral in Danger.

It has been discovered that the north-east wall of the chancel aisle of Peterborough Cathedral has moved one foot out of the perpendicular. Immediate buttressing of the wall has become imperative to save this part of the fabric from ruin.

Future of Devonshire House.

In a letter to "The Times" Mr. Beresford Chancellor suggests that Devonshire House should be turned into an "International" club. The forecourt could be paved and made into an open-air restaurant.

Housing at Llanelly.

Llanelly Corporation have decided to apply to the Ministry of Health for sanction to proceed immediately with the erection of a further 200 houses. Officially compiled figures show that to meet fully the needs of applicants 847 houses are required.

Selby Abbey.

Somewhat serious cracks are making their appearance in the south transept of Selby Abbey Church. It is feared that the foundations of cement are giving way.

Housing at Tredegar.

Tredegar Urban District Council have decided to apply to the Ministry of Health for permission to erect more houses. The Council's existing scheme comprises one hundred houses of varying types, about three-quarters of which have been completed and are occupied.

Housing at Wrexham.

Wrexham Town Council have accepted a tender at £379 per house, including the construction of the main drains, for twenty-two additional dwellings to complete the Acton Park housing scheme. The cost of previous houses on the same site averaged £1,000.

Tenement Houses for Glasgow.

Glasgow Corporation Housing Department are undertaking the erection of 102 tenement houses in Polmadie district, the estimate being £29,162. The cost is, for two-apartment houses, £285 each, and for three-apartment houses, £305.

York Racecourse.

York Corporation has approved a plan submitted by the York Race Committee showing the proposed improvements in the enclosure of the racecourse on Knavesmire with the elevation of the proposed buildings. The buildings will be constructed of a grit stone of a brown tint.

Building at Dundee.

At Dundee plans have been approved for the construction of houses, warehouse premises, workshops, etc. Further work is to be undertaken at the new Caird Hall, including the construction of two bays for market purposes at an outlay of £6,500. The east wing is also to be built, and plans are in hand.

A War Memorial at Nottingham.

A memorial is being erected in Nottingham by the parents of Captain Albert Ball, V.C., to the memory of their son. It takes the form of eight homes for mothers or widows of men who fell in the war, and the architect, Lieut.-Col. A. W. Brewill, D.S.O., has equipped them with every modern labour-saving convenience.

Neath War Memorial.

The Gnoll mansion and estate near Neath, the home of the late Sir Evan Thomas and the birthplace of Admiral Sir Hugh Evan Thomas, is to be purchased by the Neath Town Council for approximately £25,000 as a war memorial for the town. The mansion will probably be converted into a hospital or a technical school, and the estate will provide the corporation with a large amount of land for building purposes.

New London Air Station.

Strong representations are being made to the Civil Aviation Department of the Air Ministry that London should have an air terminus much nearer to the heart of the metropolis than is the present air station at Croydon. The question has been referred to a committee, who will, it is understood, proceed on the basis of considering future possible needs rather than immediate requirements.

The Drawings of William Walcot.

A lecture on the drawings by William Walcot, A.R.E., F.R.I.B.A., of the great temples of antiquity and some Roman compositions will be given by Miss Atkins at the Architectural Association, 34 Bedford Square, W.C., on Thursday, September 14, 1922, at 4 p.m. The lecture will be illustrated by lantern slides.

Jersey Housing Scheme.

The States of Jersey have considered an offer from Sir Jesse Boot to build fourteen houses on a plot of land where the States have already erected a certain number of huts to relieve the housing problem. A portion of the land will be reserved for a children's playground. It has been decided that the land required should be leased to Sir Jesse Boot at a nominal rent, and that a letter of thanks should be sent to him.

Historic House Sold.

Belhus Park, Aveley, Essex, the Tudor mansion and estate of Sir Thomas Barrett-Lennard, Bt., has been sold by him to the Thames Land Company, of which Lord Cowdray is the head. The house has been the residence of the family since 1346. Queen Elizabeth stayed there before reviewing the troops at Tilbury. Her bedroom remains adorned with hangings of blue and gold brocade. There is a complete collection of family portraits, including examples by Holbein, Vandyke, Lely, Dahl, and Opee. The furniture is to be sold next spring.

"New Village Communities in Wales."

Mr. E. Hall Williams, of Rhiwbina, Cardiff, secretary of the Welsh Town-Planning Trust and several Welsh garden villages, has read an interesting paper on "New Village Communities in Wales" before the Welsh School of Social Service, held at Llandrindod Wells. Mr. Williams explained that his object was to interest the members of the school in the progress of co-operative garden villages. He mentioned that in one of the Welsh villages with which he was connected houses were now being built at below half the cost incurred in building the same type of house during the time of the boom period of 1919-20.

St. Paul's Cathedral.

The Skinners' Company have voted a grant of £300 towards the Cathedral Preservation Fund. Among other recent contributors have been: Hoare's Bank, £250; Williams Deacons' Bank, and Messrs. Whitbread & Co., 100 guineas each; the Union Bank of Australia, St. John del Rey Mining Company, and Mr. E. S. Hamilton, £100 each; and Messrs. Sharp & Perrin, 50 guineas. Further contributions are urgently needed, and should be sent either to the Treasurer (Canon Alexander) at the Cathedral, or to the Receiver (Mr. H. T. A. Dashwood) at the Chapter House, St. Paul's, E.C.4. Cheques may be crossed "Hoare's Bank."

R.I.B.A. Conferences

In view of the fact that the conferences held by the R.I.B.A. at Liverpool and Cardiff are but the first two of a long series, it may not be unwise to review the position, to endeavour to see clearly what are the objects of these conferences, and by what means these objects may best be achieved. It is admitted on all hands that the conferences already held were highly successful, reflecting great credit on those who worked so ungrudgingly for them, but the question naturally arises whether any means can be found to make those of the future even more successful. It may be assumed that the primary object of a Royal Institute Conference is the advancement of architecture, and that we endeavour,

(1) To get together in one place as many members of the R.I.B.A. and of the allied societies as possible;

(2) To arrange for certain experts to put before these members their views on subjects of interest to architects, and to provide opportunities for discussion either formally at the meeting, or informally afterwards;

(3) To arrange visits to buildings of architectural interest;

(4) To arrange various social functions such as a civic reception, a dinner, and the like;

(5) To provide a somewhat special stunt to wind up the proceedings, such as the river trip at Liverpool or the Wye Valley excursion from Cardiff;

(6) To interest the public in the district in which the conference is held, and if possible over a much wider area.

Let us consider the points in order.

(1) At the previous conferences there were good attendances, but it is naturally hoped that the numbers will grow from year to year. How can more architects be got together? The date of the conference is, of course, very important. It has been suggested that the one selected for Cardiff—the week-end following Whit Monday—was not a good one, and it is possible that the Friday and Saturday immediately preceding Whit Monday might work better. It would mean giving up work from Thursday afternoon to Tuesday morning, but it would mean only one break instead of two. The early summer seems to be a good time, but it is just possible that further thought may show that the autumn would be preferable. How can those responsible for the arrangements proceed in the best way to ensure that the members of the Institute and its allied societies really get it firmly fixed in their minds that a conference which will be well worth attending is to be held at a certain place, at a certain date, and that by a certain previous date applications must be received at headquarters? It does not seem possible to do much more than was done in the case of the last conference. Perhaps something more could be done in the direction of persuading the committee of each allied society to work up enthusiasm in its own area some little time before the conference, so that each allied society would be as strongly represented as possible. The date of sending out the final invitations is also important; if they are sent out too early they may be put on one side for future consideration and possibly be forgotten, while on the other hand, if a sufficient interval is not allowed members may be prevented from attending the conference by previously made engagements.

(2) The question of papers is one which affects the whole programme, the tendency being to overcrowd it. When a preliminary programme first appears it will probably be found best to treat it as a breaking load, and to divide it by a factor of safety. At Cardiff, for instance, while possibly some found the fixtures arranged all they could tackle, others fixed up extra ones and managed to squeeze in between tea and dinner a visit to Llandaff Cathedral, to a garden village, or to a colliery some considerable distance away. In any case it would seem wise to leave some brief intervals either for rest on the part of the weaker brethren or for additional activities of an informal character for the more energetic ones. While the programme must not be overloaded with papers it should at the same time be realized that they are an extremely important item on the programme. If anything, the amount of time devoted to this part of the conference at Cardiff was, perhaps, too short. The question of leaving time for ample discussion is also important. While it may not be well to lay down any definite rules, it would seem generally advisable to allow plenty of time.

(3) It is not clear that the visits to important buildings are an absolutely fundamental necessity. At Liverpool and Cardiff such visits formed an important part of the proceedings, as they will, doubtless, in due course, at Edinburgh and Oxford. Still, the promoters will probably find it advisable to hold a conference some year in a city much less attractive from this point of view. In this case the social functions and the papers with discussions would become more prominent.

(4) The social functions—the receptions, the dinners—these are, of course, such stuff as conferences are made of. They give opportunities for members from different parts of the country to get to know one another better, and generally speaking they help to oil valuable machinery which gets a bit rusty now and again. But in addition to the formal reception and the dinner there should be an informal evening if possible. The smoking concert at Cardiff was invaluable as a means of bringing people together, the opportunities for general talk being obviously far greater at such a gathering than at a dinner. Unfortunately the available evenings are few. If there were a fourth, a supper—at about half the cost of the dinner—might be found very attractive.

(5) The special stunt to end the proceedings has so far been found very useful indeed, both the river trip at Liverpool and the motor tour of the Wye Valley proving very attractive features. Such efforts may not always be possible, but when they are they should be adopted. They add a holiday touch to the proceedings and give ample opportunities for just the right sort of social intercourse.

(6) The question of interesting the public is fundamental. At Cardiff this was managed in various ways, direct and

indirect. There was no public meeting at the conference proper; the difficulty being, of course, that the summer is not a good time for public meetings. At Cardiff two meetings to introduce the conference and its objects to the Press and the public were held some time before the conference proper. These were followed by a series of six or eight articles in the local press, which also gave reports of the meetings and of the speeches at the dinner and other functions. Clearly the last conference did good work in this direction locally, and that should always be one of the results of our conferences. A Royal Institute Conference is, however, not only a local affair, and it is hoped that the growing interest in architecture may result before long in our conferences being adequately recognized as national affairs by our leading papers.

In the hope, then, of furthering the interests of our conferences, let us be quite frank. Does anyone who attended either or both of the past conferences see ways in which such efforts can be improved in the future, and are there any who were absent for reasons within the control of those arranging the conferences? Constructive criticism can but help the Institute in its attempt to bring together in the interests of architecture the maximum number of its members and of the members of the allied societies.

The Rebuilding of Russia

At long last we have apparently to deal with a repentant Russia—a Russia once again more eager to build than to destroy, to attract capital rather than to attack it. Mr. Huntly Carter's articles on the subject come at a peculiarly opportune moment, when Russia is giving proofs that it has awakened to the folly, as well as the wickedness, of attempting the annihilation of eternal principles like honesty and justice. Once again the gates are being thrown open to foreign trade, and schemes for reconstruction are being projected on so large a scale as to raise rather anxious doubts as to whether the power to carry them out is equal to the aspiration, the Russian character tending rather to over-elaboration of theory than to perseverance in practice. It is to the foreigner that the Russian looks to get things done—and paid for! If the Russian publicist is really astute, he will look to Britain rather than to Germany for substantial help in his extensive schemes of reconstruction, and in the honest and effective development of Russia's vast natural resources. When Russian trade rights itself, a general return of business prosperity for the rest of the world will be well within sight. Mr. Huntly Carter's timely and well-informed articles give some idea of the deplorable state of that country. And now that it is essential, we hope for Russia's sake that outside aid will come from England.

The Institution of Structural Engineers

The Concrete Institute proposes to enlarge its functions and change its title. Under its memorandum of association, the Concrete Institute was restricted to research work in concrete and reinforced concrete. It now seeks to widen its scope so as to include every kind of structural engineering. The proposed changes are coming up for consideration at an extraordinary general meeting of the Concrete Institute, to be held on September 28, at Denison House, Vauxhall Bridge Road, and there can be but little doubt that on that date the Concrete Institute will cease to be, and the Institution of Structural Engineers will come into existence. Some such change has been long foreseen, and was ripe for debate when the war intervened. Founded in 1908 and incorporated in 1909, the Institute has been for fourteen years *de facto* what it now seeks to become *de jure*, an Institution of Structural Engineers, dealing not merely with the materials, but also, and perhaps mainly, with the methods of construction of certain special types. It would be interesting to know exactly when and by whom the comparatively new term "structural engineer" was introduced. It did not come into general use until iron or mild steel became a familiar substitute for timber in building construction, while reinforced concrete came largely into use instead of brickwork. Several years before the Concrete Institute was founded this Journal had discerned the vitality and importance of the newer methods and materials of building construction, and in 1906 had actually assumed as its supplementary title that of "Architectural Engineer," which term many professional men still think preferable to "Structural Engineer," as being more definite and distinctive, and more accurately descriptive, besides implying due recognition of the art of architecture; for the art of the architect is independent of systems and materials, and is not to be lightly ignored. It would therefore be wise for the new Institution to embody in its title some plain indication that architecture enters into its calculations.

Land Drainage and Roadmaking

Simultaneously with the announcement that large land-drainage schemes are to provide work for the unemployed comes a complaint that "The delay in providing houses is attributable largely to the fact that there are no roads made up along which to erect them." If, it is contended, local authorities could obtain available sites and intersect them with roads properly laid and sewered, there would be no lack of builders coming forward to purchase the land and erect houses thereon. Might it not be profitably combined with the land-drainage scheme and other relief works contemplated by the Government?

Norland Old Hall Expatriated

The very stones of Norland Hall cry out against their expatriation. They have been bought by an enterprising American, and are being packed for shipment to San Francisco. Mr. Louis Ambler, in protesting—vainly, alas!—against this ab-alienation of a fine old Yorkshire house, states that its stone front was built 250 years ago by Joseph Taylor, whose initials and the date, 1672, appear on the door-head and elsewhere; "but there was much of the old timber work of the original house remaining before the building was dismantled nearly nine years ago by a London firm of antique dealers, who proposed to remove and re-erect it in Surrey." Mr. Ambler thought it would be a misfortune to send into Surrey "a typical example of a West Riding seventeenth-century house, with its large many-mullioned hall window and two other features which are peculiar to the locality, namely, the upper floor windows, with the two more lights in width below the transomes than above, and the finely and elaborately carved terminals to the label mouldings." Very interesting indeed; but ninety-nine-hundredths of the interest will evaporate in an alien atmosphere; and we are in most hearty agreement with Mr. Ambler in his suggestion that there ought to be a law preventing the removal of ancient and historical buildings from one country to another. The ancient jest about wealthy Americans carrying off St. Paul's, the Abbey, and the Tower of London, is beginning to wear a sinister aspect.

Mr. Arnold Mitchell's "Find"

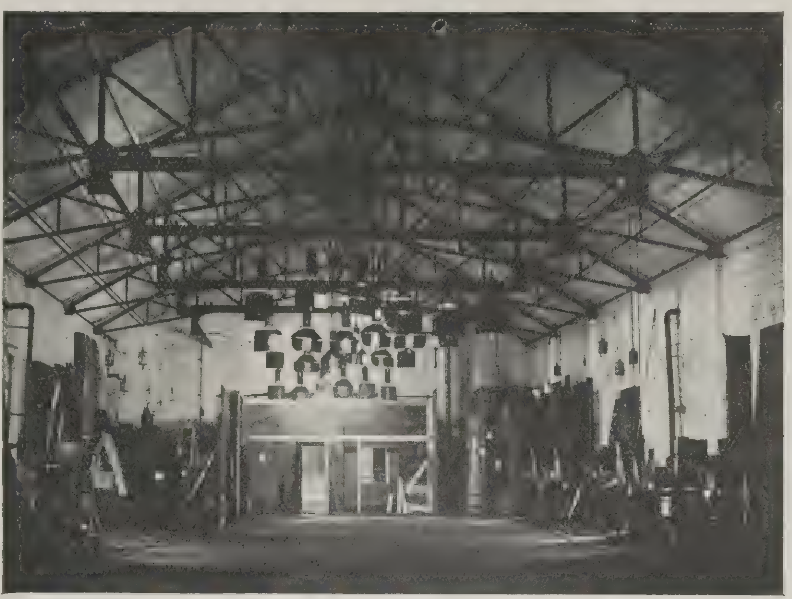
Mr. Arnold Mitchell, F.R.I.B.A., is now to be counted among the select band of architects who have made important archæological discoveries. In Dorset he has found a Greek statue of great beauty and antiquity. It is of marble, and is of a woman. Dr. Percy Gardner, Professor of Classical Archæology at Oxford University, is said to believe that the statue was probably carved *circa* 300 B.C., and is thus 2,200 years old. It is thought that the marble, which is "the coarse-grained material of the Islands," may have come from somewhere near Smyrna. But how came it to Dorset? That is an unanswerable question, except conjecturally. It is now deposited in the Ashmolean Museum.

A Street in Cinema-Land

THE great mercury lamps of cinema-land shone white over a street in seventeenth-century London. A camera-man with intent eyes peered over his apparatus as he wound. The producer danced wildly and shouted incomprehensibly: "Now you're smiling. Now you're holding him by the hand. Now you're happy. . . . Good!"

The hand of the camera-man ceased its steady winding and the actors gathered round the producer laughing, and became, despite their picturesque clothes, just ordinary people. Also, the writer walked round the back of that lath and plaster street in seventeenth-century London, and beheld the ledges and braces that kept it up.

But in a few months, when the play appears, such things will never be guessed at by the audience in the crowded picture-palace. The curtain will ring down upon a loving couple who, it is quite clear, live happily ever after; villainy has been vanquished; virtue upheld. They leave the theatre satisfied that the play has ended just as they always like it to end, and carry in their memory some charming pictures of London during the period of the plague—cobbled streets, galleried and half-timbered houses diamond-paned windows, picturesquely projecting upper floors. Nor will they ask whether all the decorative and structural details are in keeping with the time. Architects, however, are more exacting; and we would here say without hesitation that when film companies go to the trouble of building in their grounds whole towns of half-timbered houses it is worth their while to call in expert advice for their design—indeed it is really essential.



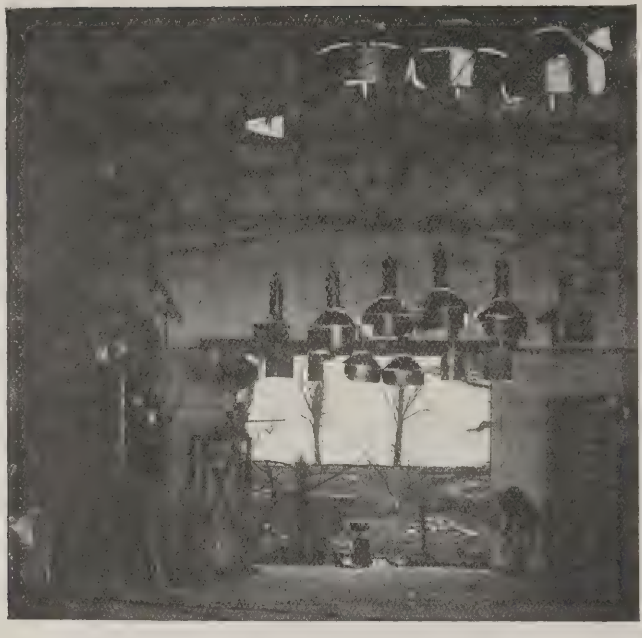
AN INTERIOR OF THE DARK STUDIO AT ISLEWORTH.

This has already been done in America. Not only does the architect have to see that every building to be screened is period-perfect, but he is responsible for the design and lay-out of the whole film. Describing how a screen architect works out the whole conception, a writer in an American contemporary says: "First, after reading the story of the play and deciding upon the type of sets to be made, he draws a number of sketches. From these, finished detail drawings are made of the various sets, and an army of draughtsmen are then turned on to produce scores of blue-prints from which, in many cases, models of every scene are erected so that the directional staff may work out the grouping of the actors, and test in miniature the effect of lighting arrangements, besides recording for future reference the exact action of the various players involved. The construction department is then entrusted with the erection of the sets, and the whole scheme materializes, still under the actual supervision of the architect."

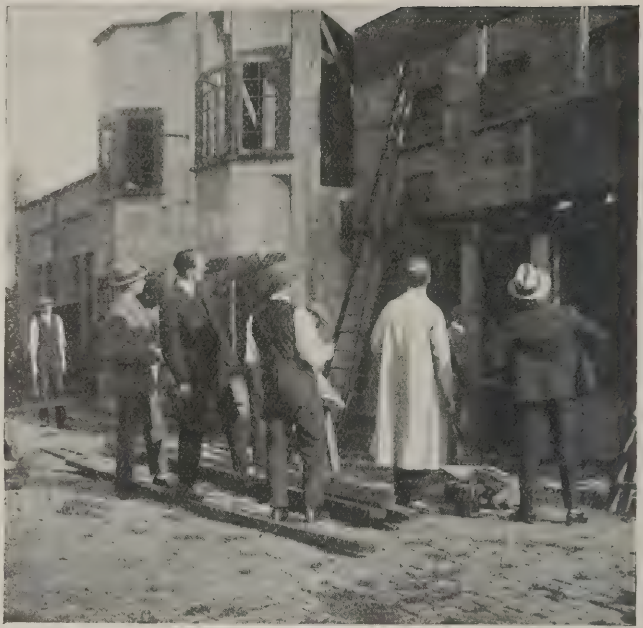
The writer remembers a film of Dante's "Divine Comedy," which was shown some years ago. The very gates of the Italian's Hell appeared in lurid light upon the screen. And as one read those dread characters above the lofty arch of the portal, "Per me si va nella citta dolente," those massive gates swayed visibly in a wind which came from the back of the studio.

The Hardy Film Company are to be congratulated on having taken careful precautions against any such mishaps. The windows here are real windows, the doors real doors, and the houses real houses—at least in front. Crossing

THE HEADQUARTERS OF A FILM COMPANY: TWO FRONT VIEWS OF THE STUDIOS AT ISLEWORTH, ORIGINALLY A FINE NINETEENTH-CENTURY MANSION.



ONE OF THE GREAT STUDIOS SHOWING THE ENORMOUS ARC LAMPS.



THE SEVENTEENTH-CENTURY TOWN IN THE MAKING.

the wide grounds which belong to the studio—a handsome nineteenth-century mansion—you come upon the street from the back. It is hidden amongst trees and studio sheds, and looks like a jumble of hoardings. At one moment you are surrounded by the life and noise of the twentieth century; the next you have stepped into the atmosphere of a mediæval city. It is a curious sensation. You see Ned Holles passing, who served under Cromwell; you find that the date is 1665 not 1922. George Monk, Duke of Albemarle, governs in Whitehall, and is greatly perturbed at the appearance of the plague in London, while the Duke of Buckingham, handsome and dissolute, a notorious rake, heedlessly pursues his pleasures with some of his satellites. Buckingham is madly in love with Sylvia Farquharson of the Duke's Playhouse. He gets her into his clutches, and she is only rescued by catching the plague. Holles, who has discovered in Sylvia his early love, endeavours to defend her, and when she is deserted, nurses her back to health, only to catch the plague himself as she recovers. When he is well he receives from Albemarle an appointment in the Indies, and carries Sylvia off with him.

The play is entitled "The Scourge," and is adapted from the book by Rafael Sabatini. It is to be produced shortly by the Hardy Film Company.

The Pride of the Mediæval Workman

By G. Ll. MORRIS

"Their land is full of idols; they worship the work of their own hands, that which their own fingers have made."
—ISAIAH, Chap. II, Verse 8.

"Wherefore I perceive that there is nothing better, than that a man should rejoice in his own works; for that is his portion: for who shall bring him to see what shall be after him?"—ECCLESIASTES, Chap. III, Verse 22.

I HAVE put these two verses from the Old Testament at the head of my article as they seem to express towards handicraft a sane and religious attitude, which must be definitely embodied in any social philosophy that includes the reorganization of modern industry. Our attitude to-day towards fine workmanship and the capable craftsman is much the same in spirit as that held by the modern "gentleman" and by the Egyptian poet who sang so prettily :—

> "I have never seen the smith as an ambassador
> Or the goldsmith carry tidings,
> Yet I have seen the smith at his work
> At the mouth of his furnace.
> His fingers were like crocodile hide
> He stank more than the roe of fish."

In this matter, Gibbon, the celebrated historian, appears to have been of the same way of thinking. He refers to soldiers as being degraded by the industry of the "mechanical" trades, and his contempt for academical degrees arose from the fact of their being "borrowed from the mechanical corporations, in which an apprentice after serving his time obtains a testimonial of his skill, and a licence to practise his trade and mistery." The same point of view is held by many to-day.

In the Middle Ages it was exactly the reverse. Pride of occupation played an inspiring part in the emotional equipment of the mediæval craftsman. Pride no less than faith nurtured the beauty which burgeoned and blossomed in those times. It inspired the workman with a sense of his own power, and taught him, as freedom taught the Arabs, "to accost his equals without levity, and his superiors without awe." (*Gibbon.*) It led him to protect his own in the wars with the lords of the soil, and to endow his work with fine craftsmanship. Pride in organization qualified him for respect and hate from those who opposed him, and made him master over the tools of his handicrafts and a power in the government of the mediæval towns.

Proud and haughty, he yet allowed himself to be the object of a most minute surveillance, and whilst obedient to his guild, hated and scorned those above and below him. Every trade made its own regulations, and used every precaution to uphold the dignity of its craft. A careless and fraudulent workman received little consideration if he used bad materials, or was casual in putting them together. The regulations on this score were most stringent. Care was taken to protect the public from fraud, and the guildsmen from a reputation for shoddy materials and inferior craftsmanship. Severe punishment awaited a shirker. He was turned out of his guild and necessity compelled him to leave his native place, the prospect of regaining his lost position being a remote one. Often he was destined to haunt the roads and by-ways, a disreputable member of that large fraternity of the Middle Ages—the "wayfaring folk."

The individual pride of the workman was no less than that of the guild. On his work he would inscribe his name to draw the attention of the buyer to his wonderful handiwork. The potter was much given to this proud playfulness, telling you by means of inscriptions on a piece of pottery his name, the date he made it, and sometimes a proverb he thought worthy of remembrance. In eastern Europe the mediæval Greek stamped his work and arrested the attention in a short and pithy sentence. A Byzantine brick in the British Museum informs you that it was made by the "most excellent Narsis." On another article are the words "Enmion made me" followed by the haughty injunction "Think of it O buyer." The names of workmen frequently occur in turn upon columns, capitals, or simply square blocks of stone, and some of the monograms from the closures under the great west window at St. Sophia are supposed to be the signatures of master-workers. (*Lethaby and Swainson.*) The Cathedral of Rouen possesses a window which bears the name of Clement of Chartres "Master-Glazier," and Professor Lethaby in his book on mediæval art gives many instances of inscriptions in honour of master-masons.

This natural desire of the workman to endow the labour of his hands with speech is as old as the hills. Among the examples of Greek lead work, some of the sling bullets are inscribed, often with jibes and jeers, so that the warrior might know his work. One in the Lewes Museum has "Well done," others have "Hit hard." (*Lethaby.*) Flaubert in his wonderful novel "Salammbo" refers to this simple and child-like method of insult adopted by a besieging force to bring the besieged to their knees. They slung at them insulting messages, inscribed upon their ammunition.

In metal the workman flaunted his pride in another way; the bars of metal twist and interlace in luxuriant fashion, blossoming into flowers and foliage in unexpected places. Armorial bearings, lettering and symbolic figures engaged his skill and ingenuity, nothing seems to have daunted him, so proud and masterful was the command he had over his material.

In wood and stone he dared to hurl the scourge of satire on the monks in consecrated places. Fantastic humour and coarse jokes, which did not disdain the obscene (*Lubke*), find their place on gargoyles, on misericordia, and in any position where he could slyly poke fun at piety and his betters. At times he simply rioted in an exuberant outburst of pride and fancy, and troubled not to hide his artistic wilfulness, but frankly amused himself at the expense of those who employed him. This has been done in a most audacious way in the Cathedral of Berne. In one of the windows the glass-maker has made sport of transubstantiation by representing a pope shovelling four evangelists into a mill from which came forth a number of wafers; these a bishop is receiving into a cup in order to distribute them to a wondering people. (*Lacroix.*) In the choir of the Protestant church of Breda the carver gave free rein to satire on the clergy, representing the monks in various comical attitudes. (*Singleton.*) Only in some of the crafts did the arrogance of the workman show itself in this way, but in his quarrels with the barons, his fellow-workmen, "foreigners," and town authorities, it leapt out at the slightest provocation; it permeated his trade regulations, and was so interwoven with his daily life that it seems easier to account for the vitality of the mediæval arts from the presence of this characteristic than from that of simple pleasure and joy. The remarks of Henry Gow the Armourer to his friend Simon the Glover are instinct with a pride of occupation, equal to, if not surpassing, the pride of birth of the aristocrat.

Simon rebukes Henry for suggesting that the craft of St. Crispin was a more honourable calling than that of the glovers. "You err, son Henry," he says, with much gravity, "the glovers are the more honorable craft of the two, as they provide for the accommodation of the hands, whereas the shoemakers and cordwainers do but work for the feet."

Proudly he upholds the dignity of his craft, saying, "Brave men fight with their hands, cowards employ their feet in flight. A glove is borne aloft, a shoe is trampled in the mire. A man greets his friend with his open hand: he spurns a dog or one whom he holds as mean as a dog with his advanced foot. A glove on the point of a spear is a sign and pledge of faith all the world over, as a gauntlet flung down is a gage of knightly battle; while I know no other emblem belonging to an old shoe, except that some cronies will fling them after a man by way of good luck, in which practice I avow myself to entertain no confidence." (*Scott.*)

It was perhaps with some little malice that Henry Gow chose to compare the glovers with the shoemakers, as originally both these crafts appear to have been incorporated in one guild. This gave rise later to many quarrels, and to the infringement of the rights of one trade by another. Blows were often exchanged, a guild being generally quite ready to identify itself with the quarrels of individual members. (*Beck.*)

Pride compelled a guild to uphold a member, hence the scenes in the streets from time to time. In London at the beginning of the fourteenth century the disputes between the saddlers and joiners and between the saddlers and lorimers and painters arose in the first instance through bad workmanship, and on a second occasion were due to the supposed infringement of the saddlers' liberties by the lorimers. Such a state of things was not to be tolerated for a moment; the saddlers instituted proceedings against the lorimers and ultimately ordered the objectionable ordinance to be burned in Westchepe! (*Beck.*) The consigning of documents, etc., to the flames was a favourite method of executing vengeance.

One of the regulations of the saddlers' guild in Paris, drawn up in the thirteenth century, ordains that a "faked" saddle should be burnt without power of redemption and without delay. The same drastic and effective measures were pursued in England, the saddles sometimes being burned before the maker's door. The guild of glovers in Scotland acted in the same way when workmen attempted to avoid the craft regulations. On the occasion of a quarrel between the saddlers and joiners, when the former were accused of making spurious goods, a committee of six members of the joiners' "mystery" was appointed and empowered to search out all goods belonging to the craft and to stamp them with a hall-mark as a means of guarding against any future attempts to palm off poor work. These quarrels, which so often led to blows in the workmen's quarters of a city, show how carefully each guild protected its privileges; the least infringement caused trouble, an uproar took place, heads were broken and patched up again. Then the Mayor would summon some of the members of each guild to present the case on a certain day. After a discussion the matter would be settled more or less amicably, and the craftsmen would go back to their work, to quarrel again when their pride was hurt or when things became too monotonous.

In England, in Henry II's reign, when the guild of tapestry-workers objected to the special privileges bestowed upon a workshop in Paris by the King, they showed their displeasure by seriously disturbing the public peace on several occasions. (*Lacroix.*) The goldsmiths in France and Belgium were equally jealous of their privileges (*Lacroix*), and so proud and haughty were the artisans in Italy at the end of the thirteenth century that the nobility were either excluded from offices of State or were obliged to become artisans. Labarte tells us that the noble Venetian patricians might marry the daughters of the master glass-makers without derogating in any manner from their dignity, the children born from their marriage retained all their quarterings of nobility; and further, when Henry III went to Venice towards the end of the thirteenth century he conferred nobility upon all the master glass-makers of Murano.

The chronicles of St. Troud record that the weavers of St. Troud and Tongres in 1133 were more forward and proud than other artizans. (*Esther Singleton.*) In France the glass-makers acquired a somewhat similar importance, and if their work did not confer "nobility" upon the craftsman as in Venice it was quite an understood thing that titled individuals incurred no degradation in working at that craft. (*Lacroix.*) In Florence in the middle of the fourteenth century the workers in wood and metal were included as members of a painters' society, a similar body in Venice reckoned amongst its members casket-makers, gilders and varnishers, and at Bologna saddlers and sheath-makers were admitted. (*Labarte.*)

Every fresh privilege gained by the workmen gave an impetus to their power and pride, which the very continuity of a craft in a family helped to foster. In Florence at the end of the thirteenth century every inhabitant was obliged to subscribe his name on the register of one of the guilds, and no person was eligible for a public office unless he was actually or professedly a member of a guild. (*Roscoe.*) There were regulations too which prevented manufacturers from expelling their workmen (*Staley*), and the emigration of skilled artisans and artificers was strictly forbidden. It is interesting to notice that women were not disqualified by their sex from enjoying the rights of membership in the guilds.

On Holy and festival days their pride found expression in the production of mystery plays; every craftsman, however humble the position of his guild, felt a real personal pride in the organization and success of these great annual performances. In the City of York, the celebration of the Corpus Christi festival was accompanied by exhibitions of these plays. (*Mystery Plays of York, Toulmer Smith; Davies' Records of York; Davies' Walks through York.*) As the day for their display drew near, each guild became busy in the long summer evenings preparing for the coming event. Each guild appears to have had its own play book, and its own pageant masters; the duty of the last named being to collect from the members of the guild contributions towards the production of the play, and to look after the movable stages upon which the plays were enacted.

These were days of great activity. Guilders Gate, Coppers Gate, Spurriers Gate, Tanners Row, and in all the neighbourhoods where the crafts were located there would be signs and sounds of preparation. In the narrow streets there would be much coming and going of craftsmen; in one part of the city the wheelwrights would be heard at work making new wheels for the travelling stages, in another part the decorators would be lavishing their skill upon fresh scenes for new plays and re-decorating old ones. At Pageant Green from a long range of buildings there would be drawn out the movable stages, and hard at work on them might be seen the painters and gilders renewing in bright gold and brilliant colours the arms of the City of York, the sign and symbol of municipal recognition of the play. Housewives would be looking over their tapestries, embroidered coverlets, and banners, to hang on the front of their houses, and buying stores of rushes to strew before their doorways, and flowers, too, to decorate their windows.

Money would be provided by the Lord Mayor for the appropriate number of torches to be burnt in the procession; and barriers would be erected in suitable positions for the accommodation of visitors to the city.

On the day of the performance, the city would begin to fill at the early hour of 4.30 a.m., and the streets to resound with the footsteps of the guildsmen on their way to the entrance of the priory of the Holy Trinity in Mickelgate where the first play was held. Blacksmiths and bladesmiths, bakers, coopers, carpenters, glaziers, joiners, innholders, coverlet-makers, and all the rest of the members of the various occupations which formed the life of York in those days, dressed in gay and fantastic costumes, trooped through the streets. Priests, troubadours and minstrels too, the latter with stringed instruments, and crowds of citizens with their wives and children, all out and about at an early hour to witness their great annual festival.

The Drawings of William Walcot

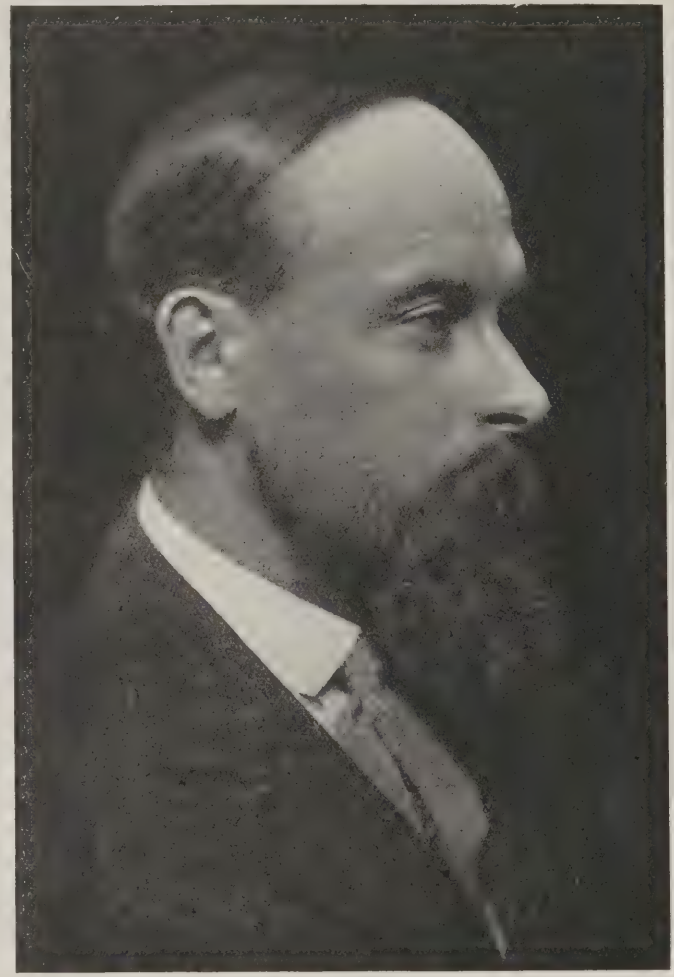
An enthusiastic audience of Walcot-lovers assembled at the Architectural Association last Thursday afternoon and had the pleasure of seeing lantern illustrations of the Roman Compositions, and a series of drawings of some of the most famous of the temples of ancient times.

An illuminating description of the slides was given by Miss Atkins, who has long worked with Mr. Walcot, and has collected a vast store of knowledge concerning his work.

The Roman Compositions, said Miss Atkins, are in the main reconstructions based on actual ruins of monuments, the others being creations of the artist's fertile mind.

You will all help me enormously, the lecturer continued, if you will try to put away from your minds the modern spirit of commercialism and science, your present forms of living, both religious and civil, and let Mr. Walcot lead you right into the heart and spirit of the wonderful days of ancient Rome, Greece, and Babylon: for that is the great beauty of Mr. Walcot's work. It is not only architectural and archæological, but an artistic impression of all these blended with a wonderful insight into the past. In fact I almost believe what many others have said, that Mr. Walcot must be a kind of reincarnation of an ancient Roman.

A critic once said that Mr. Walcot worked with a magic brush, but it is also a very human one, as he brings us so directly in touch with the people themselves and their various modes of life.



WILLIAM WALCOT. A.R.E.. F.R.I.B.A.

Miss Atkins then proceeded to describe the slides, giving a full and deeply interesting account of the social and historical aspects of the cities which Mr. Walcot has literally re-created. The Colosseum, she said, was begun by Vespasian, consecrated by Titus A.D. 80, and finished by Domitian. The first arcade was built with Doric, the second with Ionic, and the third with Corinthian "engaged" columns. Round the theatre ran a high massive wall, with vaults for the animals; on it rested the Podium, where were the seats of honour—those of the Imperial family, the officers of State, and the Vestal Virgins.

Above these again rose the seats of other spectators in concentric rows, and the whole space could be sheltered from sun or rain by an awning supported on masts, which were let into corbels of stone that jutted out of the upper circumference. The arena could also be laid under water for the exhibition of sea fights.

It accommodated 87,000 spectators, and was an example of the prodigal contempt of labour and expense which the Roman Emperors displayed in their great works of architecture.

The exterior is built of fine masonry, in large blocks set without mortar. Next to the Pyramids the Colosseum swallowed more stone than any other structure reared by man.

In the Roman Court of Justice the opening ceremony of a court of law is depicted, a procession of the magistrates, consul, and proctor from the curia, returning from the religious ceremonies attached to the opening of a new session.

The Propylæa, Athens, acted as a vestibule on entrance to the Acropolis of Athens. They were built by the architect Mnesicles between 437 and 432 B.C., and are thought to be one of the most perfect examples of Greek architecture. The artist shows us a procession in the act of passing through the centre portico on its way to the Acropolis.

In the House of a Patrician there is no pretence of reconstruction. The artist shows us a house, such as he might have designed for himself in the days of ancient Rome when housing problems were not what they are to-day. The house, though not of a typical Roman style, is infused with a Roman spirit. An interesting point in this etching is the treatment of materials both from the etching and the building point of view.

Speaking of the two etchings of the Baths of Caracalla, the lecturer gave some account of the Roman public baths, of which there were between the years A.D. 150 to 250, 856 in the city. Here from dawn to midnight the people came in never-ending streams to prepare for the fatigue of the coming day, or to invigorate themselves after the war-like exercises in the campus martius.

The charge made to enter the baths was very small, and the emperors, when they wished to ingratiate themselves with the people, used, at certain times, to throw them open to the public.

Babylon, the Forum, and a Tragedy by Sophocles, were also described, and these were followed by a series of ancient pagan temples, including that of Apollo at Thermos, the Etruscan Temple of Jupiter Capitolinus, and those of Luxor, Ephesus, Baalbec, and others of equal antiquity.

The Temple, it was pointed out, was not necessarily a place of public worship, many being open to the priests only. It had a twofold function in that it was the shrine of the God, and had a place of general assembly adjacent; in this way it became the centre of national life.

Mr. Hamp, in proposing a vote of thanks to the lecturer, paid a glowing tribute of admiration to Mr. Walcot's work, which, he felt sure, would be as much appreciated in America, where the artist is about to make a tour, as it was here. Architects were proud to number Mr. Walcot among them, but he personally could not help regretting that such an artist had been lost to the ranks of practising architects. He wished that they could have seen buildings of Mr. Walcot's design, and felt sure that they would have been a source of inspiration as were his etchings.

Rebuilding Soviet Russia

By HUNTLY CARTER

2.—The Condition of Urban Russia

I THINK the first thing that took my attention on re-entering urban Russia this year was the new owner. The second thing was the condition of his environment.

The new owner of the cities and towns is the worker. In Moscow and Petrograd, with the exception of beggars, refugees, and speculators, I saw nothing but workers. Men in peak caps, house-blouses and top-boots, women in cotton blouses and kerchiefs, and many with bare legs, thronged the main thoroughfares, crowded the green boulevards, looked out from the windows of the great mansions in the fashionable quarters. They surrounded you in the theatre, received you in the public offices, and, in a word, swarmed everywhere. There were no bourgeoisie to speak of. Here and there a shabby down-at-heel specimen of the former ruling class offered the remaining items of his personal property for sale, or hurried through the throng of proletarians as though fearful of attracting too much attention. To me it seemed that Russia was very firmly indeed in the possession of the workers. But I overlooked the fact that Moscow is not Russia, and later, when I visited the rural districts, I came to the conclusion that Russia was shared between the workers and the peasants. It was firmly in their possession, and nothing but an earthquake could dispossess them of their property. This much should be carefully borne in mind, for it is with workers and peasants, or their representatives, that business will have to be transacted in the near future. As M. Tchicherine was careful to point out not so very long ago, when speaking of parliamentary rule, "the working class will keep political power and say to the capitalists, 'Thus far and no farther.'"

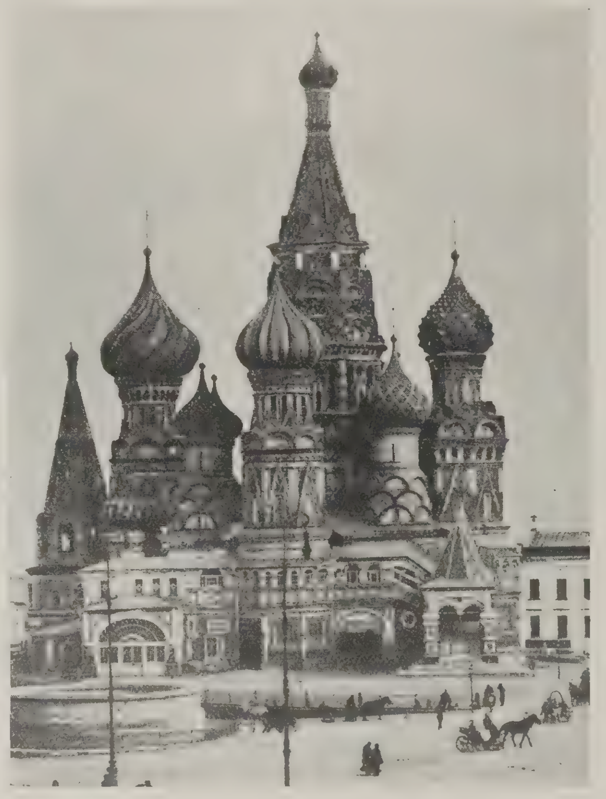
THE KREMLIN, MOSCOW, WHOSE DOME, ONCE GILT, IS NOW PAINTED RED.

If I was impressed by the new worker population, I was no less impressed by the condition of their surroundings. Let me say at once that never in the whole course of my experience have I seen the surroundings of civilized beings in a worse condition, in one that reflected more discredit on those who consented to live among them without stirring a hand—or so it seemed—to improve them. My impression of Moscow and other big cities was that they ought to be pulled down and rebuilt from end to end. I dare say that would be the impression of any practical architect who visited Russia to-day. He would find these places beyond patching-up, and if he had any voice in their renewal he would refuse to give them a new lease of life. If he happens to come from the better preserved parts of Western Europe he could not possibly enter, say, Moscow and Petrograd without a feeling of stupefaction at their appalling architectural and civic condition. And if by chance he visited both cities before the war, and remembers what they were like then, and compares this with what they are like now, his stupefaction will be increased.

He will, of course, recollect that neither city was a model of an up-to-date civilized city. Both were a mixture of the old and new, and both exhibited characteristics that

OLD RUSSIAN ARCHITECTURE IN MOSCOW.

belonged to an earlier period of the world's history than the twentieth century; some of them indeed were born long before modern civic improvements were dreamt of. There were, for instance, the execrable rough cobbled main thoroughfares, the wooden houses sandwiched in between big stone commercial buildings, the bad drainage and sewerage, and many more dangerous features. Perhaps Petrograd had fewer of these characteristics, for, compared with Moscow, it is a fairly modern city dating from the time of Peter the Great. It may be said to be a European city, whereas Moscow is a typical old Russian city dating many hundreds of years before Petrograd.



THE "PINE-APPLE" CATHEDRAL IN THE RED PLACE, MOSCOW.

But within recent years Moscow has been touched by financial and commercial advance, with the result that in 1914, like Petrograd, it exhibited a queer mixture of new elements superimposed on the old, which made it look as though someone was trying to build a new city without first of all clearing the old foundations. Architecturally the result was a hotch-potch of old Russian and new European commercial buildings. Moscow contained a great deal of old stuff, of different periods, some of it wonderfully picturesque, including the gorgeously decorated chapels, against which the great blocks of stone and concrete buildings—most of them too ugly for words—stood out as though asking to be criticized by their superiors. The diversity of architectural style was not only amusing, but highly instructive. Side by side were mammoth structures built with a solidity (a characteristic of modern Russian architecture) that seemed to fit them to stand till Doomsday, and ancient one-story log buildings, beautiful in line and proportion, and looking so frail that you wondered why they were not crushed to death by the giants on either side. If one excepts the commercial ugliness of many of the big buildings in the business streets there was nothing very offensive about the extraordinary mixture of architecture. As we know, ugliness is a predominant expression in recent commercial buildings in the more progressive continental cities, notably in Berlin and Cologne, where towering, monumental, and massive banks and Trust buildings look down upon you like financial dreadnoughts and cyclopean forges. Perhaps in pre-war days the old buildings in Moscow had a dirty and neglected appearance, of which Russia was not particularly ashamed, or it would not have tolerated it. But the new structures were different. The luxurious hotels, the blocks of flats, the commercial and civic buildings, had clean exteriors and an imposing, even inviting look of comfort that contrasted strongly with the blackened and worn surfaces of the old buildings. In particular, the hotels, say, the Savoy and the Metropole and the National at Moscow, were very cheerful indeed, with their spacious entrances, palm-decorated foyers, cosily carpeted stairs, corridors and rooms, swift-moving elevators, electric lights, conveniences of all kinds, and efficient service—in a word, their air of soft comfort. They were excellent copies of the best hotels in London, Paris, and Berlin.

In addition to the proud new finished buildings there were great buildings in course of construction which promised on the one hand to carry on the work of converting Moscow's great fashionable business streets, Petrovka, Tberskoi, etc., into Fifth Avenues, and, on the other, to promote the return to a national form of archi-

THE CHERNIKEV BRIDGE: A MIXTURE OF WOODEN HUTS AND MONUMENTAL PALACES.

tecture. A very good example of the latter tendency was to be seen in the new Ryasansky Station, to which I referred in a previous article on architecture in Soviet Russia. This mammoth station was designed by the Russian architect Tschiekev, who was strongly influenced by old Russian motives. It remains unfinished, and to-day it presents a pathetic spectacle. Traces of a promised magnificence are to be found in a vast uncompleted fresco on the wall of the great hall, while all around are evidences of unparalleled destitution. The floor of this hall and a wide area of the approaches to the station are simply strewn with a dirty grey verminous litter of human beings, refugees from the Famine District, passing on no one knows where. Opposite is the typically Russian Jaroslavsky Station. On the whole, in 1914, there was both in Moscow and Petrograd plenty of evidence to show that, architecturally, Russia was being strongly touched by influences coming from East and West. The East was contributing a spirit of renaissance to promote national forms of a somewhat savage grandeur, while the West was contributing the spirit of Mammon in palaces of modern capitalism, exhibiting overpowering strength and enterprise, but no beauty. Since then there has been a desire to unite these two opposing forms, and thus to create a new one in harmony with communistic ambition. But a union of Tartar and modern industrial forms sounds impossible.

With all its faults and deficiencies Moscow was then an

A SOVIET MASS MEETING TAKING PLACE IN THE RED PLACE, MOSCOW.

interesting city. It was rather emaciated and unclean in parts, but it managed to conceal this under a fairly gay exterior. How different it is to-day. It has suddenly grown very old and dismally grey. It looks like a weary traveller who is worn out, destitute, filthy, and evil smelling. It is hung about with foul and bedraggled masses of humanity, whose condition is almost indescribable. They line the business streets, standing shoulder to shoulder, at all hours of the day and night. They lie in festering grey heaps in front of the stations, in the waiting-rooms, wherever they can, waiting days and days for permits to travel. Many die before they come. Moscow is, indeed, hung, as with pestiferous festoons, with swarms of beggars, swarms of speculating vultures, swarms of refugees, swarms of lice and disease-ridden immoralists, who fill the air with a horrible stench of decayed human flesh.

So both Moscow and Petrograd have lost the air of soft comfort which distinguished a considerable part of them before the war. They have found one of hard and bitter adversity. Adversity has spread a pall of destitution, dirt, disease, dilapidation, and destruction over the urban centres of Russia which has no equal in history. Indeed, the present-day story of urban Russia is a story of great cities and towns turned by war, invasion, and revolution into blood-begrimed barracks and wreckage. There may be better words for describing the condition of public and private buildings—hotels, institutes, residences, and so on—but I think barracks fairly describes the new buildings, and wreckage the old. Perhaps wreckage belongs to both. The conversion of business and residential buildings into barracks is not hard to account for. Immediately after the Revolution all buildings were requisitioned by the Soviet Government for military and civil purposes. The following extract from a Government document suggests the kind of thing that took place: "In large centres we (the Government) expropriated bourgeois flats, and distributed them. We confiscated the most necessary furniture and distributed it among the workmen. There are whole streets recently forming bourgeois quarters that now are the quarters of the proletarian-communist workmen, for workmen-communists have settled here, workers of the factories and so on." This only accounts for a part of the house property. When the workers poured into the palatial residences in the fashionable quarters they were accompanied by the soldiers, and by the vast new bureaucratic staff. Between them they requisitioned all the public institutions, the great hotels, the palaces, and other buildings for residences and offices. And between them they converted practically the whole of the "house" property in Moscow and Petrograd into vast barracks.

Nothing was sacred to the new occupiers. Magnificent interiors were put to the most destructive utilitarian uses. The priceless contents were partly removed, stolen, wilfully destroyed, and partly re-adapted to serve working-class purposes. Likewise rooms of great æsthetic value were carelessly adapted to uses for which they were never intended. When coal ran short, and it became necessary to burn wood, emergency stoves of brick and plaster were erected in magnificent interiors. From these unsightly stove pipes were carried up and across richly decorated ceilings to the walls in which holes large enough to allow them to pass to adjoining rooms or out into the street were literally hacked. Following these pipes are trails of soot, and in many places inside decorations and outside masonry are blackened beyond recognition. To-day one interior is like another. The rooms in the great handsome houses which have been handed over to the various Relief Administrations are mostly bare. All the furniture has disappeared, except one or two precious bits that serve to indicate the taste and wealth of their former owners.

A very great deal could be said about external conditions, but a few words must suffice. Both buildings and

MODERN COMMERCIAL ARCHITECTURE: FORMER BUSINESS PREMISES NOW USED BY THE INTERNATIONAL RELIEF COMMITTEE.

streets present an unequalled picture of dirt and dilapidation. In the best residential streets, for instance, the Krapolkin and Starynar Boulevards of Moscow, are massive blocks of white stone flats looking like decayed tenement buildings in China Town, New York. Their fine fronts are shattered, their windows broken and patched. Their entrances are dark, dirty, and evil-smelling, resembling those of slums rather than the mansions of the wealthy. From many, especially in Petrograd, the window frames, doors, and other woodwork have been removed for firewood. Elsewhere private and public buildings are fast crumbling away. House and shop fronts are falling to pieces. Hospitals and other public institutions are mere shells, shadows of their former splendour. The hospitals in particular are pitiable: cold, insanitary, and without medical equipment — furniture, appliances, and drugs—to meet the overwhelming increase of disease. On all sides are gaunt unfinished structures, shot-riddled and burnt walls, and signs of missing electrical and sanitary fittings. When the Revolution took place everyone must have joined a help-myself society. If there was anything they wanted, individuals simply took it. I do not remember seeing one external rain-water pipe intact. About nine to ten feet of the lower part of each have been stolen. I fancy they all went to make stove pipes.

THE STATUE OF THE EMPEROR ALEXANDER II AT THE KREMLIN, WHICH HAS BEEN REMOVED BY THE BOLSHEVIKS.

If the house fronts and roofs are battered and shattered, and masonry and fittings generally beyond repair, the roads and pathways are no better. Ten years of hard wear and tear and ill-usage have made wild mountain tracks of them. The rough cobbled roadways resemble switchback railways. In places the tramlines project so much above the surface that they resemble an excellent steeplechase course. The pathways are alternating patches of rough cobbles and asphalt. The asphalt is, in many places, worn through to the brick and earth foundation, leaving holes that might have been made by Jack Johnsons. To add to the extreme danger of getting about on this surface there are iron rain-water gutters which stretch from the house fronts to the gutter and project several inches above the level of the path. In some of the main streets walking after dark is practically impossible. A further source of inconvenience, annoyance, and danger is the sewerage and street drainage. Both of these are obsolete and worn out. The one stinks, the other fails to do its duty. So that when it rains heavily the streets are very quickly turned into roaring torrents, to which the broken gutters and shortened water-pipes add their contributions in cascades that fall from sheer heights and send up dense masses of spray that almost drown unfortunate pedestrians. Trying to walk through Niagara is nothing to trying to walk through Moscow during a cloud burst. Of course, the Russians are fairly seasoned to this form of shower bath. They take shelter in archways at the risk of being washed out by the flood, and as soon as the storm abates the women remove their shoes and stockings, cross the road as though they were crossing a Scotch stream in spate, and paddle home.

Such, briefly, is the condition of cities and towns in Russia. The conclusion is that a great deal, if not all, of urban Russia will have to be rebuilt, and it is not too much to believe that foreign co-operation will be invited for the purpose.

The Tenth International Congress of Architects

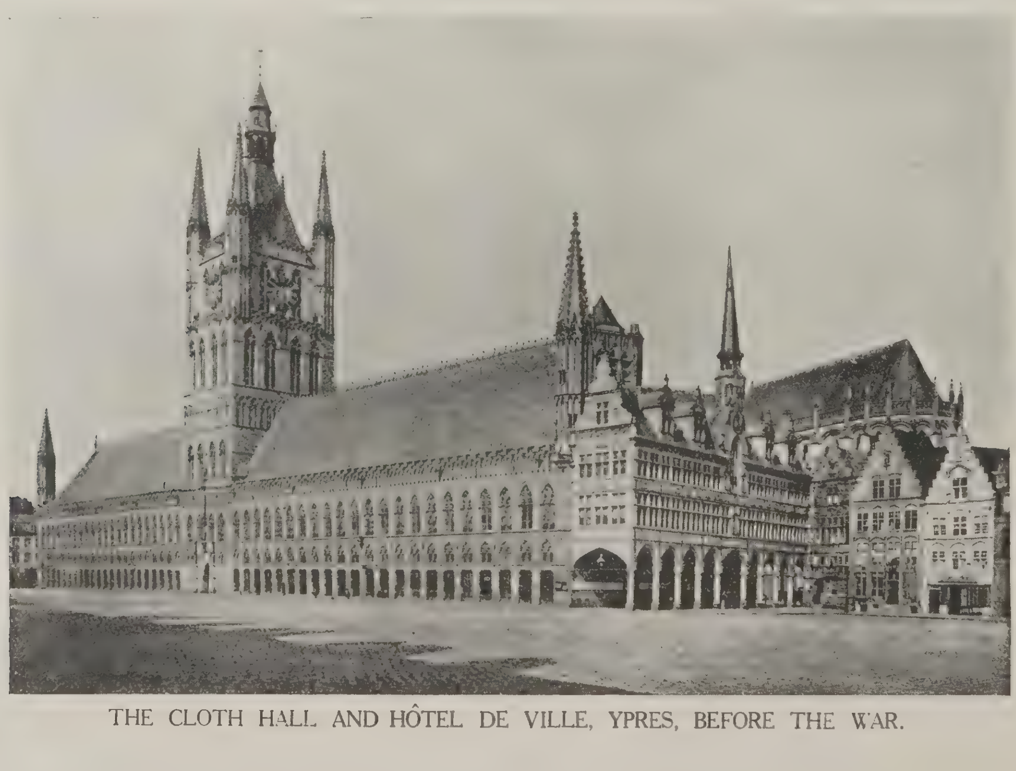
By JOHN SLATER, B.A., F.R.I.B.A.

THE Tenth International Congress of Architects, held at Brussels from September 4 to 11, met under somewhat unusual conditions. In the past the Congress has been organized by the Comité Permanent International. This year, being the fiftieth anniversary of the foundation of the Société Centrale d'Architecture de Belgique, that Society decided to hold the Congress and issued the invitations. No members of the enemy countries—Germany, Austria-Hungary, Bulgaria, and Turkey—were invited, so that the Congress could not be called fully international. It was impossible not to sympathize with the French and Belgian members on this point, but there was great danger that the Comité Permanent would cease to exist. This committee has done an enormous amount of work through its indefatigable honorary secretary, M. T. M. Poupinee, of Paris, in collecting and publishing records of the more important congresses. An informal meeting of members of the old committee was held prior to the opening of the Congress, and this danger was avoided by the constitution of a temporary and provisional committee—to be called the Comité Centrale—to carry on the work of the Comité Permanent. Hopes were expressed by all the members that it would be possible in a year or two, when the animosities created by the war had cooled down, to re-establish the Comité Permanent on its old footing. The constitution of the temporary committee was confirmed at the first meeting of the Congress.

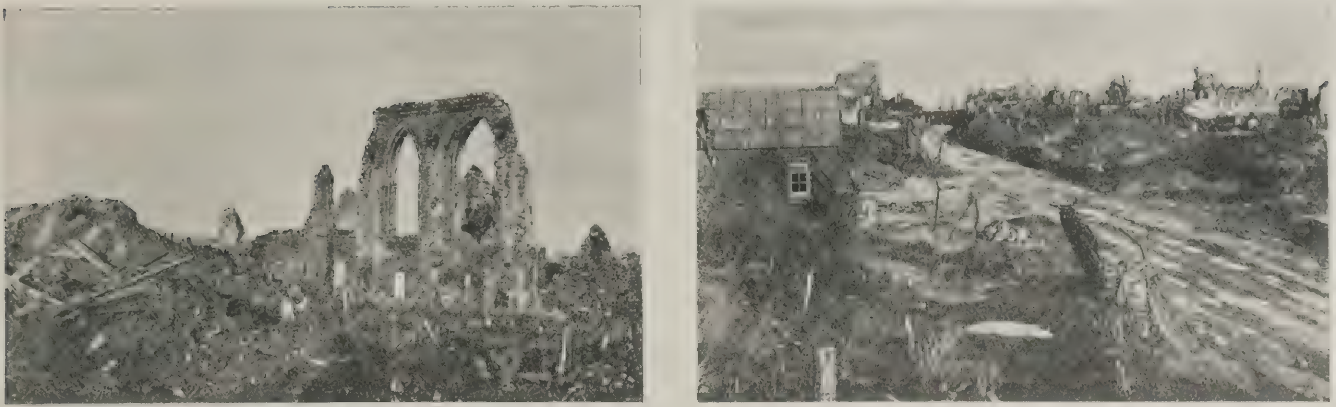
The Congress was a great success. A large number of countries were represented—Uruguay sent a delegate for the first time—and the meetings were fully attended. The matters discussed comprised such subjects as "The Responsibilities of the Architect"; "Women Architects"; and "Architects' Copyright." The long-continued efforts of M. Armand Avocat, of Paris, with regard to architects' copyright have resulted in a recognition in nearly all countries of the right of an architect to protect his works in the same way as an author or a painter. In the course of discussion on "Dwellings for the Working Classes," there was a remarkable concurrence of opinion that it is a mistake to make cheapness the main aim at the cost of the convenience and comfort of the occupants. "Town-planning" and "The Influence of Locality on Architecture" were also subjects of discussion.

An interesting excursion was arranged through the devastated regions of West Flanders. A number of motor cars met the members at the little station of Menin and drove along the Menin Road past Geluvelt, Poelcappelle, and the Houthoulst Forest to Ypres. All along the road were seen derelict tanks, masses of barbed wire, old trenches, gun emplacements, blasted trunks of trees, ruined villages, and numerous cemeteries.

At Ypres, which is practically razed to the ground, the ruins of the Cloth Hall and the Cathedral seemed to rise out of a desert. At this town over 50,000 tons of steel had to be cleared away before any reconstruction could take place, but the energy of the inhabitants in the work of



THE CLOTH HALL AND HÔTEL DE VILLE, YPRES, BEFORE THE WAR.



DIXMUDE AFTER THE LAST BOMBARDMENT.

restoration is remarkable. Picturesque little garden cities are being erected for the working classes on fresh sites, and many houses are now inhabited. A commencement has also been made with the rebuilding of part of the Cathedral.

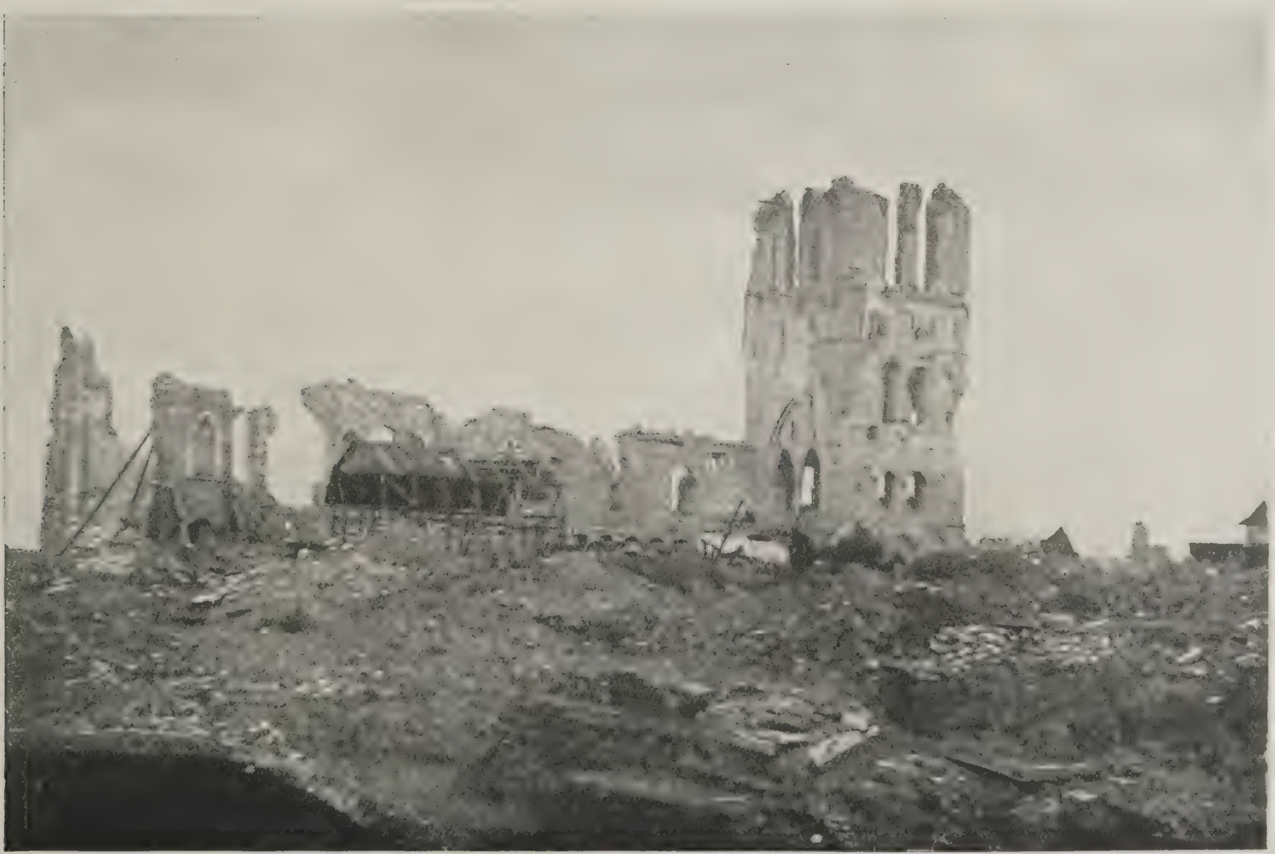
Dixmude was then visited. Here not a house was left standing, but many new ones are near completion. The fine church of St. Nicholas has been rebuilt largely with the old materials, and is now almost ready for the roof trusses, but the beautiful rood screen and loft are irreparably gone. The amount of rebuilding which has been accomplished would have been impossible but for the ready acquiescence of the workmen who are willing in the summer time to work fifteen hours a day.

The route lay through Furnes, where the damage has not been great, to Nieuport, which has been wholly demolished. Here, again, a great deal of rebuilding has been done. The long drive of over 120 miles ended at Bruges. A day was devoted to this town, and one had the opportunity of reviving memories of the lovely mouldings in the Hôpital St. Jean and other works of art.

Saturday, September 9, was devoted to a long excursion to Antwerp, on Sunday there was a banquet at the Hôtel Métropole at Brussels, and the concluding meeting of the Congress was held on Monday morning.

In connection with the Congress a very interesting exhibition of international architectural drawings was arranged in the Palais d'Egmont. Unfortunately, through some postal miscarriage, no notice of this exhibition reached this country in time for any steps to be taken for sending any selection of British works, so that we were not represented here. The United States sent a large proportion of the drawings which were exhibited in the R.I.B.A. Galleries, and they attracted as much notice in Brussels as here. One of the most interesting exhibits was a restoration of some pre-historic buildings in Yucatan, which had been recently measured and sketched by Major Totten, of Washington. These drawings showed a completely novel conception of architectural form and decoration, one of the most striking being a column in the shape of a serpent, the head forming the base, and the body curling upwards and over to form a sort of capital to support the superincumbent masonry. And this building had a very spirited frieze of jaguars. Nothing is as yet known of this early civilization, but the remains seem to indicate a form of snake worship. Major Totten showed some lantern slides of these buildings at an evening meeting at the Hotel Ravenstein.

The hearty thanks of all are due to M. J. B. Dewin, the President of the Belgian Society of Architects, and to M. J. Caluwaers, the President of the Organizing Committee, for their untiring efforts to promote the comfort and entertainment of the members.



THE CLOTH HALL, YPRES, AT THE CONCLUSION OF THE WAR.

The Seventh Holland's Industries Fair, Utrecht

By L. E. WALKER

UTRECHT, if judged according to population, is, with its 140,000 inhabitants, fourth in the order of importance among the towns of Holland. The city occupies a noted place in the history of the Netherlands, and both the Union of Utrecht (1579) and the Treaty of Utrecht (1713) are historical incidents of considerable importance. The choice of Utrecht as a home for the fairs was, no doubt, largely influenced by its exceptionally favourable position, situated, as it is, in the centre of the country and at a junction of rail and waterways; it is consequently easy of access from all sides. The institution of the fairs was, however, in some measure due to the initiative of the citizens.

The first three fairs were held during the war, and were devoted exclusively to the exploitation of Dutch industries. The exhibits were housed in temporary wooden buildings, erected in the several large open squares in the heart of the city. The success of these fairs was so great that it was decided to erect permanent buildings and, as hostilities had now ceased, to make the fair an international one.

The design made by the architect, Mr. J. de Bie Leuveling Tjeenk, B.N.A., includes, in addition to the building in which this month's fair was held, two other blocks of a similar size and character, and the three buildings when completed will be connected by wide corridors.

The illustrations reproduced on the opposite page show that the primary consideration in planning was the provision of as many sample rooms as possible of a like size (about 16 ft. 3 in. by 10 ft. 6 in.), each with external lighting. The principal staircase in the centre of the building provides the greatest possible freedom from congestion. There are four passenger elevators adjacent to the principal staircase, and two of these elevators are express to the top floor.

The planning of the five floors is uniform in all respects except that the top story has only roof light, and is intended for the exhibition of materials for which such lighting is especially suitable.

On those sides of the longitudinal corridors adjacent to the light wells the stalls are without enclosures, which would interfere with the lighting. These open stalls give the corridors a lively aspect which accords with the character of the fair. The building covers an area of over 3,500 sq. yds., and contains 350 sample rooms and 428 sq. yds. of space available for open stalls.

The elevations of the building, with the exception of the window-sills, are built entirely of bricks which approximate in colour and texture to Crowborough stocks. Their design exhibits a facility of expression and inventiveness which seems to be the peculiar attribute of the Dutch architect. The elevations have a strong vertical emphasis, and the wealth of simple detail which is formed by slight rhythmical projections of the bricks at varying angles is satisfying and in complete scale and harmony with the dignity of the whole design.

To the visitor from this country it was disappointing to find Great Britain so sparsely represented. Careful inquiries showed that Dutch buyers of building specialties, and indeed of all goods are strongly in favour of British materials. This without doubt is the result of experience.

Out of a total of 537 exhibitors, the various nations were represented as follows: America, 3; Austria, 3; Belgium, 21; British, 17; Czecho-Slovakia, 2; Finland, 2; France, 9; Germany, 44; Holland, 427; Hungary, 1; Poland, 6; Russia, 1; Switzerland, 1.

Of the 17 exhibits of British material, only five could be classified under the heading of "Building Materials and Equipment." The following is a brief description of these British exhibits:—

Messrs. Aug. Lachappelle, Breda, Holland, were showing "Parafloor" flexible rubber carpeting, rubber mats, and other products of the North British Rubber Co., Ltd., of Castle Mills, Edinburgh. The standholders themselves exhibited samples of parquet flooring made in their factory at Breda, Holland.

Messrs. Kerner-Greenwood & Co., Ltd., King's Lynn, England, were showing their "Pudlo" brand cement waterproofer, and the exhibits were a replica of those which have been the features of their stands at the Building Trades Exhibitions held at Olympia, London. The exhibits included a hydraulic testing machine, by means of which cylinders of waterproofed cement and sand were tested against percolation by water under pressures up to 300 lb. per sq. in., together with models illustrating the waterproofing properties of "Pudlo."

The stand of The Rawlplug Company, London and Delft, bore such a marked resemblance to the firm's exhibit at Olympia that it appeared to have been transported from England, but we were told that all the examples of the uses of Rawlplugs had been prepared in Holland by the firm's Dutch representatives. On this stand was displayed a command from the Queen of the Netherlands for a demonstration of the Rawlplug methods. The demonstration took place and resulted in an order for the supply of Rawlplugs to the Royal Household. We were informed that Rawlplugs are used by the Dutch State Railways and Telephone and Telegraph Departments, and that in the new factory for Messrs. Siemens at The Hague over 14,000 Rawlplugs of varying sizes have been used.

The Amsterdam house of "Ripolin" Enamel Paints exhibited samples of work executed with "Ripolin."

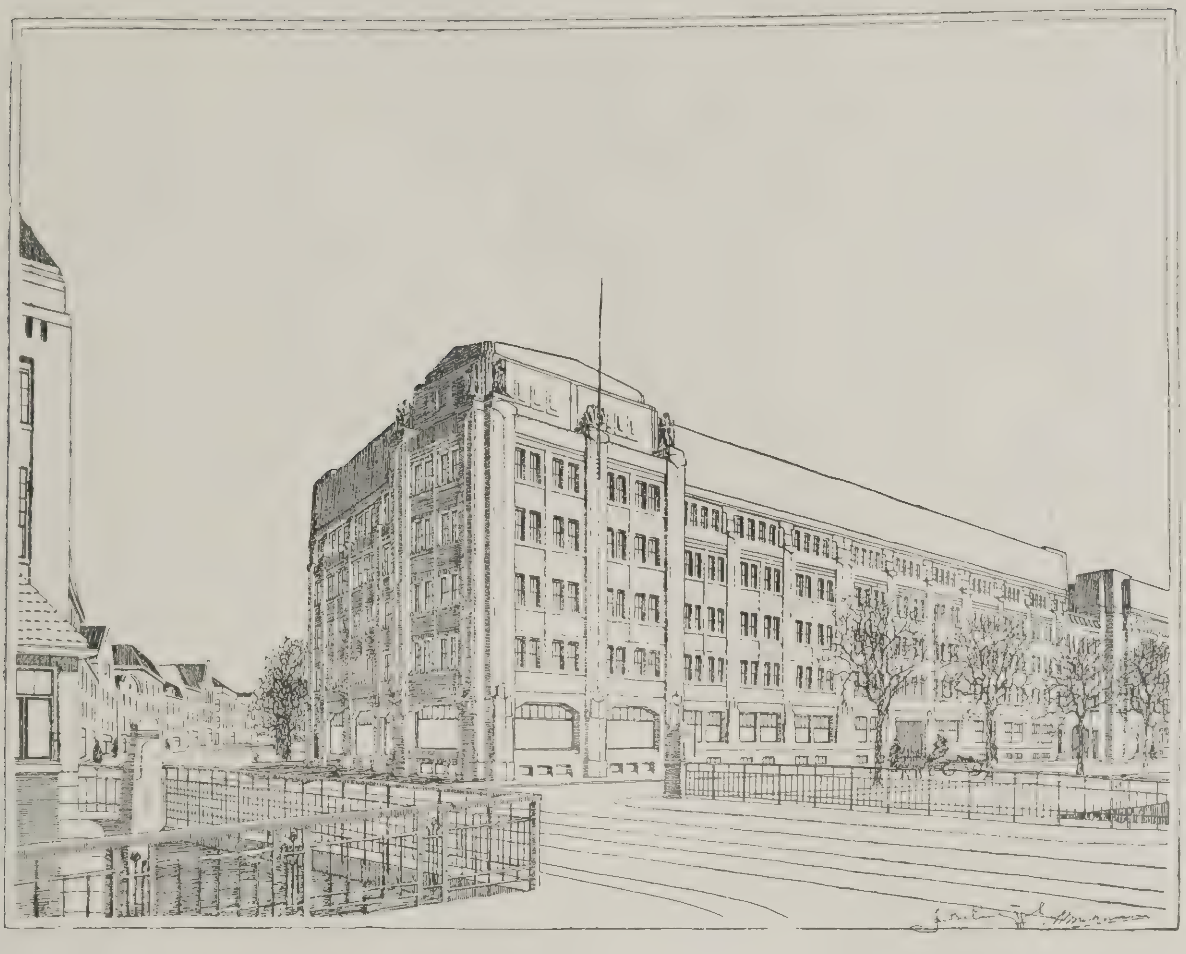
The Amsterdam branch of S.K.F. Ball Bearings displayed a length of steel shafting about 4 ft. long, supported by four S.K.F. plummer block bearings, and deliberately distorted to show how the universal bearings adapt themselves to the irregular movement. The shafting and other overhead pulley blocks and shafts connected to it were driven by the wind current generated by a small electric fan and transmitted to an opposing fan coupled to the shafting. There was no connection whatever between the two fans so that it was evident that the friction was practically nil.

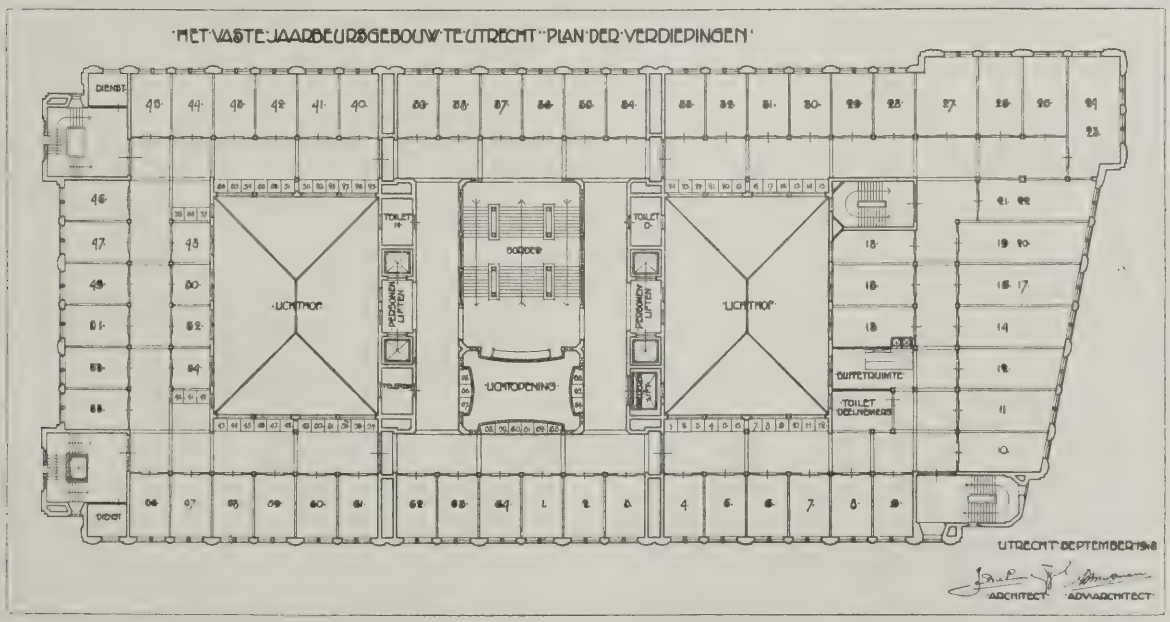
An Exhibition of Contemporary British Architecture

AN exhibition of Contemporary British Architecture will be held in the Galleries of the R.I.B.A., 9 Conduit Street, W.1, from November 1 to December 9.

The following arrangements have been made for the organization of the exhibition:—

1. All architects in the British Empire are invited to submit their work.
2. Work that has already been exhibited elsewhere will not be excluded.
3. Exhibits must be confined to works executed or illustrations of works projected since the beginning of the twentieth century.
4. All exhibits must be framed and may be glazed.
5. There is no limit to the number of works which may be included in one frame.
6. Models will not be accepted for exhibition.
7. Exhibits may consist of photographs, elevations, perspective drawings, and small scale plans. The exhibitor may choose whether he will send any or all of these. Photographs of drawings are admissible.
8. As the available wall-space is very limited it is anticipated that not more than 15 sq. ft. of wall-space (inclusive of frames) can be allotted to any exhibitor.
9. Charges for packing and transport of exhibits to and from the exhibition must be defrayed by the exhibitors.
10. An insurance policy will be taken out for the exhibits while they are in the custody of the R.I.B.A., but the R.I.B.A. will incur no legal liability for loss or damage.
11. The last day for the receipt of drawings and photographs will be October 7, 1922.
12. All exhibits not accepted must be removed by exhibitors not later than October 22, 1922.
13. The exhibition will be open to the general public (free) between the hours of 11 a.m. and 6 p.m.
14. There will be a Press view on October 30, and the private view and opening will take place on November 1, 1922.



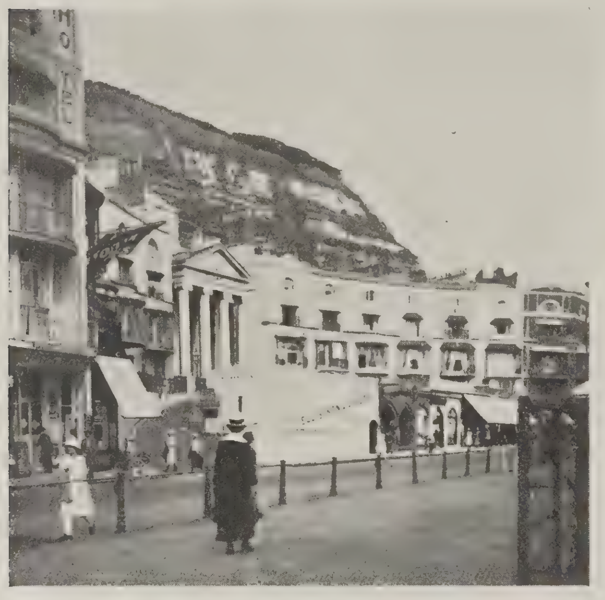


THE FAIR BUILDINGS AT UTRECHT. J. DE BIE LEUVELING TJEENK, B.N.A., ARCHITECT.

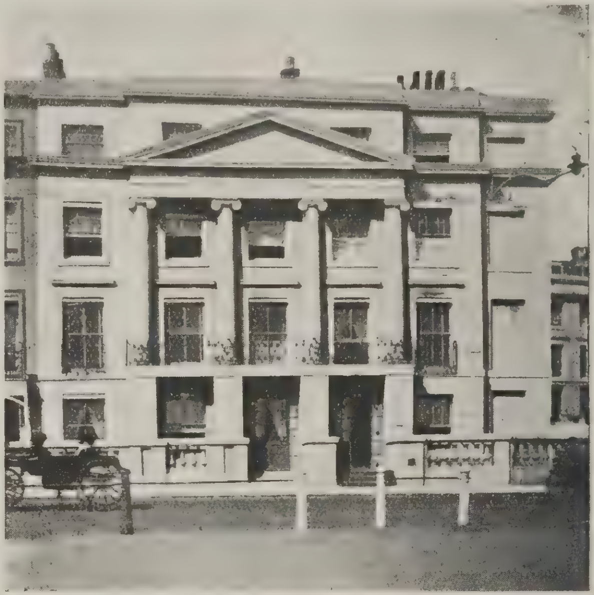
A Pictorial Review

Illustrations of Topical, Practical, or Curious Interest

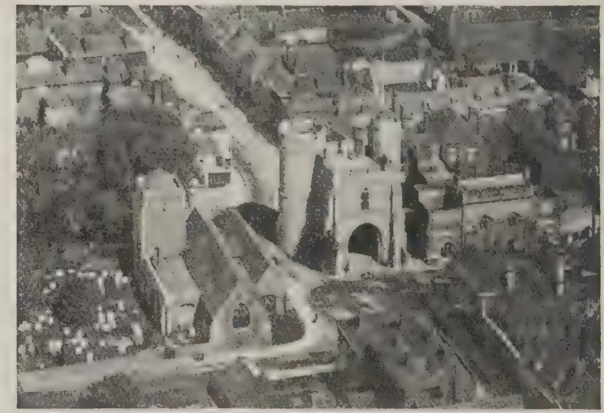
Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.



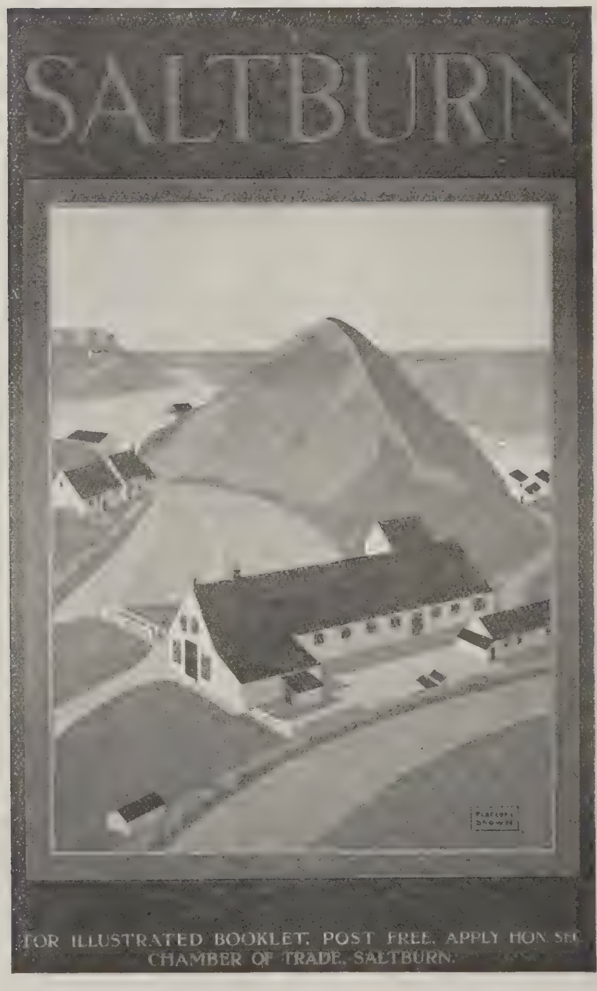
St. Mary-under-the-Castle, Hastings.—This church is surely unique in its position under the tall cliff on which stands the ancient castle. The church is a very respectable example of the pseudo-classicism affected in the eighteen-thirties, and its effectiveness is infinitely enhanced by the sweeping crescent flanking the portico'd entrance.—J. F.



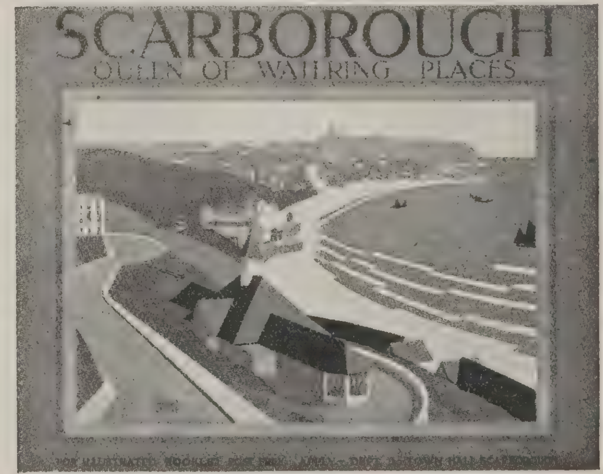
Another view in Hastings, which is full of good nineteenth-century work. This façade is a little dull and over dignified, yet possesses a balance and a reticence which is absent, generally speaking, from even the best modern work.—J. F.



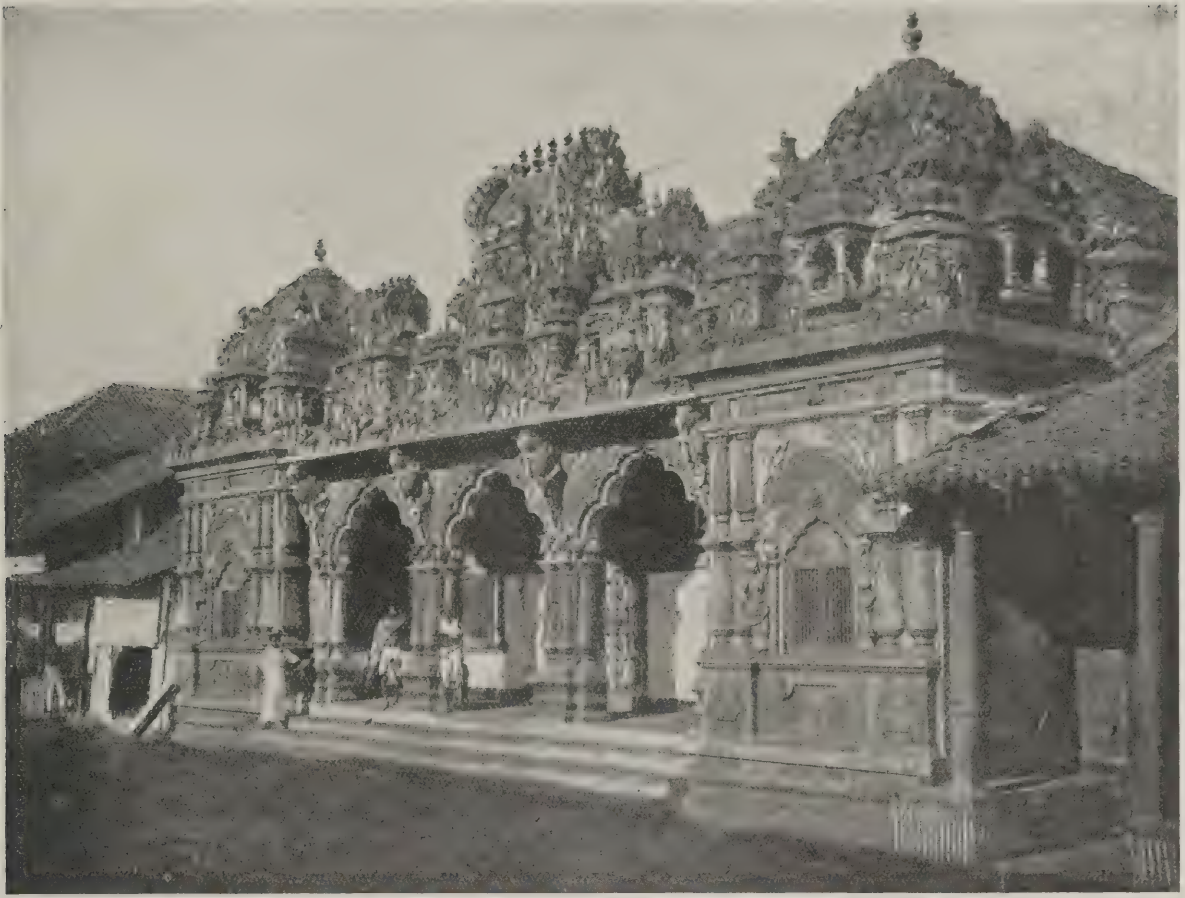
This photograph was taken during the war. It shows in an amusing way the straits to which the town council have been put in circumventing the West Gate at Canterbury. At this spot charabancs cluster at all times of the day, the "Gate" forming a superb obstruction to the free circulation of traffic. R. B. H.



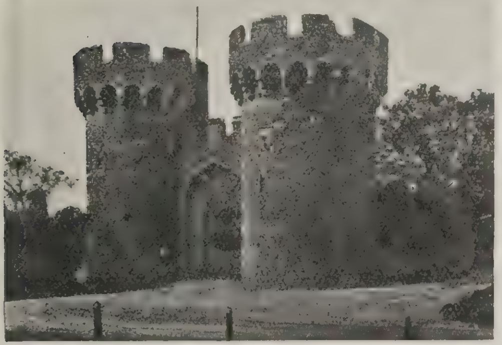
SALTBURN
F. GREGORY BROWN
FOR ILLUSTRATED BOOKLET, POST FREE, APPLY HON. SEC.
CHAMBER OF TRADE, SALTBURN.



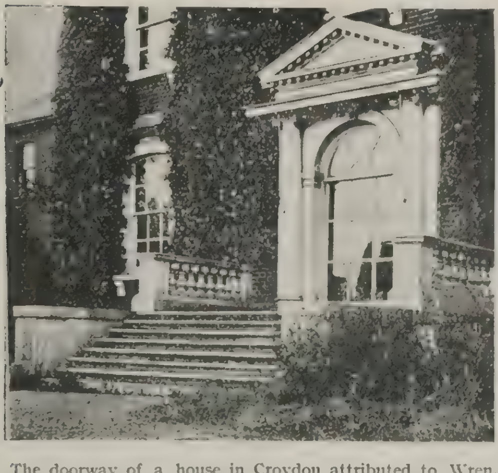
The evolution of the poster is a study of the greatest interest. Above are two posters exhibited on the hoardings by the North Eastern Railway. They show an interesting handling of architectural forms; indeed, their whole treatment may be called architectural. Such posters as these are a decoration to the streets of London, and great credit is due to those who have had the vision and the enterprise to substitute them for the "Sunny Spifton" type of advertisement which repels at a glance. The two posters above were designed by F. Gregory Brown.



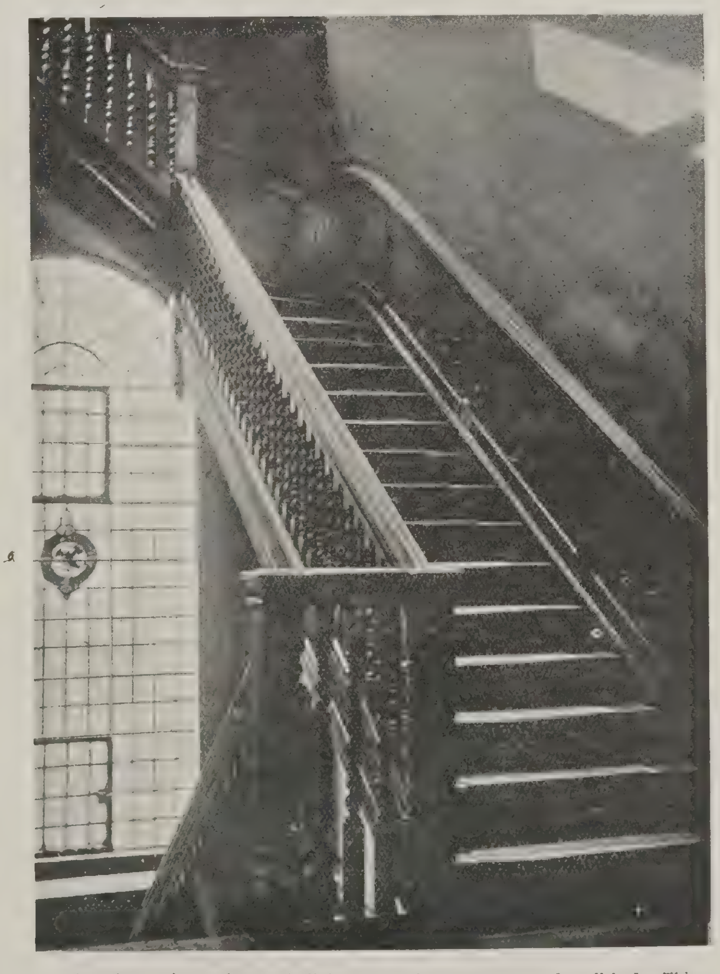
This Hindoo Temple in Colombo, Ceylon, is a good example of the extraordinary craftsmanship which the Eastern races lavished on the detail of their buildings. It is constructed almost exclusively of timber and plaster, and decorated with innumerable plaster models of various gods. The central portico with clustered columns and bold flanking pavilions is a typical Western composition.—F. C.



Cooling Castle in Kent was built to protect the marshes from invasion by the French. The remains of it shown above act now as gateway to a small farm. The early scenes of "Great Expectations" are laid at Cooling.—L. P. PLAYFORD.



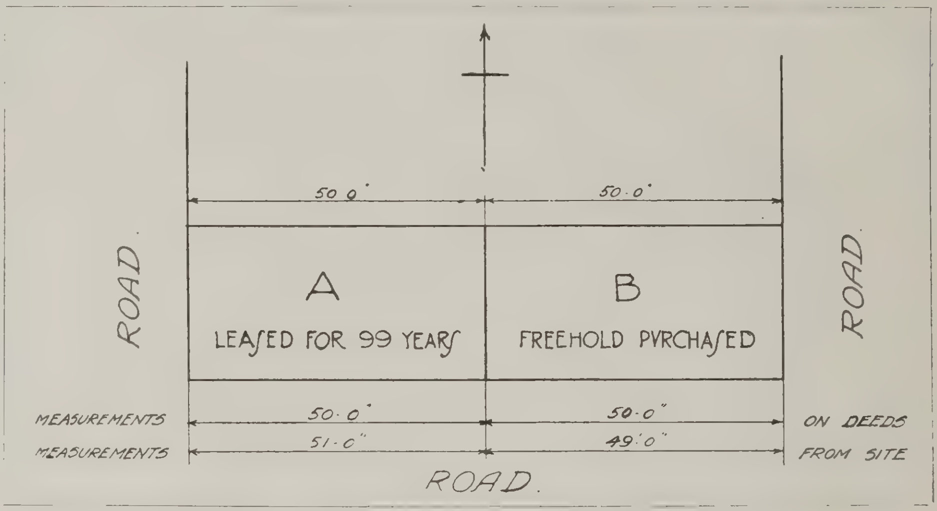
The doorway of a house in Croydon attributed to Wren. The proportions are very fine, especially those of the balustrade. The doorway is of wood, painted white.—P. W. D.



A Georgian staircase from a building near Bishopsgate, now demolished. This staircase possesses the rather unusual feature of a newel drop.—P. W. DAWNEY.

Enquiries Answered

The Editors cordially invite enquiries from readers who require information on architectural, constructional, or legal matters. Answers to enquiries are in all cases the work of experts ; and while every care is taken to make the replies thoroughly reliable, the Editors cannot hold themselves responsible for any inaccuracies that may inadvertently occur. Correspondents whose difficulties involve possible legal proceedings are strongly urged to consult their solicitors before taking action on any advice that may be given. Examination questions cannot be answered. It must be understood that, as a rule, both question and answer will be published in these columns. The name and address of the querist must always be given, not necessarily for publication. Correspondents are requested to be as brief as possible, and to write on one side of the paper only.



LAND ENCROACHMENT. (*See answer to P. L.*)

Land Encroachment.

P. L. writes : "Please give me your advice on the following case : 'A' is the lessee of a piece of land bounded on the west and south by two roads. The length of the south frontage mentioned in the lease is 50 ft. 0 in., and the whole site is covered by a building. Twenty-five to thirty years afterwards 'B' purchases the freehold of the land to the east of 'A' bounded on the east and south by roads, and with a similar frontage of 50 ft. 0 in. to the south. 'B' covers his site with a building and finds on checking the southern frontage that there is only 49 ft. 0 in. instead of 50 ft. 0 in., and on checking 'A's' frontage, he finds that there is 51 ft. 0 in. instead of 50 ft. 0 in. At the time 'A' erected his building it is obvious that he encroached 1 ft. 0 in. on the then vacant land to the east.

"I shall be glad to know the following :

"1. Has 'A' obtained an easement over the land covered by the eastern wall of his building and the overhanging shute attached to same ?

"2. What is 'B's' position in view of the fact that he has bought 50 ft. 0 in. of frontage and finds that there is only 49 ft. 0 in. ?

"3. What is the position of the landlord with regard to 'A's' encroachment, and can he proceed against him for trespass ?

"4. What is the vendor's position with regard to 'A' inasmuch as he cannot deliver the actual amount of land sold to 'B' ?

"NOTE.—The landlord of 'A' and the vendor of 'B' are the same person.

"5. I shall also be glad if you will let me know, in the valuing of a party wall at the present day of a building built before the war, whether the valuation should be based on the cost of the wall as built, say, twelve or fifteen years ago, or on the actual cost of building the same wall at to-day's prices ?"

—A tenant can only acquire land by encroachment, right of his landlord's property, and the tenant personally has no interest in it (save as part of his tenancy). I am of opinion that :—

1. "A" is entitled to continue to hold his premises exactly as they now exist; it is too late to go into the rights and wrongs of his boundaries and privileges.

2. "B" must put up with his bargain, and he must accept the land as being approximately what his contract called for.

3. "A's" landlord certainly has no just right of action against "A" who, if anything, has enhanced the value of his property rather than injured it.

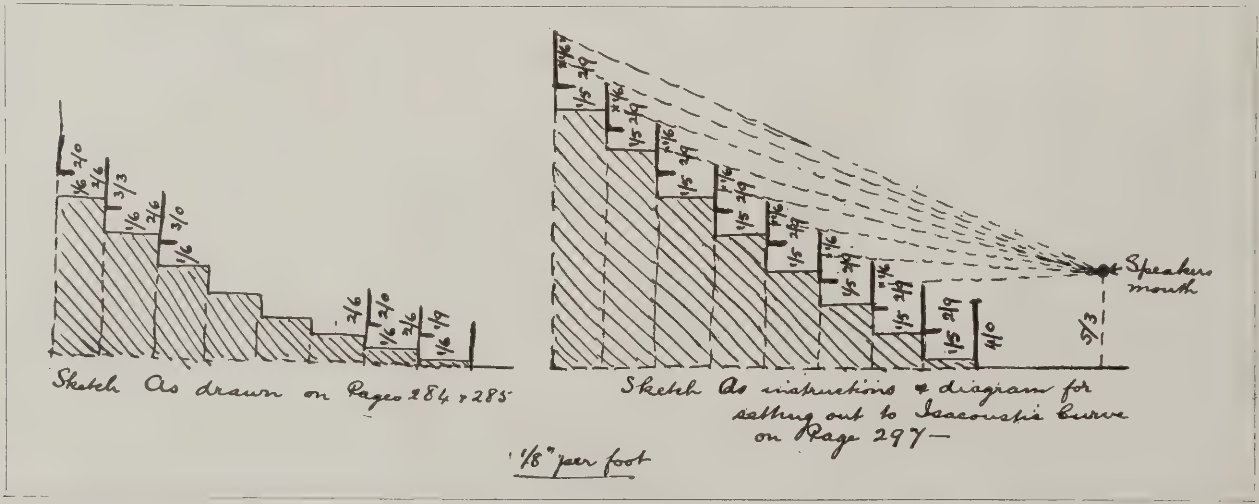
4. The vendor, it is true, is unable to give the full area of the land he proposed to do, but the deficiency is not enough to invalidate the contract even if the words "about" or "be the same more or less" do not occur in the contract.

5. This depends on the wording of the agreement under which the party wall was built, but if there be no agreement I am of opinion that the prices at the time when the wall comes into use as a party wall should govern the payment made by the new user of it.

F. S. I.

Gallery for a Lecture Theatre.

H. F. writes : "I cannot see how the drawings of a 'Gallery for a Lecture Theatre,' by Messrs. A. W. S. Cross, F.R.I.B.A., and Kenneth M. B. Cross, M.A., architects (illustrated on page 284 of your issue for August 30), agree with the instructions and the diagram for setting-out an isacoustic curve on page 297. In those instructions the height of the students' heads above the seats is



Sketch As drawn on Pages 284 & 285
Speakers mouth
Sketch As instructions & diagram for setting out to Isacoustic curve on Page 297—
1/8" per foot

RISING GALLERY FOR A LECTURE THEATRE.
(*See answer to H. F.*)

stated to be taken as 2 ft. 9 in., but on the drawing this dimension seems to vary from 1 ft. 9 in. in the first seat to 3 ft. 3 in. in the seventh seat, and then drops back again to 2 ft. 0 in. in the back seat. I can only account for this setting-out by supposing that the students are arranged according to height so that the shorter ones are put in the front rows and the taller ones are placed in the back seats, graduating them, so to speak, towards the rear. Also I do not see why the heads of the students in the back seat should be only slightly higher than the ones immediately in front of them. I have made two rough sketches [see page 390] comparing the drawings on pages 284 and 285, and what I understand to be the working out of the instructions. I have taken the height of the heads of the students on one row 1 ft. 6 in. above the 'sight-line' from the students' heads on the row in front to the speaker's mouth (measuring the 1 ft. 6 in. on the back of the rear seats). I have taken the maximum difference in height, as given on page 297, but according to this rule it raises the back seat a great height above the floor, and it would be very difficult, if not impossible, to work in the steps to the gangways."

—We are pleased to hear of the question raised by your correspondent, and we appreciate the care with which he has analysed the drawings. Our large scale illustration is intended to show the timber-framed construction of a typical gallery, and was, in fact, compiled from actual working drawings, but in this instance the principles of the isacoustic curve were subject to some modification owing to the special requirements of the case. Our diagram is intended to illustrate Mr. Scott-Russell's theory as to the best way in which seating may be arranged in a large hall, a system which is frequently, but by no means invariably, adopted. A. W. S. CROSS and K. M. B. CROSS.

Building to Measure.

G. N. writes: "What buildings are suitable for sketching or measuring in and round Ilford, Essex?"

—This is not a rich district. Eastbury House, Barking (often measured), is a fine Elizabethan house. Barking Abbey gatehouse, East Ham Church (with Norman east end), and the fine old inn at Chigwell, are the only places which occur to me at all near—but London is within fifteen minutes and teems with suitable material for study. E.

"Rod and Tape" writes: "Are King's Manor House, East Hendred, Berkshire, and Marsh Court, Leominster, Herefordshire, worth measuring or good for detailed study? What buildings are worthy of study in the neighbourhood of Shrivenham, Berkshire?"

—The buildings you mentioned are certainly worth detailed study. The Manor House at East Hendred has been in the possession and occupation of the family of Eyston since about 1450, and contains a chapel of thirteenth-century date. There are other interesting buildings in the village (once a market town), including the church, Champs chapel, and some good timber houses. Almost every village in and around the Vale of White Horse contains something of interest, Sparsholt and Uffington churches being exceptionally fine and well preserved. E.

List of Competitions Open

Date of Delivery.	COMPETITION.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8,000 francs.
Nov. 1	Labour-saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C.4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.

Competition News

Auckland War Memorial Competition.

The Secretary of the R.I.B.A. has received a cable from the promoters of the Auckland War Memorial Competition stating that the plans of the competitors from the United Kingdom have been received, and that the award is expected at the end of September.

"Labour Palace" Competition.

A project has been brought forward to build in the heart of Moscow a huge "Labour Palace," having a central hall capable of holding 8,000 people, with four smaller halls around it, and a tower which shall be one of the highest, if not the highest, in the world. Preliminary plans have been worked out by M. Shchusieff, chairman of the Society of Architects, but the final plans will be the subject of a competition in which the architects of the world will be invited to enter. Valuable prizes will be awarded the winners.

According to the preliminary plans, the whole structure will occupy a surface of 216,000 sq. ft., and to make room for it the unemployed are to begin at once to pull down the Continental Hotel, Testova's Restaurant, and six blocks of houses. The contractors for building the palace must undertake to begin work not later than the spring of 1923.

Publications Received

"Housing in Philadelphia." By Bernard J. Newman, Philadelphia Housing Association, 130 South Fifteenth Street, Philadelphia.

"Empire Forestry," Journal of the Empire Forestry Association, Imperial Institute, London, March, 1922. Price 4s. net. Messrs. Macmillan & Co., Ltd., St. Martin's Street, London.

"The Administration of the Town Planning Duties of Local Authorities." A supplement to "The Case for Town Planning." By Henry R. Aldridge, Secretary National Housing and Town Planning Council. Published by the Council, 41 Russell Square, W.C.1.

"Manual of Reinforced Concrete." By Charles F. Marsh, M.Inst.C.E., M.Am.Soc.C.E., M.I.Mech.E., and William Dunn, F.R.I.B.A., Assoc.M.Inst.C.E. Price 21s. Constable & Co., Ltd., 10 Orange Street, Leicester Square, W.C.

The Concrete Institute

An extraordinary general meeting of the Concrete Institute will be held at Denison House, 296 Vauxhall Bridge Road, London, S.W.1, on Thursday September 28, at six o'clock for the following business:—

1. To consider, and if thought fit to pass, a resolution "That the name of the Company be changed to The Institution of Structural Engineers."

2. To consider, and if thought fit to pass, a resolution "That Article 3 of the Memorandum of Association of the Company be altered by omitting the several objects numbered 1 to 25 both inclusive therein, and by substituting the following objects in lieu thereof, namely:—

"(*a*) To promote the science and art of Structural Engineering in any or all of its branches.

"(*b*) To enable Structural Engineers to meet and correspond and to publish or communicate information relative to Structural Engineering, including the constitution, properties, and use of materials.

"(*c*) Subject to the provisions of Sec. 19 of the Companies (Consolidation) Act 1908, in any lawful manner to acquire hold, and/or dispose of for the purposes of the Institution real and personal property and any rights or privileges necessary or convenient for the said purposes, and subject as aforesaid to exercise in respect of property of any nature, all the rights and powers of an absolute owner of property of that nature.

"(*d*) To do all such other lawful things as are incidental or conducive to the attainment of the above objects."

3. (*a*) To consider, and if thought fit to approve, the draft new Articles of Association which will be submitted to the Meeting and in the event of the approval thereof with or without modifications, then

(*b*) To consider, and if thought fit to pass, a Resolution to the effect "that the new Articles of Association already approved by this Meeting and for the purpose of identification subscribed by the Chairman thereof be and the same are hereby approved, and that such Articles be and they are hereby adopted as the Articles of the Company in substitution for and to the exclusion of all the existing Articles thereof."

Should the above resolutions be passed by the required majority they will be submitted for confirmation as special resolutions to a second extraordinary general meeting which will be subsequently convened for 6 p.m. on Thursday, October 19, 1922.

The Week's News

Disappearing Regent Street.

The Café Royal is to be pulled down and rebuilt.

Finchley War Memorial.

Of the £22,000 needed for the extension of the local hospital, which it is proposed shall form Finchley's war memorial, all but £2,500 has been subscribed.

An Architect Drowned.

Believed to have fallen overboard during a sudden illness while fishing from a boat, Mr. F. W. Goolden, of St. Mawes, near Falmouth, architect, has been drowned.

New Dock Extension.

A contract for the Workington Dock extension has been given to Messrs. Kirk and Randall, contractors, of London. The work will begin at once, and will occupy two and a half years.

Thames Bridge in Danger.

There is a possibility that the Teddington suspension bridge may have to be closed. The cables of the bridge, which are sunk in the banks of the river, are showing serious signs of wear. The bridge has been closed to ordinary traffic.

Peterborough's Bathing Pool.

Peterborough Town Council have decided to apply to the Unemployment Grants Board for a contribution towards a £14,000 scheme—a proposed bathing pool—which is being promoted with the object of finding work for the unemployed.

Bookham Common.

By public subscriptions the manorial rights of Bookham Common have been purchased in order to save the beauty spot from the builders. It is proposed to ask the National Trust to undertake the future care of the common.

New Building for Manchester.

The foundation-stone has been laid of a new block of buildings which is being erected in Oxford Street, Manchester, at the corner of Charles Street. The new structure is being built for Messrs. Cohen, drapers, of Manchester, and the architect is Mr. Charles Swain, of Manchester.

New Barrow Road.

It has been decided to get out plans and estimate of cost for a new coastal road from Rampside, in the borough of Barrow, to Bardsea, along the shore of Morecambe Bay, with a view to providing work for unemployed, in addition to improving the road communication in Furness.

Harlech Hotel to be Rebuilt.

St. David's Hotel, Harlech, which was destroyed by fire last May, is to be rebuilt immediately at a cost of £30,000. The contract has been let to Messrs. Trollope and Colls, of London and Liverpool. The new hotel which will contain over a hundred bedrooms, has been designed by Messrs. O. M. Roberts and Son, architects, Portmadoc, and is to be ready by next July.

New Market Place for Nelson.

Mr. G. Jones, of Hengoed, is the architect for a market place which is being erected at Nelson, South Wales, by the local branch of the National Farmers' Union. Messrs. Enoch Williams and Sons, Dowlais, are the contractors, and the work is being carried out at a cost of over £1,000.

Freemasons and Peterborough Cathedral.

Freemasons have placed £1,000, collected at the recent Masonic service in Peterborough Minster, at the command of the Cathedral Restoration Committee, who, in consequence have instructed the architect to proceed immediately with the foundations of the buttresses to save the chancel wall from falling.

Roman London.

Excavations in Aldersgate Street for a new building have laid bare a large portion of the Roman Wall. At this point the wall turned to the north-east, and, as was expected, the remains of a bastion have been found. The Guildhall authorities have taken photographs and made drawings of the remains.

Astor Office Sold.

The Astor Estate Office, just off Victoria Embankment, has been sold to Sir Ernest Fawke, director of the Central and Western Corporation, Ltd. The cost of the building is stated to have been £250,000. It has been sold for a little over £100,000. It is one of the most ornate buildings in London.

The New Olympia Building.

Work is proceeding on the extension to Olympia, which will double the capacity of the building. Efforts are being made to have the extension completed for the Christmas circus. When it is completed it is claimed Olympia will have the largest floor space of any exhibition building in Europe.

Visit to Westminster Hall.

At the invitation of Sir Frank Baines, of H.M. Office of Works, the Art Standing Committee of the R.I.B.A. have arranged a visit to Westminster Hall to inspect the roof on October 14, at 3 p.m. The work on the roof is now completed, and scaffolding will be removed shortly. An opportunity for examining the work is not likely to occur again for many years. Members and their friends who wish to take part in this visit should apply to the Secretary, R.I.B.A., by whom tickets will be supplied.

£200,000 Scheme for Newcastle.

New baths and a city hall are proposed for Newcastle at an approximate cost of £200,000. The City Council is recommended to approve of a proposal to obtain competitive designs from architects for a general scheme of baths and a public hall on the site of the Northumberland Baths. It is suggested that the premium for the first design should be £750, for the second £250, and for the third £100.

Alterations at the Junior Carlton.

At the Junior Carlton Club premises at the corner of St. James's Square, Pall Mall, one story is being taken off and two stories are being put on. The workmen are operating from the outside of the building in order that the club members may not be unduly disturbed. The existing building is five stories high, and, in order to take the weight of the added floors, the structure will be strengthened by additional steel girders.

The Late Mr. G. D. Stampa.

Mr. George Dominic Stampa, of Battlebarrow House, Appleby, Westmorland, formerly official architect to the Sultan of Turkey, designer of the Sultan's Palace, several mosques in Constantinople, the British Embassy at Therapia, and the Palace of the Khedive of Egypt, who died on July 14, aged eighty-seven years, left estate of the gross value of £3,136, with net personalty £3,047.

Glasgow Building Schemes.

Plans passed for new buildings to be erected in Glasgow include a Roman Catholic school at Govan to cost £13,000. The Glasgow Public Utility Society, Ltd., are to erect eighteen blocks of four- and five-apartment houses in the Cathcart district of the city at an estimated cost of £22,000. The Housing Department of Glasgow have a large scheme planned for houses and shops at Pollokshaws. Private enterprise is building houses in that district also; and a Methodist hall is to be erected at Maryhill Road.

The London Society.

On Friday, September 22, a visit will be paid by the London Society to the Church of St. Bartholomew the Great. Mr. E. A. Webb has consented to conduct a party of fifty members round the church. Members will meet at 3 p.m. inside the church. The nearest station is "Post Office" on the Central London Tube. Tickets may be obtained from the Secretary, the London Society, 27 Abingdon Street, London, S.W.1.

The following new members have been elected: Sir A. E. Bateman, Miss Leigh Browne, J. E. Drower, Captain Sir Douglas Hall, Bart., M.P., Mrs. E. S. Machell-Smith, L. S. Merrifield, Lady Roney, Mrs. Foster Welch, Colonel Sir Robert Williams, M.P., and J. H. Wise.

An Important Road Improvement.

The road from Kingsworthy, through Winchester to Chandler's Ford, is under reconstruction. Mr. W. J. Taylor, the county surveyor of Hampshire, in order that this reconstruction may proceed promptly, and with the minimum of inconvenience and delay to road traffic and danger to the road men, suggests that motorists should whenever possible avoid this road, which runs between Kingsworthy and Winchester on the north, and between Winchester and Chandler's Ford on the south. The work involves putting in new foundations and kerbs. On Otterbourne Hill, near St. Cross, the steepest part of the gradient is being cut down one-half width at a time. For the information and assistance of motorists, copies of the map showing the alternative routes will be sent on application to the secretary, The Automobile Association, 66 Whitcomb Street, London, W.C.2.

Correspondence

Gate of Honour, Gonville and Caius College, Cambridge

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—In your issue for September 13 I notice that the statement is made that "This Gate, one of the most pleasing works of the early Renaissance in England, was erected in 1574, traditionally by an architect named Theodore Haveus, a native of Cleves, but more probably by Dr. Caius himself," etc.

The following extract from the "Annals" of the College (trans. Willis and Clark) referring to the Gate of Honour seems to state the facts of the case quite clearly: "It was built of squared, hard stone wrought according to the very form and figure which Dr. Caius in his lifetime had himself traced out for the Architect." Dr. Caius died in 1573.

KENNETH M. B. CROSS.

On Going Forward

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—I owe you and your correspondents an apology for the lateness of my reply to their letters on the subject of my article "On Going Forward." My excuse is the vagaries of continental travel.

I have to thank the writers for their kindness to my article in general, and to me in particular, but I confess I would be happier if they had advanced my ideas in the same sense of progression in which I endeavoured to express them.

We have to question ourselves as to the actual processes of education in use to-day to decide as to how far they assist the training of an architect. To take instances. What is the primary use and purpose of examinations? As they exist do they give the greatest assistance to both students and staff, which we might reasonably expect of them? If they do not—and who can maintain that they do?—are we justified in keeping them in their present form? Or again, is the method of lecturing generally in vogue to-day the best we can use for storing the student's mind with certain knowledge? If it cannot be proved that it is—and it cannot—what reason have we for holding to it?

Further, do our present methods of historical study sufficiently explain that all manifestations of architecture have common underlying principles? This question also needs answering.

I must agree with Mr. Robertson that my phrase "to proceed from the indefinite to the definite" may appear "imperfectly expressive." But I see he understands the idea I intended to convey when he says, "I believe to-day all educationists must be agreed that it is essential to teach principles first, and their application afterwards." With this meaning, Mr. Purchon, I hope, will be more convinced that to proceed from the indefinite to the definite is the best way of going forward.

On the subject of the student's education before he enters the architectural school I might write at some length, but I will try to express myself in a few words.

Mr. Purchon is not clear on one of "Professor X's" points: "That a smaller amount of general education is required before starting" at a school of architecture. This surely is explained by the "Professor" himself when he adds that a proper study of architecture contains within itself a liberal and much of a general education. I should be the first to insist that a certain standard of education is necessary to the student before he enters the architectural school.

Education is only good in so far as—

(1) It helps the Art of Living.

(2) Helps the work of Life.

And since a proper study of architecture is itself a liberal education, (1) is as much the business of the architectural schools as of the "general" schools, while (2) is essentially their province.

Life is so short, Art so long, and funds so often hard to come by, that we should concern ourselves only with systems of education which are, at once, the most productive and the most economic.

JAMES BURFORD.

Podmokly, Czecho-Slovakia.

The Public and Architecture

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—The indifference of the lay public to architecture is one of the most serious problems with which we, both as professional men and as exponents of a noble Art, are confronted. All of us complain about it, yet none will do anything to tear aside the veil of mystery which conceals the Mistress Art from the people.

With the exception of the architectural societies, all the professional and trade societies, such as those concerned with electricity, gas, steel windows, glass, etc., etc., have a well-organized system of propaganda. The public are educated to appreciate the advantages of all these products by propaganda organized by the respective trade societies, and carried on mainly in the public Press. Yet architecture, the art above all others on which the people require information, has nobody to plead its cause.

The Councils of the R.I.B.A., the Society of Architects, the A.A., and their allied societies have behind them the resources and the support of practically the whole profession. If these societies would undertake well-worded and refined propaganda in the principal newspapers and in leaflets distributed amongst manufacturers, etc., I am convinced that the public would develop an interest in the Mistress Art which would gradually raise the tone of general architecture to a standard equalled only by ancient Greece and Rome.

Let the R.I.B.A. give the idea a few years' trial. They will never regret it.

E. LUCAS.

Professional Prospects

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—The leading article published in your issue for September 6 deals with a subject which vitally affects the large number of men in the profession of architecture. Yet the article overlooks the class of men who are assistants and who will remain assistants. It does not take notice that this class is, like the poor, always with us.

It is assumed that the student, having completed his training, gives his services as an assistant merely to gain experience in office work, prior to setting up in practice for himself. Unfortunately, owing to force of circumstances, only a limited number of firms may be in existence at a time. Were it possible for all the assistants to start in practice many present-day practitioners would become assistants.

More than merit is required to become a practitioner. A large amount of work is never open to competition, and this allows a correspondingly large field where influence comes before merit, and to the young man keen to build up a practice influence is as vital a necessity.

To start in practice is the exception, and is far from being the rule. In the majority of cases those who are assistants remain assistants, and their prospects depend not on merit alone, but on the number of those in their ranks seeking employment. They are, therefore, anxious for protection not only for themselves, but for those dependent upon them. Large numbers are members of the professional bodies, and they naturally expect these bodies to make efforts to afford them some measure of protection from unemployment and unfair conditions of employment. Nothing is being done in this direction, relief being expected on the return of better days. Protests are seldom made concerning even notorious cases affecting assistants' conditions. A scale of fees protects the practitioners; I urge that a scale of salaries for the assistants is equally essential.

It devolves upon employers (also members of these professional bodies) to ensure that their fellow-members in such times as the present are not left to the whim or caprice of the individual practitioner, but are protected by a code of rules for inter-professional conduct as rigorously carried out as the rules governing their own payment by the public.

The close relationship which of necessity exists between principal and assistants can stand the strain of a discussion and a finding on these principles, which will give to the assistants some measure of comfort and security and to the employer the satisfaction that in the professions at least there exists that spirit of reasonableness so necessary to good workmanship.

I am, Sir,
Yours, etc.,
JOHN MITCHELL,
General Secretary,
Architects' and Surveyors' Assistants' Professional Union.

The Clerk of Works' Association : A Visit to Brickworks

Members of the Incorporated Clerk of Works' Association of Great Britain, forming a party of over thirty in number, were the guests of Messrs. Eastwoods, Ltd., on a recent Saturday afternoon, the occasion being a visit of the Association to the company's works at Halstow, near Sittingbourne.

Mr. J. F. Wyllie, general manager of Messrs. Eastwoods, received the visitors at Victoria, and at Sittingbourne Mr. F. W. Webb, managing director, joined the party, which was conveyed by motor coach to Halstow, where the works—one of nine owned by the company—are situated.

Here the guests were met by Mr. B. W. Cook, local works manager, and Mr. F. Watson, manager of the Conyer Works, who first of all showed them the pit from which the earth employed in the manufacture of the bricks is obtained.

The deposit averages about 4 ft. in depth and covers a wide area. It was explained that after the earth has been dug out, the land must return to cultivation. This entails the careful removal of the top soil and its preservation in the form of ridges—known as callows—until the supply of brick earth has been exhausted. The callows are then spread evenly over the lowered surface of the land in readiness for the farmer.

Every facility had been afforded by the company for demonstrating each stage in the comparatively new method of manufacturing machine-made kiln-burnt stock bricks, by which they are made, dried, burned, and freighted in eight or nine days.

Such bricks, it may be added, can be manufactured all the year round, whereas by the older process hand-made clamp-burnt stock bricks take from four to eight weeks to burn, and can only be made during six months in the year.

The visitors next inspected the wash-mill, where the revolution of four harrows breaks up and washes the earth and mixes it with a certain proportion of chalk, which is conveyed to the mill by means of a pipe, after being previously washed at the chalk-pit. Chalk is necessary for improving the colour of the bricks.

After passing through a screen, the slurry is pumped from the wash-mill into large open reservoirs or wash-backs, on the beds of which has previously been spread a 10 in. layer of Medway clay. This increases the tenacity and density of the brick earth.

At the Halstow works there are twenty-five of these wash-backs, where the slurry is allowed to mature for periods which vary from ten weeks to six months, according to the time of the year.

When the slurry has been drained of its superfluous moisture and has become plastic, it is sufficiently seasoned to be dug out (together with the 10 in. clay bed), loaded into tip wagons, and hauled up an incline by means of an endless cable to the mill. Sifted ashes are there added to it before it descends through hoppers to the mixing mill.

After the operation of machine-moulding has taken place the green bricks are placed on "dryer" trucks—each containing a batch of 192—and then enter the dryer, in which 30,000 bricks can be dried in twenty-four hours.

The dryer comprises seven long parallel tunnels, and the drying is effected by exhaust steam and hot air. An arrangement of fans graduates the temperature throughout the length of the tunnels from but a little above that registered outside the entrance to 120 deg. C.

It was mentioned by Mr. Cook that approximately twelve ounces of water are extracted during the drying process from each brick, which also had to measure 9⅞ in. in the mould, to allow for subsequent shrinkage down to 9 in. after drying and burning.

What may be termed the climax of the demonstration occurred when an electrically driven ram pushed a truck of dried bricks into the burning-kiln.

This kiln (which holds 140,000 bricks) and another at the Conyer Works are of the latest tunnel type, and are the only ones in the British Isles.

Simultaneously with the entry into the kiln of each truck of dried bricks, one containing burnt bricks, ready for sorting, makes its exit from the other end.

The process of burning is similar to that employed with an ordinary continuous kiln, and occupies about five days. The fuel—fed from the top—consists of "washed nuts," as unwashed coal leaves a large residue and also spoils the colour of the bricks.

Figures quoted by an official of the company show that Messrs. Eastwoods' present output from the whole of their nine works amounts to two million bricks per week all the year round, in other words, enough bricks every half hour to build an average cottage !

The visitors were further informed that an order for the supply of ten million stocks—such as they had seen made—has recently been placed with Messrs. Eastwoods, in connection with the construction of the L.E.R. extension from Golder's Green to Hendon.

At the conclusion of the Association's visit to the works the members were entertained at tea by the company in an orchard behind the village inn, which hospitality, together with the courtesy shown by the firm, was acknowledged on behalf of the guests by the president, Mr. H. W. Page. F. C.

The Polytechnic School of Architecture

The School of Architecture, Building and Surveying (Evening Department), of the Polytechnic reopens on September 25. The lecturers and instructors are as follows : George A. Mitchell, A.R.I.B.A., M.C.I. (Head of Department) ; A. E. Holbrow, A.R.I.B.A., M.S.A., M.C.I., (Senior Lecturer) ; H. A. Douglass, A.R.I.B.A. ; W. A. Ross, A.R.I.B.A. ; W. Harvey, R.A. Schools, Gold Medallist ; D. W. Ayre, A.R.I.B.A. ; F. G. Pearson, P.A.S.I. ; J. A. Ray, Nat. Gold Medallist, Art ; J. Preston Davies, Nat. Silver Medallist, Art ; T. Hobart Pritchard, Maths. ; W. Cox, Hons. Medallist C. and J., Carpentry ; W. Scott, M.R.S.I. ; J. Dunkin, Furniture Design ; H. C. Sands, F.S.I. ; R. H. Pentleton, P.A.S.I. ; A. M. Mitchell, B.Sc. Eng., Hons., A.C.G.I. ; L. H. Flanders, A.M.I.M.E. ; J. R. Southerst, B.Sc., Maths. ; P. Jennings, B.Sc., Maths. ; S. R. Hollingdale, Construction ; V. Helbing, Construction ; T. R. Cox, Carpentry ; L. B. Webb, Hons. Medallist, Cabinet Making ; J. W. Barrett, Carpentry ; R. J. Audrey, Gold Medallist, Inst. Plumbing ; H. Perkins, R.P., Plumbing ; and J. T. Garside, Furniture Design.

At the termination of the session and based upon the school examinations, the Board of Studies will award Silver and Bronze Medals to successful students for class-work, homework, and studio testimonies.

The Polytechnic diploma and the senior group course certificates are also awarded to students reaching the necessary standard of proficiency.

The winter term of the day school commenced on September 19. The curriculum is based on the suggestions and recommendations of the Board of Architectural Education of the R.I.B.A., and the full course will cover a period of three years.

A summary of all the classes held at the Polytechnic may be obtained (5d. post free) from the Director of Education, The Polytechnic, 307–11 Regent Street, W.1.

DRYER TRUCKS CONTAINING BRICKS AT EXIT FROM DRYING CHAMBER.

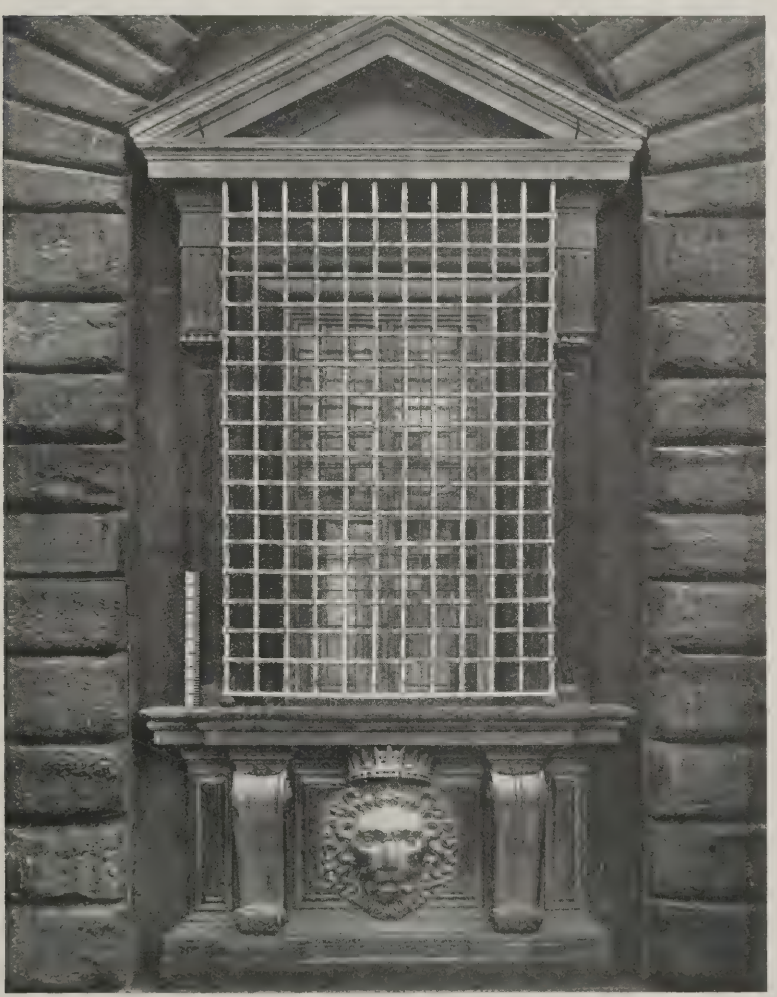
THE ARCHITECTS' JOURNAL & Architectural Engineer

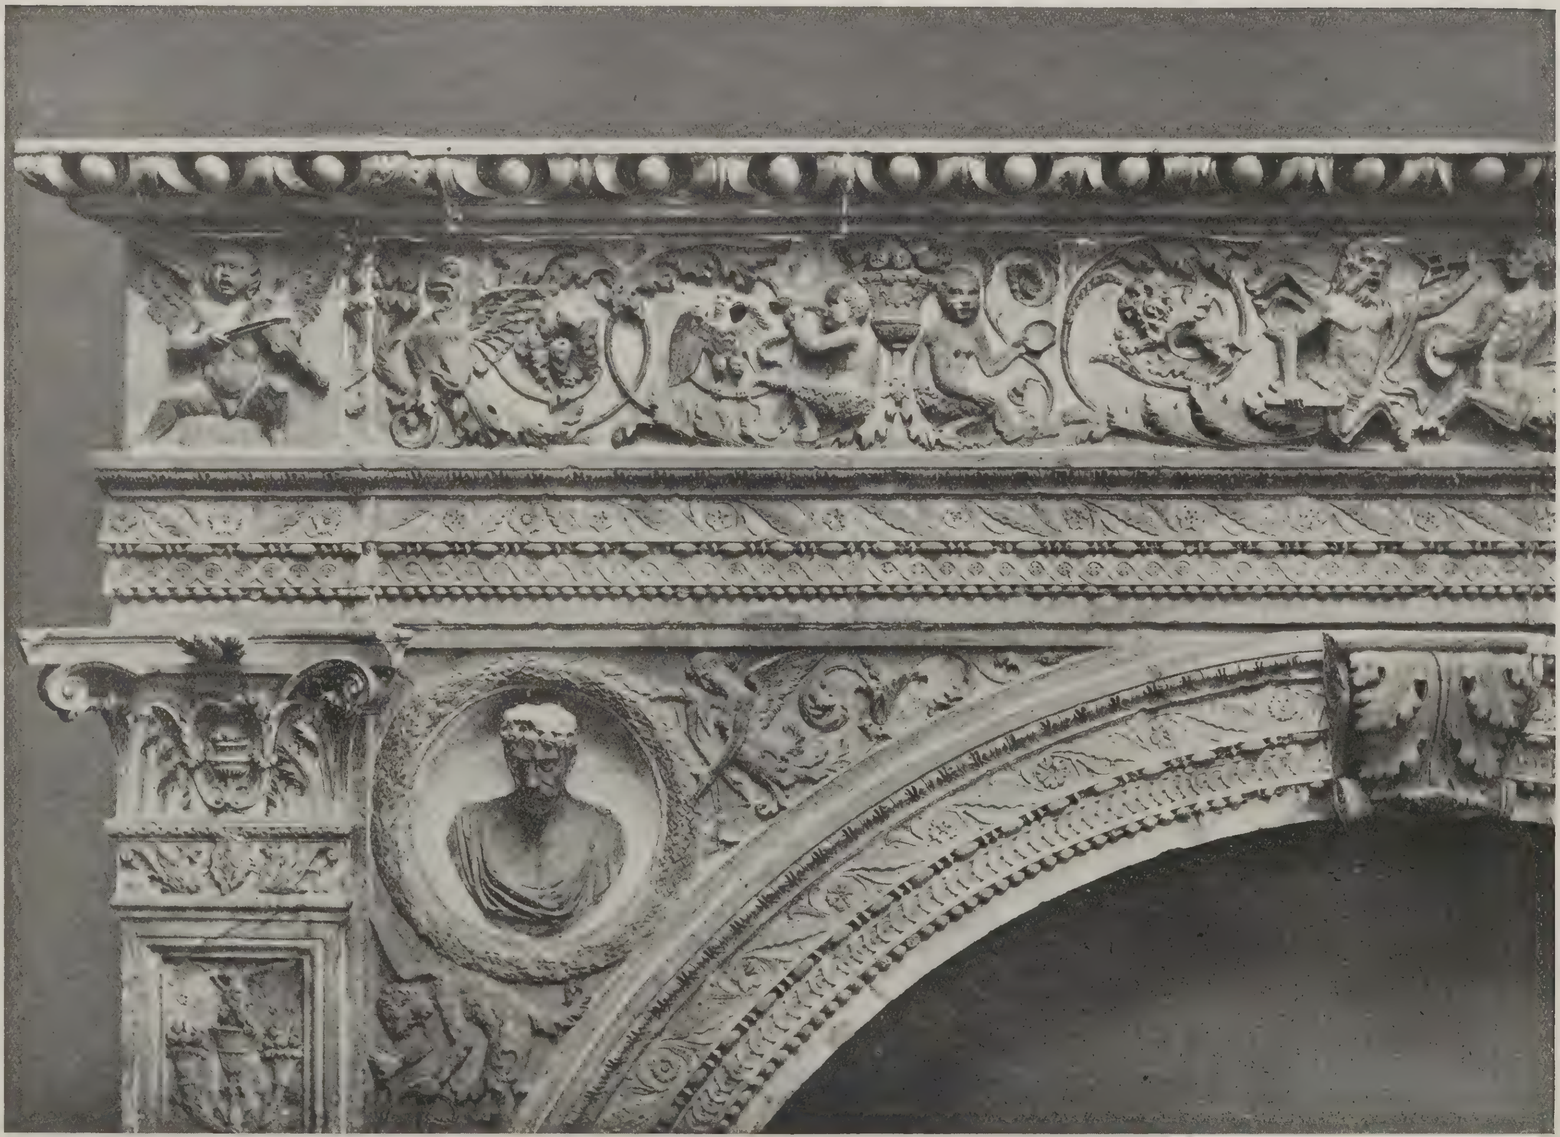
With which is incorporated "The Builders' Journal."



A WINDOW IN THE PITTI PALACE, FLORENCE,
BRUNELLESCHI, ARCHITECT.

27-29 Tothill Street, Westminster, S.W. 1.

Architectural Details. 34.—A Gateway from Ghedi, Brescia



This Gateway belonged originally to the palace of the Counts of Pitigliano, at Ghedi, in the province of Brescia, and is now in the South Kensington Museum. It is constructed of Istrian stone, parts of which have been restored, the busts and medallions being modern work. The detail, however, which is original, is extraordinarily interesting. It is full of vigorous energy, and seems to be animate with that elfish zest which we usually associate with the spirit of the Gothic craftsman.

THE

ARCHITECTS' JOURNAL

Wednesday, September 27, 1922 Volume LVI. No. 1447

Architects and Compulsory Town Planning

WHEN Sir Charles Ruthen made his startling indictment of the architectural profession earlier in the year, which put the whole profession up in arms against him, he was in reality exaggerating out of all proportion the possible truth that the study of the economical provision of working-class houses had not been brought to a highly specialized science. This was not the fault of the architect. The profession as a whole had never before in its history been faced with the problem of building working-class houses, for the simple reason that the people who had formerly considered such schemes were either authorities who were magnificently contemptuous and ignorant of the humble uses of the architect, or speculative builders who were simply trying to exploit the working classes. When, therefore, the Government launched its great housing campaign, the architect was to a certain extent in a foreign element. His difficulties were enormous. Co-operation with a municipal body is often a difficult matter, but when that body is harassed by a regional office which in its turn is acting under a constant flow of contradictory orders from ministerial headquarters, it is indeed a case of big fleas and little fleas, and it is not to be wondered at that the architect found his position far from pleasant, his remuneration far from adequate, and the problems of his work almost impossible of solution. The farcical and impertinent assertion was then put about that he was inefficient, an assertion readily disproved by making a comparison between those housing schemes which are the work of qualified architects and those which are not. In the interests of the nation and the profession it is essential that there be no repetition of these conditions in connection with the compulsory town-planning schemes which many local authorities are obliged to prepare.

Since the International Conference on Town Planning, which was held under the auspices of the R.I.B.A. in 1910, the subject, which hitherto had been in the hands of a few specialists, has received more and more attention until now it figures on the curriculum of every school of architecture. Moreover, many excellent books have been published dealing with it from every aspect, and a flourishing society exists, composed of members who are specially interested in the matter, which has discussions and publishes a town-planning journal. It is to be presumed, therefore, that it is a subject with which every architect is to some extent familiar. Owing to the ever-increasing complexity of modern life specialization is essential. The architectural profession, no less than the medical, has its general practitioners and its specialists, and there may well arise certain complex schemes of regional planning which the ordinary practising architect may not feel competent to undertake. Nevertheless, he should be sufficiently familiar with the subject to carry out the necessary investigations, and draw up a scheme which does not call for very highly specialized knowledge such as might be necessary in any particularly congested industrial area.

Unfortunately, architects rarely take a prominent part in local affairs. We imagine that the number of architects who are members of their parish, rural, urban, or borough councils is exceedingly small. Yet in the council chamber or on committee their experience and knowledge would be invaluable. Much of the popular misconception as to the *use* of the architect is due to his own lack of prominence in public affairs. The day of the well-informed and cultured patron is passing, and the architect has to rely more and more for employment upon commercial concerns and municipal bodies, and the latter particularly are apt to think that anything appertaining to building or land development in any of its multitudinous ramifications should be at once referred to the municipal surveyor, and that the retention of independent outside advice is a waste of public money.

Many of the matters which municipalities are now handling do not come within the province of the district surveyor's duties. Frequently the surveyor himself would infinitely prefer that the matter should be referred to experts, but fear of appearing incompetent or unwilling prevents a frank admittance of inability or a furtherance of a request for the work to be given to a qualified architect. The preparation of a scheme calls for a particular kind of collaboration between the staff of the municipality and the outside architect. The former must collect the necessary data—and for this the co-operation of the surveying and medical branches of the municipality are required—and the latter must collate these facts into a comprehensive scheme. When the time comes for the execution of the work the services of the surveyor are once more required for supervision, ordering materials, connection with, and alterations to, existing drainage and street lighting systems, and similar matters with which he is obviously more able to deal.

For the most part town planning is a matter which the local architect rather than the outside expert should be most competent to handle, for reasons which become apparent if we once more seek an analogy from the medical profession, which shows us that the family doctor, thoroughly familiar with the medical history—to use an army phrase—of his patient, is of more use for the ordinary ailments of the body than the outside specialist. The local architect knows the topography of his town, its historical monuments that must at all costs be preserved, its unhealthy areas, its points of traffic congestion, the comparative rateable values of its various districts, the most suitable positions for development as factory sites, shopping areas and the like. These are all points which an architect assimilates without special effort from his daily surroundings, and combined with this knowledge, his special artistic training enables him to suggest methods of grouping and placing buildings, of designing the curves of his roads on a definite preconceived plan that will yield vistas, climaxes, axial terminal points, instead of indulging in aimless tortuousness.

Unfortunately, however, there are many municipal authorities who fail to realise the importance of æsthetic considerations, and consider that town-planning is merely a matter of creating new road frontages—a matter that can safely be left in the hands of the local surveyor. And this suggests yet a further reason for the desirability of qualified architects securing the work. We have all both heard and read unflattering and detrimental remarks concerning the architect on account of those hundreds and thousands of small late nineteenth century houses, which are bad both in plan and elevation, just because no architect had a hand in them. This ironical situation will arise again in connection with town planning, and a subsequent generation will blame architects for ill-considered work which is none of their doing.

Much of the work in connection with the compulsory town planning will already have been put in hand, and where no start has yet been made it doubtless figures on the agenda of an early meeting in the council's autumn session. It is in the interest of everyone to see that this work is secured by men who are competent to deal with it. In achieving this end the architect himself can do most.

Reform the Water Board !

London should at once set about getting its Water Board reformed. It is abundantly clear that The Metropolitan Water Board has inherited bad old traditions, and is every whit as extortionate and tyrannical as were the old private water companies, which were chartered libertines in these vices, and were suffered to be so in recognition of original enterprise and of the vested interests of shareholders. But the Metropolitan Water Board is now presumably a public institution, and should be conducted in the public interest, and not as if its chief concern were to earn dividends for private investors. Yet, as traders know only too well—builders especially—the charges for water are often exorbitant, and the methods of punishment for default are primitive and barbarous in the extreme. Nor are the incidents of domestic supply less draconic. For instance, a letter to "The Times" relates this example of archaic procedure : The water-rate (£3 14s. 9d.) of a small unoccupied town house having been inadvertently left unpaid, "the roadway has been dug up and the water unceremoniously cut off without the slightest warning, and the old-lady caretaker left without water." The money having then been paid, the Board refused to re-connect until the householder should pay not less than £5 for the operation. Such freaks are too ghastly Gilbertian for a supposedly civilized city, and the Water Board should be made to smart for its crude and cruel jokes. In every instance in which it rushes in exultantly to make a dwelling-house insanitary and uninhabitable, and incidentally damages and disfigures the pathway or roadway by digging it up, the Board should be compelled to make reparation. At present, its powers are a blot on civilization, and Parliament should be called upon to bring them within the bounds of common humanity and common sense. The Board combines the privileges of the New River Company founders with the vindictiveness of the villainous old law that freely sentenced people to death for petty larceny. The ethics of the Water Board are a shocking anachronism —no less, and the Board's arbitrary powers should be brought within the bounds of reason and equity.

Architectural Trickery

A correspondent animadverts against what he calls "the slick tricks of the architectural draughtsman. Looking back over the past twenty years," he writes, "one can recall any number of trivial tricks that, after a brief spell of popularity, dropped out of use, though they still remain in evidence in our streets as examples of the foolish fashions of the near past. Many of them owe their origin to eminent architects, whose mannerisms are quickly copied by the empty-headed. The Norman Shaw 'pediment-and-poker' motif had quite a vogue for a time, but it is never done to-day. Then there was that extraordinary type of column which had circular sections alternating with square ones through the greater part of its height (the 'nut-and-bolt' style somebody aptly called it). Nowadays this is never done, not even in Suburbia. This fashion coincided with the craze for huge keystones bulging out all over the face of a building. This is seldom done to-day, though there is some trace of the fashion in the new County Hall which, of course, was designed when the giant keystone was at the height of its popularity. And then there was the pedimented window era, which, perhaps, has not yet altogether passed away. At one time no window was considered respectable without a pediment supported on small columns. And who does not remember that meaningless piece of trickery, the pendulous drop, which emerged from the face of a building wherever there happened to be room for it ? What unworthy tricks, too, have been played with capitals. It must have been a very depressed architect who first conceived the idea of turning the volutes of the Ionic cap upside down ! One could go on like this endlessly about the past. But are we doing any better to-day ? Looking at many of our recent buildings, I cannot honestly say that we are. The giant order, as used to-day, is merely a passing fashion, and a pretty useless and expensive one at that ! When funds will not run to an order, the almost invariable practice is to substitute a pilaster treatment, which is equally dismal and meaningless. If neither order nor pilaster is employed, then the prevailing fashion is to play absurd tricks with mouldings and panelled surfaces. Never do we seem to solve a simple problem of solid and void in a simple way. There is too much straining after effect and too little reticence. With all of which we find ourselves in complete agreement.

The Lead Paint Question

It is announced in "The Daily Chronicle" that although the prohibition of the use of lead paint on the interior of buildings does not come into force until six years hence, the British Government is already taking preliminary steps to effect the change, which cannot fail to have far-reaching consequences. If the use of lead paint is prohibited, all the lead-producing and lead-using industries will be seriously affected, and some of them will be hardly able to carry on at all. Is there sufficient reason for inflicting all this injury on industry ? In a letter which will be found in our correspondence columns this week, Mr. E. M. Johnson, chairman of the White Lead Makers' Section of the London Chamber of Commerce, contends very ably and temperately that total prohibition of the use of white lead is unnecessary and undesirable. He holds that the case could be quite adequately met by the enforcement of proper regulations and precautions in the use of white lead. It would appear to be the abuse of the material, rather than its use, that causes all the mischief laid to its charge; and the introduction of waterproof sandpaper for "rubbing down" obviates the chief menace to health from the use of lead paint. The chief danger seems to arise from the paint-dust distributed in dry rubbing, a process that may now be abandoned, since the new waterproof sandpaper has been, we understand, tried and found satisfactory by many eminent master painters, Home Office experts, and operative painters. Other precautions are usefully indicated in Mr. Johnson's letter, to which the reader is referred for a very clear statement of the case. House-painters are clearly in favour of the retention of white lead. In a lecture delivered by Sir Thomas Oliver, M.D., in 1914, at the Royal Institute of Public Health, the lecturer stated that, in reply to questions on the relative merits of zinc white and lead carbonate, forty-three out of forty-five master-painters "expressed themselves in favour of white lead for the exterior of buildings; while for inside work seventeen preferred zinc white to lead."

Brightening Burnley

By F. R. JELLEY

EXPONENTS of up-to-date advertising claim to have developed their methods to the level of a fine art, and although their activities may not altogether commend themselves to practitioners of that comparatively obscure and antiquated art of architecture, it is impossible to refrain from admiring the energy and ingenuity with which the modern advertisement contractor pursues his objective.

With Pistol he says, in effect, "the world's mine oyster," and concentrates, in a jovial kind of way, on opening it up as a huge background for the display of trade signs and announcements. He scribbles information concerning custard powder or brass polish on the sky, and jots down bright ideas on the pavements. He drives members of the architectural profession to despair by cheerfully appropriating the façades of their completed buildings, and transforming them into advertisement hoardings. Even amidst the most rural surroundings his memoranda are ever at hand, warning the forgetful wayfarer to beware of imitations of everything from bottled beer to boot polish.

He is, in short, the commercial prototype of the imaginative small boy with a piece of chalk in a street where there are lots of blank walls and no policemen.

Opinion may be divided concerning the maximum dead load that the exterior of any building will take without ceasing entirely to masquerade as a mere façade and blossoming forth as a fully developed hoarding. But it will probably be agreed that, at the present time, what may be termed the offensive method of using buildings as a medium for the display of advertisement is far more in evidence than the legitimate method.

It is offensive, for example, to contemplate a building with a slated roof, if the slates are marked with yellow letters five feet high urging upon passers-by the desirability of eating pickles. It is offensive to contemplate a tithe-barn to whose weather-beaten walls are affixed large enamelled tin plates with superscriptions inviting all and sundry to purchase baking-powder. But it is certainly not offensive to come upon the hanging sign-board of an inn, or the projecting sign of a banker or a gold-beater or a tea-man, or even the traditional trade sign of a barber or a pawnbroker.

The recent announcement that the Burnley Town Council has decided to levy a tax on all projecting signs will therefore come as a distinct surprise. It is possible that there are no advertisement signs in Burnley that do not project, and that the elected representatives of that town are determined to preserve the architecture of the streets in all its virgin purity. It is credible that the outward walls of Burnley are not decorated with gigantic portraits of tooth-brushes or immense representations of tins of deep-sea salmon, and that the main approaches to the town by road and rail are not lined with enormous inscriptions extolling the merits of hygienic underclothing or Sunday newspapers or furniture on the easy payment system. If such is indeed the case, then the inhabitants of Burnley are to be congratulated on their unique situation.

On the other hand, it is possible that the astonishing decision of the Burnley Town Council has been reached with the ulterior motive of replenishing the municipal cash-box, in which case its efforts have obviously been misdirected, and can only be likened to those of a poor but very tender-hearted Government, who might endeavour to discourage big-game hunting, and at the same time increase the revenue, by imposing a heavy tax on nickel-plated peashooters.

Everyone will agree that some sort of control over the exhibition of advertisements in public places is considerably overdue. An admirable but little-known Act of Parliament of 1907 empowers local authorities to sweep away hoardings and advertisements that disfigure the natural beauties of certain rural localities. No such protective measure has apparently been considered necessary with regard to the disfigurement of buildings, and the Burnley Town Council's contribution to the solution of this problem merely penalizes the very method of advertisement that can be regarded as legitimate. If its proposal is carried into effect, it will provide the advertisement contractor with a perfectly reasonable excuse to "brighten up Burnley," in his own inimitable manner, by descending on that town in the rôle of Aladdin up-to-date and offering new signs for old; signs that do not project for signs that do; startling and sensational signs; electric signs that flash red and green and yellow messages through the night at intervals of thirty seconds; signs that will penetrate the darkest blinds and keep the townsmen of Burnley from their sleep by expatiating on the excellence of soup powder or cigarettes or pen nibs.

The decision of the Burnley Town Council has not been widely reported but, as an excellent example of how not to do it, the proposal is worthy of the greatest publicity.

It is true that by an Act of Charles II swinging signboards were forbidden, for the simple reason that they decreased the lighting of very narrow streets, and were a source of great danger to the public during gusty weather; but no one suggests either that the streets of Burnley are unusually narrow, or that the Council is prepared to tolerate dangerous signboards only on condition that they are taxed.

Instead of driving them into oblivion by the imposition of ill-considered restrictions and petty penalties, the few traditional trade signs still in use in this country should be carefully preserved and respected. None of them detract from the dignity of the buildings from which they depend; many of them are fine examples of craftsmanship; and all of them afford ample proof to those trades that are of more recent development that the most blatant advertisement is not necessarily the most enduring one.

No one will deny that the signs projecting from the banking houses in Lombard Street give a touch of interest and colour to that somewhat grim and gloomy thoroughfare. No one who knows the high roads of this country will support any movement that is likely to jeopardize the retention of an object so picturesque as the average old English inn sign. And no one will advocate any proposal to penalize a watchmaker for hanging a clock outside his shop, although everybody knows that large numbers of tradesmen who are not watchmakers also hang clocks outside their premises for advertising purposes.

The proper place for traditional trade signs is not behind the walls of museums, where nobody troubles to look at them, but on the walls of the streets where everybody can see them.

A commercial street without projecting trade signs would be as lifeless as a commercial street without people, and it is as illogical to tax all such signs because one or two of them happen to be of an objectionable nature, as it would be to fine all the people in the street because one or two of them happened to be intoxicated.

The most effective and lucrative method of maintaining the dignity of the architecture of the streets is fairly obvious.

Under existing conditions anyone who desires to do so may allow, say, a lurid representation of a bottle of sauce fifteen feet high to be painted on the walls of his premises, and the unfortunate occupants of the surrounding habitations have no redress. A luxury tax of so much per foot super per advertisement per annum on people who decorate their property in this manner may appear somewhat drastic, but a mere by-law calling upon them to abate the nuisance will hardly meet the case. The nation is undoubtedly entitled to some compensation for the increased wear and tear on its nervous system.

THE LIVING-ROOM.

Bentley Cottage, Great Missenden

By A. PERCIVAL STARKEY

THIS cottage stands in an attractive garden at Great Missenden, Buckinghamshire. Mr. Percival Starkey was the architect.

Externally the building is built of 2 in. multicoloured facing bricks, and the roof is covered with handmade roofing tiles. Special bricks have been made for the main entrance doorway, and both the main entrance door and that to the garden room are of oak fitted with wrought iron furniture, made locally. Casement windows with leaded lights have been used.

The exterior of the building is constructed of ordinary materials used in a simple manner. No ornamentation is embodied in the design, and the architect has relied for his architectural effect on the grouping and arrangement of the various parts, the use of gables, and the creation of an interesting roof shape. Due prominence has been given to the main entrance by projecting it forward, carrying it to the first floor, and providing it with a gable finish. The main entrance is approached through a gateway, with brick piers, and up a crazy pathway. The simplicity of the chimneys is particularly pleasing. On the elevation to the garden a garden room has been secured by carrying down the main roof to the first story.

Practically the whole of the ground floor is occupied by the living-room and the kitchen-scullery. The living-room is approximately 24 ft. long by 15 ft. wide. The kitchen-scullery is well supplied with cupboards, and in the recessed portion of this scullery a table has been fitted.

From the kitchen access is gained by means of a covered way to the tradesmen's entrance, fuel, tools, etc., and to a fruit loft over the outbuildings.

On the first floor there are three bedrooms, a bathroom, and boxroom.

Messrs. Geo. Biggs and Sons, of Great Kingshill, High Wycombe, were the builders, and the leaded lights were supplied by Messrs. Henry Hope and Sons.

The Science of Architectural Acoustics

The Present Position

It is strange that a subject of so much practical importance as architectural acoustics should hitherto have received so little scientific attention in this country. Much useful information on it, however, is now available and we give it below together with a brief resumé of the remarkable investigations by the late W. C. Sabine, of Harvard, the great pioneer in architectural acoustics.

ARCHITECTS are often accused of defective knowledge of the science of acoustics in so far as it relates to audibility of the human voice in buildings.

To blame the architect is quite in accordance with old-established precedent. For any fault that can be found "on, in, or about" an important new building the architect is always blamed liberally, but by no means generously. Blame for "poor acoustic properties" has been laid at the door of all the most eminent architects of yesterday and to-day—Wren and Street (for St. Paul's Cathedral and the Law Courts are undoubtedly extreme cases) are notorious instances; the Houses of Parliament are by no means ideal speaking chambers; and eminent American architects have been occasionally subjected to the same ordeal by sound in respect to certain buildings of their design. Indeed it was largely owing to the initiative of American architects that scientific investigations were first set afoot.

Until now, the architect has had little or no assistance from the English man of science in the matter of applied acoustics. English science could not tell him quite definitely why in some rooms voices were clearly audible, while in others speaking could not be distinctly heard; and foreign literature on the subject has not received the attention it merits. Empiricists had made a few hesitating assertions as to the acoustic effects common to certain shapes, surfaces, dimensions, proportions, but in this country the data thus put forward were not ascertained with anything like scientific precision; and up till now the first and last manual on the subject that has been published in England is Mr. T. Roger Smith's "Acoustics in Relation to Architecture in Building." It was published in 1876, and a second edition was published in 1895. And Mr. Roger Smith was an architect, not a professed man of science.

It was in 1895 that Mr. Wallace C. Sabine, A.M., then, or subsequently, Professor of Physics and Lecturer on Architectural Acoustics in Harvard University, began to make his famous scientific experiments and ascertainments. In

THE CLOISTERS, NEW COLLEGE, OXFORD.

(See the Measured Drawing on the opposite page.)

1900 he wrote in the technical Press an important series of articles dealing with his studies of the phenomena of reverberation and cognate subjects. During the next five years he extended his inquiries into the phenomena of the musical scale, and in June, 1906, he published the results in the Proceedings of the American Academy of Arts and Sciences. Other contributions of his relating to the science of acoustics as applied to buildings are to be found in the "Engineering Record" of 1900 and 1910; the "American Architect" of 1900 and 1913; and "The Brickbuilder" of 1914 and 1915, while he contributed to the "Architectural Quarterly" of the University of Harvard an article on the correction of defective acoustics in completed buildings.

Professor Sabine gave much attention to the acoustical effects of peculiarities of form in buildings, and to the causes of variation in audibility in various parts of an auditorium. His general advice on completed buildings was that the treatment should be "medicinal rather than surgical"—that is, there need be no radical change in form, dimensions, positions of wall-surfaces, nor changes in the heights of ceilings.

In the above-mentioned English manual—a gallant, but not altogether successful attempt to fill a yawning chasm in technical literature—Professor Roger Smith had discredited the familiar device of stretched wires "to break the echoes," and Professor Sabine denounced that old-time expedient as being utterly valueless, having no scientific justification and showing no record of successful use. Nor did he put much faith in the use of the sounding-board, the value of which, however, he did not absolutely deny, while declaring it to be much overrated; the remedial effect being apparently proportionate to the size—the bigger the board the greater the effect—within certain limits, of course.

Some of Professor Sabine's methods of dealing with defective buildings may be here briefly recapitulated as being quite interesting, and no doubt of some practical utility also. At the Congregational Church at Naugatuck, a smooth cylindrical ceiling was corrected by breaking up its smooth surface into a series of coffers of sufficient depth to prevent the sound from travelling along a focal line.

In the House of Representatives in Rhode Island State Capitol, the walls of the room were of stone to about half their height; above that they were of stone and plaster, and there was a coffered ceiling. Professor Sabine's diagnosis of the case was that sound striking a side wall was reflected across the room to the opposite wall, and then back again, and thus to and fro, mounting gradually until it reached the ceiling, whence it was reflected directly down upon the audience. Sound meeting only feebly absorbent surfaces came back rather slowly, confusing the ear. The remedy applied was that of diminishing the reflecting power of the side walls by placing suitable felt on the plaster walls between the engaged columns, and covering the felt with decorative tapestry. The remedy was effective, and the decoration was pleasing.

The lecture-room of the Metropolitan Museum of Art, New York, had become notorious as "the Hall of the Seven Echoes." The hall was semicircular, the platform being nearly, but not wholly, within a broad but shallow recess. The auditorium was surmounted by a spherical ceiling with short cylindrical extensions following the straight side walls, while in the centre of the ceiling there was a flat glass skylight. Reverberation of sound was excessive, resolving itself by focusing into a multiple or sevenfold echo. Remedy: Ceiling coffered, and the semicircular wall at the rear of the auditorium fitted with panels, which were filled with felt over which burlap was stretched.

These cases are seen to have been comparatively simple. Complexity arises where various shapes set up diverse reverberations, each space "pouring sound into and receiving sound from others," as Professor Sabine expressed it. Cathedrals, he observed, commonly present in varying degree the geometrical complications which lead to excessive echoes. The cathedral at Detroit offered an interesting problem in acoustics. The nave, broad at one end and moderately narrow at the other, represented in effect two simply connected spaces, an upper and a lower; the lower space, when filled with people, being abundantly absorbent of sound, while the clerestory part was non-absorbent. Highly satisfactory results were obtained by placing felt in the panels of the ceiling, and the felt, treated decoratively, produced highly pleasing artistic results, while the acoustic effects were entirely satisfactory; equal success attending similar treatment in other parts of the building.

In the New Theatre, New York, seating 2,300, the acoustics were greatly improved by changing the position of the twenty-three boxes, and, in effect, reducing the height of the ceiling of the main auditorium by 20 ft., an oval canopy, 70 ft. by 20 ft., being provided to obtain this result.

In generalizing on these and other cases, Professor Sabine remarked, not altogether superfluously, that sound on reaching walls in a confined auditorium spreads spherically, and is in part absorbed and in part reflected. "The part which is reflected re-traverses the room until it meets another surface, where it is again in part absorbed and in part reflected, and this process continues until, after a greater or less number of reflections, the sound becomes of negligible intensity"—dies away, as it were. The phenomenon had been until then inadequately discussed, Professor Sabine held, "owing to failure to take into consideration the phenomenon of diffraction in the propagation of a sound nearly parallel to an absorbing audience, the phenomenon of diffraction in reflection for an irregular surface, and, above all, the phenomenon of interference." The first of these three considerations is of primary importance in calculating the intensity of the sound which has come directly from the source; in calculating the effect of distance on the audience; and in calculating the relative loudness on the floor, in the gallery, and at the front and back of the gallery. The second consideration enters into the calculation of the path of the sound after reflection from any broken or irregular surfaces; and the third factor is of the utmost importance when the sounds which are crossing at any point in the auditorium are of comparable intensity and have travelled along paths of so nearly equal length that they have originated from the same element.

All honour to the late Professor Wallace C. Sabine for his admirable pioneer work in what in his time was an unexplored field. The importance of his researches is warmly acknowledged by Mr. G. A. Sutherland, M.A., of University College, London, in his article in "Science Progress" (published quarterly, price 6s. net, by Mr. John Murray, Albemarle Street, W.), for July, 1922, in which he gives the most complete and most useful account that has yet appeared in this country of the present position of what may now fairly be called the science of architectural acoustics.

By courteous permission of the publisher we are enabled to give some of the conclusions reached by the author of this important article, which architects are recommended to read in its entirety and file for reference. This is the simple explanation of the case on which Mr. Sutherland bases his thesis:—

"When a speaker delivers an address," he observes, "the sound proceeds from him in spherical waves to the boundaries of the room, unless it is absorbed on the way. At the walls it may be reflected, or transmitted, or absorbed. In general it will suffer all three kinds of treatment in relative proportions, which depend on the character of the walls. Hard and smooth walls will reflect the major part of the sound, while porous and yielding walls will reflect very little. Eventually, after successive impact on different surfaces the whole of the sound will be absorbed. The effect of reflection is twofold. If the room is not too large the first effect will be to produce the same average loudness at different parts of the room. In the case of a room 40 ft. square, reflections will occur at least twenty-seven times a second. On the other hand, if the walls are hard, little energy is absorbed at each impact, and very many reflections will occur before the sound dies out. This produces slow decay or reverberation, which is the most common defect in audience halls." In a general sense these facts are well enough known to architects; but this clear restatement and explication of them will not be the less welcome on that account.

A fact that is less familiar is that if a hall is to be used both for speaking and for music "a middle course must be steered. The reverberation must be made somewhat too long for speech, somewhat too short for music, yet fairly satisfactory for both." The building owner, therefore, should have a very definite notion to impart to his architect as to the use to which the hall is to be put—music, oratory, or either by turns. But the practical point that arises is this : "We have seen that a succession of reflections produces reverberation; in some circumstances a single reflection produces an echo, and echoes are the next most common defects in audience halls. The conditions necessary for the production of an echo are that the wall from which reflection takes place should be at such a distance from the hearer that the impressions formed by the direct and reflected sounds are quite distinct. The minimum interval that must elapse between the two effects for this to be the case is about one-fifteenth of a second, though, of course, it varies for different observers. As the velocity of sound at 15° C. is 1,120 ft. per second, this gives the minimum distance of the reflecting wall as $\frac{1120}{2\times 15} = 37$ ft. The farther off the wall, the more distinct is the echo." A curved wall "exercises a focusing action, and produces regions of undue intensification and of comparative silence; it is almost inevitably a menace to good acoustics." This matter of curved walls is the subject of a paragraph in the summary of conclusions to which we refer at the end of this article.

Mr. Sutherland throws out several useful cautions. One is : "It is assumed that perfect acoustics are to be expected when a new auditorium is modelled on an old one whose acoustics are unobjectionable. This is apparently not borne out by experience, largely because the importance of detailed conformity to the model is not realized. . . . Unless the new hall is constructed of similar materials, and accurately to the same scale, its acoustics will not follow those of the model. . . . And even though the proportions be the same, any great difference in size will alter the acoustics markedly in certain respects." It therefore follows that acoustics have been often either better or worse for the rebuilding of a hall. Mostly the change is for the worse, because, while the main characteristics of a hall that originally was acoustically satisfactory have been faithfully followed, there has been, in the rebuilding, some alteration of a detail that was not suspected of the vital importance actually inherent in it. Any great difference in size and the tendency is almost invariably to build larger—"extension of premises" being the familiar phrase—or any change in the character of the materials of construction, or even some rearrangement of the fittings or hangings, or alteration in the nature of their substance or surface or texture—any altered conditions such as these may considerably affect the acoustics of the hall.

A passage in which Mr. Sutherland gives a clear and terse exposition of the general principles underlying the cure of reverberation must be quoted for the light it sheds on the whole question : "The general principle underlying the cure of reverberation is the introduction of material which will absorb the sound. The reverberation in an empty house is notorious, and the improvement effected by hanging heavy curtains is also a matter of common knowledge.

"The reason is clear when one considers the nature of sound. Sound is a form of energy. It cannot be destroyed, it can only be converted into some other form. Some will escape through open windows, some will be used in imparting mechanical energy to the walls, some will pass directly by friction into heat. A hiss is very soon killed by air friction, and the frictional effects are increased by the presence of porous walls and hangings. It is only by true dissipative forces such as viscosity that sound can be so converted. No mere modifications by the introduction of irregularities are of any avail in this connexion. The breaking up of smooth surfaces by relief work may eliminate echoes, but it does not cure reverberation unless the total absorbing surface is increased by the breaking up. The sound is still present, and must be converted into energy of another form before it can cease to be heard."

Mr. Sutherland cites W. C. Sabine's famous experiments (too little known in this country, however) with the organ-pipe and cushions. Professor Sabine ascertained with a chronograph the time that elapsed under varied conditions before the sound from the organ-pipe became inaudible in the Fogg Art Museum in the University of Harvard. Cushions were gradually introduced into the hall, and their effect on the "decay" of the sound was carefully observed and tabulated. With no cushions in the room, the time of decay was 5·61 seconds, and the time was affected by the gradual addition of cushions until, with the presence of 213 metres of cushions, it was reduced to 2·33 seconds. The absorbing powers of various materials with the same pitch of note were then determined in terms of these "cushion-metres," with the results here shown :—

Sabine's experiments, quoted by Mr. Sutherland, give for the time of reverberation—

$$t = \frac{\cdot 164\ V}{a}$$

where *a* is the total absorbing power of the room and contents.

(If there are in the room surfaces S_1, S_2, S_3, etc., having respective absorption co-efficients a_1, a_2, a_3, etc., then $a = a_1 S_1 + a_2 S_2, + a_3 S_3 + \text{etc.}$) "This formula," Mr. Sutherland remarks, "together with the numerous values of absorption co-efficients for various substances given in Sabine's tables ["The Brickbuilder," vol. xxiii, pp. 1–6, 1914], enables calculation to be made in advance of construction, and was responsible for clearing up much of the fog that had surrounded the subject before the investigation."

Mr. Sutherland's brilliant paper in "Science Progress" concludes with a summary of his review of the existing data relating to the acoustics of buildings, and this summary is preceded by the reassuring observation that "sufficient information is available to enable satisfactory acoustics to be ensured in advance of construction." Briefly summarized, his conclusions are :—

1. Size of room must not be excessive.
2. Curved walls almost always bad, but any doubt on the point should be settled by experimenting scientifically with a small model of the room.
3. Size and shape, and materials of construction must be carefully adapted to Sabine's formula, taking into account the prevailing conditions in the auditorium.

Excessive reverberation can be reduced by introducing suitable absorbent material and surface treatment.

A necessarily short but still valuable bibliography of the subject is appended to the paper. As this list of what has been published on the hitherto obscure subject must necessarily have cost the author considerable labour to compile, it would be unfair to reproduce it here, and for intensive study of the whole subject the reader must be referred to "Science Progress" for July, 1922, in which Mr. Sutherland's important article, with its many elucidatory diagrams and formulæ, appears.

Rebuilding Soviet Russia

By HUNTLY CARTER

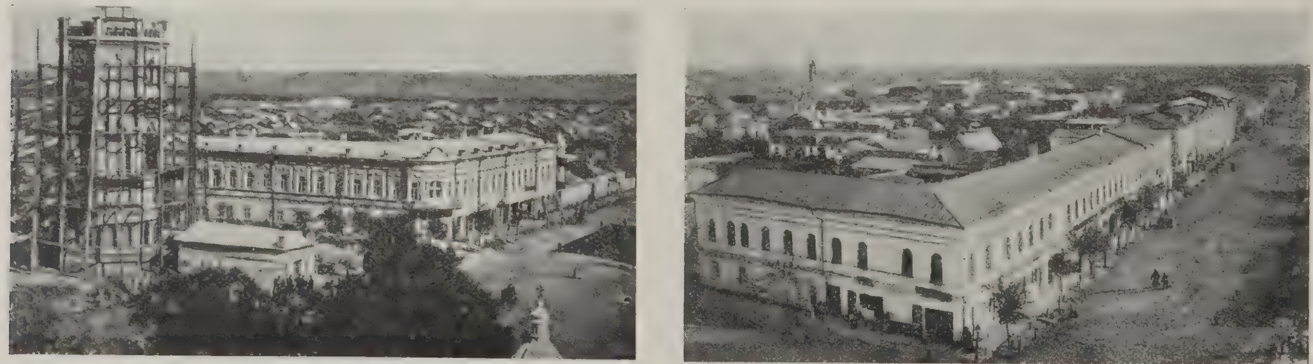
3. Rural Russia and the Famine District

I SUPPOSE a visit to the Russian Famine District to-day does not at first sight hold out much promise of a very fruitful discussion of architectural possibilities. Probably no one would dream of going to Samara, Buzuluk, Andrievka, Orenburg, and other districts marked in black on the Russian map, to ascertain whether these places require rebuilding or extending, and if so who will be required to do the work, and when, and how much pay and profit there is hanging to the job, any more than young and enterprising modern architects would dream of going to Central Africa to find out what experience and money are to be gained by building bungalows for blacks. Yet there is much that is architecturally important in a visit to the down-and-out parts of rural Russia to-day. It ought not to be overlooked that rural Russia has a population of over 130,000,000, and that this population must, if the electrification scheme of the Soviet Government is carried out, be re-housed within the next ten years, this being the period fixed for applying the scheme. And it is not fantastic to believe that a great many foreign experts—architects, engineers, and others—are preparing their plans and materials in expectation of doing business with this vast country—a country that covers a sixth of the world's land-mass. Therefore authentic information on the condition of areas to be rebuilt should be welcome

THE QUAKERS' WAREHOUSE, BUZULUK.

There is no need to say that the Famine District is not a pleasant land to visit, not one, like Canaan, overflowing with silk and money. It is more like No Man's Land during the war. But it possesses luxuries of its own. They are far too numerous to enumerate. The chief are typhus, cholera, malaria, dysentery, influenza, and plague, and a variety of disease-bearing germs and insects all capable of inoculating individuals with one or more of these diseases. Perhaps the most active of the insects is the louse. At any rate, the first thing I had to do after literally fighting my way through the horrible mass of creatures that packed every corner of the vast Moscow station was to engage in de-lousing that portion of the rolling stock which was to carry me to the black district. The second was to learn how to keep clear of the swarms of refugees, beggars, loafers, and other verminous carriers of disease who besieged the car at every step.

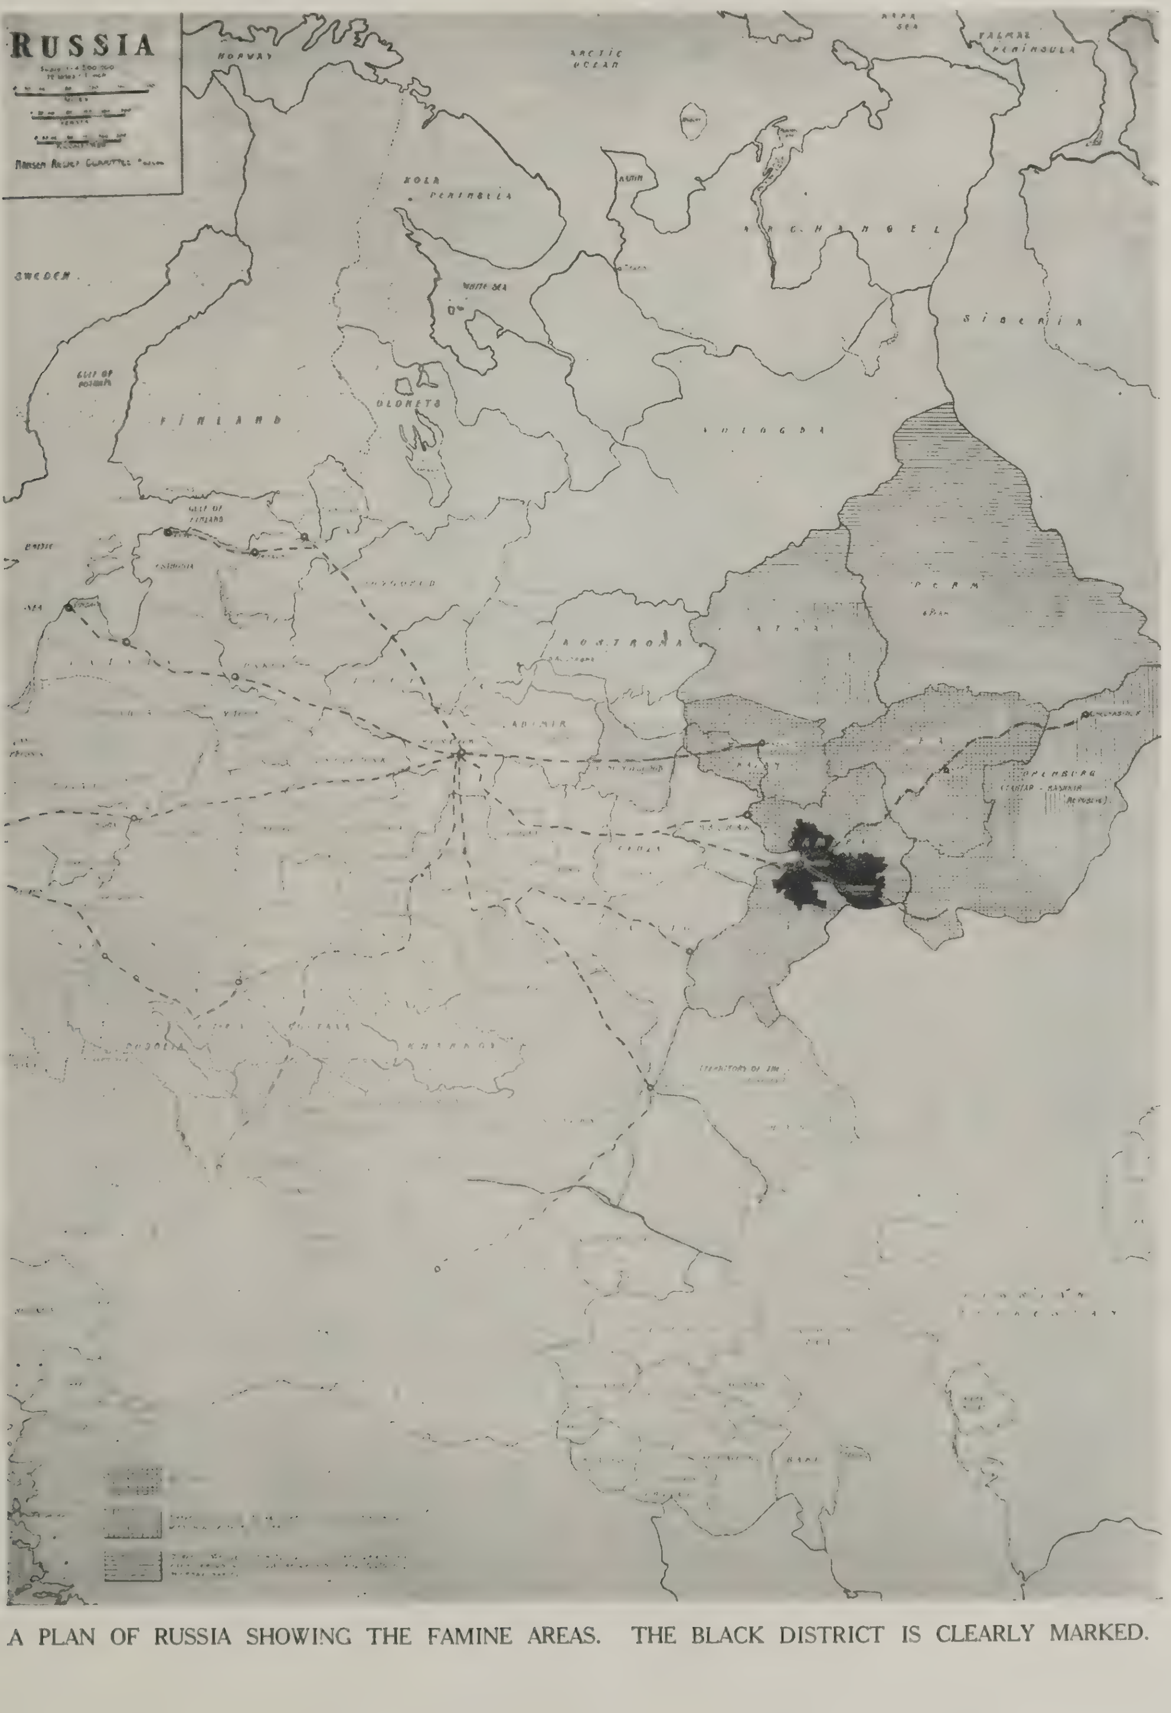
After covering the seat of my compartment with a louse-proof cloth, and squirting insect powder over everything and myself, I was at liberty to take stock of my surroundings. In the course of doing so I made some curious architectural discoveries. One was that to-day the Russian rolling stock fulfils more architectural purposes than is imagined by people outside Russia. Indeed, the Russian cars form portable architecture capable of three or four



TWO VIEWS IN BUZULUK, THE CENTRE OF THE BLACK DISTRICT ITS POPULATION HAS BEEN REDUCED BY MORE THAN HALF.

distinct divisions. There is the Relief Administration architecture, the Refugee architecture, the Bungalow-car architecture, and so on. These architectural structures consist of sleeping cars, wagons, better-class passenger coaches, and private cars, all of which have been put to purposes which neither man nor heaven intended.

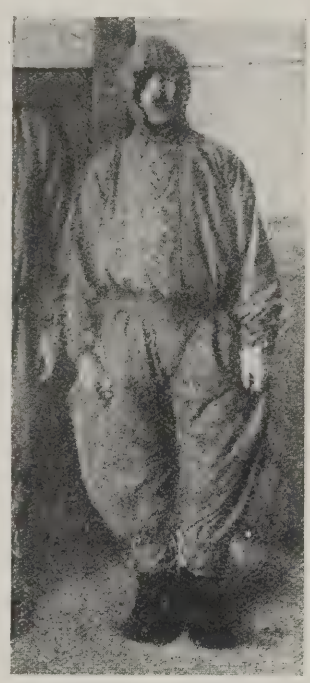
The first is the international sleeping car which has been allotted to the use of the relief workers. This car is not the luxurious affair with which the Continental Express routes have made us familiar. It has no down-like seats, snow-white bed linen, costly upholstery, pleasing decorative effects, clear bevelled windows that open and shut at a touch, tassels, soft springy carpets, shaded lights, regulated temperature, and all the modern conveniences and elegances that add so much to the pleasure of present-day travel. It is really a car-de-luxe that looks as if it has been standing in a house-breaker's yard, in all weathers, for twenty or more years. It is little better than a battered and dirty freight car divided into compartments, and containing the remains of the equipment of a passenger sleeping car. Its windows are broken, patched, and fixed, its floors bare and filthy, its upholstery old and torn away in places, its lamps broken and useless. The lavatories in the sleeping compartments are used by the profiteering guards to store fruit and potatoes grown by themselves or collected in country places. And the lavatories at each



A PLAN OF RUSSIA SHOWING THE FAMINE AREAS. THE BLACK DISTRICT IS CLEARLY MARKED.

end of the car are in such a condition that one approaches them only with shuddering dread. Their stench is over everything. In cars of this description the relief worker travels for days at a stretch. It may be said that he lives in them. For he is always travelling from place to place, and wherever he goes he is accompanied by portable bundles of bedclothing, candles, soap, and large baskets of food, also cooking and other kitchen stuff. As there is nothing on the car except bad smells and live-stock he must be prepared to do for himself. If the chance traveller happens to be without his own blanket and pillow, and has not laid in a stock of edibles and portables he is likely to be in a bad way. It may be that he is a newcomer from some of the soft countries out West, and is travelling with a trunk or two full of fancy wear. In which case he will soon find himself reduced to feeding on fancy trousers and socks, or bartering these sometime useful goods for something more digestible.

This means that there is no restaurant car on the alleged express train in Russia. There is one international sleeping car, which is attached to a long string of passenger cars, consisting of box-cars, as they are called. These are simply the well-known cattle-trucks with small portholes near the roof for ventilation, also for sightseeing if the passenger has a neck like a giraffe. In such infernos a mixed collection of human beings—peasants, refugees, soldiers, etc.—are densely packed, and men, women, and children stand, sit, and lie for days, even weeks, together. Many of these cars have been converted into portable dwellings by being fitted with stoves and other domestic appliances. These cars travel from place to place and remain stationary on sidings for long periods. Railway workers live in them and succeed in giving them a garden-suburb look by surrounding them with flower and vegetable-strewn verandas. Relief workers sometimes live in the small box-cars which they travel in. These are fitted with sheet-iron stoves with stove pipes running through the roofs, army furniture, and places for food supplies. It should be said that the wagon-dweller is common to Europe to-day. In Hungary a very great number of people live in wagons just outside the principal stations.



LICE-PROOF CLOTHES WORN BY RELIEF WORKERS IN THE FAMINE DISTRICT.

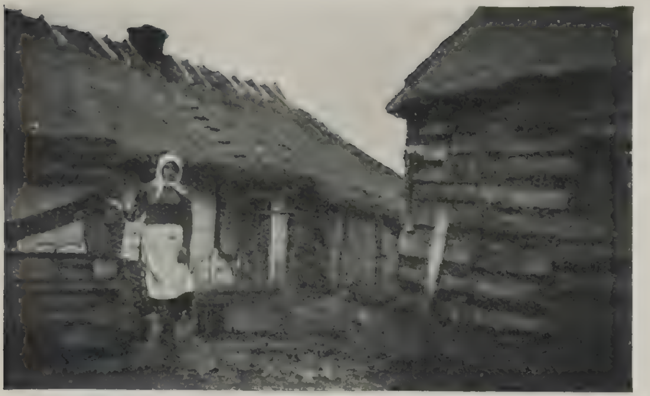
Another form of railway residence that I noticed consists of the better variety of passenger coach, which seems to have weathered the storms of war and revolution and remains in a fairly good state of preservation. This also has architectural additions of a domestic character, including improvements to the entrance and fixed steps leading to it. It is used by Communist officials.

Anyone who visited Russia before the war and saw the excellent state of the railroads and the great number of comparatively luxurious cars in use cannot avoid being amazed at the deplorable condition of the one and the almost total disappearance of the other. With the exception of the said international sleeping cars and the cattle trucks there seem to be no adequate conveyances, though it is true there is a service of tolerable trains between Petrograd and Helsingfors, in which the passenger may indulge in the use of such pre-war luxuries as soap and towels and clean attendants.

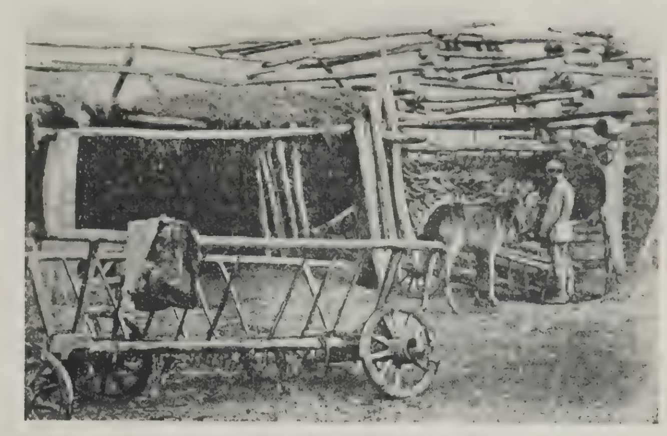
From the travelling residences one's attention passes to the railroads, the stations, and the passing peasant village architecture. Before the war and revolution the mileage of railroad was exceedingly great. I have not the exact figures before me, but, of course, it ran into many thousands. Much of this was of recent construction on the broad-gauge principle. Much was destroyed by invasion and counter-revolution after counter-revolution, and the rest was worn out by constant use in seven or eight years, during which time it was not possible to renew the deteriorated sleepers. The Soviet Government state that a good deal of railroad repair has been carried out and transport improved accordingly. One would not think so when one travels over the railroad system in Russia. The journey from Moscow to Samara, a distance of between seven and eight hundred miles, takes from three to four days. The slowness may be due to the engines, and it may not. My own impression is that it is partly due to the dangerous condition of the lines and partly to the engine. The engines, like the railroads, have suffered very badly. At one time there were 20,000 or more serviceable engines. To-day many are "dead," a great many more are "sick," and, comparatively, a few, perhaps 1,000, are in active service. The latter are wood-fed and play all sorts of tricks in the course of a journey. One of them is suddenly to desert the train in the open country and go off somewhere for two or three hours' recreation or rest. This occurs so often that finally you begin to wonder whether you are really going to Samara, or are merely out on a land inspection. In addition to these stoppages there is an interminable wait at every station, at some while the deboshed engine takes in a fresh stock of rapidly consumed wood. At each wait you are besieged by throngs of pitiable creatures—old and young—beggars, refugees, parasites, all clamouring for bread. They follow you about, tug at your clothes, beat the car windows with their fists, fall on their knees, kiss your feet, cross themselves, whine, whimper, beg, beseech, pray. "Kleb! Kleb! Kleb! Give us bread!" they cry. And you can do nothing but seek to avoid them, for you know there is death in contact with them.

I have said so much about travelling architecture that I have not much space for a consideration of station and peasant village architecture. Still, it is possible in a short space to show that both stations and villages need rebuilding. The stations are simply wooden shacks, with here and there an imposing cement structure at some important railroad centre. For instance, the stations at Samara and Buzuluk are very large and have the appearance of having been fairly handsome before dirt and dilapidation took possession of them. Moreover, they have concrete and granite platforms, a luxury which is denied to the great number of primitive-looking halts. Most of these halts are memorials, as it were, of stations that have been swept away by invasion, civil war, and revolution. Each is provided with a disgusting lavatory that stinks to heaven and far beyond. And each is hidden beneath grey, festering heaps of human forms.

The peasant villages are all of a pattern. Seen at a distance each looks like a heap of dried leaves clustering round a tall silver church. At close quarters each is seen to be the limit of dull destitution. I visited several typical villages in the Urals. They were scattered far apart and approached by roads that were simply back-breaking tracks through ploughed fields baked solid by the blistering sun. The most interesting thing about them was that they foretold vast road-making enterprises. The villages are of two degrees of importance, those with a church coming first, and those without second. The houses are usually strung on to a long, wide, curving, turf-grown main street. They are built of mud, cement, or wood, and are of two sizes. The majority are simply low-thatched, one-roomed huts, with dark, unwholesome interiors. Each interior is almost entirely taken up by a large brick stove, with a flat top that serves as a sleeping place for the family. Most of these huts are without chimneys, and it is a mystery how the people huddle together in them without being suffo-



TYPICAL RUSSIAN VILLAGE ARCHITECTURE:
1.—A COTTAGE BEFORE THE FAMINE.



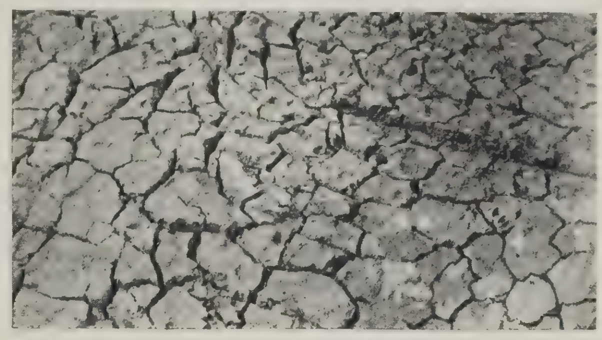
2.—THE SAME COTTAGE, WITH ITS THATCH EATEN OFF BY STARVING PEASANTS.

cated. They all have wicker lean-to sheds for cattle, farming implements, etc. The better-class houses are of pine logs, and rarely of more than one story. They are usually very elaborately ornamented with carved woodwork, the scrolls on the roofs and the screens on the windows and above the doors, and the decorative balustraded balconies giving them quite an Oriental look. In the centre of the important village, occupying a square green space, is the church, usually a very picturesque and colourful structure. The church, of course, has a religious function, and besides this it exerts a very strong æsthetic influence on the peasant.

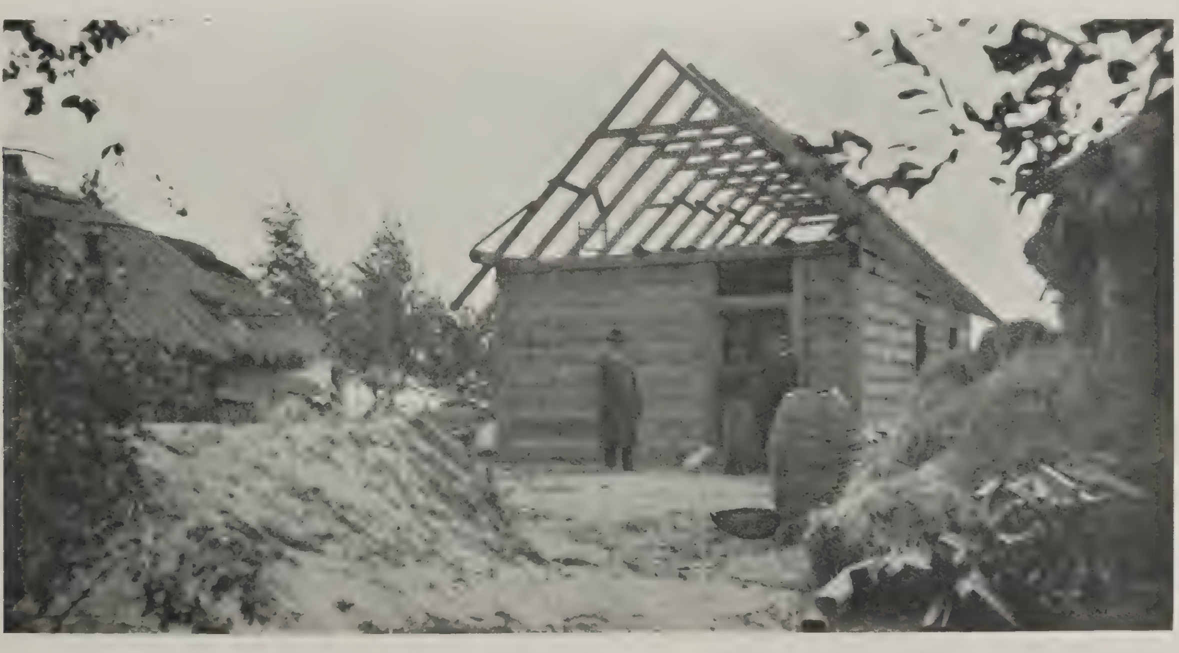
The rest is a story of the Stone Age. There is no gas, no electric light. The water is pumped from fœtid wells, and the insanitary condition of the huts would shock a Hottentot. There is no railroad communication. There is a postal delivery at long intervals, and news from the outside world comes very slowly indeed. In short, in none of these villages are there any signs of modern technical and scientific advance. But, as already pointed out, elaborate plans exist in the municipal offices at Moscow and Petrograd for converting the rural districts into garden cities, and thus carrying out reforms which were partly projected before the war, while Russia was strongly touched by the European Town Planning and Garden Suburb Movement, and partly since in harmony with the big plan of electrification.

But all these reforms, excellent as they are, must wait their turn for realization. Within the last twelve months many things have happened to put a stop to reconstruction schemes. Government resources have grown so short that theatres, factories, and places of business have been denationalized in the hope of letting them profitably to private tenants. Then the famine has played havoc with the new conception and organization of Russia.

A very great deal could be written about the famine, perhaps, on the whole, the worst Russia has ever experienced, and so full of terrible features that only a man of stone could withhold his pity from the sufferers. At the same time there is much that is indescribable. I wandered for days and days in the black area—Samara, Buzuluk, Orenburg—noting the facts of the ravages of famine, typhus, cholera, and their accompaniments. I visited the far-



THE CONDITION OF THE FIELDS IN THE FAMINE AREA.



3.—A THIRD VIEW OF THE SAME COTTAGE RECONSTRUCTED BY THE QUAKER RELIEF MISSION.

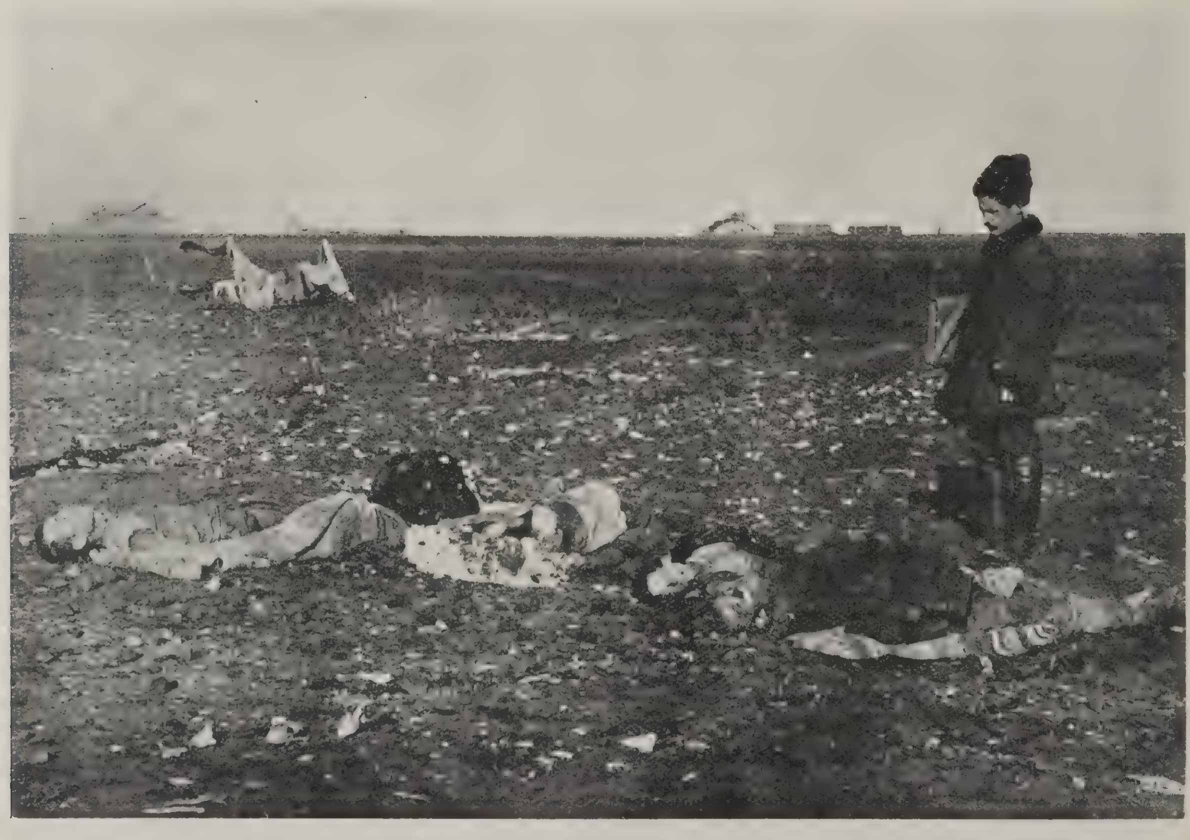
DEAD BODIES OF REFUGEES IN A STREET AT BUZULUK.

flung and distant-lying villages (or remains of them) and wrote down what I saw, or as much as my stomach, so to speak, would permit. When one sees ravenous dogs fighting over the festering corpse of a girl who has died of starvation one rapidly notes the fact—perhaps notes, too, the behaviour of the dogs disturbed at their ghastly banquet; but beyond this human observance can seldom go. The details of universal hunger which drives men and women to eat each other, parents to eat their children, domestic animals to play the part of carrion crows, and carrion crows to look as though they were floating masses of human entrails, all this no doubt fixes itself on the mind vividly enough. But the healthy mind, sickened by the sudden inrush of unaccustomed horrors, simply refuses to play its part of retaining them. One is conscious of severe mental vomiting.

It is therefore doubtful whether the most terrible facts of what I and others witnessed will ever be recorded. I have met seasoned relief workers coming out of emergency marquees and feeding centres clasping their heads and looking as though they were about to drop dead. Their faces had terrible and unforgetable expressions. Ask them what they had seen and they could not tell you. It might have been a room some 30 ft. by 40 ft., with the



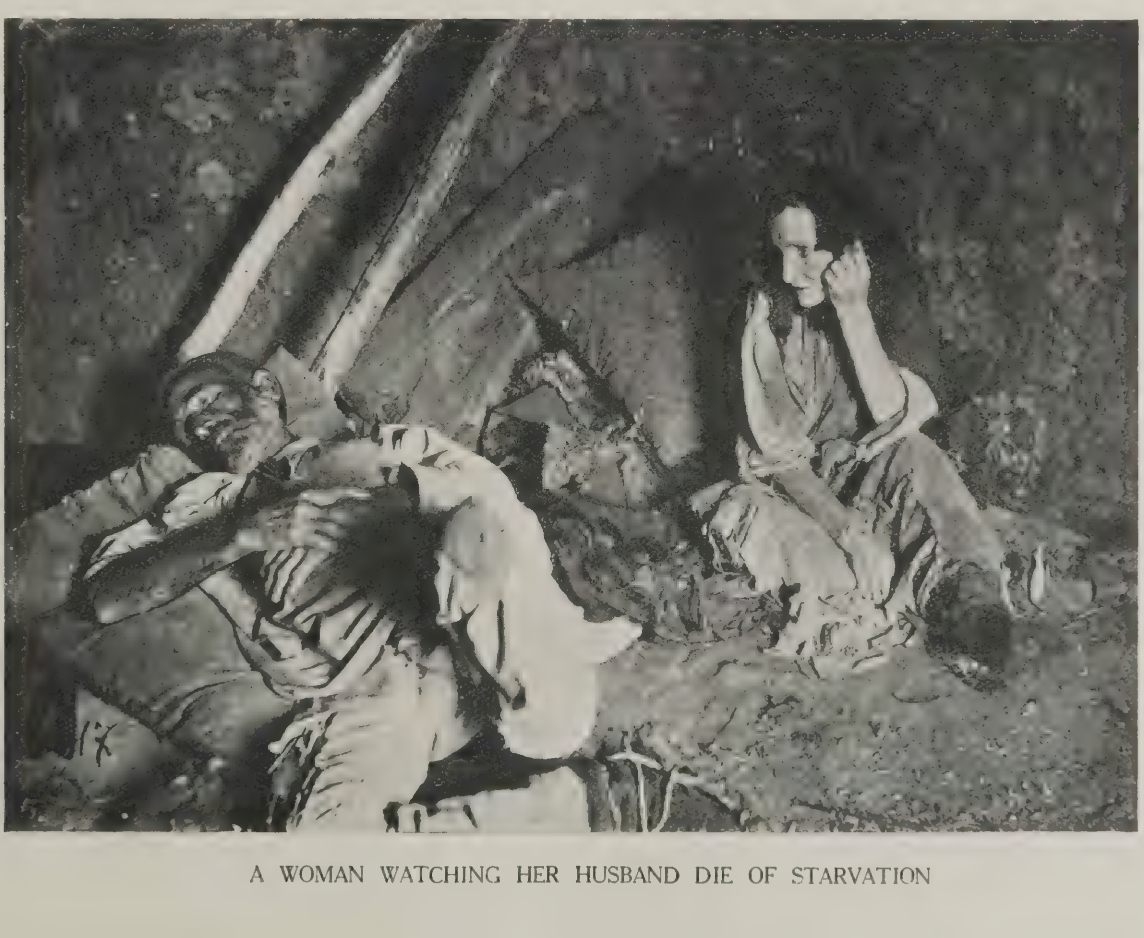
DEAD PEASANTS IN THE FIELDS. IN THE BACKGROUND CAN BE SEEN A CART, THE HORSES OF WHICH HAVE LONG SINCE BEEN EATEN.

appearance of having been of great importance once. The floor is bare and sloshy with mud and other filth. The walls are bare and reeking with water. There is no furniture. There is nothing except a shapeless mass of human beings resembling a filthy thick layer of grey rags. What one sees is really a hundred or more human beings in the last stages of starvation and disease. The low hoarse murmur of sounds, coughing, choking, sobbing, groaning, retching, even death-rattle, the air dense with the stench of rotting human flesh, the cold, clammy beads of perspiration dripping from the ceiling, and the glassy stare of dead here and there standing out from the moist grey mass—all these things are present. You do not see them, you feel them, and stagger away mentally blinded, sick to death.

A GROUP OF DEAD CHILDREN IN THE STREET.

One turns with relief from this living tomb to the morgue, formed by a shed, containing, it may be, fifty or sixty bodies piled one above the other, stark naked (for the clothes are removed from the dead and burned instantly), sprawling in every attitude, and so emaciated that they reminded me of the bags of bones of unidentified soldiers that one used to pick up at Vimy Ridge and other battlefields on the Western Front.

I fancy it was with even more relief that I turned to the cut-and-dried facts of cannibalism. The cannibals themselves treated their ghastly business with so much indifference that it put me in quite a cheerful mood. I was as cheerful, in fact, as I was after dissecting bodies for six months at a London hospital. Many of these people have been photographed with the implements they used to dismember the bodies and the uneaten parts of the dismembered bodies. To look at them one would never imagine that they were cannibals. As one of them said, "We must eat something to live. We have eaten the thatch off our roofs, the skins off the deer, and our animals. We have stewed manure, wood, leaves, everything there was, and as a last resort we have come to this. Human flesh," he continued, "is palatable, but it is very salt." He did not say how much nourishing food is to be obtained from a body that has died of starvation. All this is unequalled for horror. For the moment Russia has slipped down into the pit of famine. How long it will remain there is uncertain. Latest reports from the Famine District are not hopeful. We may take it as proved that the whole acreage of Russia requires rebuilding, but nothing can be done till the present economic situation has improved. Economically Russia does not exist; so much the worse for Europe.



A WOMAN WATCHING HER HUSBAND DIE OF STARVATION

Brookfield Estate, Highgate, London

A Housing Scheme for the St. Pancras Borough Council

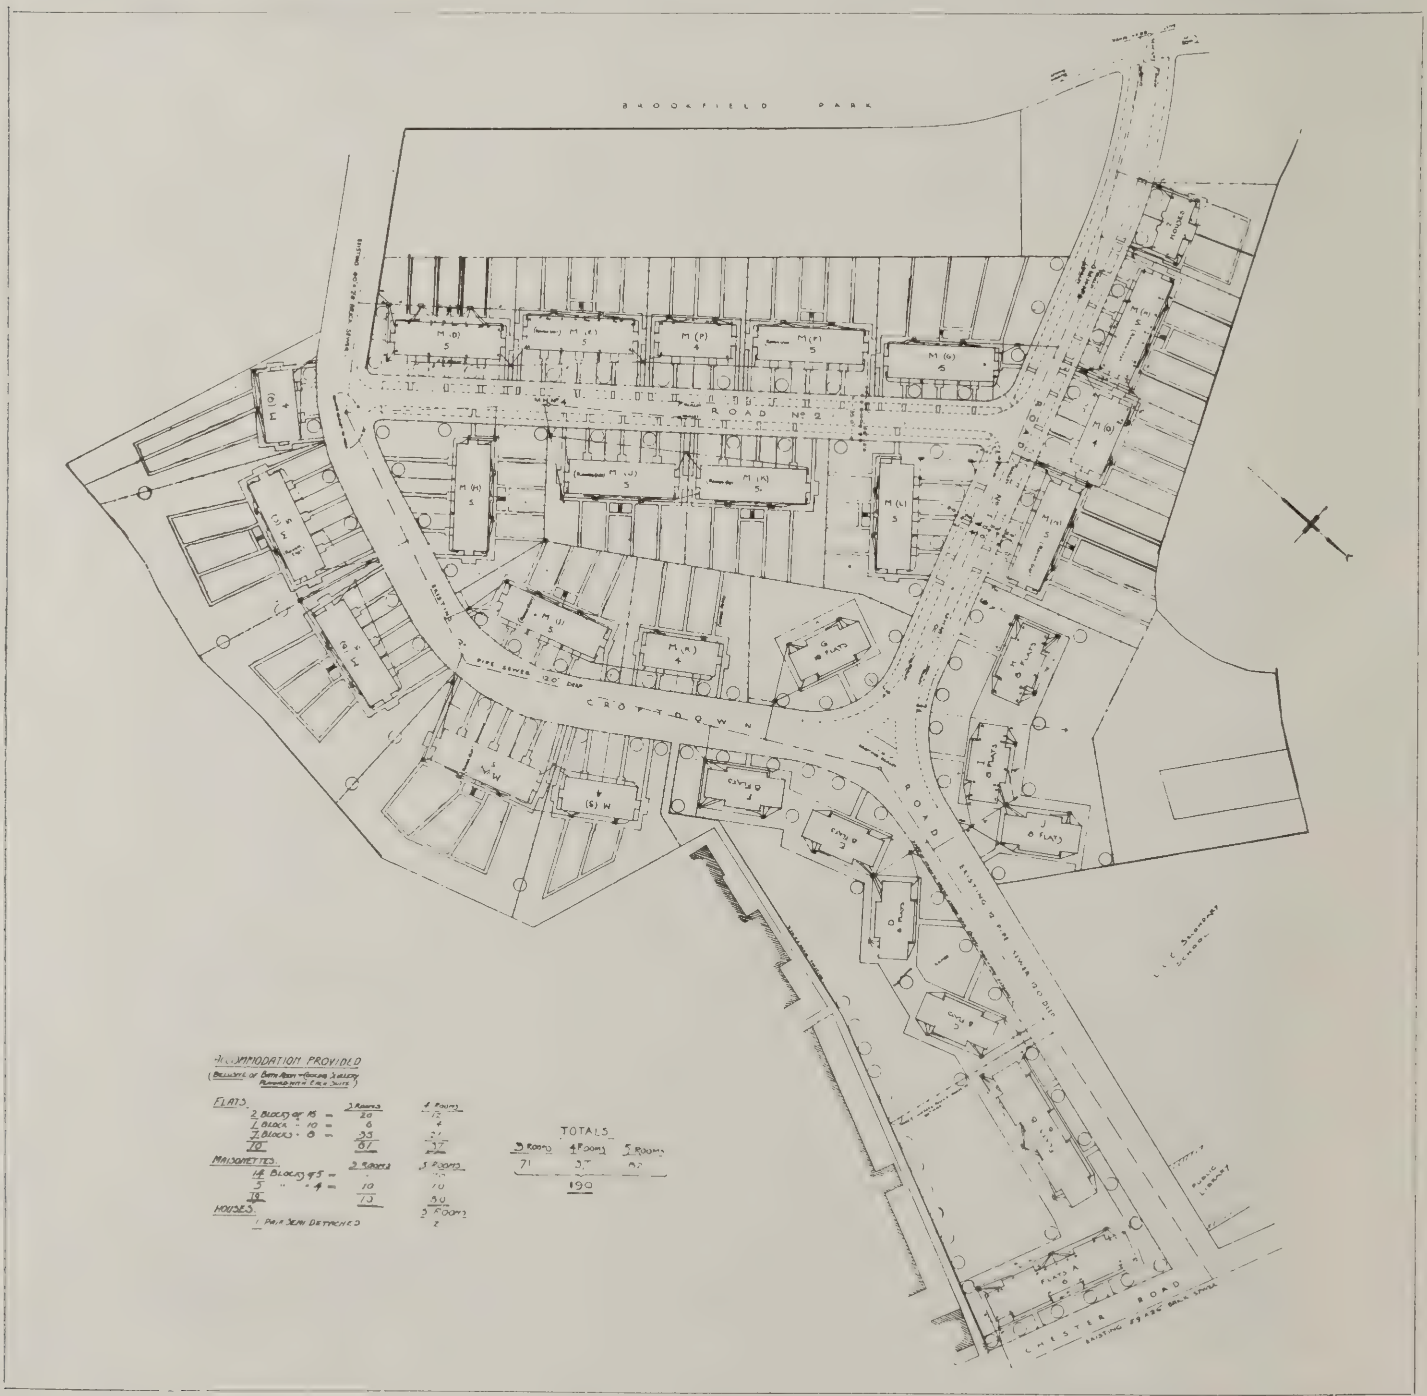
BROOKFIELD HOUSING SCHEME is now in process of completion. It has been designed by Mr. Albert J. Thomas, M.S.A., Lic.R.I.B.A. The scheme consists of three types of buildings—cottages, maisonettes, and tenements; but whereas there are only two pairs of cottages, there are ten blocks of tenements, and eighteen blocks of maisonettes.

There are seven blocks of eight tenements, two of sixteen, and one of ten, the block of ten being five stories in height—that is one story higher than any other block. The two blocks of sixteen tenements contain ten three-room and six four-room flats; the blocks of eight tenements contain five three-room and three four-room flats, and the block of ten tenements, six three-room and four four-room flats, exclusive of cooking sculleries and bathrooms. They are designed with the utmost simplicity, and line Croftdown Road from Chester Road as far as the centre square of the housing scheme.

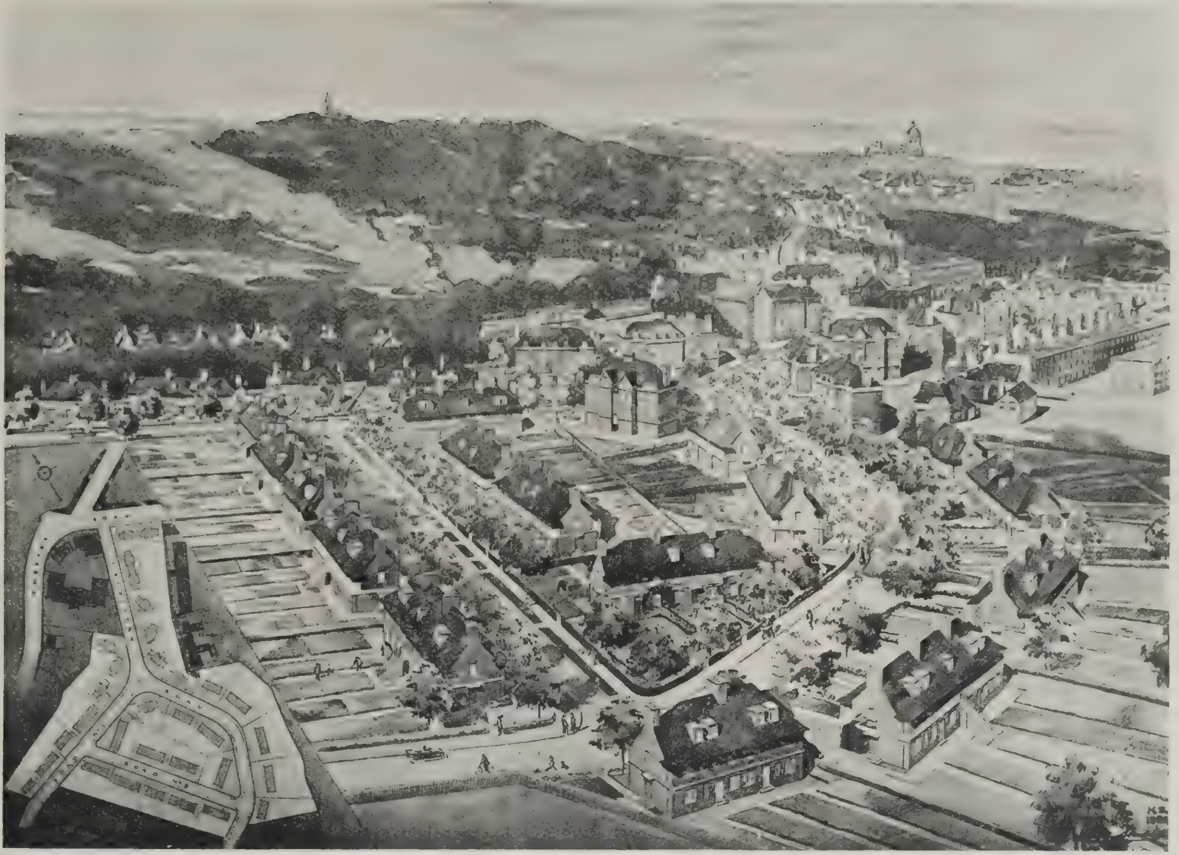
From this square two new roads branch off at equal angles. These are lined by maisonettes planned in such a way that no two directly overlook each other.

Of these maisonettes there are two types. There is a larger block consisting of five maisonettes, two on the ground floor and three on the upper floors, each maisonette having five rooms; and there is a smaller block consisting of four maisonettes, two of four rooms on the ground floor, and two of six rooms on the upper floors; all these are also fitted with a cooking scullery and bathroom.

The planning of each block is much the same. The larger block illustrated on pages 416 and 417, has three doors in



THE LAY-OUT OF THE HOUSING SCHEME.



A BIRD'S-EYE PERSPECTIVE OF THE SCHEME.

front, one at each end, and three at the back. Of the doors in front, those on each side lead into the ground floor maisonettes, their duplicates at the back acting as garden doors for the same maisonettes. The centre door in the front, however, leads straight up to the centre maisonette on the first floor, which has bedrooms in the roof, the dormers of which can be seen in the illustration. This maisonette has a back door at first floor level, its coal cellar being situated under the exterior staircase that leads down to the garden.

The two end maisonettes on the upper floors have one door only—that at the end of the building. The dormers of their bedrooms face towards the back. The smaller

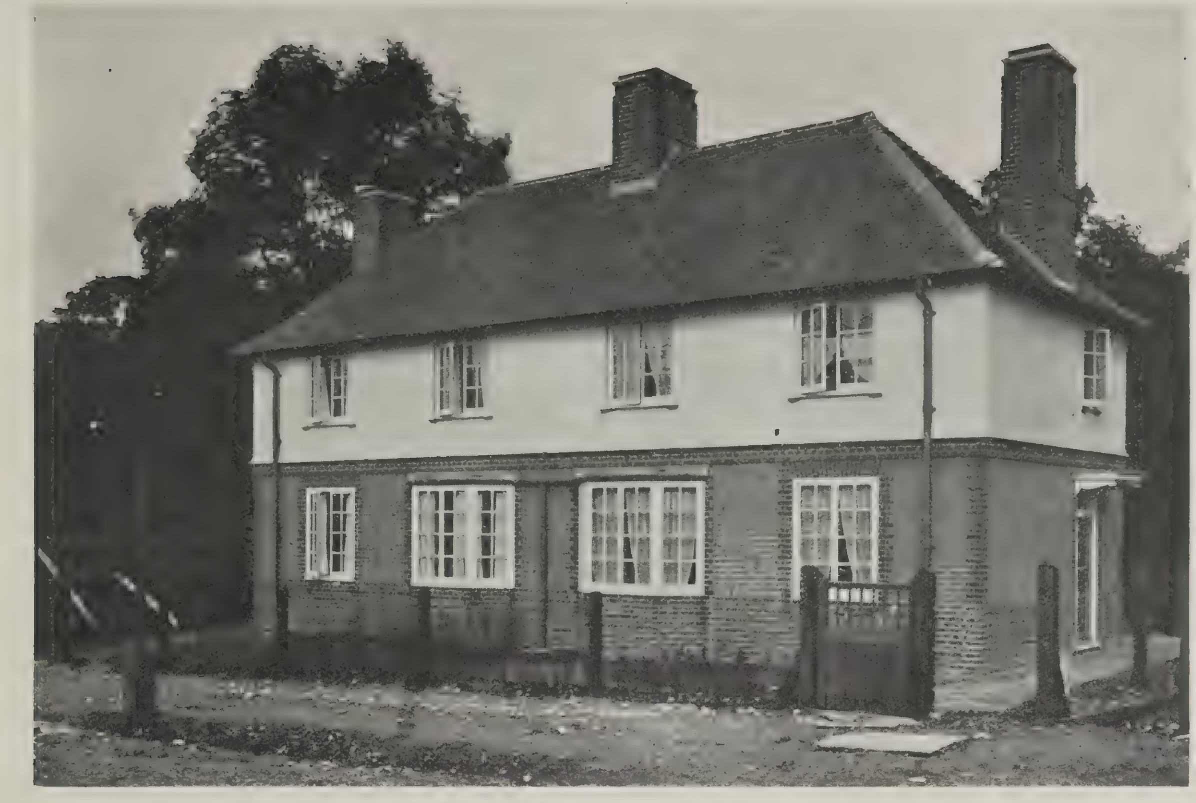
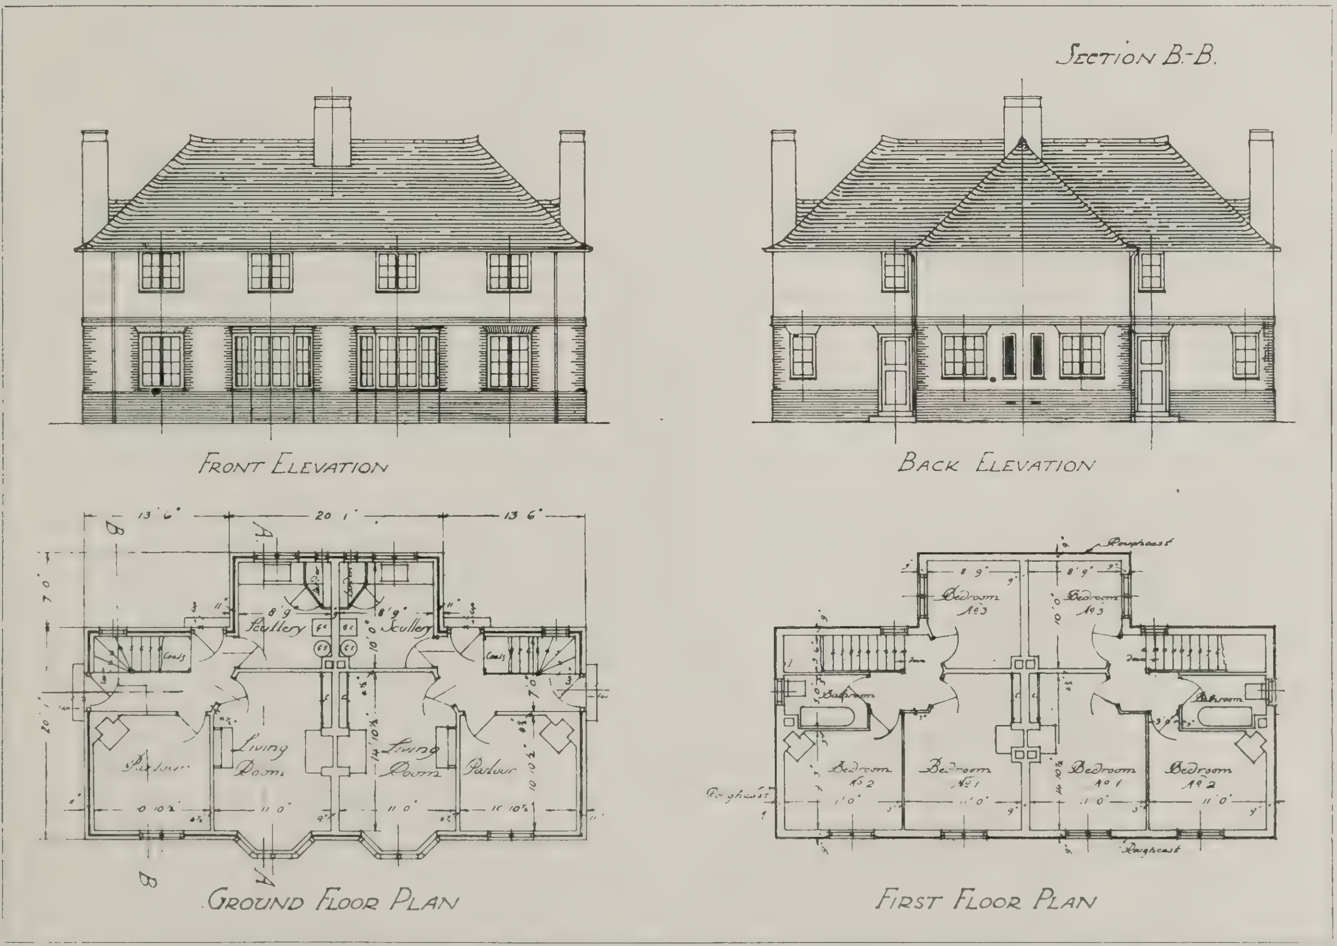
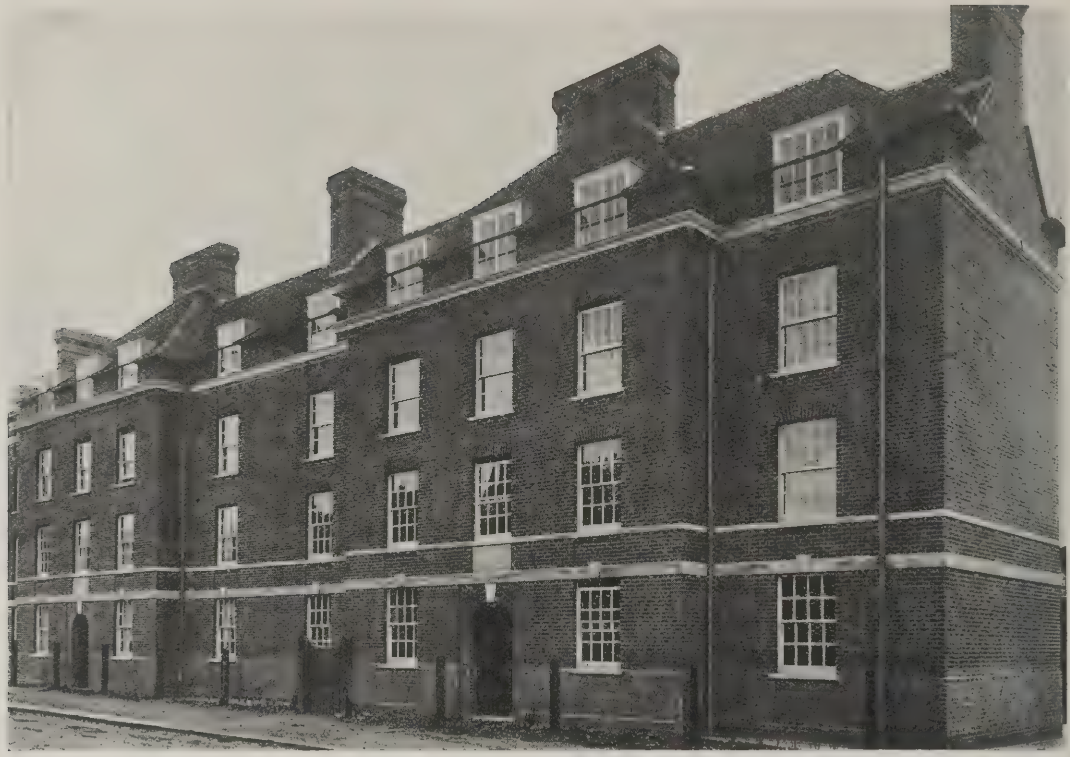
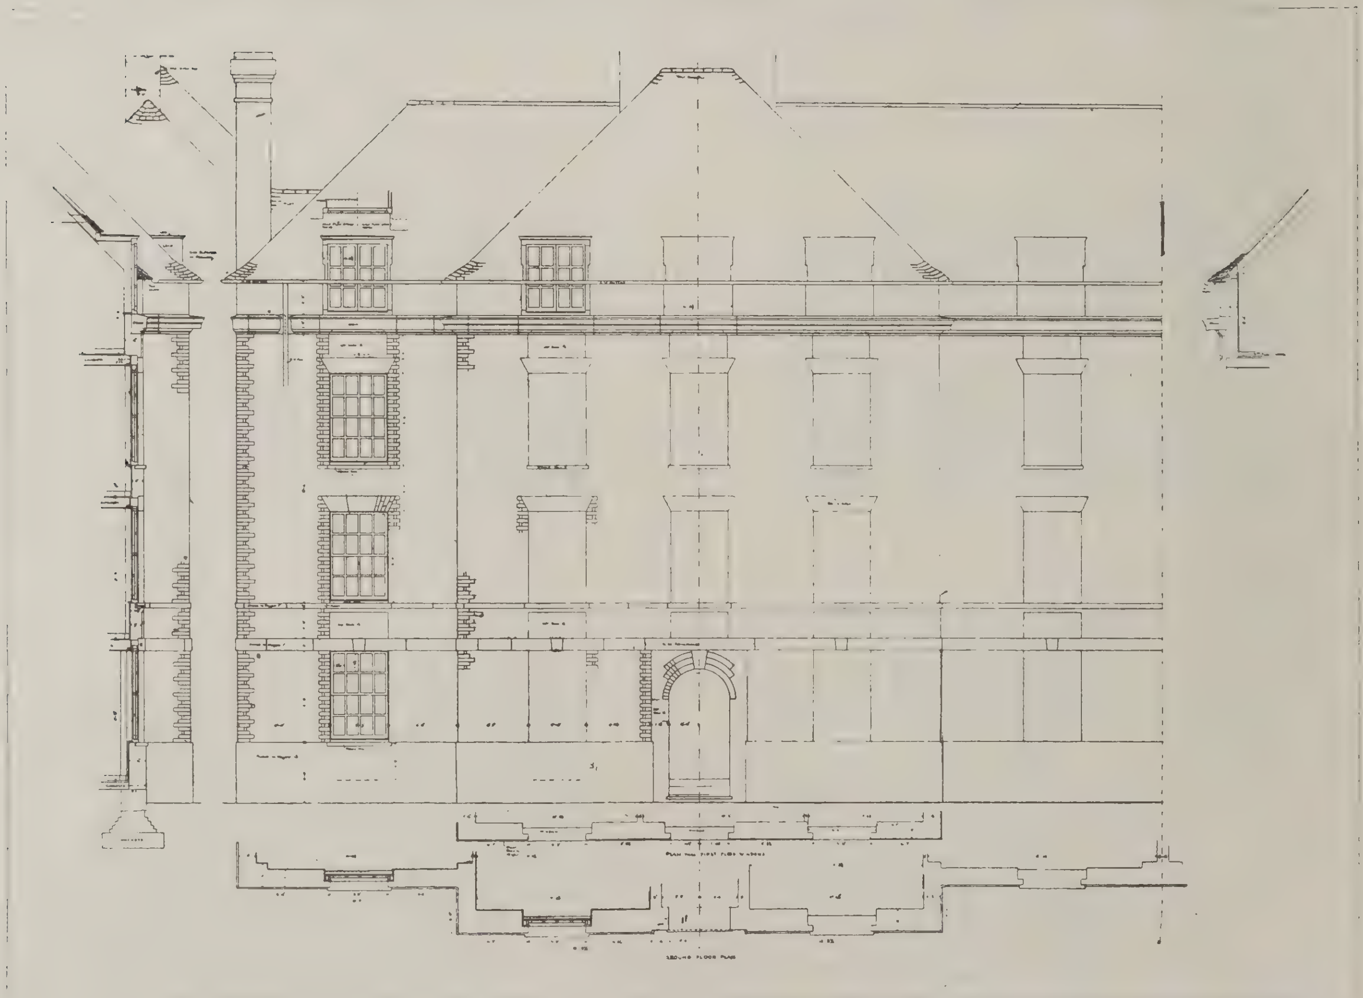
A BLOCK OF FOUR MAISONETTES: THE BROOKFIELD HOUSING SCHEME, HIGHGATE, LONDON.





A PAIR OF COTTAGES: THE BROOKFIELD HOUSING SCHEME, HIGHGATE LONDON.





A BLOCK OF SIXTEEN TENEMENTS IN CROFTDOWN ROAD: THE BROOKFIELD HOUSING SCHEME, HIGHGATE, LONDON.

blocks of maisonettes are planned on much the same lines, though the number of their rooms is different.

Each maisonette has its own back and front garden. The manner in which this is arranged can be seen by a study of the lay-out of the scheme. The centre maisonette on the first floor has a garden in the centre, the ground floor maisonettes gardens flanking this, and the end maisonettes on the first floor, gardens at the extreme sides. This is a very interesting arrangement.

The two pairs of cottages have six-room accommodation —a parlour, a living-room, a kitchen-scullery, three bedrooms, and a bathroom.

Every house, flat, and maisonette is lit by electricity, and is gas-heated and provided with a gas copper. All cooking is also done by gas, though other rooms have coal fires.

The Brookfield Estate itself stands in a high part of Highgate, and gives the residents a view over the "roof of London" to Westminster and St. Paul's. It is, in fact, a very delightful place to live in.

The general contractor for this work (which will have been completed and occupied by the tenants within the contract time) is Mr. Albert Monk, of Lower Edmonton, N. The electrical work is by T. Smerdon, London; the tiles by Colliers, Reading; the bricks by Major Morrisons, Pangbourne, the Daneshill Brick Co., Old Basingstoke, and Lawrence, Bracknell, Bucks.

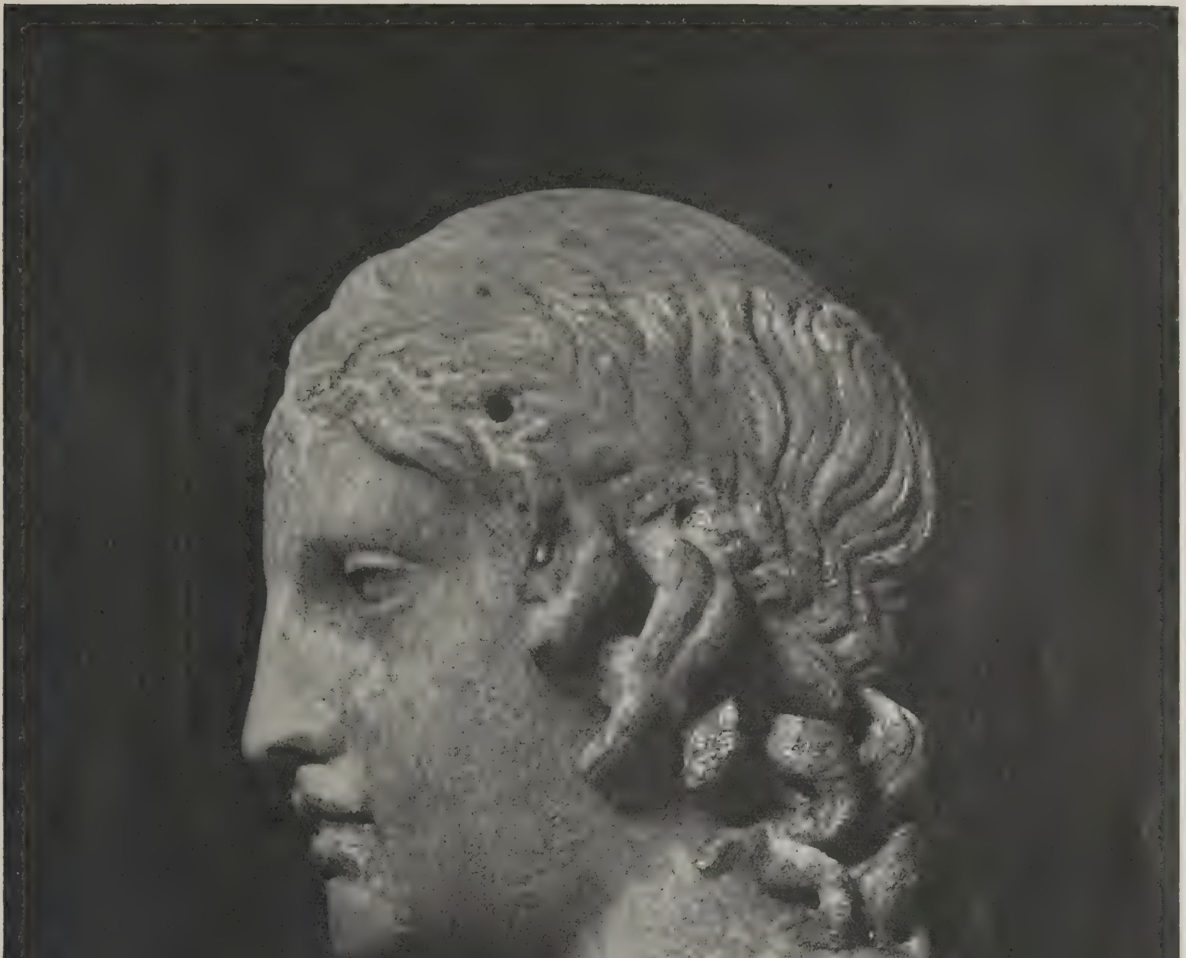
The Newly-Discovered Greek Statue



Mr. Arnold Mitchell, F.R.I.B.A., has enriched the Ashmolean Museum with a magnificent specimen of early Greek sculpture, which he had the good fortune to find in Dorset. The statue is thought by Dr. Percy Gardner to have been carved about 300 B.C., out of marble that, from its texture, would seem to have been quarried somewhere near Smyrna. How it came to Wessex baffles conjecture ; but its supreme beauty would easily account for and condone the abduction.

Little Things that Matter. XV—Pantiling

By EDWIN GUNN, A.R.I.B.A.

NOT so many years ago the authors of building construction books were wont to dismiss pantiling—the chief and almost the sole roof covering in use in large tracts of England and in the Low Countries—with a few contemptuous words. It may be admitted that the pantile roofs carried out in the slums of London during the late eighteenth and early nineteenth centuries deserve harsh criticism; nevertheless, they have one manifest advantage—if they often leak, they are easy to repair. Still, pantiles laid in the manner customary to those districts where they have long been adapted for all but the most monumental buildings can provide a very satisfactory roof covering, and these methods of laying are worthy of investigation.

The ordinary pantile is a slab of burnt clay, about 10 in. wide by 14 in. long, formed to a wave section crossways, but straight from head to tail, and clipped at two diagonally opposite corners as shown in Fig. 41 (see opposite page). A single nib is formed at the head, in line with the channel part of the wave section.

The gauge and spacing of the pantiling are practically fixed by the clipped angles, at 11 in. gauge and 8 in. side spacing, and any adjustment, apart from the variation brought about by other than normal sized tiles, is possible within narrow limits only. Though good pantiles lie close, usually it is not safe to rely on the narrow margin of the head or the side lap alone to secure a watertight roof, nor are tiles merely laid dry likely to be steady under stress of weather. They are, therefore, either bedded (of which more anon), torched, or pointed; the object in each case being to prevent wind—and with it rain and snow—from penetrating between the edges of the tiles, and also to hold the latter firm so as to prevent stripping.

Torching consists of pointing up all the joints in the roof covering from the underside after the tiles are laid. It has two obvious defects, its execution is hampered by roof timbers and battens so as to be less than perfect, while a slight movement of the roof causes considerable portions to loosen and drop out.

Pointing is a similar process applied to the outside surface of the roof. It can be done more completely, but it does not improve the appearance of the roof. It is apt to require renewal, and in time causes the surface of the roof to appear to be constructed more of pointing material than of tile.

Bedding consists of settling each tile as laid on a mortar fillet running beneath the ridges formed by the side junctions of each row of tiles. Several methods may be adopted. By the "strip lath" method a triple row of wrent laths is nailed above the tiling battens and running from eaves to ridge, to receive a mortar fillet below each joint as Fig. 42. This method uses the minimum quantity of bedding material, holds the mortar well, and has a neat and workmanlike appearance, but it lacks some of the advantages of "reeding and bedding." This latter method consists of filling in the spaces between the tile battens with a layer of reeds laid in the same direction and held in position by short pieces of lath sprung in under the battens as Fig. 43. Upon this basis the mortar fillets are laid, and in old work it was often usual to plaster between the rafters on the underside of the reeds. Reeding has the threefold advantage of (1) acting as a sort of "blotting paper" to absorb any trifling moisture which may percolate through tiles or joints; (2) in the case of roofs liable to wind pressure from beneath (as in many farm buildings), protecting the tiling from stripping; and, (3) providing a valuable insulating layer against heat and cold. The finish of the pantiling at the margins presents features differing from those of ordinary tiling or slating, owing to the curvature in cross section of the tiles.

When a half-round ridge tile is placed over the pantiles a considerable space is left above the furrow part of the tiles, and this requires filling. In good old work the space was always packed up with pieces of broken tile in mortar, or neatly filled with strips of plain tile as Fig. 44, which gives a very attractive and craftsmanlike finish. If the 11 in. gauge of the tiling did not quite suit the length of roof slope it was sometimes customary to make up the difference with one course of plain tiles above this packing and immediately below the ridge. In modern practice the space under the ridging is more often clumsily daubed with cement.

The soundest work is produced by laying an under eaves course of slates or plain tiles (out of sight) on which the tails of the bottom course of pantiles should be bedded in mortar, Fig. 45, or a brick corbel-course, as Fig. 46.

Owing to the fact that pantiles are commonly made right-handed, a gable will show a different edge on the two opposing slopes. Many old roofs were terminated at the gables by a low parapet of brick on edge, either 4½ in. or 9 in. wide, and rising just sufficiently to back up a cement fillet on the tiles, Fig. 47. This gives a finish full of character, but the parapets are apt to provide a ready means of ingress for damp. The ordinary tile verge with undercloak is not a very happy treatment for pantiling, and if a gable form arises the finish most common in East Anglia is practically the best that can be devised. It is shown in Fig. 48. The capping above the barge board holds down the exposed verge, the place where stripping usually begins.

Any of the ordinary types of cover flashing may be used with pantiles, though an apron flashing requires extensive labour in dressing it to the corrugations of roof. Soakers cannot be applied to a pantile roof. The use of leadwork in connection with pantiling is inclined to savour of patching a fustian garment with satin. The head and side joints with which the roof is intersected depend on mortar pointing or fillets, and one such joint more or less can make little difference.

Hips can only be covered with half-round ridging, beneath which the same problem as at the ridges must be dealt with. Intersections in old work were often formed by a course of pantiling laid down the valley, over which the tiling of the intersecting slopes was cut and bedded. This looks much better than an open metal valley, but it must be admitted that most of those which have been seen appear to have given trouble at some time or other. This covering is not really well adapted to a roof with many intersections, but to a bold and simple form free from complications and used under these limitations pantiling gives quite good results.

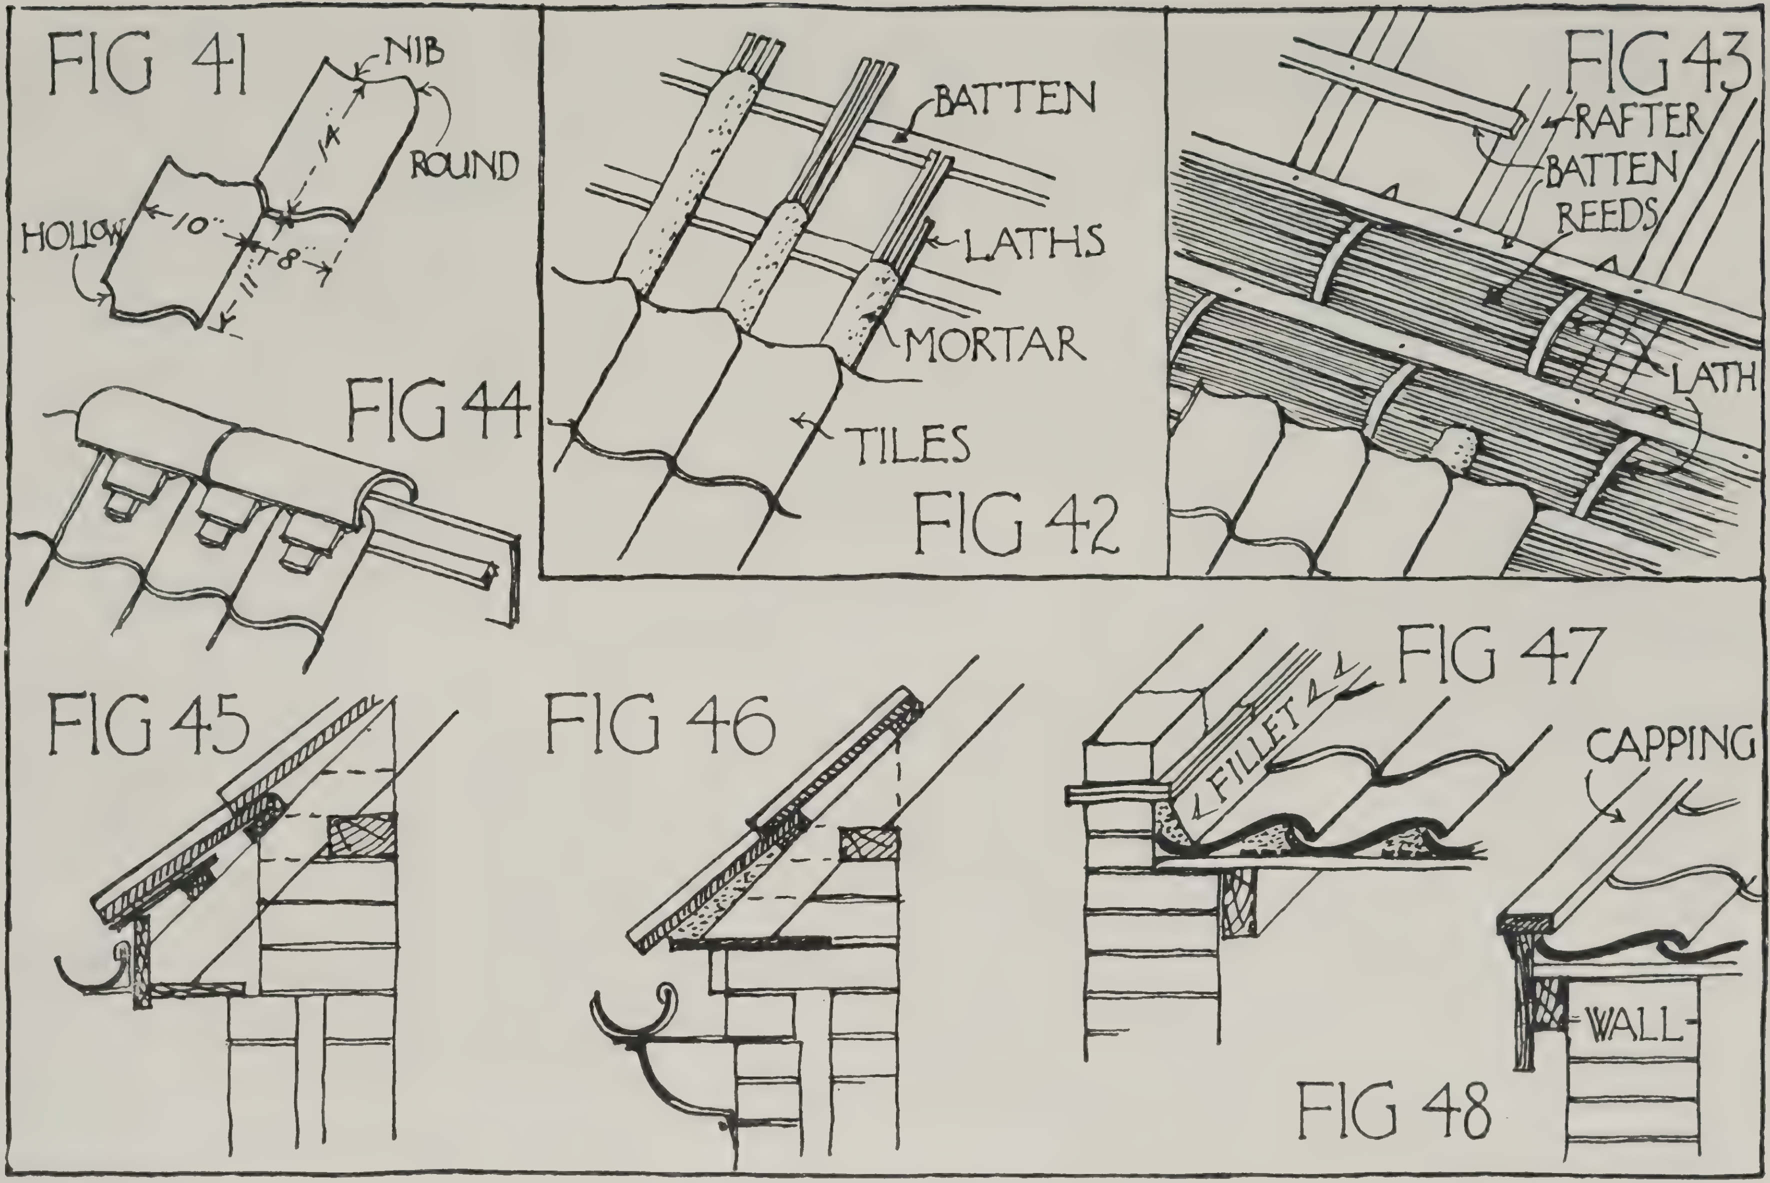
A Chapel in Every Home

It is possible that architects in designing the homes of the future will have to consider the spiritual as well as the physical comforts of the occupier. A movement for a chapel in every home has been begun by Mr. Joseph R. Wilson, of Philadelphia, and already it has the support of three cardinals, the Primates of the Anglican Church in Scotland, Ireland, Canada, India and Ceylon, the West Indies, and the Metropolitans of Australia and South Africa, three archbishops and one hundred and twenty-one bishops of the United States and Great Britain, the presidents of twenty-five universities, colleges and seminaries in the United States, the leading clergymen of the foremost denominations, and distinguished laymen.

It is suggested that in the future in planning homes, no matter whether they be houses, apartments, or tenements, provision should be made for a sanctuary. Mr. Wilson points out that there is nothing new in the idea. There were churches in the homes of Nyphas, Priscilla and Aquila, and even Pagan Rome had household temples for her idol gods. Mr. Wilson views with great concern the lack of religion displayed in the home of to-day, and the book * has been published at his personal expense for distribution among churchmen, public officials and publicists for no other purpose than as a contribution to the general betterment of humanity. He realizes that the home is the cornerstone upon which rests national life and progress, and that any effective means of strengthening and uplifting the home life will have a vital effect on national life. From the standpoint of the architect there is nothing impracticable in the suggestion.

Dr. Warren Powers Laird, Dean of the Department of Architecture, University of Pennsylvania, adds this contribution to the book: "To the architect, whose created works are not only the seat but the symbol of the life to be lived within them, the opportunity to incorporate a chapel in the home must bring peculiar satisfaction, for it would enable him to complete the practical provisions for the various functions of the home life, now too universally confined to the physical and social sides."

"An Appeal to the World for a Chapel in Every Home." By Joseph R. Wilson, LL.B., 1525 Spruce Street, Philadelphia.



DETAILS OF PANTILING. BY EDWIN GUNN, A.R.I.B.A.

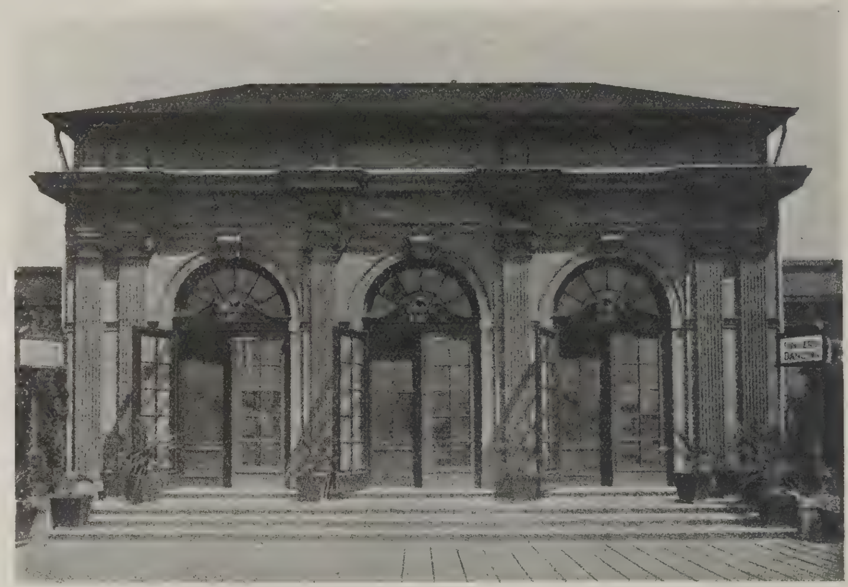
Magazines of the Month*

A Literary and Pictorial Digest

THE ARCHITECTURAL REVIEW for September devotes a large number of its pages to an article on the new London County Hall, by Mr. Maurice E. Webb, illustrated by a particularly fine series of photographs specially taken by Mr. F. R. Yerbury.

Delightful etchings of Wells, by Harold Falkner, accompany a descriptive article; and St. Paul's Church, Deptford, forms the subject of an illustrated article by Mr. Godfrey Pinkerton.

Mr. Walter Keesey is represented by some etchings of Paris, one of which we reproduce.



A REFRESHMENT AND DANCE PAVILION, SUNNYSIDE, TORONTO. CHAPMAN OXLEY, AND BISHOP, ARCHITECTS.

(From "Construction.")

CONSTRUCTION shows us how the Canadian takes his pleasure by the lake side. At Sunnyside, in the west-end of Toronto, the lake front is being rapidly transformed into an extensive playground and recreational area. One hundred and thirty acres of land have been reclaimed, and the lay-out makes provision for a building strip, traffic street, boulevard drive, and promenade. The Sunnyside pavilion, the first building improvement on the reclaimed area, comprises an outside terraced garden for refreshment and dancing. The bathing pavilion is in the centre of the area devoted to bathing, and is 375 ft. by 115 ft., with the entrance in the centre off the promenade. The entrance is a semicircular colonnade, with a large archway in the centre. This leads up a wide flight of stairs to the terrace, overlooking the bathing beach, and running the full length of the building. The two sides of the entrance colonnade are respectively given up to men's and women's dressing-rooms, with a separate section for boys. Both men and women bathers are provided with lockers, dressing-booths and shower rooms; lavatories, and first-aid rooms are provided, and a room for the serving of light refreshment is accessible from the beach. The building is constructed in reinforced concrete, with roof construction of timber.

The Harbour Commissioners cold storage warehouse in Montreal forms the subject of another article, and town planning is discussed from various points of view.

THE ARCHITECTURAL ASSOCIATION JOURNAL has an article by Mrs. Manning Robertson on The Architectural Cinderella, describing the housing experiments of Miss Octavia Hill. Sun Dials on Old English Churches are described by Mr. Gerald Bunce, and Mr. Lethaby's book on Form in Civilization is reviewed.

The September LONDON MERCURY contains a good deal of interesting architectural matter. In Editorial Notes it is contended that a university could do more for a plastic artist than for a man of letters. "When you come to architecture," says Mr. Squire, "you come to an art in which mechanics are even more important than elsewhere, an art which simply cannot be practised by the greatest natural genius who has not gone through a technical

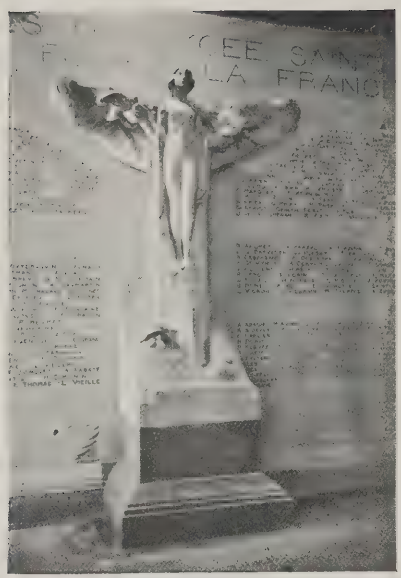
PARIS—BEAU BOURG. FROM AN ETCHING BY WALTER M. KEESEY.

(From "The Architectural Review")



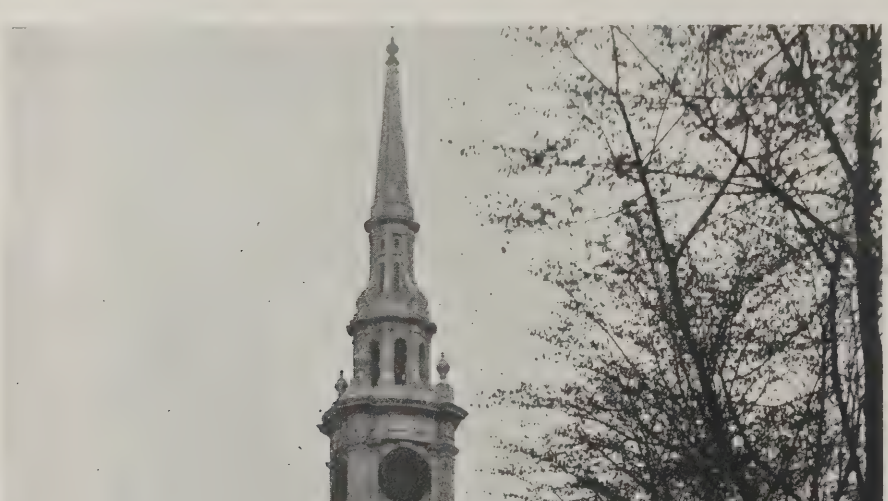
THE LYCÉE SAINT LOUIS WAR MEMORIAL.
(*From "L'Architecture."*)

training. The art is already recognized at the universities; late in the day a degree can be got for it at Cambridge." Does anyone suggest that if it had been recognized long since, and its study made a popular one among undergraduates, we should not have had a more active and enlightened public criticism of architecture than we have? It is still unsafe to perpetrate a false quantity in this country, but you can put up the oldest college building and nobody will say a word.

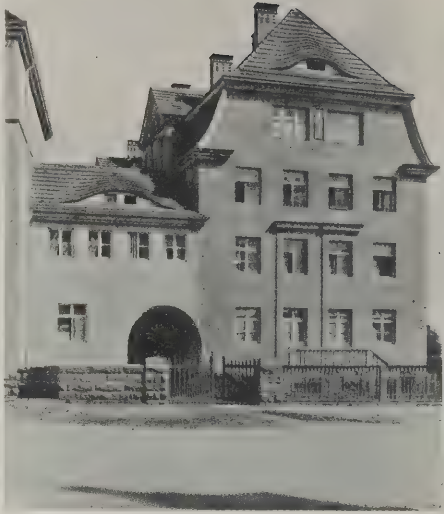
Mr. Halsey Ricardo contributes a scholarly article on The Historical Teachings of Architecture, and Mr. Powys's pungent criticisms of various new London buildings make piquant reading.

L'ARCHITECTURE has an article, illustrated by reproductions from eighteenth-century drawings, on The Construction of the Bridge of Orleans, which is described as one of the outstanding engineering feats of the time.

The Lycée Saint Louis war memorial is also illustrated. The joint work of MM. Leprince Renguet, architect, and Gaumont, sculptor, it is one of the finest memorials that has yet been produced. Executed in low relief, it takes the form of a long plaque supported on a plinth. In the centre, on a socle of perfect simplicity, stands a symbolic figure with outspread wings. By this arrangement the architect has obtained an effect of harmonious symmetry; the names of the dead even contribute to the decorative scheme and emphasize the cruciform effect of the composition.



ST. PAUL'S CHURCH, DEPTFORD. THOMAS ARCHER, ARCHITECT.
(*From "The Architectural Review."*)



A GROUP OF DWELLINGS IN DRESDEN-LÖBTAU. DR. OTTO SCHUBERT, ARCHITECT.
(*From "Moderne Bauformen."*)

The architect evidently understood the desire for simplicity which has always characterized the work of M. Gaumont, who from the beginning of his career has shown a rare knowledge of nature and a love for the spacious serenity of Greek art. Here, says the writer, we have something far removed from the effigies of gesticulating soldiers, with which our public places are crowded. Youth, with outspread wings, ascends from the soil of past days towards the light of a future of hoped-for peace, holding in open hands the doves of prosperity and brotherhood. The harmony of the whole composition, the perfect agreement between two great artists, the loftiness of the symbolism, will keep before the eyes of the students at St. Louis an example of dignity and restraint which will, we hope, be taken to heart by other public institutions.

MODERNE BAUFORMEN. In the August number is an article on the work of Professor Otto Prutscher, and some fine examples of craftsmanship and decoration executed under his supervision are illustrated. Building societies in Germany are evidently doing excellent work, to judge by the examples illustrated in BAUFORMEN. Dr. Luigi Otto Schubert, of Dresden, is responsible for the group of dwellings in Dresden-Löbtau, illustrated on this page.

THE CONNOISSEUR celebrates its coming of age in the September issue, and marks the date by a welcome reduction in price. A number of portraits by Pieter Borsseler, a forgotten seventeenth-century master, are reproduced, and Mr. Collins Baker contributes an interesting article.

Mr. Beresford Chancellor writes delightfully as ever of some scarce London books, from Stow's great work onwards, and reproduces a number of illustrations from books in the British Museum.

HOUSE AND GARDEN illustrates two houses by Mr. Guildford Dudley, L.R.I.B.A., and publishes some charming garden pictures.

ST. FRANCIS BOULEVARD, SAN FRANCISCO.
(*From " The Building Review.*")

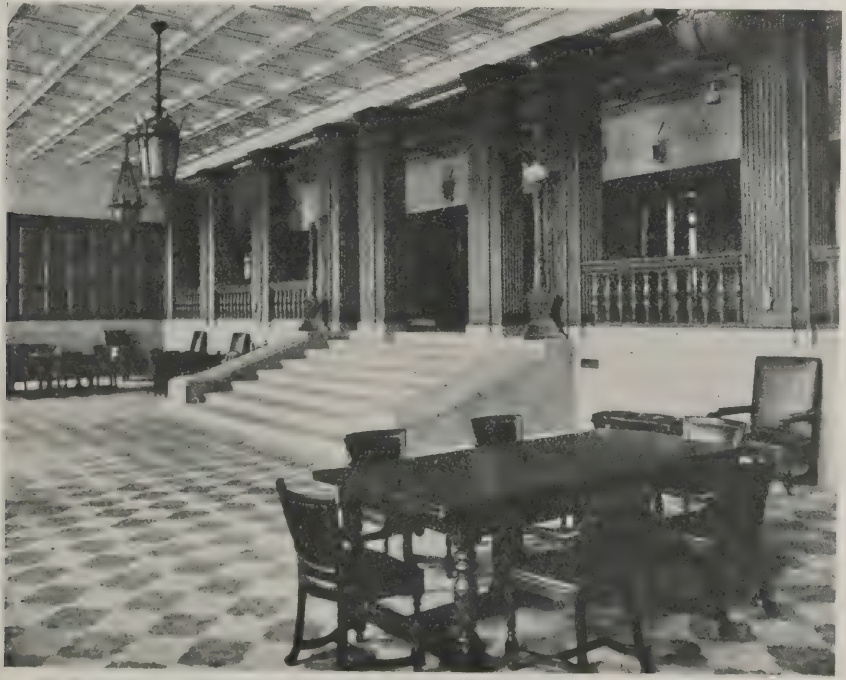
A HOUSE IN CALIFORNIA. MARSTON AND VAN PELT, ARCHITECTS. (*From " The American Architect.*")

THE AMERICAN ARCHITECT AND ARCHI-
ECTURAL REVIEW for August 30 has an
xcellent article on " The Relation of Pipe
rgans to Architecture." The writer
mplains of the wretchedly inadequate
aces so often allotted, and contends
at the fundamental responsibility for
e successful installation of an organ
sts on the architect. Many a fine
gan, he says, is handicapped from the
art by the architect's neglect of acous-
cs, and unless also the opening from the
gan chamber is of sufficient size to per-
it the tones to escape unimpaired, the
strument may be seriously choked.

The æsthetic value of good painting is
scussed by Mr. C. W. Cousens, and a
rtinent editorial comment urges the
cessity for architects to become better
siness men. Far too much work, it
ys, is being carried out by the archi-
ctural department of construction com-
nies, and it suggests that for a number
years architects have been shouldering
tails on to contractors, and have gradu-
y and involuntarily taught them how
get on with a minimum of architectural
rvice. This grievance is not unknown
English professional circles.

A HOUSE IN ST. FRANCIS WOOD, SAN FRANCISCO. H. H. GUTTERSON, ARCHITECT. (*From " The Building Review.*")

We reproduce the front view of a Californian house, designed by Marston and Van Pelt, and also a view of the main lobby of the Willys Overland building in Toledo.



THE MAIN LOBBY OF THE WILLYS-OVERLAND CO., TOLEDO, OHIO
MILLS, RHINES, BELLMAN, AND NORDHOFF, ARCHITECTS.
(*From " The American Architect.*")

In THE BUILDING REVIEW for August St. Francis Wood, a residential estate near San Francisco, is described and illustrated. The estate has been excellently laid out with finely proportioned sites, and certain restrictions govern the nature and extent of houses that may be erected. One-family homes alone are permitted, and these not over two stories high. Holdings of less than 40 ft. frontage are not allowed, and the best architectural talent available has been invited. The result is a group of residences of unusual charm. The boulevard illustrated constitutes the central feature of the estate, and a typical house is also shown.

Auckland Competition Result

A cablegram to the Secretary of the R.I.B.A. announces that all the prizewinners in the Auckland War Memorial Competition are resident in New Zealand. Three students of the Architectural Association however, are prizewinners. No names are given as yet, but further particulars are awaited and are promised for an early date.

Current Art

The London Salon of Photography

"The aim of the London Salon is to exhibit only that class of work in which there is distinct evidence of personal artistic feeling and execution." This note is given prominence in the catalogue of the exhibition now open at 5A Pall Mall East, and it is obvious that every care has been taken to keep within the aim of the Salon. However, evidence of personal artistic feeling must be a difficult thing to decide upon in photographic work, and in looking round the exhibition one wonders if some of the exhibits have met with the judges approval on altogether artistic grounds, and have not passed through more on account of clever technique.

For instance, there is an astonishing portrait of Madame Astafieva, which as a photograph was, no doubt, in its original state a very pleasant thing to look at, but which now appears besmeared with a multitude of really nasty colours; and again there are other prints which in general appearance and sloppiness of sentiment take one back to the engravings of 1870, or thereabouts. We say engravings, because in many of the exhibits there seems to have been every attempt made to obscure the fact that photography is the medium by which the pictures have been produced. Extraordinarily clever no doubt it all is, but why do it when the only result is to turn what was a good photograph into an imitation of an etching, a chalk drawing, or (what has happened in most cases) an imitation of a cheap reproduction, which anyone with any real artistic sense would not care to possess? There are quite a number of exhibits which come under the latter category, and should find no place in an exhibition of pictorial art. This is unfortunate because generally the exhibition arouses the keenest pleasure and admiration.

Photography has its limitations, and has its definite place, and it seems foolish to attempt to do things with it which are beyond its scope. One wonders what the comment would be if some of our best water-colourists held an exhibition of water-colours which by clever manipulating had been made to look like etchings ! ! !

After some of the "fake" prints it is, indeed, refreshing to turn to the "straighter" type of photograph of which so many do give evidence of genuine artistry. Undoubtedly the portraitists have the honours of the show. "Alphonso Wing," by J. Capstack, "Shadow Play," by Mrs. G. A. Barton, "John Galsworthy, Esq.," by Furley Lewis, "J. C. Squire," by Herbert Lambert, besides many others, are almost beyond criticism.

There are, of course, plenty of examples of very fine pictorial work. "In the Garden of the Villa D'Este," by Charles Job, is, perhaps, one of the best, and of a different type "Cannon Street Station," by Ward Muir, but there are so many of such great merit that it is difficult to single out individual exhibits for special mention.

There are a number of essays in the nude, but as a whole they are not convincingly satisfactory, with the exception, of "Atlas," by Nickolas Muray, which is really a most delightful study.

Lord Carnarvon's "The Toilet," two nude girls sitting about in a stone portico, excellent as it is in many ways, seems altogether wrong; one somehow feels that this sort of thing isn't done nowadays, if it ever was, and it all seems curiously artificial and posed, as, indeed, do all the nude photographs taken out of doors of "mermaids," "sea-nymphs," and so on.

F. R. Y.

The Fiftieth Liverpool Autumn Exhibition

When the architectural prodigies of Liverpool wolfed the Prix de Rome it was suggested in THE JOURNAL that the Mistress Art has "a loge in Liverpool." This suggestion was very charming, and, in regard to the matter under discussion, not to be challenged. But there are other sides to the question.

Says the hopeful outsider: "Are you not ungracious? Does this city not understand the mother of the arts? Is it not proud of its architects?" The City may be, but civically it does not appear aggressively grandiose about them. A large exhibition has been held for fifty years, and, for at least twenty, scarcely any architecture has been seen there. This year architecture has not a corner allotted to it.

The lay British mind does not always seem quite to comprehend that architecture is art. So the average exhibition satisfies the public by presenting to it pictures—pictures everywhere—and not a place to put them. Painters, not content with this ascendancy, complain that architects make no account of pictures in their designs. The public (ever loyal to its frames) avenges the painters by hanging their work on the middle of pilasters, and in other murderous spots. Architects, exhibition promoters, and the public are apt to forget the sculptor. And we all bridle when the foreigner decries our art methods.

At the very door of the present exhibition stands Elme's masterpiece, "St. George's Hall." Inside the gallery the works of Alfred Stevens, Fred Walker, Madox Brown, Holman Hunt, Rossetti, Millais, Burne Jones, Furse, and others, acclaim that painting has, in this England of ours, produced many fine artists. Our lack is that the tidy national mind puts the arts in compartments and refuses to see them as one great force. An authority on the Liverpool gallery gives two reasons for the architectural nullity of the exhibitions—the public do not want to look at plans and elevations, and the architects do not send their work.

If Liverpool is stronger in architecture than in painting and sculpture (and it seems to be so), perhaps this gargantuan feast of painting is desirable; and as we possess not the great civilization of some past ages, when the architect was sponsor to the sculptor and painter, and among them they builded great cities, we must be content for the present in examining and reflecting on the reasons for the greatness of painted art. Broadly, the tests are very similar to those for architecture and the rest of the arts. The peculiar manner in which the exhibition is hung, with masters and other painters indiscriminately mixed, assists the work of contrast.

We pass through a room of the greatest Pre-Raphaelites, each picture a complete and serious whole, when suddenly we are faced with Mr. Sim's "Lady Rocksavage." This picture is an Italian Madonna (with variations) from the top to the middle. Below that it is a Louis Quinze affair, all rococo gilt and high heels. An Italian Renaissance structure on a Baroque base: this kind of building is not confined to painters, but the painters to whom "Jimmy" Whistler referred as "swells" seem to avoid it. At least there is none of it in any of the English, or in the work of the four American "swells"—Whistler, Sargent, Alexander, Abbey—which we are indebted to the hangers for including. Whistler's "Carlyle," in addition to being one of the finest extant instances of a great soul's transference to canvas, is one of the most exquisite structural unities ever painted.

Jewel-like and serene, the work of the old Liverpool men — Huggins, Daniels, Windus—meets us here and there. A few modern locals are also worth seeing, though most of this sort of decoration is of the "simili" type of jewel. But though her artists have been scared away, Liverpool has yet Professor Reilly, who recently instructed the city on the subject of her beautiful Town Hall, which is enriched with paintings by Furse. In the exhibition are examples of lunettes, designed by Mr. Frank Salisbury, for inclusion in the Town Hall with the Furses. These examples leave one three modes of expression—a shriek, a curse, or a prayer. The modern rooms (or, rather, those where modernity predominates) are enlivened by many portraits of the modern woman.

There are in this important and varied collection some 2,204 exhibits. We forgot to mention that there are two architectural drawings in one of the bottom left-hand corners.

JESSICA WALKER STEPHENS.

The Surrey Garden Village Trust, Ltd.

Handicrafts Exhibition.

The second Handicrafts Exhibition, held under the Surrey Garden Village Trust Ltd., and on behalf of its funds, is now in preparation. For a young concern it is full of vitality, and keenly alive to the immensity of its aims and the usefulness of its ideals. These fall into three main branches: (1) In this period of swift workmanship and rapid amassing of money it is of tremendous value, even if it be only relaxation, to stand aside awhile from the rush of commercial life, and create with hand, mind, and imagination, slowly and with sincerity, some object which will be a living memorial and a thing of beauty. (2) To show that essential objects may also be beautiful. At a time when one's brain grows dizzy with the statistics of the numbers of objects that can be turned out from a factory with *n* men working for *n* hours on *n* masses of machinery, it is like turning from the glaring dust of a main road with its hurrying traffic into a shady bylane, to create, with one's own hands, something, not only useful, but beautiful. (3) To facilitate the sale of artistic productions, and to put the artist and the public into direct relationship. Even in this millennium of trade, there is a buying public which knows and understands the pleasures of artistic creation, and loves the object, not because it has been turned out at the highest pressure, but because it is a work of art, an individual thing, in short, an artistic production.

It is for the purpose of putting artists into touch with such a buyer that this exhibition is being held. Almost every form of individual effort is being covered —wood, metals, precious metals, leather, textiles, needlework, lace knitting,crochet, models of machinery, basket work, toys, illustrations, cookery, pictorial photography, lettering poster work, etc., and valuable prizes are being offered, while the judgments will be made by artists who have reached the top rung of the ladder. The exhibition is under the patronage, among others, of His Worship the Mayor of Croydon and the Mayoress, the Countess of Bective, Viscountess Astor, the Lord Bishop of Croydon, Dr. Jane Walker, Mr. Oswald Crompton, A.R.C.A., Miss Gladys Cooper, Miss Lillah McCarthy, and many other distinguished people. In short, Monday, October 9, to Saturday, October 14, will be a week of opportunity, not only for artists and collectors, but all those interested in the fine arts.

The exhibition will be held in the Large Public Hall, George Street, Croydon. It will be open at the following times :—

Monday, October 9, 2.30 to 7 p.m.
Tuesday, 11 a.m. to 7 p.m.
Wednesday, 11 a.m. to 9.30 p.m.
Thursday, 11 a.m. to 7 p.m.
Friday, 11 a.m. to 9.30 p.m.
Saturday, October 14, 10 a.m. to 1 p.m.

N. D. H.

List of Competitions Open

Date of Delivery.	COMPETITION.
Sept. 29	Laying out 200 acres of land as a Park for the Province of Antwerp. Premiums 10,000 and 8,000 francs.
Nov. 1	Labour saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C. 4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.
No Date	War Memorial at Birkenhead. Cost not to exceed £4,000. Premium 75 guineas. Assessor Major Gilbert Fraser, M.C., F.R.I.B.A. Apply Town Clerk, Birkenhead. The competition is open to all architects and sculptors of Birkenhead, Liverpool, and Chester only.

Correspondence

The Lead Paint Question

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—The publication of the draft of the Regulations to give effect to the Convention passed at the International Labour Conference at Geneva last year marks an important stage in this controversy, which has always been keen and sometimes bitter. I have no wish to revive these "old, unhappy, far-off things and battles long ago." The white lead makers have long maintained that, while the extent of lead poisoning among painters was very doubtful, and had probably been grossly exaggerated, yet the danger must be met, and that the only rational method was to establish Regulations for the safe use of white lead rather than to adopt the simple, but unscientific and uneconomic policy of prohibiting the use of a product necessary for the maintenance and protection of so much of our structural and material wealth.

The draft Convention passed last year at Geneva vindicated this view. It adopted the general policy of Regulations for the use of white lead in painting ; but for the inside of buildings, where it was considered to be difficult to make Regulations effective, and where white lead was considered to be less indispensable, it proposed to prohibit its use after November 17, 1927, except in cases, such as for industrial establishments, where its use is necessary.

These draft Regulations have been prepared with a view to giving effect in this country to that part of the Geneva Convention. They are of the same nature as the Regulations advocated by the white lead makers, and are, indeed, almost identical in detail. A number of them provide for obvious precautions in cleanliness and medical examination. Of others the most important are those :—

(*a*) Prohibiting the use of white lead or sulphate of lead in dry or powder form.

(*b*) Prohibiting spraying for interior painting, and

(*c*) Prohibiting dry rubbing down.

Of all the Regulations, that which in my view is the most important is the prohibition of dry rubbing down. The danger of lead poisoning admittedly lies in the inhaling of lead dust, and the process most productive of dust is the dry rubbing down of paint. The method of damp rubbing down with pumice stone is, of course, well known, and demonstrations were made last year which show that this could be used satisfactorily even within twenty-four hours of fresh application of paint to the surface. There were, however, I understand, certain cases, such as the arrises of door mouldings, etc., which presented difficulty; it is therefore of importance to note that a waterproof sandpaper made by more than one process and manufacture has recently been introduced into this country from the United States which, according to the experts and practical painters who have examined it, overcomes all objections, and is, if anything, more efficacious for producing a good surface than is dry rubbing down, so that the technical and economic feasibility of damp rubbing down has now been admitted by some who heretofore denied its practicability.

It is well known that in this controversy employers and employed have taken opposing views. It is therefore perhaps the most satisfactory feature of the whole matter that the Conference of master painters and operative painters convened by the Home Office was, as I am informed, characterized by entire harmony, and that the draft of the Regulations recommended by them was adopted with unanimity. If the same co-operation and mutual goodwill be shown in carrying out these Regulations, the problem of paint poisoning among painters will, in my view, be solved and this long controversy be stilled.

E. M. JOHNSON, Chairman,
White Lead Makers' Section, London
Chamber of Commerce.

Enquiries Answered

Wiring Thatched Roofs.

"Architect" writes : "The owner of some cottages now being re-thatched wishes to cover the roofs with galvanized wire netting to prevent damage by high winds and birds. Can you tell me the best method of securing the netting, especially in the valleys ? What size of mesh should be used ?"

—Half-inch mesh galvanized rabbit wire should be used. The most vital points to protect are the verge, the eaves, and the "roving" or capping, below which birds commonly enter. The thing to guard against in fixing is any spike or rod driven *down* through the thatch, which might afford an easy passage for wet. Wiring over the ridge may be bound through the roof from side to side with wire, and at the eaves and verge one edge of the wiring may be stapled to the wall face and the other wired to the hazel pegs securing the runners. Hips and valleys should be covered with a width of wiring laid in the direction of their intersection and wired to the edges of the netting covering the slopes. Any fixings necessarily driven into the thatch should be pushed in at a slightly upward slope so as not to conduct water. E.

Lassar Baths.

F. writes : "Can you give me any information with regard to the method of working Lassar baths, and tell me where it is possible to inspect an actual installation ?"

—Full information and drawings of "Lassar" or lavatory baths are given in "Public Baths and Washhouses," by A. W. S. Cross, published by B. T. Batsford in 1906. An installation on this principle may be seen working at Acton Public Baths. The principle briefly is as follows : Instead of a large bath tub or "slipper" in which the bather is immersed, only a shallow sink-like tub is provided to catch the water from a series of sprays and conduct it to waste. The bather, therefore, is in running water. To enable full advantage to be taken of this speedy method of ablution, two dressing boxes should be provided to each bath compartment — one bather disrobing while another is bathing and dressing.

The system is very popular in Germany, and has many points to recommend it.

E.

The Week's News

New Roads for Finchley.

Finchley Urban District Council proposes to spend £21,996 on private roads.

Architect's Change of Address.

Mr. G. T. Jell, A.R.I.B.A., is moving, at the end of this month, to 20 Hanover Square, W.1. Telephone: Mayfair 560.

Preston Improvements.

Preston Town Council has accepted the tender of an English electric company of £94,900 for the erection of a new generating station in the town.

New Attractions for Hartlepool.

Hartlepool's spacious town moor is to be converted into lawn tennis courts and bowling greens, and in the neighbourhood of the promenade it is proposed to have a big open-air bathing pool.

Roof Lifting at Brixton.

At the Bon Marché, Brixton, a roof weighing over 100 tons is being raised bodily by bottlejacks to make room for the construction of a new story. As the roof is raised the walls are built underneath.

The New Lord Mayor of Sheffield.

Alderman W. C. Fenton, J.P., F.R.I.B.A., has been invited to become the next Lord Mayor of Sheffield. Mr. Fenton is a past president of the Sheffield, South Yorkshire and District Society of Architects and Surveyors, of which he was a founder and the first hon. secretary.

New Home for Freemasons.

The Freemasons are considering whether they should increase the size of the premises in Great Queen Street or whether they should acquire a site for a new building between the Strand and the Thames. The latter scheme would involve the building of a "great Temple of Masonry."

The Exhibition of Contemporary British Architecture.

Before forwarding their drawings and photographs to the R.I.B.A., intending exhibitors at the Exhibition of Contemporary British Architecture are requested to apply to the Secretary, R.I.B.A., for a copy of a printed form which they are asked to complete and enclose with their exhibits.

Great North Road Reconstruction.

Sections of the Great North Road within the County of Huntingdon are under reconstruction. These sections cover the road from Water Newton Village to "Kate's Cabin" (at the junction with the Peterborough-Oundle road), and the longer stretch from Norman Cross to within a mile north of Brampton Hut, at the junction with the Huntingdon-Thrapston road.

The Architectural Vacancy at Hong Kong.

Applications for the post of architectural assistant to Messrs. Little, Adams and Wood, of Hong Kong, announced in THE ARCHITECTS' JOURNAL for August 25, are now being considered. Any further applications should be sent without delay to the Secretary, R.I.B.A., 9 Conduit Street, W., from whom full particulars can be obtained.

New Infirmary for Roseneath.

The trustees of the late William and John Jones have come to terms with the Charity Commissioners on the question of pooling the resources of the William and John Jones Trust, the Wrexham Infirmary and the Wrexham and East Denbighshire War Memorial, in order to build a new infirmary at Roseneath, to replace the present one in Regent Street, at a cost of about £66,000.

Company to Supply County Councils.

A company under the title of the Public Authorities' Mutual Supplies, Limited, has been formed to safeguard municipalities purchasing goods for public services from being overcharged. The company, into whose operations the making of profits would not enter, is to take the place of the agent and the merchant, and to deal direct with the producer.

A.A. Exhibition of Sketches.

Members of the Architectural Association are invited to send sketches, etc., for the annual exhibition of the Association to be held between October 30 and November 23. Notification of intention to exhibit should be sent to the Secretary not later than October 14. All sketches, which should be framed and labelled, must be delivered to 35 Bedford Square, by October 25.

The late Mr. S. C. Searle.

We regret to record the death, at St. Margaret's-on-Thames, of Mr. Septimus Cecil Searle, A.R.I.B.A., in his sixty-ninth year. An old Harrovian, Mr. Searle, senior partner of Messrs. Searle and Searle, of Paternoster Row, had been in practice for forty-seven years in the City of London, and carried on the business of architect and surveyor founded by his father, Mr. Charles Gray Searle, in 1840.

Cinema on Chapel Site.

Excavations at St. Peter's Chapel of Ease in Palace Street, on the site of which a cinema is to be built, have disclosed an ingenious method of constructing foundations. The site on which the chapel stood consists of reclaimed lands. The whole of the walls were supported solely upon an ingeniously constructed raft of timber baulks, many of which had been reduced to mere wood pulp by the action of the subsoil.

Slum Clearances at Edinburgh and Leith.

Important slum clearances and reconstruction schemes are under consideration for Edinburgh and Leith. Those for Edinburgh represent an outlay of £200,000, and those for Leith, £82,000. In Edinburgh the total number of houses involved is 635, and 105 shops and other business premises. In Leith 558 houses are dealt with, and, in addition to reconstruction, there will be 150 new houses erected.

Improving Ramsgate.

Prizes of £600 have been awarded by Ramsgate Council for plans in connection with the development of the West Cliff, where a large area of land previously under private ownership has been acquired for the expansion of the town.

The winners were: £300, Messrs. W. Harding Thompson and P. B. Hepworth, Gray's Inn Road, London; £200, Mr. G. T. Morris, 37 Chancery Lane, London; and £100, Messrs. Franklin and Deacon, Luton, Beds.

Construction of Hotels in Angola.

A law has been passed authorising the Government of Angola to grant concessions for the construction and exploitation of two hotels in Mossamedes and Lubango respectively, each with a minimum of fifty rooms. United Kingdom firms interested may consult a copy of the main provisions of the law on application to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1 (quoting Reference 6460/F.L.).

New Olympic Games Prizes.

Competitions in literature and art will be a feature of the Olympic Games of Paris in 1924. The competitions will be international, and will be five in number, namely: architecture, literature, music, painting, sculpture. The prizes, as in the athletic contests, will be Olympic medals. The competitors will be absolutely free in the choice of their subject and in the form and dimensions of their work. The only conditions imposed are that the work shall not have been previously published or exhibited, and that it shall be directly inspired by the idea of sport.

A New Institute.

A dinner is to be held shortly to inaugurate an Institute of Paint and Varnish Technologists. Among the objects of the new Institute will be the dissemination of practical and scientific knowledge by reading and discussing papers, the improvement of technical education, the promotion of research, and the establishment of close relations with the Government and with societies interested in the products of the industry and their application. Applications to attend the inaugural dinner should be sent to Mr. H. D. Bradford, at 42 Ribblesdale Road, S.W.16.

Proposed Tube Railways in Calcutta.

The Office of the High Commissioner in London for India has forwarded to the Department of Overseas Trade copies of a report on the possibilities of a tube railway in Calcutta between the East Indian Railway and the Eastern Bengal Railway, together with a book of plans and a longitudinal section. These documents can be inspected by representatives of United Kingdom firms interested on application to the Department of Overseas Trade (Room 49), 35 Old Queen Street, London, S.W.1, after which date they will be available for loan in order of application to firms in the provinces who are unable to have them inspected in London.

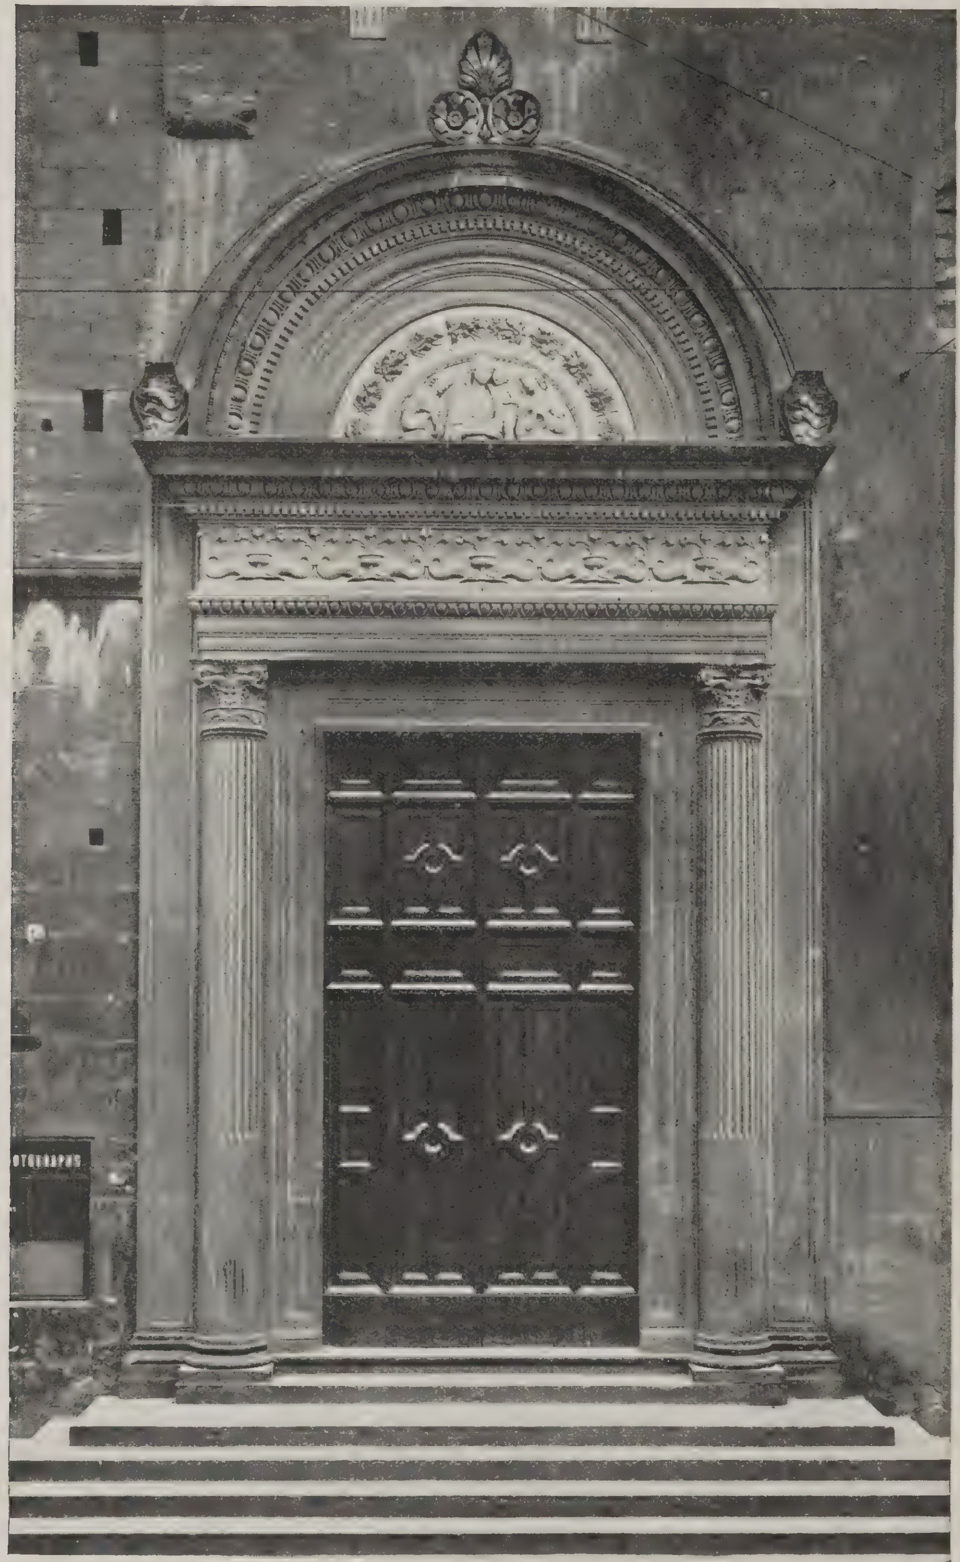
Architectural Details. 35.—Doorway, Chiesa di Badia, Florence

Benedetto da Rovezzano, Architect



The detail of this doorway is extremely curious, the principal motive being a dolphin, which can be seen formally composed along the frieze, on each side of the lunette, and upon the capitals of the columns, where it is used rather aptly in the form of little volutes. The flower arrangement in the frieze and around the sculpture is also original and charming.

A Conference on Architectural Education

THE suggestion has been put forward recently that the Royal Institute of British Architects should organize a Congress on Architectural Education. It would be difficult to think of a more useful piece of work for that body to undertake, for architectural education, with all that those two words imply, is the foundation on which the future of the profession is being built.

During recent years there have been important developments in the training of the coming members of our profession—the growth of the schools of architecture and the decline of the pupil system, the award of degrees in architecture by leading universities, the " recognition " of the schools by the R.I.B.A., carrying with it exemption from the major part of the Institute's own examinations, the introduction into this country of the Atelier system and the Prix de Rome competitions.

During this period of change and growth there have naturally been put forward many widely different opinions as to the best lines of development, and the time is surely ripe for a thorough assessment of our efforts. There should be as complete a comparison as possible of the work of the various schools in our own country, and of that work with the products of the schools in other lands, and a " full-dress " debate on some of the various problems which are inseparable from a great scheme of professional education affecting directly the architecture not only of this country but of the whole Empire.

For such comparisons and for such discussions a Royal Institute Congress would provide most excellent opportunities, and, what is equally important, would enable the Institute to exhibit one of its main activities not only to architects and to the members of the teaching profession in our primary and secondary schools and in the universities, but also to many of our most enlightened citizens who, while not taking an active part in educational progress, are keenly interested in it.

Such a Congress would naturally include in its scope a great exhibition of students' work—English, French and American, and this exhibition in itself should prove to be of a most instructive and stimulating character, of profound interest to architects, students of architecture, and all to whom beauty in one of its highest manifestations is a sheer delight.

The possible subjects for discussion are fascinating in the extreme and almost overwhelming in their variety A small number of them may be mentioned in order to indicate the breadth of interest possible at such a Congress:

" The object of architectural education."—Are the schools, for example, endeavouring to produce brilliant draughtsmen, useful assistants, all-round practitioners or specialists in a branch of architectural practice, and are they producing men who will worthily carry on the traditions of the great architects of the past?

" The subjects of a course of architectural education, and their interaction."—There is material enough for a paper on the development of the teaching of each subject—History of Architecture, Theory of Design, the Science of Architecture (including Theory of Structures, Sanitation with Heating and Ventilating, and Acoustics), Materials of Construction, etc. There is here, too, a fine opportunity for a brilliant essay on the influence on design of varying studies, historical and scientific. " Draughtsmanship " is another fascinating subject, and one which would doubtless be well illustrated by the various exhibits on view. The members of the Congress might also consider with advantage the extent to which professional students of architecture should devote time to the study of Town Planning, Decoration, Furniture Design, Sculpture, and other cognate arts, Practical Craftsmanship, Social and Economic Conditions, and such subjects of general culture as History and Literature.

A paper should certainly be read on " Teaching Methods in Architectural Education, with special reference to recent experiments."

Among other subjects which would be suitable for discussion at such a Congress may be mentioned, " The Relation between School and Office work," "Architectural Education and its connection with Professional Bodies, their Examinations and Admission to the Profession," and " Post-graduate Education, and Research in Architectural Education;" while the general questions of school libraries, equipment, scholarships, prize schemes and methods of examination should not be overlooked.

So far, the suggested Congress as outlined above deals only with the training of architects. To be fully effective it must also include in its scope, (*a*) architectural education for art students, and (*b*) architectural education as a part of general education.

The first of these points raises extremely interesting questions with reference to the part played by architecture in the training of artists in other spheres. If, for example, architecture be recognized as the Mistress Art, we might well discuss the development of schools of art with architecture as the dominating subject, or, on the other hand, the development of schools of architecture including in their scope the training of workers in all cognate arts and crafts.

The last point—architecture as a part of general education—becomes in its ramifications almost the most important of all. If, through the ages, architecture has been and still is at least one of the noblest of the arts, comparable to music and literature in its influence on the human mind, and if architecture and town planning are the very roots of Preventive Medicine and of the utmost importance to the well-being of humanity, these facts should surely be adequately reflected in our schemes of primary, secondary, and university education. In the latter, for example, it should always be possible for a student reading for an Arts degree to study architecture as an optional subject. If our future teachers and public men could have such opportunities our towns and cities would develop on sounder lines in the coming years.

This section of the Congress would also be concerned with the question of public lectures and newspaper articles dealing with architecture as a living art, and would inevitably, raise the subject of architectural criticism, which should clearly be, in the interest of architecture, as free and open as it is in literature, if our art is to play its fullest possible part in life.

It would seem, then, to be quite clear that a Congress on Architectural Education would not only serve an extremely useful purpose, but that it would also be a particularly fine opportunity for the Royal Institute to interest a large and influential section of the public in its activities; and it is hoped that if proposals for such a Congress are put forward officially they will receive the active support of every member of the Institute.

A Building "Boom" at Hand

The long-expected building "boom" is upon us. Master-builders, it has been stated to a "Times" interviewer by a competent authority, are everywhere "engaged in pricing to an extent unparalleled for many years past." The ambiguity of the phrase will not cause any real misapprehension of its true meaning, which is placed beyond cavil by the further assurance that the important works now in hand or in contemplation include the rebuilding of Messrs. Fuller's premises in Regent Street; the construction of municipal baths at Paddington; extensive additions to the premises of the Metallurgical and Chemical Corporation, Willesden; a contract in Westminster estimated to cost a million sterling; extension of the Criterion Restaurant; building an annexe to the Prince's Hotel, Regent Street; conversion of the Hotel Windsor, Victoria Street, into offices. This list could be greatly extended, but there is no need to add to it to show that architects and builders are getting very busy indeed. Then the work for widening the tunnels and lengthening the stations of the South London Tube Railway is absorbing much energy and material; while the preparations for the forthcoming British Empire Exhibition at Wembley Park are in themselves a powerful antidote against inactivity and unemployment. Having long foreseen this turn of affairs, we have lost no opportunity of counselling business men to put their building work in hand in anticipation of the "boom." It is not yet too late to act on this advice, but obviously there is no time to be lost. Wages are stabilized for the next six months; after that, however, there may occur an abnormally heavy demand for labour and materials, with the usual effect upon prices. Those prospective "building owners" who put their work in hand without further delay may expect to reap considerable benefit from prompt action. But, at any rate, architects and builders are to be heartily congratulated on the visible and palpable signs of returning prosperity.

Rival "Costing" for Housing

The "cost of housing" discussion is always with us. From its general trend, a cynic might infer that it has assumed the aspect of a game of football, with uncommonly selfish players aiming at the opposite goals. Government spokesmen struggle hard to impress the public with a tremendous idea of the wisdom, tact, and foresight with which officialdom has vindicated economy and thwarted the desperate efforts of wicked builders to inflate prices; while the National Federation of House Builders responds with an imposing array of figures in support of the contention that "the builder, however anxious he may be to build a cheap house, cannot do so under 125 per cent. on the 1914 figures." The figures that the National Federation of House Builders are "broad-casting" do not greatly encourage building enterprise. It was judicious, therefore, to counteract this effect with the explanation with which the secretary of the Federation was prompt to supplement his first letter. "However true the statement may be—as it applies to Government contracts"—namely, that the cost of building is only 60 to 70 per cent. above pre-war—"it does not hold good," he avers, "in the case of houses which are built to attract a purchaser." There's the rub; and it is only too true that, as the secretary says, "the usual type of Government house would not sell readily to people who are prepared to buy a house to live in. To build a house for sale," he adds, "the designs must be not only convenient, but attractive; the fittings and the finish of the house must be bright, and done with a view to pleasing the taste of the buyer. Leaded lights, panelled doors, a good class of grates, mantels, and door and window furniture, are all necessary to the house-builder, and [officially regarded as] luxurious in a Government house." In all which there is decidedly an element of truth—in fact, the tale is "ower-true." Houses built under the influence of a frantic effort for economy, real or false, are apt to be a painful spectacle, destitute of every mark of grace, denuded of every trace of dignity, devoid of any pretension to charm, and of any indication that "man does not live by bread alone." A walk round some newly-built Government or local council group of dwellings is a most depressing experience, and one does not willingly incur again the headache and heartache it induces. Truly this is housing reduced to the utmost limits of graceless featurelessness. Primness and plainness in such excess as one finds in a poor-law building destroy the idea of house-pride and house-joy. Much as one detests the house "made bright with a view to please the taste of the buyer," one is bound to admit, however reluctantly, that even the "bright" house shows some sort of aspiration, some desire to escape from sheer æsthetic dejection, some degree of buoyancy and gaiety: all which is infinitely less hopeless and abject than the sullen "submission to hard fate that is so painfully suggested by many a Government-sanctioned "brick box with slate lid." It is a matter in which inferior taste is better than no taste at all—better morally, if not æsthetically. To this extent we agree with the secretary of the House-Builders' Federation.

The Menace to the Whitgift Hospital

Croydon councillors, or the majority of them, are itching to destroy their only beautiful building—Whitgift's Hospital of the Holy Trinity. They are about to ask Parliament to consent to this act of barbarism. Parliament will probably do nothing of the kind, observing that the necessary street widening could be effected by pulling down certain modern buildings that have but scanty claims to respect, and, unlike the Whitgift almshouses, none whatever to veneration. Built in 1596, the almshouses are a quaintly beautiful monument to their pious founder, and a priceless example of the building modes and methods that prevailed in his day. The Society for the Protection of Ancient Buildings, and the National Trust, may surely be counted upon for strenuous opposition to the ill-advised Bill; but it is a pity that Mr. John Burns is not in Parliament to thunder against it. To his efforts in the House we are indebted for the respite given the almshouses on the last occasion when they were ruthlessly threatened with extinction. Croydon ratepayers should indignantly repudiate the ill-advised action of their councillors in spending money on the promotion of a Bill for the destruction of the only vestige of amenity to which the town can lay claim. Those practical-minded persons who feel unable to deny that the almshouses are obstructive to traffic have suggested their removal, bodily or piecemeal, to some more convenient site; but a building deprived of its original environment loses most of its own distinctive charm, and fails to impart to its new neighbourhood the glamour withdrawn from the old. Removal breaks the spell; and, besides, if the Croydon burgesses had the misfortune to pass their precious Bill, it is not beyond possibility that the Whitgift Hospital, once its portability was proved, might be shipped to America.

The Exhibition of Students' Designs at the R.I.B.A.

AN exhibition of designs, prepared by students of the "Recognized" schools of architecture who have qualified for exemption from the Final Examinations of the R.I.B.A., is now being held in the Institute rooms at 9 Conduit Street. It is unique in being the result of a departure from the hitherto recognized course of qualification for diploma of the R.I.B.A. It is the practical work of the student carried out during his or her last year's course in the schools of architecture for the diploma which is now recognized as equivalent to the passing of the examination for the R.I.B.A. qualification.

A medal is to be awarded to the student submitting the best designs.

One's first impression of the exhibition is the seeming greater activity of the Liverpool School of Architecture, its exhibits comprising work carried out for the Prix de Rome Scholarship, while those of the Architectural Association, the Glasgow and Aberdeen Schools, are limited to student's work for the diploma alone.

Undoubtedly, the best set of drawings—so far as they go—is by Miss E. G. Cooke, of the Architectural Association School, particularly the plan for a "Restaurant on an Island." The feeling, quality, and artistic character expressed in this unsymmetrical plan is unequalled by any in the room. The plan for the lay-out of the square in front of Victoria Station is also good, and shows a grasp of essentials. One only wishes that this student had shown as much ability in elevational design as in planning.

The general standard of the work of the Liverpool School is very high, more particularly so in the sets of half-inch blue print working drawings for a bank. I consider these are the most valuable of the exhibits sent in by this school, for, although undoubtedly American in character of design and method of delineation, they show the capacity of the student to grasp the essentials of clear practical drawings, an asset invaluable to the student entering the practical world of architecture, and one not infrequently absent from or dormant in the strictly academically trained man. The latter, as most practising architects admit, so often fails in the effort to represent his ideas or those of his chief in a way which will not only be beautiful as a dream on paper, but as a practical document capable of producing a beautiful building.

The Prix de Rome designs of the Liverpool School for the "Home for the Royal Academy" have not, however, the same merit. The plans are in most cases confusing, with too many elements, and do not show that bigness of grasp so essential in good planning. Like the "Lake-side Restaurant" designs, they lack true inspiration and freshness of thought.

The design for the wall treatment of an office building by Mr. P. S. Haswell is interesting, but the windows are too small for a commercial building in this country. The triple-light windows would have been better as twin windows, to be more in keeping with the circular-headed windows over. Nevertheless, the effect is direct and "clean," which is more than can be said for most of the work which is being carried out in one of our most important thoroughfares to-day.

In his design for a "Building for the Storage of Documents" he has rather missed an opportunity for something resh in treatment. The side features are meaningless and he central windows would have been better treated in vertical lines.

Mr. E. R. Arthur of the same school produces a dramatic effect in his church design, the long vertical spire or minaret contrasting with the squat church behind, but his foreground has gone to seed.

This student's leaning towards the dramatic is also shown in the unacademic colouring of the plans for his "Home for the Royal Academy."

Mr. E. W. Martin has not risen to any great height in his unexpressive "Aviation School," unless, of course, his idea was to camouflage its purpose.

His "Lake-side Restaurant," like others for the same design, does not fit the site, but it is probably the best of this group.

Mr. W. A. Devereaux's best drawing is his colour scheme for an interior. It does one good to see what the architectural schools are doing in this direction, and one ventures to hope it will inspire the London architect to conceive something more than his usual white scheme in his next new building.

Mr. Devereaux's plan for a "Lake-side Restaurant" is satisfying, and his elevations are fresh in design and delightfully coloured.

As in the work of the other students of this school, his working details, although practical, would not, I fear, produce the artistic result promised in the smaller scale designs.

The work of the Glasgow and Aberdeen schools shows a thoroughness which is to be commended, but the designs are more practical than artistic, and do not show much advance on the usual street architecture.

Mr. Ian A. Moodie, of the Aberdeen school, in his design for a Presbyterian Church in Scotland, shows a most thorough and practical set of drawings worked out in every detail except the artistic. Why he should have designed it for Scotland is difficult to see. It is scarcely characteristic of that country in aught save its thoroughness. I would rather it were built somewhere else than in Scotland.

His designs for the restoration of Elgin Cathedral are his best drawings, and he appears to have caught the spirit of the old building; but his façade for the Reference Library is not long enough for a triple motive.

Mr. G. B. Scotland's work does not come up to one's expectations in connection with the Glasgow school. The practice of rendering in black ink and colour is not conducive to good work.

The holding of this exhibition should do much to keep up the interest in the various schools by fostering that healthy spirit of rivalry, showing them their weaknesses, and inducing them to do better work. But it is a question whether the awarding of a medal to the student who shows the best work will achieve its purpose. There may be a tendency both with the student and the masters to aim at winning the medal rather than honestly carrying out the studies which will ultimately make better architects.

T. S. TAIT.

[It should be pointed out that the exhibition is not really representative of the best work of the schools, as students who have already obtained their Associateship are not allowed to exhibit, though we believe it was originally the intention to admit their work. Consequently the exhibition loses a good deal of interest. At the moment of going to press no announcement has been made of the name of the student to whom the medal has been awarded.—EDS. A. J.]

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

to admit them. People simply lose their reason at the sight of the famine horrors. It is for this reason that, as I stated in a previous article, the full story of the famine will never be told. With an effort the cultivated reporter can seize such facts as little hungry children gnawing their hands; a ravenous man biting off the outstretched finger of another man and calmly chewing and swallowing it; men and women falling upon a dying girl and devouring her raw flesh; two women eating two children and an old woman, and also killing two other women in order to eat them; and the discovery everywhere of human corpses cut up for food. Official investigators were sent to certain towns and villages in the Samara district, and I have photographs in my possession of these investigators at work surrounded by the body-eaters and the remains of their shocking banquets. One well-known English author said to me, “ Do tell me, yes or no, have you direct evidence as to whether children have actually been eaten for food in Russia? It would not surprise me in Central Africa.”

THE INSANITY OF STARVATION.

What has the Russian artist, poet, draughtsman, and short story writer seen in these truly terrifying facts? Looking through a large collection of “ art of the famine ” productions, it seems to me that the romance in him has invested his subject with the æsthetic and religious garment of a Visitation.

It is not the first time since the Revolution that Russian artists have experienced and expressed the religious aspect of a momentous event. It seems that the old pre-war intelligentsia, the anarchist-individualist, dreamt the Revolution, gloried in it, deified it. “ You welcomed the ruin and tragedy and horror of a new deluge,” as one of their fellow poets reminded them. When it came they were staggered. Some fled, others clothed themselves in a protective idealism and raised the banner of religious romanticism. They deified the Revolution as the Great Liberator, spoke of the revolutionaries as “ holy bandits,” saw Russia crucified on Calvary, being taken down and hurried to a glorious resurrection. For a time the Revolution was a dream. Then came civil war and its bitter realities. Liberation had not come, and the revolutionary ardour vanished at the touch of violent reality. Some of the old intelligentsia fled, others became dumb, and others accepted the inevitable course of events. They sang poems to the Revolution, the new Russia, the new art, the new everything. They composed passionate verse exhorting their fellow artists to be up and doing in a civic art way. They were to come into the open and celebrate the re-union of art and life. I will quote some of the outpourings in the article on Civic Art.

In the same way as many artists gave the November Revolution a romantic interpretation, so many have seen religious romanticism in some of the awful facts of the famine. I fancy the peasant in them has come to the surface in familiar religious and mystic images, especially empty landscapes strewn with primitive crosses and devout suffering figures. Like the simple peasant maid, the primitive in the artist has interpreted the famine as a Visitation. None the less, they recognize the bleak truth of the famine and suggest its realities, however poetic the latter may appear.

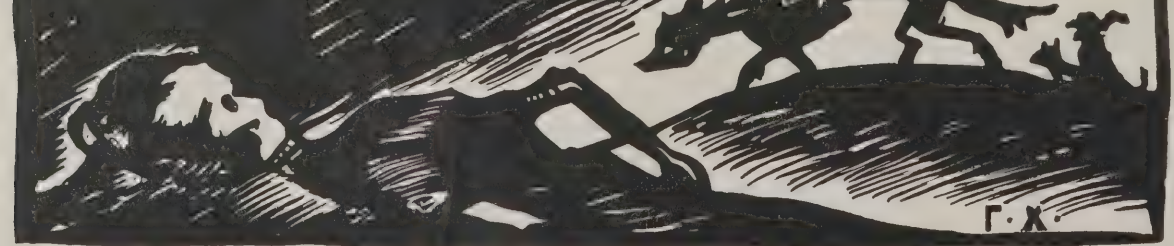
As an example of the short story evoked by the famine, the following extracts from one may be given. They are taken from a sketch called “ The New Land,” printed in the Moscow “ Pravda.” A Russian peasant and his sister lay by the old cart in the barn. They have eaten their last scrap of rat's meat. The girl speaks of a new land that has been opened in the south where corn is plentiful. They will trek there. The story continues :—

“ Men began to make ready for the journey: they repaired their carts. Those who had not eaten their horses fed them on scraps of hay and dried dung. The horseless ones made hand carts as best they could.

“ The rats had gone—a grey moving blanket of them had passed through the village two days before. The villagers had killed all they could; these were already eaten.

“ Myron had to keep his big body out of sight. Men's eyes were greedy for meat. He ate little—crushed bark, or boiled hide cut from fallen animals that made a pinkish stew. But all his flabby flesh hung on his bones still, like wet sand: his bones found no support in this sand and were becoming numb.

“ Nadka, flat-chested, with a greenish skin, and sore-swollen eyelids, was always near him, saying: ‘ Don't show yourself, Myron. Men have gone mad before now,



ANIMAL SCAVENGERS.

particularly of nights. They will kill you. You'd better get thinner. Get yourself thinner, Myron.'

" ' I can't get thinner,' answered Myron hoarsely.

" He shook his dusty, moppy head and sought safety in the barn.

" ' It's all a fraud, I tell you. It's water, not flesh. You just feel it.'

" Timidly Nadka felt his legs.

" ' True, it's a fraud. And what a body you used to have. I remember. But they won't believe that, and will kill you. You'd better not show yourself.'

" Myron slept with open eyes. The nights were long and dry like the days. He stretched ropes near his shelter so that he might hear any stranger bent on evil."

They continue toiling on day after day across the burned-up soil. The woman dies, and the man goes on alone. He develops delusional insanity. Imagines that he is pursued by cannibals, while he in turn pursues the Fata Morgana of a field of yellow, richly-growing corn. As he tries to catch the spikes they slip through his fingers. Then comes the tragic end :—

" Myron crawled under the next cart, lay down in the shade, and looked out. Under the cart which he had just left he saw the four. The woman winked at him again. Myron moved his head close to the wheel and shut his eyes. Before him quivering, winding cornfields stretched, full of crimson, green, and brown ears of corn. Throwing the ears aside with its horns a cow with a dull fat muzzle stepped out and looked at him. And suddenly its eyes grew dark and receded, and over them floated a shadowy wolf's snout.

" Myron opened his eyes.

" Behind the wheel the woman squatted, and a man was pressing a hammer into her hand.

" Myron leant his head against the spokes and closed his eyes."

PLAGUE.

The vision of golden corn lures him on, while the apparition of cannibals goads him to death. It is a poetic description of human beings driven mad by hunger.

Famine verse takes all forms—proletarian, symbolist, imagist, futurist, suprematist, even nothingist. The latter is a sort of dadism or negation of everything. Some of the samples handed out take the breath away. Here is one quoted by " Broom," an Italian publication :—

" Dir boor shtchill
oobyeshtchoor
skoom
vy so boo
rlez."

After that, futurist monosyllabic verse appears quite simple. One telling, strongly worded appeal in this form begins :—

" Stop !
Listen to this !
Listen to the great never-ending cry."

Then it appeals to each country in turn,

" London
At banquet
With King and Queen ; "

Paris, which it implores to follow Nansen, Washington, and the American farmers; Berlin—all are brought into a general design by the refrain " Bread ! Bread ! Bread ! "

Many appeals are made by large coloured propaganda posters, propaganda postcards and stamps, and woodcuts of considerable merit appearing in official publications. Among the latter is " Chernaia Godina " (Black Year), a monthly publication issued for the first time this year. Each number contains fifty pages of matter, stories, verse, facts and figures on the realities of the famine. It is illustrated with woodcuts which interpret the famine from the point of view referred to—an appreciation of the reality with an insistence on poetry and religious romance. The whole might be called " The Days of Visitation are Come."

THE EXODUS.

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

THE LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

it will give an appearance of cheerfulness and sunlight to the interior, such as always exists in the tomb of Napoleon in "Les Invalides," Paris.

The business of the company is confined almost entirely to acting as executor and trustee, and in designing the interior this point has been strongly emphasized. Ample accommodation for protracted conferences is provided, the officers and their private rooms occupying one entire side of the bank, the other side being given up to tellers, etc., whose banking screen consists of marble and bronze with clear plate glass.

There is a safe deposit vault on the main floor, level with the street, another below this; and in the basement three separate vaults, each 50 ft. by 116 ft., have been laid out for future requirements. These vaults will be of the latest type of concrete, steel and electric protection. In the basement are two large committee rooms also conveniently arranged for conferences. Below the entire structure is a sub-basement, which gives the utmost protection from tunnelling as well as providing space for a heating and ventilating plant.

For the employees, locker rooms and rest rooms with shower baths for both sexes are provided.

The adjoining First National Bank, which is twenty stories high, was also designed by Mr. Bossom.

The building for the Greenwich Trust Company, at Greenwich, Conn., is constructed of pink Milford granite, the dome being of granite terra cotta. The vestibule is treated in Botticino marble, with a Tennessee marble floor. In the centre of the vestibule floor is an illuminated floor clock, operated from the master clock in the dining room in the basement. The ceiling is a cove of ornamental plaster and is lighted by concealed "flint reflector" lighting in the cornice.

THE ENTRANCE VESTIBULE.

On entering the bank, we find the men's room is on the right-hand side. It is fitted up in quartered oak in Elizabethan style; the furniture is of brown leather and all the fittings have been designed to harmonize with the style of the room. To the left of the entrance is the ladies' room, designed in the Adam style. In connection with the men's and ladies' rooms modern toilet facilities have been provided.

The large banking room, including the two balconies, has been treated in a very complete manner. The ornamental ceiling and decorations of the banking room have been copied from the work of Giulio Romano and Giovanni da Udine in the Villa Madama, just outside Rome, on the northern slope of Monte Mario. The decorations have been carried out as exactly as possible in the identical colours made from actual sketches of the Villa Madama, but subjects appropriate to the bank have been introduced, notably its coats of arms, and other emblematic treatments have been employed, including a medallion sketch of General Putnam on his famous ride down Horseneck. In the main ceiling around the dome

A VIEW IN THE RECEPTION ROOM.

FIREPLACE IN THE RECEPTION ROOM.

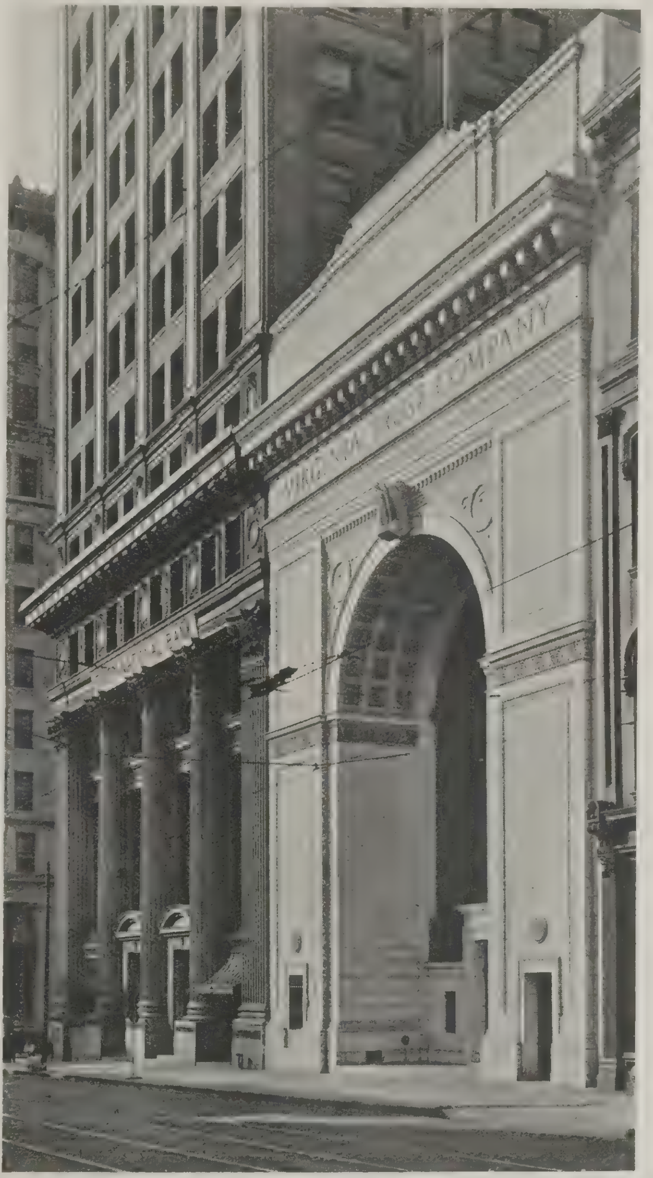
there are eight figures, symbolic of the four seasons and four elements. Over the large windows in the centre of the Trust Company are two cartouches on each side, representing Art, Architecture, Building and Engineering, the crafts entering into the production of the building. The decorations have been carried out, both as to design and colour, to reproduce faithfully the original conception of the artists.

The walls of the banking room and the banking screen are Botticino marble; the steps of the stairs leading to the front balcony are of Tennessee marble; and two columns at the front of the banking room supporting the front balcony are of Escolette marble. The Botticino marble used comes from the Province of Isria in the northern part of Italy, and the Escolette marble from Greece. All the marble has been carefully collected for beauty in graining and soundness of material.

All the metal work in connection with the banking screen check desks is of bronze executed to special designs prepared by the architect, and the railing of the front stairs is of iron, painted in colours to correspond with the interior decorations.

The banking room receives its artificial light from a large central chandelier, containing fifty-nine lighting bulbs, and designed to harmonize with the interior of the room. The centre of the ceiling of this room is composed of stained leaded glass in soft tones. This is lighted from above by a skylight, which allows the light from the roof to come through this leaded glass. The apex of the dome is 43 ft. above the floor.

The committee and consultation rooms are situated off the bank lobby. They are finished in American walnut, and all of the furniture is of the same material. All the counters and desks required for the employees are of walnut and of modern type, with all the latest devices and improvements. The officers' space, at the front of the banking room, has a parquet floor with marble border and walnut furniture. The entire working space on both sides of the Trust Company, and the floors in the committee room and consultation room are of cork, and the floor in the safe deposit department is of marble. All the lighting fixtures throughout the building have been designed specially for the various spaces in which they occur, and with a view of getting the very best results.



THE VIRGINIA TRUST COMPANY'S BUILDING, RICHMOND, VIRGINIA. ALFRED C. BOSSOM, ARCHITECT.

In the basement and on the first floor and the mezzanine are fireproof vaults for the storage and safe keeping of the bank's records. These are provided with fireproof doors operated by combination locks. At the rear of the Trust Company main room are the vaults, which have been built to resist any attacks. The outside of the vaults is finished in polished steel, then there is 20 in. of concrete, and the inside of the vault has a 3-in. chrome steel lining which is fireproof. The entire inside of the main vault, which measures 16 ft. by 15 ft., is finished in polished steel and equipped with money chests and safe deposit boxes. The main entrance to the vault, including the vestibule, weighs 64,000 lb., the door itself weighs 35,000 lb; the circular opening to the vault is 7 ft. in diameter, and the emergency entrance on the side of the vault (which is used in case of a lock-out on the main door), including the vestibule, weighs 12,000 lb. The total weight of all the material entering into this main vault, which includes the doors, linings, safe-deposit boxes, etc., is 214,000 lb. This vault is fitted up with all the latest devices for the safety of both the Trust Company and customers.

At the side of the vault is the president's office, which is finished complete and furnished in mahogany, and equipped with private toilet conveniences. At the rear of the other side of the vault there are locker rooms and other conveniences for the employees of the Trust Company. The walls of the vault are isolated so that an employee standing at one side of the vault, by turning on the lights, has a complete view of the sides and rear of the vault at all times, which precludes the possibility of any burglarious attacks on the vault from the rear.

The director's room is finished and furnished in American walnut with walnut panels. A room on the front mezzanine is provided for the use of the bank stenographers, and the rear mezzanine is devoted to working space for the clerks and toilet facilities.

In the basement are fireproof vaults for the storage of trunks, silver, and ordinary storage. They are provided with modern doors which are governed by time locks. All these vaults have steel shelving.

The rear part of the basement is divided up into examination rooms, fitted up with tables for the examination by clients of the material which they have stored. This department is treated in a putty-colour finish with plate glass. Also in the basement is the storage room for furs, in connection with which a refrigerating machine insures the proper temperature at all times to keep the furs in proper condition. This room is provided with a vault door controlled by time locks to make absolutely safe all articles in storage.

Off the examination rooms there is a room provided for the furrier, where the furs can be examined and altered as the owners desire, and at the rear of the furrier's room is the dining room for the employees of the company. In conjunction with the dining room is a kitchen and pantry and a refrigerator. The boiler room, which comes next, is fitted out for the heating of the building, and for the distribution of the hot water required for the various fixtures in the building.

Underneath the sidewalk is a complete storage battery plant consisting of cells, generator, and automatic controls.

The St. Pancras Housing Scheme

H. V. ASHLEY and WINTON NEWMAN, FF.R.I.B.A., Architects

IN 1919 the St. Pancras Borough Council invited ten architects to submit designs in competition for the tenement housing scheme for Prince of Wales Road, N.W., and the assessor, Mr. Harry Redfern, placed first that of Messrs. H. V. Ashley and Winton Newman, FF.R.I.B.A.

The buildings as executed are in lay-out substantially as originally planned; but the elevations have been considerably modified—we fear to their detriment—by the elimination of the roofs and the substitution of asphalt flats, and the separation of the main block facing Prince of Wales Road. It is not uncommon, but nevertheless it is very regrettable, that the trained judgment of architects should have to give way to the often lightly considered rulings of a lay committee. It is difficult to make a domestic brick building look right without a roof, and in this connection we are pleased to illustrate the architects' original proposals for the treatment of the elevation to the main road.

The site was a difficult one to plan owing to its shape, and a long blank wall of a tall factory building had to be taken into consideration and disguised as far as possible. Provision was required for a crèche, which also was ultimately not proceeded with.

The illustrations show clearly the disposition of the several tenements and their detailed planning. Care has been taken to give a sunny aspect to all the living-rooms and bedrooms at some time of the day, and generally to render the flats as light and airy as possible. The central courtyard, with its raised playground and perambulator stores below, is quite successful in execution.

Hot water, limited in amount, is supplied to each flat. The living-rooms are fitted with a "worker" grate, for open fire or range, as may be required, and the sculleries with gas stoves and gas coppers. All the rooms are wired for electric light. Hand-lifts for coal, etc., give on to each landing.

The general walling is in multi-coloured red brick with artificial stone dressings, and the floors are constructed with steel joists and hollow tile filling, and finished on top with breeze, to which wood flooring is nailed.

The general contractors were Messrs. Chessums, Ltd.; the sub-contractors being as follows: Thomas Faldo & Co. (asphalt); Bristow Bros., of Speen, Bucks (facing bricks); Stuart's Granolithic Co. (artificial stone); Young & Co. (steelwork); J. A. King & Co. (hollow tiles for constructional floors, partitions, etc.); F. Edwards & Son and The Falkirk Iron Co. (stoves, grates, and mantels); Ames and Finnis (sanitary ware and fittings); The Gas Light and Coke Co. (gasfitting); F. Geere Howard, Ltd. (electric wiring); Yannedis & Co. (door furniture); T. W. Palmer & Co. (gates, railings, handrails, balusters, etc.); Waygood-Otis, Ltd. (lifts and cranes); J. Jeffreys & Co. (heating and ventilating).

Construction. 27.—New Offices for the Liverpool Victoria Friendly Society

SINCE the publication of the first article on the progress of this block of commercial offices a considerable advance has been made with the construction of the foundations and underpavement vaults. The outer ring of the reinforced foundations for the portion now in course of erection is all but finished, all the grillages for the stancheons being now covered. The centre section of the vaults in Southampton Row is practically completed, part of the shuttering and forms for the panels, counterforts, back and roof having now been struck. The retaining wall along Bloomsbury Place is also well advanced, and another three or four weeks should see its completion and that of the north-east corner of the vaults along Southampton Row.

Fig. 6 illustrates the bottom reinforcement at this corner, at the point where the vaults and the retaining wall meet. It will be noted that the surface behind the bars consists of the 1 in. layer of asphalt which runs up the back of the vaults and retaining wall, and helps to convert the whole site into a watertight "tank." The reinforcement of one of the counterforts is shown on the right of this photograph, but a closer and clearer view of a similar one is given in Fig. 1, which also shows very plainly the asphalt surface at the back.

Along Bloomsbury Square the main reinforcement for the bottom portion of the vaults is now in place, and the level of the floor of the coal vaults has been reached. The design of the vaults is illustrated in the drawings 3 and 4 reproduced on the following pages. The drawings on the opposite page show a series of sections taken along this side of the building, and those on page 454 the plan and elevations of the coal vaults at the point where they meet the existing buildings.

On the first drawing the complete section shown on the left applies practically over a distance of about 40 ft. from Bloomsbury Place, the level of the vault floor being the same as the general basement floor level. After this there is a drop of 2 ft. 8 in. in the basement for the boiler-house, the floor of the vaults being raised 6 ft. 3 in., as indicated in the complete section and elevation shown in the middle of the drawing. The whole of the vaults opposite the boiler-house are to be used for the storage of coal and coke, and chutes are being constructed at intervals in the floor of the vaults in order to feed the coal bins opposite the boilers. A 6 ft. by 4 ft. 6 in. hydraulic ash hoist is also provided in order to raise the ashes, clinker, etc., from the boiler-house to the street level, a section of the vaults at the point where this hoist is incorporated being given on the right of the drawing.

It will be seen from an examination of the drawings that the coal vaults are connected to the main foundation raft by means of a reinforced concrete beam, through which the coal chutes are formed. This beam is designed as a cantilever to take the full thrust due to the earth pressure at the back of the vaults, and transmit it to the blue clay of the foundation, due allowance being made for any reverse movement which might be produced in the case of the vaults being full of coal and a settlement occurring in the sandy soil beneath the vault floors. Fig. 2 is a view of part of the reinforcement of this beam near the ash hoist, the cast-iron pipe in the centre being intended to take the hydraulic ram for the hoist.

Many difficult problems were encountered during the design of these vaults owing to the number of different sections which had to be dealt with, and considerable thought had to be given to the arrangement and spacing of the reinforcement in order to evolve a method of construction which would not interfere with the timbering of the trench and the asphalting.

The drawing on page 454 indicates the provision made for the continuation of the vaults when the building is extended after the expiration of the present leases. The plan and elevation of the end panel wall (on the left) shows a return portion which forms, with the wall itself and the back, an empty space or recess. It is proposed to fill this with a temporary brick wall in order to support some old existing brick vaults shown on the left of the drawing. When the existing buildings are pulled down and the new building extended, a duplicate panel will be built in the recess mentioned above, and the vaults continued from this panel in the manner already described. The drawing also shows a general plan of the coal vaults and chutes, and the junction of the main foundation raft with the base of the wall underpinning the end wall of the first of the existing block of buildings (see Fig. 4). The return of the asphalt is also clearly indicated.

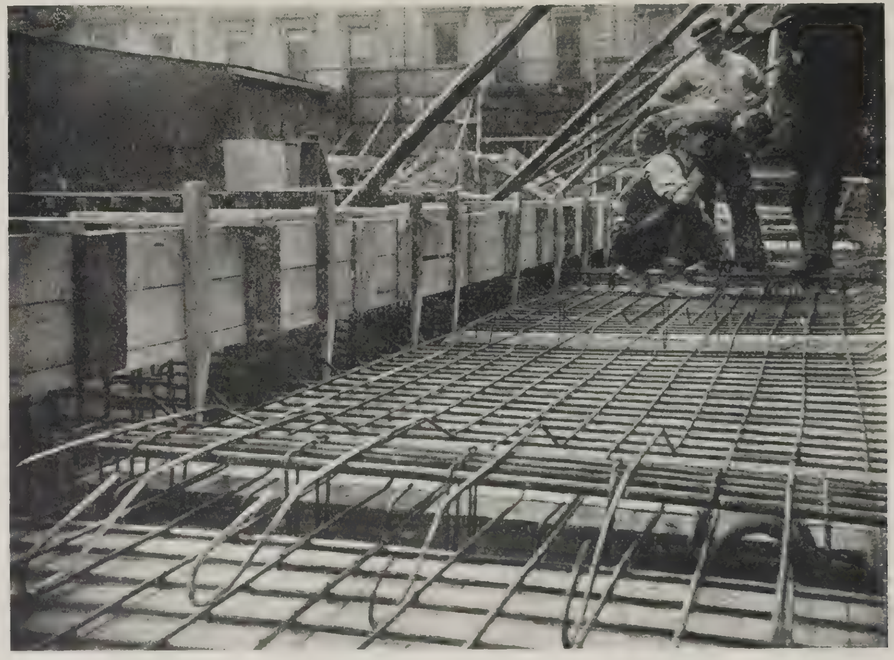
6.—BOTTOM REINFORCEMENT OF VAULTS.



7.—REINFORCEMENT OF TOP OF VAULTS.

THE LIVERPOOL VICTORIA FRIENDLY SOCIETY BUILDING, SOUTHAMPTON ROW, LONDON

Mention was made in the previous article of the difficulties met with from underground water. This question naturally is of great importance in connection with the amount of reinforcement to be provided in the basement floor. Fig. 5, an outline drawing of the foundations, shows clearly the arrangements made to deal with this problem. In order to keep back the water whilst the main foundations were being laid, a light super-cement wall, reaching above the water level, was erected practically round the whole of the site, the underground water being then diverted into suitable sumps from which it was pumped day and night. This left the blue clay surface quite dry, and enabled the asphalt to be laid and the foundations to be built without much trouble. The whole of the site is now surrounded by a ring of solid foundations, reaching well into the impervious blue clay, except along the line of the existing buildings. Along this line an under-pinning wall is being built with its base also in the clay, and this wall will eventually join up with a low super-cement water-wall which has been started from the Southampton Row side. As the site will then be entirely isolated from water, very little reinforcement will probably be necessary for the basement floors.

The design of the reinforced concrete retaining wall along Bloomsbury Place, and of the under-pinning wall of the existing building, will be dealt with in a special article to be published shortly.

The architect is Mr. C. W. Long, F.R.I.B.A., of London and Cambridge, and the consulting engineers for the steel and the reinforced concrete work are Messrs. C. H. Lobban, B.Sc., A.M.Inst.C.E. and C. A. Geneve, B.Sc., A.M.I.Mech.E., both of the University of London (King's College). Messrs. James Carmichael (Contractors), Ltd., are the general contractors, and Messrs. Dorman, Long & Co., Ltd., are supplying the structural steelwork.

The previous article on the construction of the building was published in our issue for May 3.

The Coventry Street Corner House Extension

THE restaurants of Messrs. Lyons are an increasingly prominent feature of London life, and their latest development, an extension of the Coventry Street Corner House, bids fair to eclipse its many predecessors in comfort and appearance as well as in size.

The new building, which is now in course of erection, is being carried out to the design of Mr. F. J. Wills, and will contain seating accommodation for about 3,000 people. There are five stories, including the basement, with a restaurant on each, the total area amounting to 40,000 ft. super.

The ground floor comprises in addition a shop and entrance hall, and there are ladies' rooms on the third floor, one at the top of each of the two staircases. Four passenger lifts are also provided.

The whole building will be heated by warmed air and by steam radiators, and an elaborate system of ventilation, by which each floor is furnished through ducts with its own supply of fresh air, is being installed.

The constructional steelwork is an interesting feature of the building, 25,000 tons having been used. This was designed by Messrs. Reade, Jackson and Parry, and was manufactured and erected by Dorman, Long & Co., Limited, London.

The steelwork is of particularly massive construction on account of the large spans required between columns to ensure a minimum of uninterrupted space in the rooms on the various floors. The bottom lengths of main stanchions carrying the basement, sub-basement and ground floors were 60 ft. long and weighed 22 tons each, and several of the main floor girders exceeded 10 tons in weight each.

The erection of the whole of the steelwork was carried out by means of two steam cranes, which were carried on the steel structure itself and lifted from time to time as progress upwards was made.

The heating and ventilation is designed by Mr. A. H. Barker, and Messrs. J. Lyons and Co.'s Constructional Department are carrying out the constructional work besides being responsible for interior fitments.

Other contractors are: Shaws Glazed Brick Company (glazed faience); Waygood-Otis, Ltd., (lifts); The Crittall Manufacturing Company (casements); Bradford and Company (hollow brick floors); Babcock & Wilcox (boilers); The Art Pavements, Ltd. (mosaic staircases); Jones & Willis (shop fronts).

F. J. WILLS, ARCHITECT.

Architecture in the Lay Press

Great Houses and Great Cities

"Everyone will wish the example of Mr. Edward Wood, M.P., in handing over Temple Newsam, his beautiful and historic Yorkshire seat, with its grounds and portraits, to the city of Leeds as a possession for ever, to be followed by other owners of historic mansions. . . . It would be an ideal way of preserving them and of enabling their beauty to be appreciated by an age to which, for several reasons, the secrets of the best architecture appear to be irrecoverable. We do our best to preserve the masterpieces of painting and sculpture, but good architecture is equally ennobling, and to judge by the numbers who visit Hampton Court, Temple Newsam is likely to exercise a similar gracious influence. Unhappily, however, an architectural masterpiece costs much to keep up, and if an owner cannot keep it up, or if it falls into unappreciative hands, with the risk perhaps of demolition, there may be no alternative, failing such a bargain as has been struck between an enlightened city and a loyal owner, to its ultimate disappearance. But there are many historic houses within reach of great cities, and their impending fate must cause sorrow to families proud of their inheritance, and anxiety to the lovers of art."—"The Times."

Must England be Jerry-Built?

"New houses must be built. With a housing shortage and an ever-increasing population, they are an unfortunate necessity. But must all new houses be ugly? The town dweller who has the slightest artistic perception has had some severe shocks on his holidays this year—observing how rapidly the 'uglification' of England is proceeding. Good architecture may be expensive, but at any rate it is ornamental—and *practical*. It may be a slight consolation to feel that the gimcrack bungalows and glaring villas which are making the English countryside an eyesore will not last for ever, but they may (unfortunately) last our lifetime. Each year that we return to the country we find it less and less lovely—more and more spoilt and overbuilt. We must resign ourselves to this. But must the speculative builder *always* choose the beauty spots of the country to 'uglify'? . . . We have already a Society for the Preservation of Ancient Buildings. Why not found a new one, to work in conjunction with local councils all over the country for the protection of the countryside from the Jerry-Builder?"—Arthur Willis, in "The Daily Mirror."

A Plea for "Soap Boxes"

"It is a fact that the more we spend upon our buildings nowadays the less satisfactory our results appear to be. We plaster our façades with pilasters, and classical orders, with the sole result of making them look vulgarly ornate. . . . Now skyscrapers have no classical orders. Nor has the new building of the Pensions Ministry at Acton. . . . And the extraordinary fact is that the result is good—definitely, incontrovertibly good. I think almost any architect would agree with me. The complete absence of fussiness and pretty-prettiness, the subordination of everything to the object in view, the honesty of the building, its utter truthfulness, has an attraction that anyone can see at a glance. I do not say that this is the last word in modern architecture, or even in the use of concrete as a building material, but it does seem to me to indicate the lines upon which we must proceed, sooner or later, if our architecture is to have any future. Let them carry on with their soap-boxes! I believe this first one was Mr. Ian Macpherson's idea. He may, without knowing it, have achieved immortality thereby."—Clennell Wilkinson in "The Outlook."

New London

"England is changing. A new order is gradually ousting the old. The traditional landlord class, criticized bitterly by many, is disappearing to make way for a newer type of proprietor. The first had a sincere personal interest in his tenants, the new regards his acres as a business proposition. He is on his trial. In the material, also, change is at work. The old mid-Victorian London is vanishing, and in its place is rising a new city with great promise of beauty. Kingsway and Aldwych have replaced a network of slums. The Regent Street of Nash is giving way to a new street of great buildings of an architectural style which must raise England's standing in the world of art. Beautiful in themselves, they are designed for the greatest utility. There is much to be said for the old artistic view that the truest utility produced the truest beauty. There is a commendable desire to preserve historic buildings, and many of them are being surrounded by new buildings designed to avoid incongruity just as was the old chateau of Versailles enshrined in the centre of the Louis XIV palace. This desire to create a new London worthy to rank artistically with the great European cities is a sign of regeneration. The national spirit is recovering from the great war."—"The Daily Express."

A Good Sign

"A revival of building is clearly shown by the fact that, owing to lower prices, work is to proceed on contracts estimated of the value of £15,000,000, of which £5,000,000 is to be spent on building in London. This is a wholly good sign. The distribution of such a considerable sum will assist a number of industries. Building activity is something that everyone can see with his own eyes; it inspires confidence. Better times may be coming. It is particularly satisfactory that the released contracts will provide work for a very considerable number of men. A fillip to the architectural profession should be another good feature of the revival. During the prolonged shutdown of private building young architects' prospects have been far from rosy. They seem brighter to-day than at any time since the armistice. It is not a coincidence, but plain cause and effect, that the Government had to stop building before private enterprise could begin. The Government building operations kept prices unreasonably high for years, put a grievous burden on the taxpayer, and caused acute discomfort through their failure to supply enough houses. Now that the Government are out of the business, house-building is rapidly coming down to a commercial basis. Private enterprise will do the rest."—"The Daily Mail."

London Transfigured

"It is not too much to hope that the next ten years should see the realization of the schemes for rebuilding the shabby south side of the Strand; the building of at least one more new bridge across the Thames; the rebuilding of Drury Lane; and the reconstruction of the huge site in Bloomsbury temporarily earmarked for the University of London. One hopes, also, that the old London is being filmed for posterity—before it is too late."—The Special Commissioner of "The Sunday Chronicle."

The Historical Teachings of Architecture

"Building craft, which includes architecture, has been and always is a living and developing art, and the fibre of tradition that runs through it is extraordinarily tenacious of life. The Italian workman, for instance, uses, when the emergency arises, the hand-to-mouth shifts and contrivances that Cæsar's legions employed when making their camps in Germany and Gaul. . . . In the ruins in Rome and the Campagna round about one can discern the desperate shifts the builders were put to, from the scarcity of wood for strutting and centering. Wood was hard to come by, and there were insatiable claimants who asserted prior rights. Wood was essential for the warming of the houses and the public baths; the bakers and cook-shops insisted on their needs; the armourer and the smith had to be satisfied; the potter and the tile maker appeased before ever a stick was available for the builder. The arches, vaults, and domes are eloquent witnesses of this cruel shortage. The use of concrete lessened the demand for bricks, but concrete for floors and roofs requires centering, and expedients to minimize this necessity help to give interest to the amazing structures that were built in the heyday of Roman prosperity. Some of these expedients are in actual use by the workman of to-day."—Mr. Halsey Ricardo, F.R.I.B.A., in "The London Mercury."

Better Looking Houses

"The tragic cost of building since the armistice has had one supremely good result: it has driven architects to express the people's need for homes in the simplest terms. At the worst this has produced dullness—the spirit of Gower Street. At the best it has driven the designer to make his work succeed by qualities of sheer design, right proportion, good grouping, rhythm, and other intangibles which critics try to describe for the confusion of plain men. Economy has brought us back, by the elimination of inessentials, to an art of common sense. At the same time the best of our architects have put the best of their skill into planning for comfort and health and not for appearances. They have taken counsel with the makers of grates and baths and sanitary dodges, so that economy and efficiency might be allied with seemly forms. That is not to say that simple houses are easy to do. The plainer the house, the more need for those subtle differences which give a plain building that elusive quality that we call style for want of a better word. The public will get what it ought to want, when it has the wit to go to the architects who can give it. Architecture is everybody's business because it is the one art which affects everyone's eye and everyone's comfort. . . . It is that quality, compounded of dignity, modesty, urbanity, and orderliness, that we want to see created in greater measure in our domestic architecture. We are on the way to it. There are architects in plenty who can give form to the conception. It is for the public to see that they get the chance."—Sir Lawrence Weaver, K.B.E., in "The Evening News."

Correspondence

The Architectural Outlook in Russia

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—As a Russian architect who has but recently left Russia, I have read with great interest the articles by Mr. Huntly Carter, published in your Journal. The picture he gives of the condition of the houses and streets of Petrograd and Moscow is exceedingly true to life. Those who knew Petrograd before the revolution would hardly recognize the comfortable, well-appointed flats of former times in the cheerless, squalid, and evil-smelling habitations of to-day. Scarcity of fuel is largely responsible for the lamentable state the houses are in. Mr. Huntly Carter mentions that in many instances the window-frames, doors, and other woodwork have been removed for firewood. Most of the furniture, it may be added, has shared the same fate. Lack of heating materials has wrought havoc with the buildings in other respects as well. Thus, in very few houses are the water-pipes intact; owing to the freezing of the water most of these have burst, generally with disastrous results, especially as regards the sanitary arrangements, which, in the average Russian house of the present day, defy description. Indeed, the cold has perhaps caused more suffering than want of food. It is misery to spend the long, dark Russian winter in rooms which can be neither heated nor adequately illuminated. Candles and petroleum are almost unobtainable; gas is not, as a rule, laid on in Russian houses, and electric light is but sparingly doled out to the general public, always on account of the need for economy of fuel.

It is, of course, inconceivable that such a state of things can continue indefinitely. A change is bound to set in, and there are indications that permit the assumption that this is at last within sight. According to the latest accounts, a certain activity prevails in architectural circles in Moscow. Some, at any rate, of the architects there have plenty of work, their earnings attaining the "astronomical" (as we say in Russia) figures of 600 and 700 million Soviet roubles a month. For the present their activities are limited to the repair of existing buildings, but in order to make one of these fit for human habitation it is often necessary to demolish two or three others, much in the same way as the Russian mechanical engineer repairs a disabled locomotive with the aid of pieces taken from others still more decrepit.

Owing to the absence of almost every kind of building material very few attempts have hitherto been made to erect new structures.

It would not be surprising should the lead, in this respect, be taken by rural Russia. The peasants are the richest class nowadays. They are credited with having hidden away or buried a considerable amount of gold, which will presumably come to the surface again as soon as a feeling of security has been restored, and communistic experiments are a thing of the past. In this connection it is interesting to note that an owner of brickfields in the south of Russia stated recently that he was receiving far larger orders for bricks now than ever before, and that his customers were almost exclusively peasants.

But it is with the rebuilding of the cities that architects are chiefly concerned New types of dwelling houses will have to be designed to suit altered conditions. Few people will be able to afford palatial residences. Lofty, spacious apartments, so characteristic of the days when money was plentiful and firewood cheap, will only be found in the mansions of such as have known how to profit financially by the present upheaval.

The question of domestic architecture is, however, only a small portion of the stupendous task which will confront Russian architects in the future. During the years of war, invasion, revolution, and internal strife, many towns have been partially or totally destroyed. These will have to be rebuilt, and a scheme of town-planning evolved in accordance with modern ideas and requirements. The problem is of unprecedented magnitude and absorbing technical interest, but its satisfactory solution depends upon an unequivocal sanction, in practice as well as in theory, of the rights of property and individual action.

R. BOKER,
Hon. Corr. Mem. R.I.B.A.

The Preservation of Westminster Abbey

To the Editors of THE ARCHITECTS' JOURNAL.

SIRS,—As an Englishman who received all his architectural training in England, I was appalled when I saw, a short time ago, in one of the American papers, that an effort was being made to prevent the disintegration of the fabric of the Abbey by giving it a coat of what almost amounted to limewhite, or calcamine, or cement wash. Having had some experience myself with this matter, I looked into it still further, and found that certain sections of Yale University had been seriously affected, but a practically invisible preservative coating has been applied, which not only hindered further deterioration, but also created a hardened surface extending back perhaps a quarter of an inch into the stone, which neither changed the effect of the stone nor its colour.

Grace Church in New York, built ninety years ago, suffered in the same way, and has also been treated by another process which in no way affects the appearance of the building, but has proved very satisfactory as a preservative.

I personally had an experience on a building in Lynchburg, in Virginia, and another in Greenwich, Conn., both of which were successfully treated without in any way affecting their appearance. I mention these matters only to show that it is not at all necessary to ruin one of the finest architectural gems possessed by the British Empire in order to preserve it.

When I went to see Henry VII's Chapel last week it gave me the impression, where it had been whitened, of looking like a poor plaster cinema which had been repainted after it had been broken in many places. The Wren Towers, the general mass of the building, Henry VII's Chapel, all of very divergent types, are tied together by a colour-scheme which no man has ever been able to equal, and if the entire building is whitened, this continuity and harmony will be seriously jeopardized, if not absolutely ruined. If this process be followed out in the Abbey the same unquestionably will be copied elsewhere, and before it is realized a great many of the gems of English architecture will be irreparably ruined. Very little work has been done so far—only enough to give the impression of how disastrous the final result will be.

Surely there must be enough studious and public-spirited men in England who will insist that the present work be instantly stopped and a thorough investigation made of other possible processes which can produce the satisfactory results without destroying the entire beauty of the edifice.

ALFRED C. BOSSOM,
New York City.

[Mr. Bossom has lately been on an architectural mission to this country, and has now left for New York. We hope to publish in our next issue an interview which Mr. Bossom has given to a representative of this JOURNAL.—EDS. A.J.]

The Resistance to Fire of Concrete and Reinforced Concrete

Some Interesting Experiments

A SUMMARY of the results of the experiments carried out in the Civil Engineering Department of the University of Birmingham with the object of elucidating the problem as to what happens when concrete structures are exposed to high temperatures has been given by Professor F. C. Lea, O.B.E., D.Sc., M.Inst.C.E., M.I.Mech.E., and R. E. Stradling, Ph.D., M.Sc., Assoc. M.Inst.C.E., in a paper read before a meeting at Hull, of section G, of the British Association. A paper dealing with a few of the preliminary experiments was presented to the section for discussion in 1920. During the intervening years further work has been done, the cost of which has been defrayed by a grant from the Department of Scientific and Industrial Board. A report giving full details of the experiments is published by the department.

Following are the general conclusions arrived at from the experiments :—

It would appear from the experimental work already outlined that it is possible to make a concrete which retains sufficient strength at high temperatures to carry the full loads imposed by ordinary design methods, provided the temperatures concerned are not above about 900 deg. to 1,000 deg. C., average values to be reached in building fires. But such an assumption is only valid for the condition imposed upon the concrete during the experiments.

The experimental conditions which differed from practical ones are mainly two :—

(1) Concrete only was used in the experiments, and was not associated with steel,* as is usual in most building work now.

(2) The strength was measured within a few hours of the cooling of the specimens which were allowed to cool in the furnace. It is just these two further considerations which are of supreme importance in reinforced concrete work, considered as a fire-resisting material, and it is necessary now to examine these in more detail.

It was pointed out in this paper that if concrete is raised above 100 deg. C., then contraction is practically obliged to occur. On the other hand, steel embedded in the concrete still continues to expand as the temperature rises.

It is not difficult to realize what must happen. The adhesion between the steel and concrete must break down either by a complete sliding of the steel through the concrete, or the concrete must crack and thus leave the steel in this way. In practice it is this latter which occurs. One has only to read the descriptions of the behaviour of reinforced concrete buildings during fires (*e.g.*, the Red Books of the Fire Prevention Committee) to realize that this is the case. One of the points on which great emphasis is laid is the "spalling off" of the concrete from the steel reinforcement, exposing the latter to the direct action of the fire.

With the amount of cover of concrete ordinarily allowed in design it is somewhat doubtful whether the question of heat conductivity of the concrete is of primary importance. This spalling action will, in many cases, occur long before the temperature of the steel can have risen to the degree which is dangerous. One of the writers has had opportunities of observing tests of large size slabs under fire conditions, in which spalling nearly always, if not always, preceded failure. The structure will fail due to the steel being heated to a point at which its strength is seriously affected, but this will usually happen by direct contact with the fire, and not by the heat conducted by the concrete. If a concrete which will not spall can be discovered the conductivity will be the only, and not by any means such a serious, menace.

This action will be seen to be most serious at the under side of beams and the sides of columns. It might be possible to counteract this effect by increasing the cover, but without actual large scale experiments it is not possible to say. Probably a type of burnt clay cover separated from the concrete by an air space or slag wool packed layer might be a solution, but again full scale experiments are required. It can now be said that the small scale experiments have shown, as anticipated by one of the authors, that much money has been wasted in large scale experiments which were carried out in an empirical manner without any real knowledge of the fundamentals of the problem.

Attention has been drawn to the fact that the specimens used in the experiments were all tested for strength within a few hours of heating. By accident on one occasion a specimen was left for about a week before testing. It was found to have lost strength quite out of proportion to the amount of heating. On leaving a previously heated concrete block exposed to the ordinary laboratory atmosphere for some days, the following is noticed :—

Though on removal from the furnace no cracks are apparent on the surface yet quite soon these appear, and after some days longer the block may crumble to pieces. It has not been possible to get the temperature accurately, but a lower limit for the previous furnace heating is about 400 deg. C.

The explanation of this phenomenon can be found in the fact that one of the chief products of hydration of Portland cement (as previously stated) is calcium hydrate. This dissociates into quick lime and water at about 400 deg. C.

$$Ca(OH)_2 \rightleftarrows CaO + H_2O$$

It must be realized that this is accompanied (as already shown) by a contraction of the concrete. Concrete is porous and the air getting in will carry moisture with it. This moisture will hydrate the quick lime again, and the product of hydration ($Ca(OH)_2$) occupies a considerably greater volume and hence causes the concrete to crack, split and ultimately to crumble. A definite example is given under.

A set of 4 in. cubes (about six months old), composed of 1 part cement, 2 parts sand (Leighton Buzzard) and 4 parts Rowley Rag, were heated to 700 deg. C. The strength unheated was about 3,000 lb. per sq. in. Specimens dropped in water immediately after heating flew to pieces. The strength immediately after cooling was about 900 lb. per sq. in. The specimens were stored in the hydraulic laboratory and two days later the strength was above 780 lb. per sq. in. Six days after heating some had crumbled to pieces and could not be picked up, whilst two had an average strength of 535 lb. per sq. in. None of these blocks had any cracks on the surface immediately after cooling down; yet they made their appearance six days later.

The importance of this "after effect of fire" cannot be over estimated. Even although it might be possible to make a concrete by using burnt clay products or dolerites, which will stand its full load at the time of the conflagration, yet when the question has to be faced as to whether the building is afterwards safe, and if not how much of it should be demolished and rebuilt, the answer would appear to be not very encouraging.

In view of the very large number of buildings already erected in reinforced concrete, the problem cannot safely be left at this point, but in the opinion of the writers the next work should be done on full-size specimens. The fundamental scientific principles on which an answer must depend have been outlined above, but the form of the answer for practical conditions of work depends upon one or two further factors which cannot satisfactorily be reproduced under laboratory conditions of the ordinary type.

If money is available for further rather expensive work, very useful data could be obatined of primary importance to the community.

As far as the present results are concerned, it is submitted that reinforced concrete as at present carried out in practice is anything but fire-resisting and the temperature of primary importance is a comparatively low one, probably about 400 deg. C., this being the approximate temperature of the dissociation of calcium hydrate.

But as important a point as the resistance during fire is that of the after effects. It is suggested that extremely careful and very skilful examination of reinforced concrete structures after a fire is required, and it is highly probable that the original factor of safety can never be replaced in the building structure except by complete reconstruction.

---

* For strength of steel at various temperatures see paper by F. C. Lea, Brit. Assoc., 1920.

Lectures in Architecture and Building

Northern Polytechnic Institute

The following special lectures on building problems and materials are to be given at the School of Architecture, Surveying, and Building, Northern Polytechnic Institute during the ensuing session :—

October 5.—The Development of Building Estates.—B. W. Adkin, F.S.I.

October 26.—The Manufacture of Portland Cement.—T. J. Clark. Concrete Utilities Bureau.

November 16.—The Organization of Building Works.—F. J. Gayer. President Institute of Builders.

December 7.—Composition and Jointless Flooring.—R. R. Butler, D.Sc., A.C.I., F.C.S.

January 11.—The Purchase and Selection of Timber.—Montague L. Meyer.

February 1. — The Manufacture of Bricks.—Arthur H. Brown, B.Sc.

February 22.—Decorative Plasterwork.—E. F. Jackson, of Messrs. G. Jackson & Sons, Ltd., Rathbone Place.

March 15.—Painters' and Decorators' Materials.

Special lectures on "Architecture and Construction," by T. P. Bennett, F.R.I.B.A. October 16.—Introduction. Principles of Proportion. November 13.—Rules of Composition. December 11.—Walls. January 22.—Doors and Windows. February 19.—The Orders of Architecture. March 19.—Roofs.

The Head of the department is T. P. Bennett, F.R.I.B.A.; the Chief Lecturer and Assistant to Head is H. J. Axten, A.R.I.B.A., and the educational staff is as follows :—

Art Masters : J. C. Stephenson, R.C.A. Slade, etc. (*Silver and Bronze Medallist*), C. F. Filbey, B.Chrom. Architectural Design : T. P. Bennett, F.R.I.B.A., R. A. Duncan, F.R.I.B.A. History of Architecture: H. Parker (*Hons. City and Guilds*), T. E. Scott, A.R.I.B.A. Perspective and Rendered Drawings : J. C. Stephenson, R.C.A. Slade. Construction of Buildings and Geometry : H. J. Axten, A.R.I.B.A., H. Parker (*Hons. City and Guilds*), T. E. Scott, A.R.I.B.A. Working Drawings and Full-size Details : G. A. Gardner, M.C.I., M. Maths. Assoc. Graphic Statics : R. G. Keevil, A.M.I.M.E., M.C.I. Valuation and Estate Agency : A. Hunnings, F.S.I. Land Surveying and Levelling : H. A. Newman, F.S.I., A.M.I.C.E., Major A. E. Gayer, M.I.M.E., P.A.S.I. Quantities : H. H. Holmes. Estimating : A. Sicklemore. Arbitrations, Valuations, Copyholds, Surveyors, Law, etc. : E. R. Canham, O.B.E., P.A.S.I. (*Surveyors' Inst. Silver Medallist and Driver Prizeman*). London Building Act, Public Health Act, Local By-laws : H. Kenchington, A.R.I.B.A., E. Alexander Young, A.R.I.B.A. (District Surveyor under the London Building Acts). English Subjects, Maths., etc. : F. G. Munday, A.T. Flight. Chemistry Applied to Building : R. R. Butler, M.Sc., A.I.C., F.C.S. Physics : J. Charlesworth, M.Sc. (Man.), S. C. F. Gibbins, B.Sc. (Lond.). Specifications and Building Materials : Henry C. Adams M.Inst.C.E., F.R.S.I., M.I.Mech.E. Drainage and Sanitation : A. C. Martin, R.P., A.R.San.I. (*First Class Hons., City and Guilds*). Carpentry and Joinery : H. T. Deacon (*Hons. Silver Medallist, City and Guilds and Carpenters' Co.*), assisted by H. W. Grainger (*First Class Hons., City and Guilds, Silver Medal Carpenters' Co.*), A. Hewitt (*First Class Hons. City and Guilds, First Class Carpenters' Co.*), F. A. Adams. Plumbing and Sanitation : A. C. Martin, R.P., A.R.San.I. (*First Class Hons. City and Guilds*), assisted by F. J. Fox, R.P., Edwin Willis, R.P., A.R.San.I. (*Hons. City and Guilds*), H. Lumley. Decorating and Painting : C. H. Eaton, F.I.B.D. (*First Class Hons. Prize, City and Guilds*), assisted by W. Quirk. Masonry and Letter Cutting : H. W. Palliser. Physical Training : Staff Sergt.-Major Mills.

A prospectus of the day and evening classes may be obtained from the Northern Polytechnic Institute, Holloway, N.7.

Lectures by Sir Banister Fletcher

On Wednesday evenings at 6 p.m. Sir Banister Fletcher, F.R.I.B.A., will deliver a course of twenty-four University Extension Lectures on "The History of Architecture (Part III, Renaissance and Modern)" at the Central School of Arts and Crafts, Southampton Row, W.C. The lectures will include a consideration of the Renaissance architecture of England, France, Germany, Belgium, Holland, Italy, and Spain, and will be fully illustrated by special lantern slides, photographs, diagrams, and models. The introductory lecture, which was open to the public without tickets, was held on September 27.

Public Lectures on Architecture

A special course of illustrated lectures will be given by Mr. Joseph Addison, A.R.I.B.A., Head of the Department of Architecture and Civic Design, in the "Lecture Theatre," Leeds School of Art, throughout the present term, on "How to Appreciate Architecture." The object of the course is to enable the public to appreciate the beauty of architecture. The lectures are arranged on an historical basis tracing the development of the art from the earliest times. The fee for the course of twelve lectures is 10s. The lectures will be given on Monday evenings from 7.0 to 8.0 p.m.

Extending Scope of Leeds Technical School

Arrangements have been made for a two years' senior day course to prepare students for the following examinations : The Institution of Civil Engineers; the Institution of Mechanical Engineers; the Institution of Electrical Engineers; the Institution of Automobile Engineers; the Institution of Naval Architects; the Institution of Marine Architects; the Iron and Steel Institute; and the Concrete Institute.

Instruction will, in fact, be given in all branches of the engineering industry except pattern making and foundry work, and it is hoped that these will be added shortly.

The head of the Engineering Department (Mr. H. C. Newall) says that he hopes that students, owing to their practical workshop training being taken in the school, will be able to take responsible places in the profession at a much earlier age than heretofore.

Liverpool's £6,000,000 Housing Scheme

"The Housing Committee had spent in the last couple of years something in the neighbourhood of £6,000,000 in their efforts to allay the acuteness of the post-war housing shortage," said Dr. John Utting, Chairman of the Finance Committee of the City of Liverpool, when speaking at a luncheon to members of the City Council. The luncheon was held in connection with an inspection of the housing schemes upon which the Liverpool City Council have been engaged since obtaining powers under the Act of 1919.

Between Walton, one of the most northern ward-districts of Liverpool, and Allerton, a district in the south-east of the city, the outermost boundaries of which are seven miles apart, on a straight line, five distinct housing schemes are now far advanced towards completion. Under the Act of 1919, 1,258 acres of land were scheduled for the work. This, it was considered, would serve for the erection of 13,000 to 15,000 dwellings. The corporation had, however, to be content with aiming, for the time, at the utilization of only a large part of the total area. Contracts were entered into for the making of necessary roads and for the erection of 5,818 houses. Of these 4,340 have been finished, and 880 others are nearing completion. Generally the areas of the new building schemes form a flat bow-line or curve, extending from a point in the Walton area in the north, to a point of Allerton, in the south-east, the bend, or convexity, of the "bow" being towards the open country.

Following this line from the north, one strikes the Walton scheme or area, the Cherry Lane scheme, the Larkhill scheme, the Edge Lane Drive scheme, and the Allerton Estate scheme.

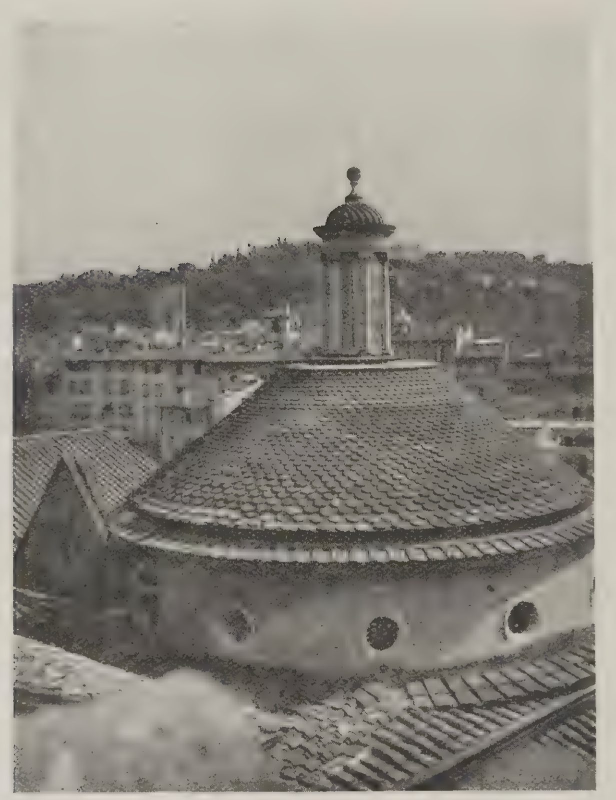
In proceeding from north to south-east, as indicated, one would strike the area of another important Liverpool housing scheme, that of the Liverpool Garden City or Suburb, on the Liverpool side of the River Mersey. This was organized and carried out on 180 acres of land by the Liverpool Garden Suburb Tenants' Ltd., on an area partly in Wavertree and partly in Childwall, rural townships to the south-east of Liverpool. This pioneer undertaking was of the nature of a co-partnership, and entirely distinct from undertakings of a municipal kind.

The scheme on the Larkhill Estate occupies a site of about 3¾ miles north-east of the Liverpool Town Hall. Many of the blocks of houses have a depth of the wall surface below the roof gutter line, at the front "rough cast"; others have an equal expanse "pebble dashed." The use of concrete with colour variations was introduced into the scheme by Mr. F. E. G. Badger, A.M.I.C.E., Director of Housing for the Corporation of Liverpool. At the present date there are 2,041 houses on the Larkhill Estate. A large amount of work on the housing scheme has been done partly by contract and partly by "direct labour." A party of architects from the United States, after visiting the various housing schemes at Liverpool, declared that they had seen nothing in England or America to touch the work which Liverpool had done.

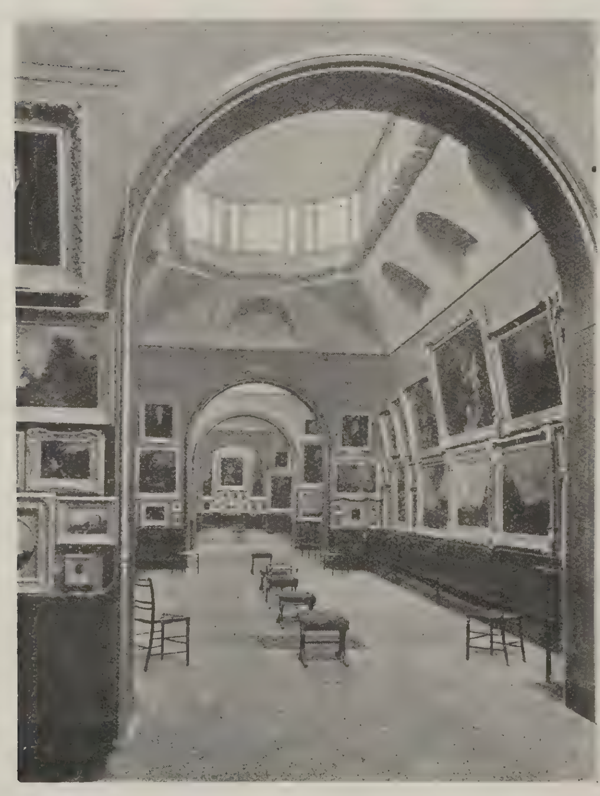
A Pictorial Review

Illustrations of Topical, Practical, or Curious Interest

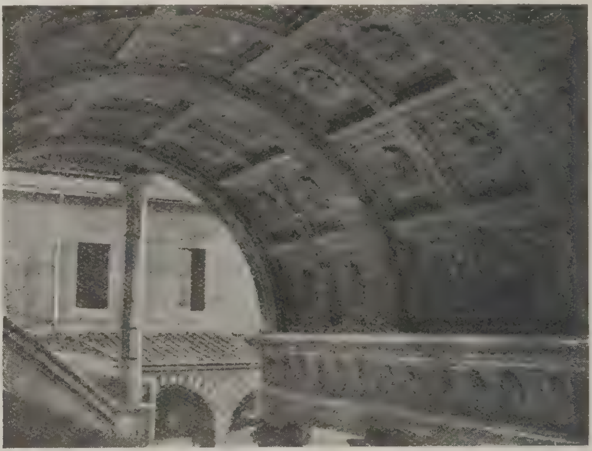
Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.



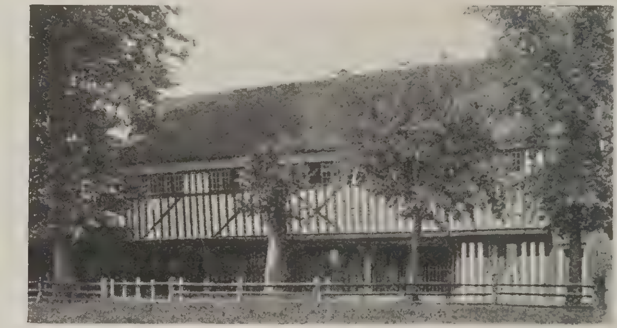
Two photographs of portions of Brunelleschi's Capella Pazzi which stands in the cloisters of Santa Croce at Florence. The one above was taken from the roof of the south aisle of the church, and shows the external treatment of the dome, in many courses of diminishing tiles, which terminate admirably in the charming little lantern.—H. D. A.



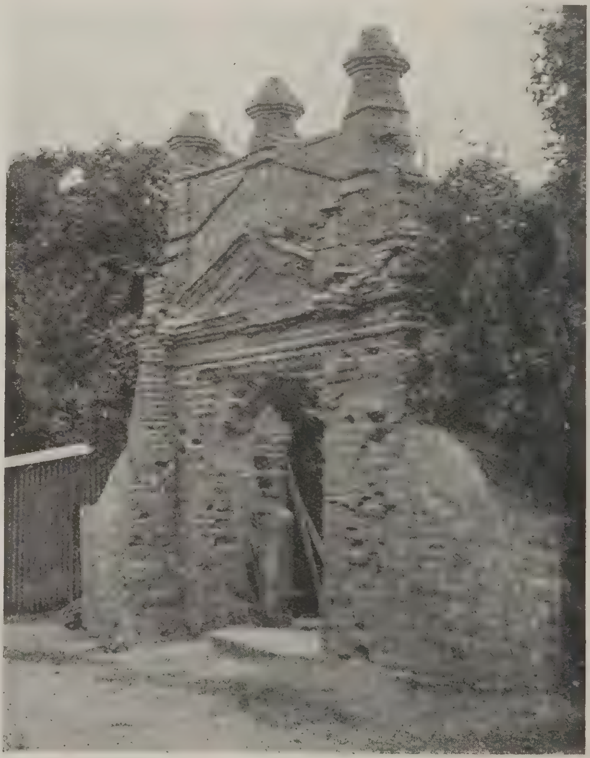
This illustration shows the excellent clerestory system introduced by Sir John Soane for the top lighting of galleries. The Dulwich Gallery, with the adjoining mausoleum, was designed in 1812 for Sir Francis Bourgeois. It is of interest to note that Soane's pupils paid great attention to the products of their master's inventive mind; for example, Basevi, who designed the Fitzwilliam Museum at Cambridge, adopted a similar scheme of lighting in those galleries.—ANON.



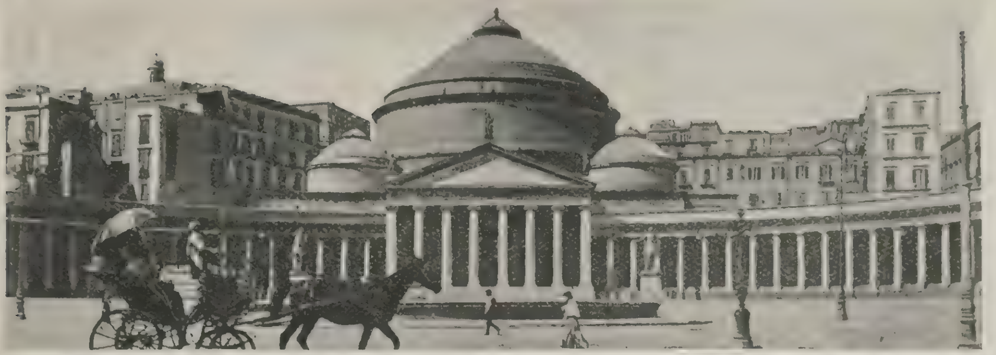
Another view in the Pazzi Chapel showing the wagon vault of the loggia with its beautiful detail.—H. D. A.



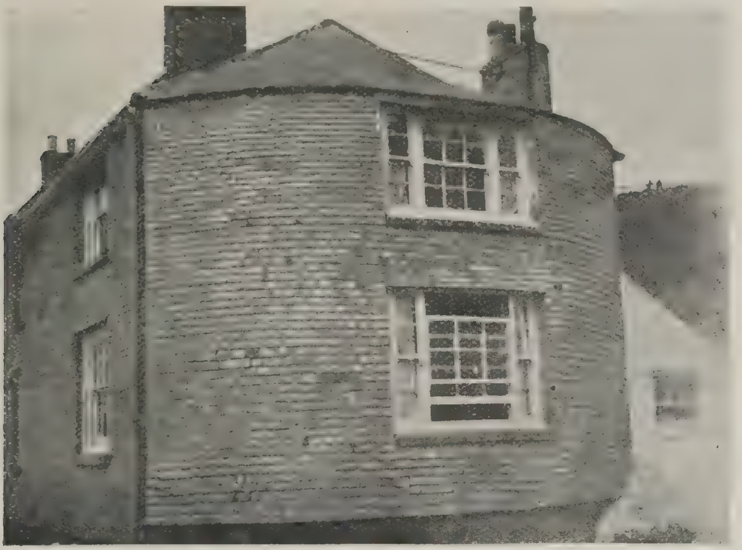
The Masonic Hall, Faversham, once the old Grammar School, a fit object for an architectural pillory. It is a fine old building, weather-boarded on its upper stories, but some curious philistine has painted lines across it to represent half-timbering. What is the idea of playing such an absurd practical joke with a building which possesses human and architectural value?—BERNARD FURNISS.



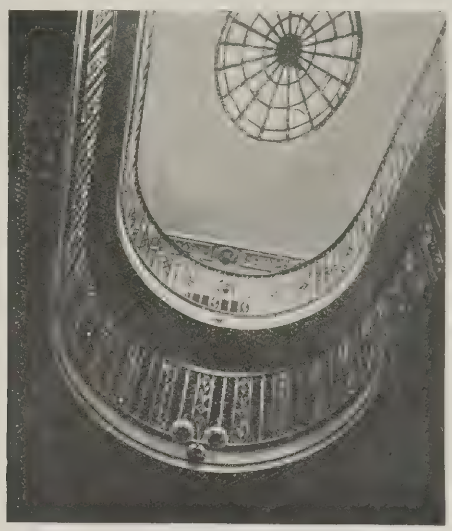
An old brick doorway to Brooke Farm, situated between Reculver and Marshside, Kent. Brooke Farm is said to have been owned by Sir Thomas Brooke, who built the gateway and part of the existing farmhouse in the days of Queen Elizabeth. Locally it is said that Queen Elizabeth was entertained there.—W. M. H.



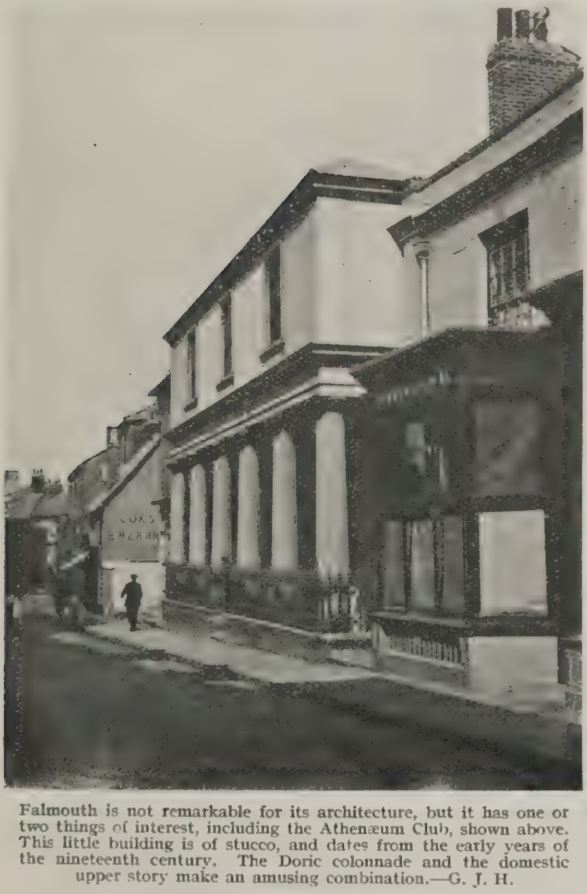
The remarkable church of S. Francesco da Paola at Naples with its bold domical treatment. The pediment does superhuman work in holding the design together, but the two baby domes on each side, when contrasted with the big parent dome in the centre, seem to me to illustrate once more the old truth that no design can be satisfactory when motives of a similar nature, but different scale, are used in proximity to one another.—J. L. JEEVES.



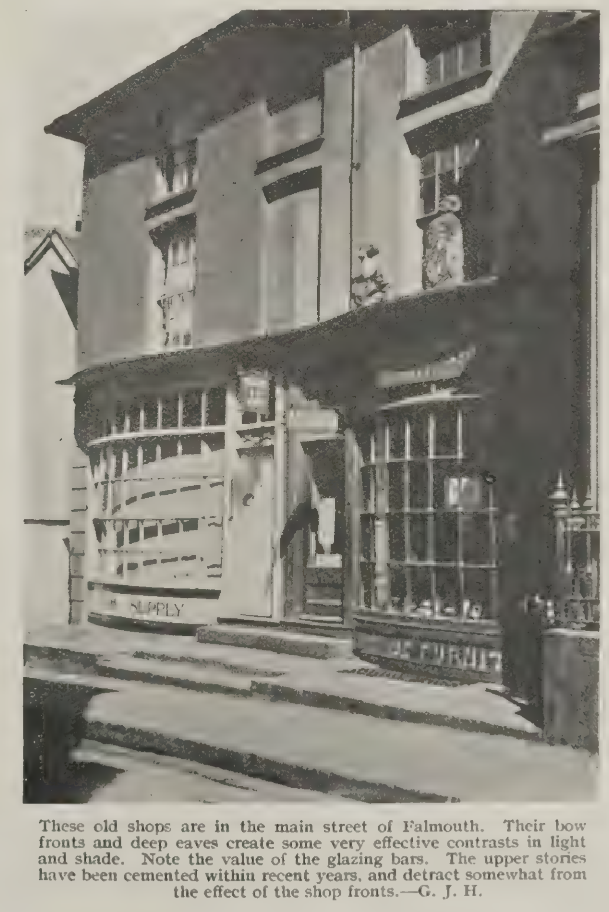
Vertical slate hanging is a striking peculiarity of Cornish vernacular work, and it is often used to cover entire elevations. The above small house, a typical example of this local building tradition, is picturesquely situated on the quay at Flushing, a small village overlooking Falmouth Harbour.—G. J. H.



The Royal Hotel, Falmouth, a hostelry dating apparently from the latter part of the eighteenth century, contains the above rather interesting example of a cantilever staircase. Running through three stories, the sweeping lines of its continuous balustrade are very effective. It is lighted by a domical top light of "cobweb" design.—G. J. H.



Falmouth is not remarkable for its architecture, but it has one or two things of interest, including the Athenæum Club, shown above. This little building is of stucco, and dates from the early years of the nineteenth century. The Doric colonnade and the domestic upper story make an amusing combination.—G. J. H.



These old shops are in the main street of Falmouth. Their bow fronts and deep eaves create some very effective contrasts in light and shade. Note the value of the glazing bars. The upper stories have been cemented within recent years, and detract somewhat from the effect of the shop fronts.—G. J. H.

Competition News

A Small General Hospital.

A competition open to all architects has been organized by "The Modern Hospital"—"to obtain for the typical small community in America a hospital building which is at the same time efficient in arrangement and creditable in architecture." Three cash awards of $500, $300, and $200, and two honourable mentions are to be given.

The Illinois Chapter of the American Institute of Architects, to which the general programme of the competition was submitted, has approved it as to form and method of procedure. Mr. Richard E. Schmidt of the firm of Richard E. Schmidt, Garden and Martin, of Chicago, is the architectural adviser. The jury of award is to be composed of two architects, two hospital superintendents, and a graduate nurse who has had experience as superintendent of a small general hospital. The prize-winning drawings, according to the rules of the contest, become the property of the publishing company, but the author is not prohibited from making any individual use of his designs.

The competition calls for a set of plans of a general hospital of from thirty to forty beds. Registration for the competition must take place on or before November 15, 1922, and the final date for submitting designs is January 15, 1923.

Requirements of the hospital (the capacity shall not be less than 30 or more than 40 beds) :—

(*a*) *Rooms and Wards.*

Private and semi-private rooms (single and - double rooms, some with private baths and water closets), 16 to 20 beds; women's ward, 4, 5, or 6 beds; men's ward, 4, 5, or 6 beds; maternity ward; one or two 2-bed or one 4-bed; children's ward, one 4-bed; at least two 1-bed rooms accessible to the wards for recovery and segregation.

The number of private rooms may be more than sixteen but not more than twenty; the capacity of the women's and men's wards may be four, five, or six beds, or one or more additional four-bed wards may be introduced.

There shall be at least 80 sq. ft. (all areas stipulated in this programme are expressed in feet and are mandatory minima) of area per bed in the wards for adult patients, and not less than 60 sq. ft. in the children's ward.

(*b*) *Services.*

There shall be separate services for private and ward patients, and at least one complement on each floor designed for the use of patients; charting space; medicine closet and sink; pantry, 130 to 160 sq. ft.; utility room, not less than 120 sq. ft.; linen closets not less than 50 sq. ft., or linen room not less than 100 sq. ft.; janitor's closet; supply closet; additional conveniences optional.

(*c*) *Verandas.*

There shall be at least three separate veranda spaces—for ward patients, private patients, and children.

(*d*) *Operating Department.*

Operating room not less than 15 ft. wide and 15 ft. long; sterilizing room, 180 sq. ft.; doctors' scrub-up room, 65 sq. ft. (may be combined with doctors' dressing-room); doctors' dressing-room with lockers and toilet, 100 sq. ft.; nurses' dressing-room with lockers and toilet, 100 sq. ft.; nurses' workroom, 180 sq. ft.; anesthesia room, 100 sq. ft.; minor operating room planned to serve as an emergency or delivery room, suitable also for dental, eye, ear, nose, and throat, and for cystoscopic work, not less than 14 ft. wide and 15 ft. long; accident receiving and surgical dressing-room; birth room, not less than 14 ft. wide and 15 ft. long; nursery, 180 sq. ft.; X-ray room, 225 sq. ft.; dark room; small dressing-room; plate storage room; clinical laboratory, 225 sq. ft.

(*e*) *In General.*

Drug room, 150 sq. ft.; waiting-room for out-patients; treatment room for out-patients; clinical record room (may be combined with office or visiting doctors' consultation room); office; reception room; visiting doctors' consultation room, 150 sq. ft.; locker and dressing-room with bath for graduate nurses, 150 sq. ft.; kitchen, including facilities for the preparation of special diets; cold storage room; storage for groceries; officers' dining-room; nurses' dining-room; helps' dining-room; resident physician's bedroom and bath, 120 sq. ft.; superintendent's bedroom and bath; two bedrooms for male help, with bathroom; two bedrooms for female help, with bathroom; laundry; clean linen room; boiler-room (but not lighting or power plant) and coal bin; storage rooms for miscellaneous supplies; lavatories and toilets, as required.

The buildings should be planned to admit of expansion and the drawings should indicate the direction of this expansion.

It is assumed that the nursing staff will be accommodated outside the hospital.

For the care of contagious diseases the hospital contemplates building a small isolation cottage. Its inclusion on the plan is optional.

Inasmuch as it is the purpose of the competition to bring out new thought, competitors are free to introduce into the plan elements which they regard as desirable, which are not specifically included in the programme.

Obviously, provisions should be made for such necessary parts as elevators, stairs, dumb waiters, soiled linen chute, boiler flue, etc., etc.

The conditions of the competition may be obtained from The Modern Hospital Publishing Co., Inc., 22 E. Ontario Street, Chicago, Ill.

War Memorial for Port Said, Egypt.

Designs for a monument to be erected at Port Said, Egypt, to the memory of soldiers of the Australian and New Zealand forces who fell in Egypt, Palestine, and Syria during the years 1916, 1917, and 1918, are invited by the Australian Department of Defence acting for the Commonwealth Government and the representatives of the forces named. Designs must be the work of sculptors and architects of British nationality permanently resident in Australia or New Zealand, and Australian and New Zealand sculptors and architects residing in other countries.

A statue, or group of statuary in marble or bronze, with granite for the pedestal, or an approved hardstone, will form the main feature of the monument. The design must embrace in its composition sculpture typifying both Australian and New Zealand horsemen; its character otherwise will be left to the designer.

Each design or model must be accompanied by a sealed opaque envelope containing the name and address of the author, together with a declaration that the design or model is the personal work of the competitor or joint competitors, and that the drawings or models have been prepared under his or their own supervision. The cost of the monument is to be limited to £11,000, of which £7,500 is to be allocated to sculpture, and £3,500 is to be allocated to the pedestal, base, and steps. Designs must be delivered, free of all charges, to the Secretary, Department of Defence, Melbourne, Victoria, on or before 12 noon of Saturday, March 31, next.

Premiums of two hundred and fifty guineas, one hundred guineas, and fifty guineas respectively, will be paid for the designs placed first, second, and third in order of merit by the assessors appointed by the Department of Defence, Major-General Sir J. Talbot Hobbs (architect); Mr. G. V. F. Mann, Director of the National Art Gallery, Sydney; and Mr. G. Sydney Jones, A.R.I.B.A. The award of the assessors will be binding on all concerned. The design placed first will become the property of the Commonwealth Government.

Further particulars, including the conditions of the competition in full, a plan and photographs of the site of the proposed monument, and a sketch of its surroundings, may be had on application at the office of the High Commissioner for Australia, Australia House, Strand, W.C.

A. & S.A.P.U. Essay Competition.

The Architects' and Surveyors' Assistants' Professional Union is offering a prize of Five Guineas for a short essay on "The true function of the Technical Assistant in the Building Industry."

The conditions are as follows :—

The competition is open to all professional and technical workers associated with the building industry.

Essays must not exceed 1,000 words in length, must be on foolscap paper, and written on one side of the page only.

Essays must not bear any mark which might identify the writer, but must be accompanied by a sealed envelope containing the name, address, and occupation of the competitor, and the business address of his firm or employer.

All essays and sealed envelopes must be forwarded, under cover, marked "Competition" on the outside, to the Secretary, Architects' and Surveyors' Assistants' Professional Union, 36 Victoria Street, London, S.W.1, not later than October 31, 1922. The winners of the competition will be announced in THE JOURNAL in due course.

The Week's News

Leicester Town Hall Extension.

The Estates Committee have submitted a scheme of extensions to the Town Hall, the cost of which is estimated at £30,000.

Women's Club for Eastbourne.

The late Mr. Charles Jewell has left £10,000 for the formation and equipment of a working women's club.

£235,000 Loan for Liverpool.

Liverpool City Council's application to borrow £235,000 for the purchase of the site of St. Peter's Church has been sanctioned by the Ministry of Health.

The Cheam Cottage.

Cheam's Old Cottage, in the Epsom Rural Council's area—reputed to be 600 years old—is being pulled down, and will be rebuilt on a site a few yards away.

Major George C. Lowbridge.

Major George C. Lowbridge, of Stafford, who had been assistant architect, has been appointed architect and surveyor to the Staffordshire Education Committee.

Plymouth Winter Garden Proposal.

An effort will probably be made to secure for Plymouth a part of the ancient citadel which stands at the eastern end of the Hoe and to turn it into a winter garden.

Housing at Brighton.

To provide work for the unemployed and relieve the pressure on house accommodation it is proposed to sanction a further outlay of £56,000 on the Queen's Park housing scheme.

Shrewsbury Developments.

The Council is endeavouring to improve its bridge approaches, and the town is spanning the Severn with a suspension bridge that in design is in keeping with the surroundings.

Preservation of Netley Abbey.

Netley Abbey has been handed over to the Commissioners of Works, under the Ancient Monuments Consolidation Act, by its owner, and preservation has begun. It is estimated that the work will be spread over four or five years.

New Artery for South-west London.

Battersea, Fulham, and Wandsworth Councils are approaching the Ministry of Transport to urge the construction of an arterial road from Fulham to Streatham. It will involve the reconstruction and widening of Wandsworth Bridge.

New Appointment for Sir L. Weaver.

Sir Lawrence Weaver will shortly relinquish the post of second secretary and director-general of land settlement at the Ministry of Agriculture in order to take up the appointment of director of the art section and the agriculture section of the British Empire Exhibition, 1924.

Rubber Road for Holborn.

An experiment with rubber paving is to be made by the Holborn Borough Council. It is intended to lay a section of the road at Upper St. Martin's Lane with concrete blocks superimposed with rubber pads about a quarter of an inch thick.

Nottingham Improvements.

Sir Jesse Boot has given land for a park and recreation ground on the bank of the River Trent at Nottingham, and as a suitable war memorial the City Council are considering the erection of an imposing gateway at the entrance at a cost of £17,400.

Church House, Westminster.

The alterations and renovations which are being made in the Church House, Westminster, have led to the discovery of a serious settlement on the west side of the houses forming the Dean's Yard front. This settlement, it is stated, will have to be dealt with immediately.

Cambridge University School of Architecture.

Mr. Theodore Fyfe will take up the Mastership of the Cambridge University School of Architecture on October 10. His business address in future will be The University School of Architecture, 75 Trumpington Street, Cambridge. Telephone : Cambridge 237.

Bournemouth Pavilion Scheme.

The tobacconists' section of the Chamber of Trade have expressed their opinion that the proposed pavilion scheme should be proceeded with by the Town Council at as early a date as possible. This is the sixth section of the Chamber which has supported the proposal.

Stowe House as Public School.

Stowe House, Buckinghamshire, for many years the home of the Dukes of Buckingham, has been bought by a committee of which Lord Gisborough is the head. It is the intention to open it as a public school next Easter, if it is possible to complete the preparations by that time.

New Bank of England.

The rebuilding of the Bank of England is not likely to begin before next year. Before the rebuilding a portion of the existing structure will have to be demolished and temporary accommodation found for a number of the staff. It is expected that the work will take several years.

Changes of Address.

Messrs. Pite, Son, and Fairweather have removed from 116 Jermyn Street, Piccadilly, to 12 Carteret Street, Queen Anne's Gate, Westminster, S.W.1. The telephone number is Victoria 8854.

Mr. Geoffrey Denham, architect and surveyor, has removed his offices from Easton, Winchester, to 41 Jewry Street, Winchester. Tel. No. 38. He has also opened branch offices at High Street, New Milton, Lymington, Hants. Mr. Denham began practice on his own account in 1903.

Gift of Furniture to Victoria and Albert Museum.

A number of interesting pieces of English furniture recently presented by Mr. Douglas Eyre have been placed on exhibition in Room 56 of the Woodwork Galleries of the Victoria and Albert Museum. These pieces of furniture date from the latter part of the seventeenth century to the middle of the eighteenth century.

New Market for Brixton.

The levelling of the ground has now begun in connection with the new market which is to be established in Brixton Road. The site will house nearly fifty stalls. An extension of the market will consist of an arcade through the present shops to another market square abutting on to Electric Lane.

The Cleaning of St. Paul's.

The work of cleaning and repairing the top of St. Paul's Cathedral has now been completed and the scaffolding is being dismantled. Those portions of the stonework which had perished badly have been renewed, the leadwork repaired, the projecting cornices asphalted, and the golden cross and ball washed.

Whitgift Hospital.

By thirty votes to twelve the Croydon Borough Council have decided to promote a Bill in Parliament to complete the widening of North End, Croydon, by the demolition of the ancient Whitgift Hospital. This has been a matter of intermittent controversy for quite twenty-five years. A similar decision was reached in September, 1919, but owing to the opposition aroused it was not followed up.

Rothesay War Memorial.

The war memorial at Rothesay has been formally unveiled by the Marquis of Bute. The design is by Messrs. Charles E. Tweedie and Sons, architects, Edinburgh, and was selected in open competition, the assessor being Mr. John Keppie, A.R.S.A., architect, Glasgow. Of grey Aberdeen granite, with bronze panels, the memorial is surmounted by the figure of an angel in bronze.

Hammersmith's New Church.

The foundation stone has been laid of the church to be erected at Hammersmith to take the place of St. Catherine Coleman, Fenchurch Street. The erection of the new church, necessitated by the demolition of the old City building, the site of which will be sold for business purposes, will cost about £14,000, and it is designed to accommodate 500 persons. The new building will contain the pulpit, Communion rails, doors, and two bells from the ancient church.

New Partnership.

Mr. Percy B. Tubbs, F.R.I.B.A., PP.S.A., has taken into partnership his son, Mr. Grahame Burnell Tubbs, A.R.I.B.A., who has been in his office for the past five years, and Mr. R. A. Duncan, A.R.I.B.A., who was until recently engaged on the teaching staff of the Architectural Association Schools, Bedford Square, W.C. In future the firm will be known as Percy Tubbs, Son, and Duncan, and will continue to practise architecture and surveying at 10 Gray's Inn Square, London, W.C.1.

Rates of Wages in the Building Trades*

The following table, which is published in the first issue of THE JOURNAL for each month, shows the rates of wages of craftsmen (bricklayers, masons, carpenters and joiners, woodcutting machinists, slaters. plumbers,* plasterers, painters †) and labourers in the building industry. The labour rates for London are given in the Table of Current Prices on pages **xxi**, **xxii**.

* In the case of towns printed in *italic type* below, the rates shown in the Table for craftsmen do not apply to plumbers.
† Except in Scotland, where painters are not included within the scope of the area grading scheme.
‡ Excluding Liverpool and Birkenhead, where the rates are 1s. 11d. for plumbers, 1s. 10d. for other craftsmen, and 1s. 5d. for labourers.
§ Excluding Aberdeen, where the rates remain unaltered at 1s. 7½d. for masons, joiners, and plasterers, 1s. 8d. for slaters, and 1s. 9d. for plumbers.
‖ It is reported that the Plasterers' Union in Scotland has not accepted the national reduction in June.
¶ In Scotland, labourers are not included in the general grading scheme.

Grading of Towns.

The localities in which the above rates have been reported to be in operation are as follows. In the case of localities printed in *italic type*, the rates shown in the above Table for craftsmen do not apply to plumbers.

NORTH EAST COAST :—

Annfield Plain, *Birtley*, Bishop Auckland, *Blackhill*, *Blyth*, *Chester-le-Street*, *Consett*, *Darlington*, *Durham*, *Ebchester*, *Gateshead*, *Hartlepools*, *Hebburn*, *Hexham*, *Jarrow*, *Lanchester*, *Leadgate*, Medomsley, *Middlesbrough*, *Morpeth*, *Newcastle*, *North and South Shields*, *Seaham Harbour*, *Stanley*, *Stockton*, *Sunderland*, *Thornaby*, *Tynemouth*, *Wallsend*, *Whitburn*, and *Whitley Bay*.

YORKSHIRE :—

Grade A.—*Altofts*, *Barnsley*, *Batley*, *Bingley*, *Birstall*, *Bradford*, *Brighouse*, Calder Valley, Castleford, *Cleckheaton*, *Colne Valley*, *Crosshills*, *Dewsbury*, *Doncaster*, *Gomersal*, Grimsby, *Guiseley*, *Halifax*, *Harrogate*, *Hebden Bridge*, *Heckmondwike*, Holmfirth, *Horbury*, *Hoyland*, Huddersfield, Hull. *Ilkley*, Immingham, *Keighley*, *Knottingley*, *Leeds*, *Liversedge*, *Mexborough*, *Mirfield*, *Morley*, *Normanton*, *Ossett*, *Penistone*, Pontefract, Pudsey, *Rawdon*, *Rotherham*, Scunthorpe, *Selby*, *Sheffield*, *Shipley*, *Sowerby Bridge*, *Stocksbridge*, *Wakefield*, *Wombwell*, *and Yeadon*.

Grade B.—Barnoldswick, Beverley, Bridlington, Goole, Hornsea, Scarborough, Skipton, *Whitby* (plumbers 1s. 7d.) and York.

Grade C.—Driffield, Kirby Moorside, Malton, Norton, Pickering, and Wetherby.

NORTH WESTERN COUNTIES :—

Grade A.—*Accrington*, Adlington, *Alderley Edge*, *Altrincham*, *Ashton-under-Lyne*, *Atherton*, *Bacup*, Barrow, Birkdale, Bispham, *Blackburn*, Blackpool, Blackrod, *Bolton*, Broughton (Flints), *Burnley*, *Bury*, Carlisle, Chester, Chorley, *Church*, Cleveleys, *Clitheroe*, *Colne*, Connahs Quay, Dalton-in-Furness, *Darwen*, *Denton*, *Droylesden*, *Eccles*, *Farnworth*, Fleetwood, Frodsham, *Glossop*, *Great Harwood*, *Haslingden*, Hawarden, Helsby, *Heywood*, Higher Kinnerton, *Horwich*, *Hyde*, Lancaster, *Leigh*, Leyland, *Littleborough*, Longridge, Lymm, Lytham, *Manchester*, *Middleton*, Morecambe, *Mossley*, *Nelson*. *Ormskirk*, *Oswaldtwistle*, *Oldham*, *Padiham*, *Pendlebury*, Poulton, *Preston*, *Prestwich*, Queensferry, *Radcliffe*, *Ramsbottom*, *Rawtenstall*, *Rishton*, *Rochdale*, Runcorn, St. Anne's-on-the-Sea, St. Helens, *Saddleworth*, *Sale*, *Salford*, *Shaw*, Shotton, Southport, *Stalybridge*, *Stockport*, *Swinton*, Thornton, *Todmorden*, *Tyldesley*, *Walkden*, *Warrington*, Westhoughton, *Whalley*, *Whitefield*, Widnes, Wigan, and *Wilmslow*.

Grade B.—Askam, Broughton, Buxton, Cleator Moor, Congleton, Coniston, Crewe, Distington, Egremont, Grange-over-Sands, Harrington, Knutsford, *Macclesfield*, Maryport, Market Drayton, Middlewich, Millom, Mold, Nantwich, *New Mills*, Northwich, Sandbach, Tarporley, Ulverston, Winsford and Over, Whitehaven, Workington, and Wrexham.

Grade C.—Ambleside, Bala, Bangor, Bowness-on-Windermere, Carnarvon, Colwyn Bay, Conway, Grasmere, Holyhead, Holywell, Kendal, Langdale, Llandudno, Llandudno Junction, Mostyn, Penrith, Prestatyn, Rhos, Rhyl, and Windermere.

MIDLAND COUNTIES :—

Grade A.—Alfreton, *Belper*, Bilston, *Birmingham*, *Blackheath*, *Burslem*, *Cheadle*, *Chesterfield*, Coalville, Coventry, *Derby*, *Hanley*, Heanor, Hinckley, *Ilkeston*, Kenilworth, *Leicester*, Lincoln, *Long Eaton*, *Loughborough*, *Mansfield*, Newcastle-under-Lyme, *Nottingham*, *Nuneaton*, Oldbury, Ripley, Stoke-on-Trent, *Sutton Coldfield*, *Sutton-in-Ashfield*, West Bromwich, Willenhall, and Wolverhampton. (Plumbers employed by the Birmingham Master Plumbers' Association within 8 miles of Birmingham, 1s. 9d.)

Grade B.—Atherstone, Bewdley, Boston, Brierley Hill, Bromsgrove, Burton-on-Trent, Cannock, Coseley, *Darlaston* (plumbers 1s. 7½d.), Dudley, Gainsborough, Gornal, Grantham, Halesowen, Hednesford, Kidderminster, Knowle, Leamington, *Leek*, Lichfield, Louth, Malvern, Market Harborough, *Matlock*, Melton Mowbray, *Newark*, Northampton, Oakengates, Old Hill, Peterborough, Redditch, Retford, Rugby, *Rugeley* (plumbers 1s. 7½d.), Sedgley, Shifnal, Shrewsbury, Skegness, Sleaford, Solihull, Southwell, *Stafford*, Stamford, Stourbridge, Stourport, Stratford-on-Avon, Swadlincote, Swanwick, Tamworth, *Walsall* (plumbers 1s. 7½d.), Warwick, Wednesbury, Wellington, Worcester, and Worksop.

Grade C.—Ashbourne, Bridgnorth, Church Stretton, *Horncastle*, Kettering, Ludlow, Newport, Oakham, Oundle, Raunds, Rushden, Spalding, Thrapston, Uttoxeter, Wellingborough, and Wirksworth.

Grade D.—Buckden, Eaton Socon, Huntingdon, St. Ives, and St. Neots.

EASTERN COUNTIES :—

Grade A.—Baldock, Bedford, Berkhamsted, Biggleswade, Braintree, Brentwood, Chelmsford, Cambridge, Colchester, Halstead, Hatfield, Harpenden, Hemel Hempstead, Henlow, Hertford, Hitchin, Hoddesdon, Ingatestone, Ipswich, Letchworth, Luton, Norwich, Ongar, St. Albans, Sandy, Sawbridgeworth, Stevenage, Stotfold, Ware, Welwyn, and Witham.

Grade B.—Aldeburgh, Ampthill, Attleborough, Aylsham, Braughing, Chatteris, Cromer, Dovercourt, Dunstable, Ely, Fakenham, Felixstowe, Frinton, Gorleston, Halesworth, Harwich, King's Lynn, Leighton Buzzard, Leiston, Lowestoft, March, Much Hadham, Newmarket, North Walsham, Puckeridge, Renthem, Saxmundham, Southwold, Standon, Stowmarket, Walton-on-the-Naze, Wickham Market, Wisbech, Woodbridge, Wymondham, and Yarmouth.

Grade C.—Bungay, Coltishall, East Dereham, Royston, Saffron Walden, and Tring.

[N.B.—Bury St. Edmunds :—bricklayers, masons, carpenters and joiners, slaters, plumbers and plasterers, 1s. 4½d. ; painters, 1s. 2d. ; labourers, 11d.]

SOUTHERN COUNTIES :—

Grade A.—Abingdon, Addlestone, Amersham, Ascot, Ashford (Middlesex), Banbury, Beaconsfield, Bournemouth, Bracknell, Brighton, Byfleet, Chalfont, Chesham, Christchurch, Cremborne, Eastbourne, Eastleigh, Egham, Eton, Gerrard's Cross, Goring, Gosport, Gravesend, Guildford, Henley, Hove, Laleham, Maidenhead, Marlow, Northfleet, Oxford, Poole, Portsmouth, Reading, Southampton, Staines, Stanwell, Sunningdale, Sunninghill, Tilehurst, Tonbridge, Tunbridge Wells, Wallingford, Windsor, Winkfield, Woking, Wokingham, and Wycombe.

Grade B.—Arundel, Ashford (Kent), Aylesbury, Bagshot, Basingstoke, Bexhill, Bicester, Bletchley, Bognor, Bosham, Broadstairs, Brockenhurst, Buckingham, Burgess Hill, Camberley, Canterbury, Chatham, Chichester, Chipping Norton, Cranleigh, Deal, Dorking (plumbers 1s. 5d.), Dover, Fareham, Faringdon, Faversham, Fenny Stratford, Folkestone, Gillingham, Godalming, Hailsham, Haslemere, Hastings, Havant, Herne Bay, Horsham, Hythe, Lambourn, Liphook, Littlehampton, Lymington, Maidstone, Margate, Midhurst, Milford, Milton Regis, Newbury, New Milton, Newport Pagnell, Oxted, Pangbourne, Petworth, Ramsgate, Redhill, Reigate, Rochester Sandgate, St. Leonards, Sevenoaks, Sittingbourne, Strood, Stony Stratford, Stow-on-the-Wold, Thame, Walmer, Wantage, Wendover, Westerham, Westgate, Whitstable, Winchester, Winslow, Witney, Wolverton, Woodstock, and Worthing.

Grade C.—Andover, Ardingley, Farnham, Godstone, Hawkhurst, Hartley Wintney,* Haywards Heath, Horley, Isle of Wight, Liss, Petersfield, Rye, Smallfield, Staplehurst, Steep, Turners Hill, and Uckfield.

[N.B.—Leatherhead :—painters, 1s. 5½d. ; plumbers, 1s. 6½d. ; other tradesmen, 1s. 6d. ; labourers, 1s. 1½d.]

SOUTH WESTERN COUNTIES :—

Grade I.—Bristol.

Grade II.—Plymouth * and Devonport.*

Grade III.—Dartmouth,* Exeter,* Kingswear,* Newton Abbot, Paignton, Portishead, Stroud,† Taunton, and Torquay.

Grade IV.—Barnstaple, Beaminster, Povey Tracey, Bradford-on-Avon,* Bridgwater, Bridport,* Brixham, Bruton, Burnham-on-Sea, Calne,* Castle Cary, Cheddar,* Cirencester,* Clevedon, Coleford,* Corsham,* Crewkerne,* Dawlish, Dorchester,* Exmouth, Fairford,* Frome,* Glastonbury, Lydney,* Melksham,* Midsomer Norton, Minehead,* Radstock, Shepton Mallet, Street, Swanage,* Teignmouth,* Tetbury,* Thornbury,* Totnes,† Trowbridge,* Wells, Westbury,* Weston-super-Mare, Weymouth,* and Yeovil.*

[N.B.—Bath, Cheltenham, Gloucester* (except painters), Hereford,* and Swindon* :—tradesmen, 1s. 5d. ; labourers, 1s. 0¾d.]

SOUTH WALES AND MONMOUTHSHIRE :—

Grade A.—Aberavon, Aberdare, Abergavenny, Ammanford, Barry, Bridgend, Briton Ferry, Brynmawr, Cardiff (plumbers, 1s. 8½d.), Chepstow, Duffryn Valley, Ebbw Vale, East Glamorganshire and Monmouthshire Valleys, Garw Valley, Gorseinon, Llanelly, Maesteg, Merthyr, Mountain Ash, Neath, Newport, Ogmore Vale, Pontardulais, Pontypool, Pontypridd, Porthcawl, Port Talbot, Rhondda and Rhymney Valleys, Sirhowy Valley, Swansea, and Tredegar.

Grade B.—Haverfordwest, Pembroke and Pembroke Dock.

[N.B.—Brecon and Carmarthen :—tradesmen, 1s. 6d. ; labourers, 1s. 1½d. Llandrindod Wells :—tradesmen, 1s. 5d. ; labourers, 1s. 0¾d.]

SCOTLAND :—

Grade A.—Airdrie, Alloa, Alva, Armadale, Ayr, Bathgate, Bellshill, Bridge of Weir, Buckhaven, Burntisland, Clydebank, Coatbridge, Dumbarton, *Dundee*, Dunfermline, Edinburgh, Falkirk, Glasgow, *Gourock*, Grangemouth, *Greenock*, Haddington, Hamilton, Harthill, Irvine, Kennoway, Kilmarnock, Kirkcaldy, Larbert, Largs, Leith, Leslie, Leven, Markinch, Methil, Motherwell, Neilston, Newmains, Paisley, Pencaitland, Perth, *Port Glasgow*, Renfrew, Stenhousemuir, Stirling, Uddingston, Uphall, Wemyss, Whitburn, Windygates, and Wishaw.

Grade B.—Arbroath, Montrose, and Peebles.

Grade C.—*Dumfries*, Galashiels, Hawick, and *Maxwelltown*. (Plumbers at Dumfries and Galloway, 1s. 6d. ; and at Inverness, 1s. 7d.)

[Douglas and District (Isle of Man :—Bricklayers, masons, carpenters and joiners, plumbers, plasterers, and painters, 1s. 4½d. ; labourers, 1s. 0½d.]

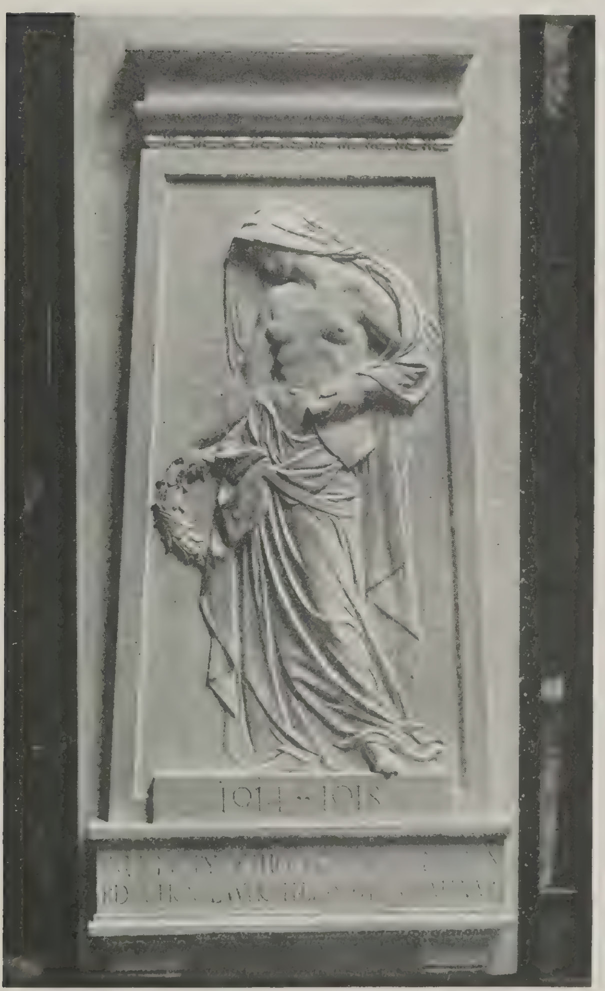
THE ARCHITECTS' JOURNAL & Architectural Engineer

With which is incorporated "The Builders' Journal."



A WAR MEMORIAL TABLET

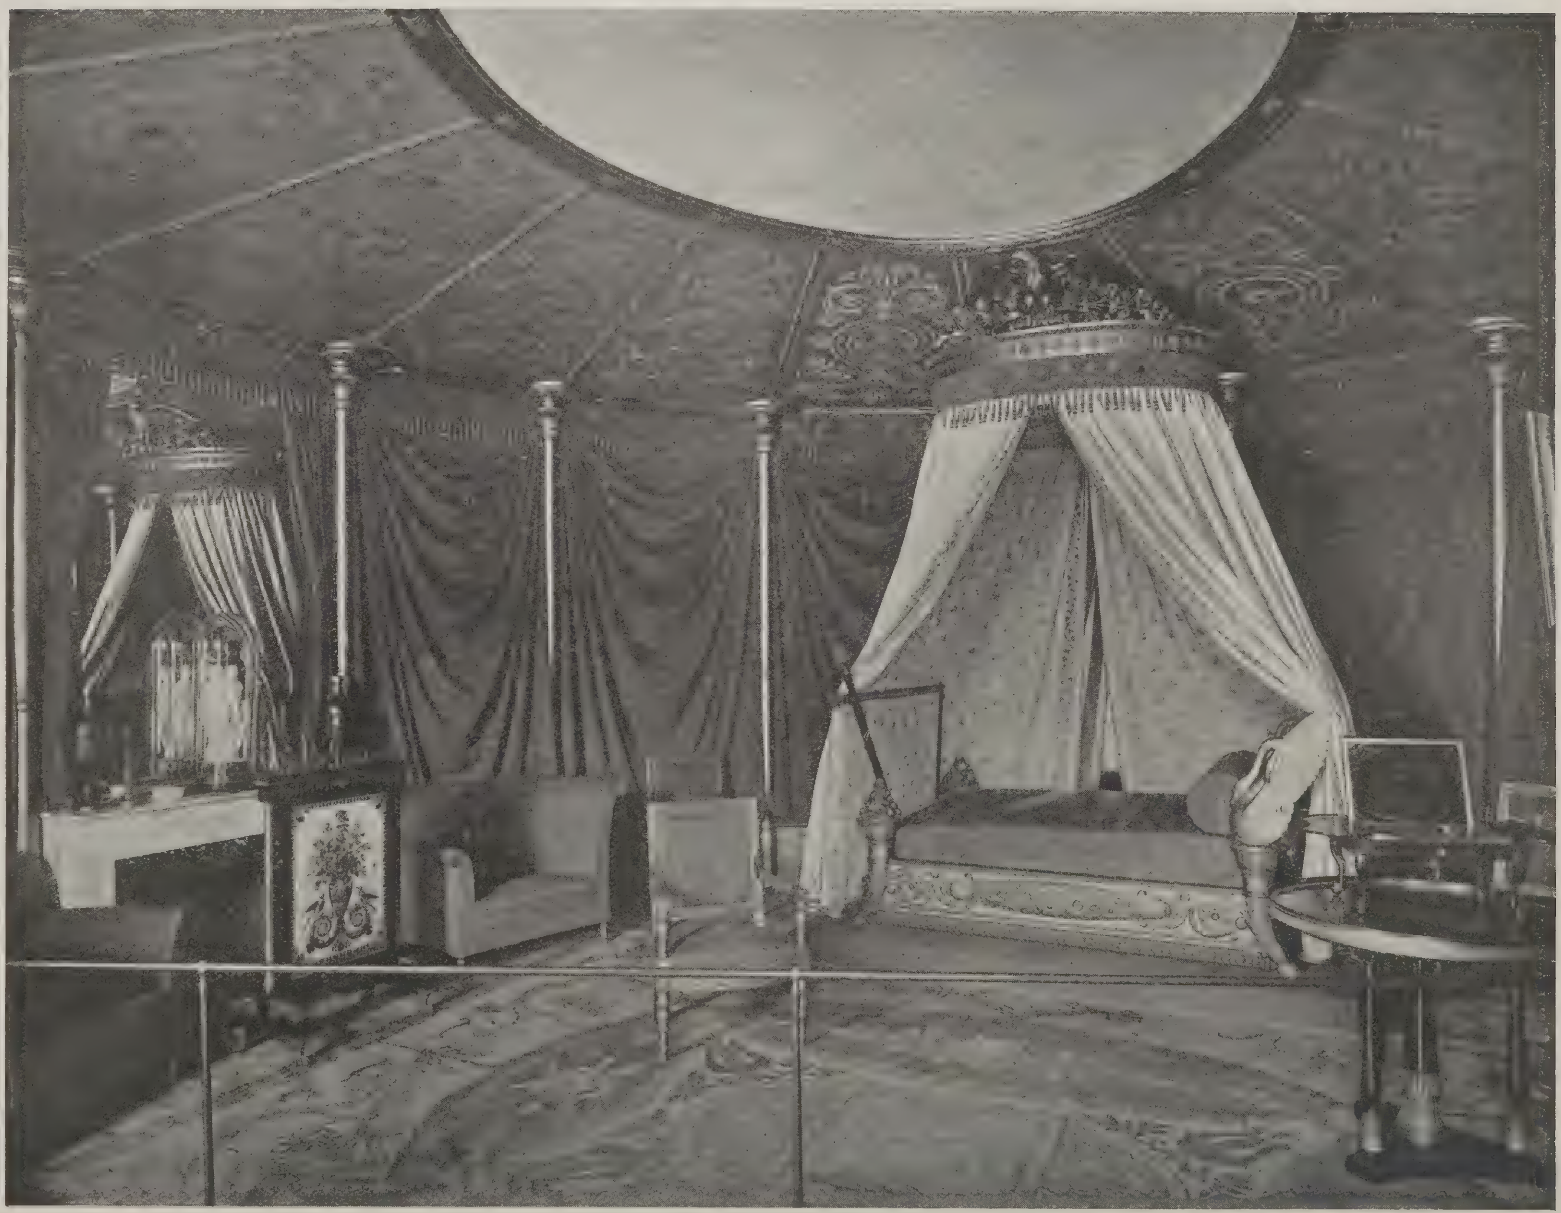
DESIGNED AND CARVED BY FRANCIS R. CLARIDGE.

The figure of this memorial is carried out in white Sicilian marble on a background of dark green Tenos marble. The above is a reproduction of the plaster model.

27-29 Tothill Street, Westminster, S.W.1.

The Bedroom of the Empress Josephine, Château de Malmaison

Percier and Fontaine, Architects



The Château de Malmaison, the country house of the Empress Josephine, was bought by her in 1798. Napoleon decided to have it converted into a palace worthy of the Head of the State, and entrusted the work of reconstruction and decoration to Percier and Fontaine, who had been introduced to him by the painter David. This was their first commission of importance, and so successful was their work that they became architects to the Emperor. They were closely associated with the creation and development of the Empire style of decoration.

Town Planning Administration

It is no unusual thing in these days for a Government department to have its publicity agents; but fortunate indeed is the department which has the loyal, unceasing, and voluntary support of a well-informed and active body. Yet this, in fact, is the relationship which exists between the National Housing and Town Planning Council and the Ministry of Health. We do not mean to say that the *raison d'être* of the Council is to support and help the Government—its scope is far wider and its activities more important; but, incidentally, it has assisted the Government in the preparation of its housing scheme; it has educated public opinion before, during the passage, and since the passing of the 1919 Act; it has organized lectures and arranged conferences among local authorities with the object of helping them to extract the maximum benefit from the powers conferred upon them under the Act; it has acted as a tactful intermediary between the harassed and often bewildered municipality and the obdurate government department; and when the sudden reversal of policy occurred in the summer of last year it poured oil on troubled waters, and endeavoured to find a *via media* between a continuation of the then extravagant procedure of building costly houses at an enormous loss and abandoning all attempts at a national housing scheme.

The latest evidence of its activities, in the cause of national housing, appears in the form of a publication * by Mr. Aldridge on the duties in connection with town planning, which it is now becoming incumbent upon many local authorities to perform. The volume forms a supplement to "The Case for Town Planning," a larger publication of the Council which appeared in 1915.

Hitherto the activities of local authorities have, for the most part, been confined to part III of the Act which deals with the provision of new houses. Now, however, their attention will be directed towards parts I and II, for during the three years subsequent to January 1923 all local authorities with a population, according to the last census, of 20,000 or over, are compelled to prepare and submit a town-planning scheme. During the passage of the 1919 Act, Section 46, which imposes this obligation, was fiercely contested, and after passing the House of Commons, was deleted by the House of Lords, owing chiefly to the efforts of Lord Downham, late President of the Local Government Board. It was, however, reinstated by the House of Commons, and eventually found its way to the Statute Book. At the time considerable discussion turned upon Section 47, which gives the Ministry power to compel an authority to prepare a scheme. In view of Section 46 this appeared unnecessary. The wisdom of its insertion and retention in face of opposition is now apparent, for without it regional planning would have been impossible.

To prepare a comprehensive scheme it is often necessary for several contiguous authorities to combine. Without Section 47, however, an authority with a population of over 20,000 would be powerless to secure the co-operation of a neighbour whose population was below that figure, and so the whole district would suffer. Now, however, the smaller authority can be compelled to make its contribution to the common welfare.

Another important section of the Act is that which removes the necessity for a local authority to obtain the Ministry's consent before preparing or adopting a town-planning scheme. Previously the position had been an anomalous one for the local authority, as it was necessary for it, in preparing its case for submission to the Ministry, to consider many of the problems which would only require solution if the consent were obtained, and to worry many persons unnecessarily to give evidence concerning an entirely hypothetical proposition.

Mr. Aldridge, in his book, gives the scope and character of the Act, and then passes on to the various documents relative to the Act which have been published from time to time by the Ministry of Health. Some of these, as, for instance, a statement issued in August 1921, which emphasizes the desirability of authorities obtaining the opinions of the various local organizations—professional bodies, chambers of commerce, and the like—as to the proposed method of development, are full of sound advice. The somewhat complicated procedure is then explained with the utmost clarity. This is a chapter which will appeal particularly to the municipal official. Chapter V deals with the administration of the compulsory sections of the Act, and gives a summary of the now famous South Wales Regional Survey: the most important survey that has hitherto been undertaken in the kingdom.

The National Council, however, is not concerned only with existing legislation and its administration, and in some of the subsequent chapters will be found interesting suggestions as to the lines which future legislation should take. The Act, as it exists, enables authorities, with a few exceptions, to deal only with vacant land. Obviously town planning implies something more than this. A town is a living and growing organism, for ever casting off dead tissue, in which the existing and the projected must be considered as a whole. England hitherto has been too prone to consider the claims of the individual to the disadvantage of the community, with the result that our towns are worse planned than any in Europe or America.

This spirit of individualism must not be allowed to interfere either with the amenities or with the health of the community. In this book will be found suggestions as to how best to reconcile the conflicting claims of the individual landowner with those of the community. Finally, there are interesting chapters on zoning in America and town-planning legislation in France. We cannot too highly recommend this book, as a plain statement of the present position and a wise forecast for the future, to every enlightened citizen and certainly to every architect whose business it is to be familiar with an Act which so intimately affects his profession and the nation's welfare.

Disappointment at Delhi

The "might-have-beens" of architects are more numerous and, as a rule, less easily remediable than those of any other artist. Even so well-beloved a favourite of fortune as Sir Edwin Lutyens has not been wholly spared such chastenings of spirit. He also, even at Delhi, has been constrained to make sacrifices to Economy, that ugly and tyrannical fetish, who has ordained that he may not build all the important palaces of so expensive a material as white marble. Some, it would appear, he is fain to finish in white plaster—no despicable finish either, when properly applied and brought to a fine surface *secundum artem*. Sir Edwin may console himself with the reflection that the early Greeks and Romans were often reduced to the same expedient, and could not always command the use of the marble veneer with which, failing solid blocks, they liked to cover their walls. Everyone will fully sympathize with Sir Edwin, however, in his very natural disappointment that in some few instances the use of the nobler material has been denied him, for the opportunities to build palaces of white marble do not customarily crowd in upon an English architect, whatever may be the case in America. But Sir Edwin, being a true artist, yet peculiarly free from all taint of personal vanity, the "lasting regret" anticipated for him by a newspaper writer will be purely æsthetic, even if it is strong enough to survive the passage home. By the way, Sir Edwin has now left England for India on board the "Kashmir." *Bon voyage!* and all possible success in the building of the new Delhi!

Herod the Great's Colonnade

A "Times" "Special Correspondent in Palestine" contributes rather thrilling accounts of the archæological spadework there. Philistine and pre-Philistine levels have been reached, "adding to our information as to the arts of the Philistines, and as to the Mediterranean relations of their predecessors, and furnishing new clues for the guidance of future excavators." Unhappily, the excavations at Ascalon by the Palestine Restoration Fund have been stopped through lack of money, to the great loss of English prestige. At Ascalon two seasons' work disclosed the ruins of the Boulouterion, "the meeting-place of the local senate or city council, with its sumptuous colonnaded approach, attributed to Herod the Great [tetrarch of Judæa 40 B.C.], its statuary and sculptures—the indications, in fact, of a classical building without parallel, thus far, in Palestine." At Beisan, the University of Pennsylvania diggers, unhampered by lack of funds, continue to make important discoveries, including a monumental inscription attributed to Rameses II (*circa* 1270 B.C.), besides many interesting traces of the Roman occupation.

The Menace to Whitgift Hospital

It has been very often suggested, sometimes playfully, sometimes in all seriousness, that architects are more keenly interested in new buildings than in old. This is an utter fallacy as regards the "compleat architect," who goes to Italy and Greece for the express purpose of admiring the noble work of his spiritual ancestors, as well as to America to study the buildings that are being put up by the most successful exponents of classical or neo-classical design. But the architect makes full use of his trained power to appreciate beauty in any building, old or new, or, in fact, in any object in which it is revealed. Hence it is that architects everywhere are expressing strong indignation at the proposal to tamper with the Whitgift Hospital at Croydon, and may be counted upon to use their influence for the preservation of this rare gem of architecture as it was practised in the days of Elizabeth. In an article, which appears on a later page, it is suggested that if the Croydon Corporation feel unable to cope with the street-widening difficulty, which they say that the Whitgift Hospital presents, they should call in the aid of skilful town-planners, who could no doubt solve the problem and save the Hospital. As to the proposed Bill authorizing ill-treatment of that beautiful old building, the R.I.B.A. will, no doubt, raise once more its powerful protest against so ominous an incursion of crude commercialism into the domain of art. Parliament should really not need to be reminded of the course it should take with respect to this Bill, yet the Institute may very properly remind it that the Whitgift Hospital is not simply the private property of Croydon, but is an heirloom belonging to England and to Art.

Early British Brickwork

Mention of the early brickwork at Temple Newsam, the fine old mansion which Leeds Corporation has had the courage to acquire for £35,000, has revived a vexed question as to the antiquity of brick-making in England. The Rev. J. Kestell Floyer, M.A., F.S.A., begins his paper on "English Brick Buildings of the Fifteenth Century" (read before the Royal Archæological Institute in March, 1913) with a denial of the statement that no brick was made in England from Roman times until the fifteenth century. The building accounts of the Beverley Bar Gate (1409–10) seem to show that bricks of native manufacture were then available; while Little Wenham Hall, Suffolk, and Coggeshall Abbey, Essex, were both built of brick in the thirteenth century; and Thornton Abbey Gatehouse, Lincolnshire, which was built about 1382, is also apparently of native bricks. It will be suspected that in such early instances Roman bricks may have been used; but Mr. Floyer thinks that there is abundant evidence to show that brick was made in England throughout the later middle ages. "Full details of working the corporation brickyard at Hull appear in the Hull Chamberlain's rolls from 1303 onwards." Mr. Floyer's paper was published in the "Archæological Journal" of June, 1913 (vol. lxx, No. 278).

Pre-Tudor Bricks

St. Peter's Chapel-of-Ease, in Palace Street, Westminster, was one of those outstanding buildings which, for some reason or other, impress a district with their character, forming a "landmark," as the popular term has it. Built in the middle of the eighteenth century, partly out of the thousand pounds won in a lottery by the eloquent but extravagant Dr. Dodd, who was the last person but one to be hanged for forgery (1777), it was, with its tall gable and rusticated-stucco front, very characteristic of its period; it not only dominated the district, but dated it. It had, however, outgrown its original utility as an aristocratic chapel, and is now in course of transformation into a cinema. Its old familiar aspect will be greatly missed by those who had come to regard it as almost integral with that part of Westminster. It is recorded in "The Daily News" that the workmen engaged in the alterations have made a rather puzzling discovery. "Two feet below the flooring of the old vault another floor, of strong wooden beams extending the whole length and breadth of the building, has been found. How the beams came to be there is a puzzle . . . and the discovery of some broken pottery and a few red bricks below the beams have further complicated matters. The pottery, unfortunately, has been carted away with demolition debris, but the bricks are in care of the architect. They are half the standard thickness regulated by the statute of 1623. Thus there is a chance that the bricks are genuine "pre-Tudor." They should certainly find their way into the London Museum.

Simpler Building Regulations

The new building regulations which have just been circulated by the Ministry of Health, and are reproduced in full on a later page of our present issue, will doubtless be minutely analysed by all to whom they are of practical concern. They will be approved or condemned as they affect various and (occasionally) conflicting interests. A just verdict awaits experience of their actual operation; but it is not premature to express the opinion that on the whole they seem to substitute common-sense elasticity for unnecessary rigour, and are adaptable and accommodating rather than arbitrarily Procrustean.

RACINE'S "PHÈDRE," AS PRODUCED AT THE KAMERNY THEATRE, MOSCOW.
An example of advanced methods. Note the stage's various levels.

Rebuilding Soviet Russia

By HUNTLY CARTER

5. The Art of the Theatre

NO one can visit Soviet Russia without being struck by the extraordinary interest which both the Soviet Government and the people attach to the Theatre. Indeed, since the revolution the Theatre in Russia has entered upon a course of development which promises to affect all outside Russia who have the slightest concern with its form and function. If the present development continues, and there is no reason why it should not, for the theatrical movement in Russia is springing rather from the inner necessity of the people than from any political compulsion, we shall see in a few years a very strong added impulse to architectural enterprise. Already Russian theorists are proposing new forms of theatres. There is, for instance, M. Kergentsev with his plans for a Creative Theatre designed to place the spectator where the deputy actor too long has been.

For the moment, however, the subject of architecture and the Theatre is one that leads to a consideration of the present deplorable condition of the playhouses, and of the peculiar use that is being made of architectural backgrounds, especially in plays, some of them written, and all of them produced, by the workers.

I need not go into the matter of the new conception and organization of the Russian Theatre under the soviets. Anyone who wishes to know something about this can do so by referring to the article I contributed to the "Fortnightly Review" early this year. Since the revolution the Theatre has been made a definite branch of the Educational

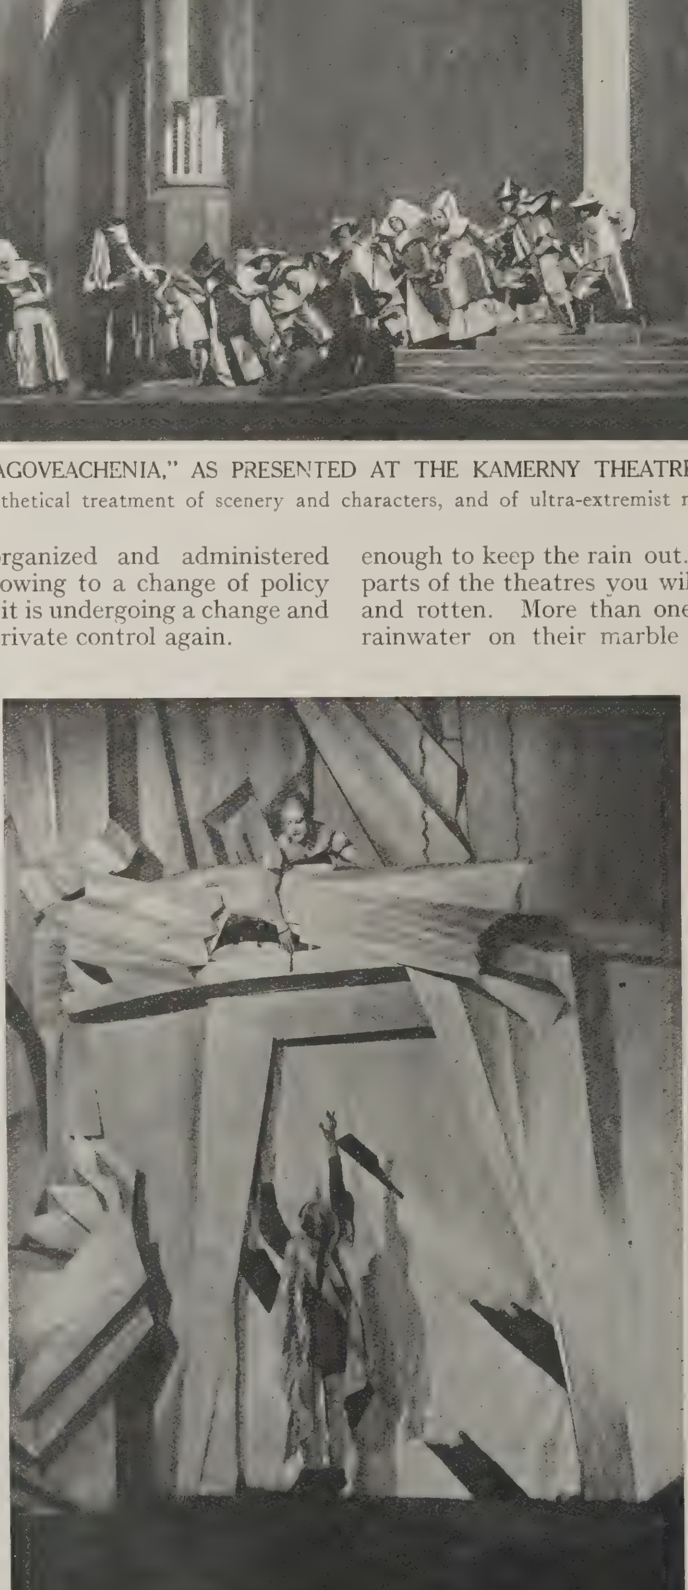
An example of the synthetical treatment of scenery and characters, and of ultra-extremist methods of representation.

Department and has been organized and administered accordingly. Now, however, owing to a change of policy on the part of the Government it is undergoing a change and passing from Government to private control again.

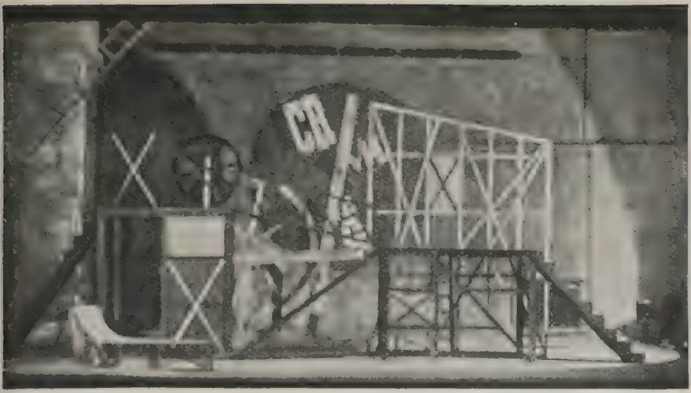


"ROMEO AND JULIET" AT THE KAMERNY THEATRE, 1922.

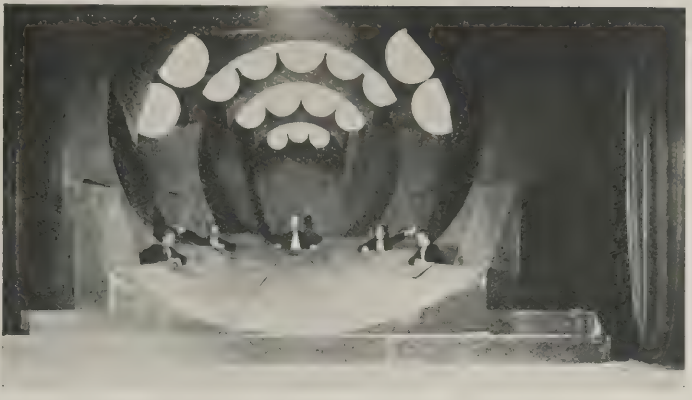
A new conception of the balcony scene.

It cannot be said that the new private owners or previous owners to whom theatrical property has been restored, are altogether in luck's way. The state of the playhouses and cinemas is not one to make them rejoice — rather the other way about. Ten years or more of being trampled on, hacked about, transferred from owner to owner, and put to every purpose, including some wrong ones, has left them looking the picture of extreme old age and chronic melancholia. Even the best theatres have sad features that leave you gasping for breath. Exteriors are indescribably dirty and crumbling away. Some of them bear the faded remains of propaganda inscriptions and other mural "decorations," which add to your excitement, but not to your pleasure. When you enter you find corridors and auditoriums dark, dingy, and gasping for renovation. Here and there the plaster is mouldering away in great patches. Above your head there is a large hole in the ceiling which has been filled up in a rough-and-ready way, but not rough-and-ready enough to keep the rain out. In the vestibules and othe parts of the theatres you will notice fine frescoes mildewy and rotten. More than one of the lounges have pools of rainwater on their marble floors. The auditoriums are dimly lit. In one large auditorium I counted just two lights during the intervals. Most of the electric fittings are out of order. The upholstery is faded and torn, the box curtains missing. The seats are very old, sometimes a queer mixture of odd chairs and wooden benches, the chairs being secured to each other by bits of string. The floors of the auditoriums, corridors, and offices are bare. The cloak rooms are unused—just a collection of empty pegs. In some auditoriums, for instance at the Hermitage Theatre, there are huge propaganda inscriptions stretching across the proscenium opening about two feet in front of the curtain. These exhort the spectators to do one thing while the play exhorts them to do another. There are no attendants and no refreshments, no programmes —no nothing, as Poor Jo might say.

The sorrows of the cinemas are much too numerous to relate. Suffice it to say that picture-palaces which once upon a time were fashionable palaces-de-luxe now look like penny gaffs that have wandered out of dreary slums.



BUILDING UP THE NEW STATE BY MEANS OF SYMBOLS.



"LENA," ACT I. THE WORKERS' IDEA OF DECORATION.

SCENERY AT THE PROLETARIAN THEATRE.

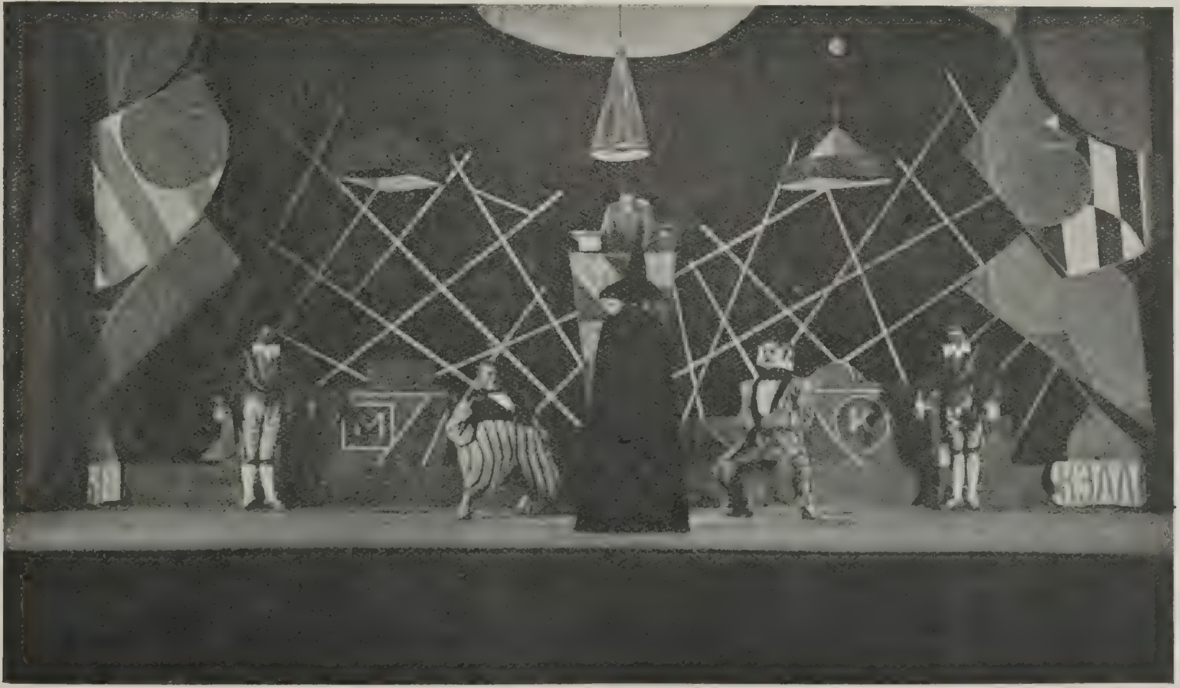
They are, in fact, dangerously filthy and lousy. Their walls are patched with plain timber, the bits of drapery are shabby and pestiferous. Cracked mirrors, crumbling ornamentation, rudimentary seating, partial lighting, emergency and worn-out cinema apparatus and films, such are a few of the descriptive details.

On the whole, then, the theatrical property is also a reflection of the utterly worn-out condition of things. Of course, the stock scenery takes part in the appeal for a general renewal. For the most part it is old and very dilapidated and quite unsuited to the purposes to which it is now put. It was originally made for bourgeois plays, but now it has to play the ridiculous part of trying to assume a fierce proletarian look. As the theatre hangings have disappeared from various causes, one of them being an outburst of looting, serious deficiencies are everywhere noticeable. A prominent one is the absence of side curtains to the proscenium opening necessary to screen the empty stage at each side of the scene.

Perhaps the unhappy condition of the old scenery does not matter. Except in the case of a repertory theatre, like the Moscow Art Theatre, there is no great need of its services. The famous Moscow Art Theatre has built up a world-wide reputation with its pre-war productions, which, together with their settings, have become classics. These settings introduced certain scenic reforms in the direction of a synthesis of form, colour, and movement which took hold of the theatres of Europe and America, and they have become so much part and parcel of the representative and interpretative machinery of the Moscow Art Theatre that they can be no more separated from it than certain perfumes from certain brands of soap.

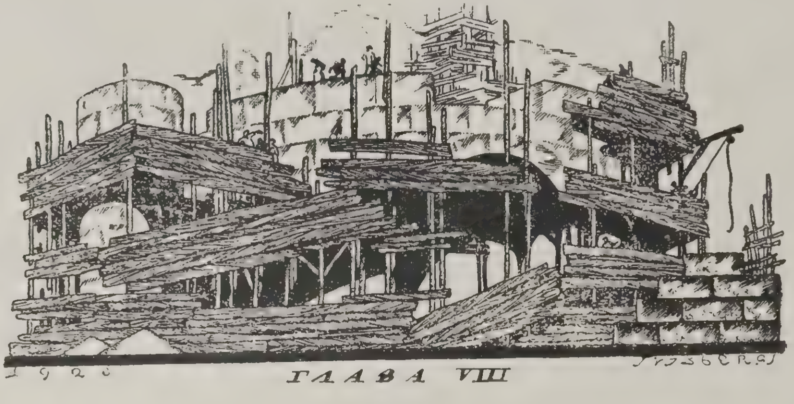
With other theatres it is somewhat different. While the Moscow Art Theatre has clung tenaciously to its old stock of plays and scenery, elsewhere plays and ballets have been born or disinterred by order of the soviets, suitable for instructing the public in the meaning of their new communistic surroundings, in the significance of the communist life, and how it is to be lived. Such plays called for new or adapted settings. As a result a tendency has arisen towards the elimination of the old bourgeois screens and properties and the production of architectural scenery symbolizing the proletarian ambitions. In short, the tendency set up by making the theatre a communistic interpreter is to clear the stage of all the old bourgeois lumber and to fill the space with symbols of the communistic state.

This movement towards new interpretative scenery is particularly noticeable in the proletarian or workers' theatres, of which there are a great number in Russia to-day. In such theatres one finds the working-class actors and actresses busy with the new conception of the State as

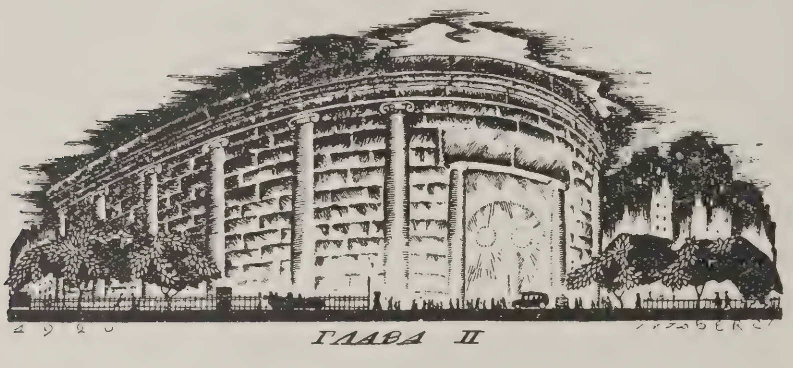


"THE MEXICAN," BY JACK LONDON, ACT II. PRODUCED AT THE PROLETARIAN THEATRE, MOSCOW, 1922.

A good example of the workers' conception of futurist scenery and costumes.



BUILDING THE NEW MASS THEATRE.

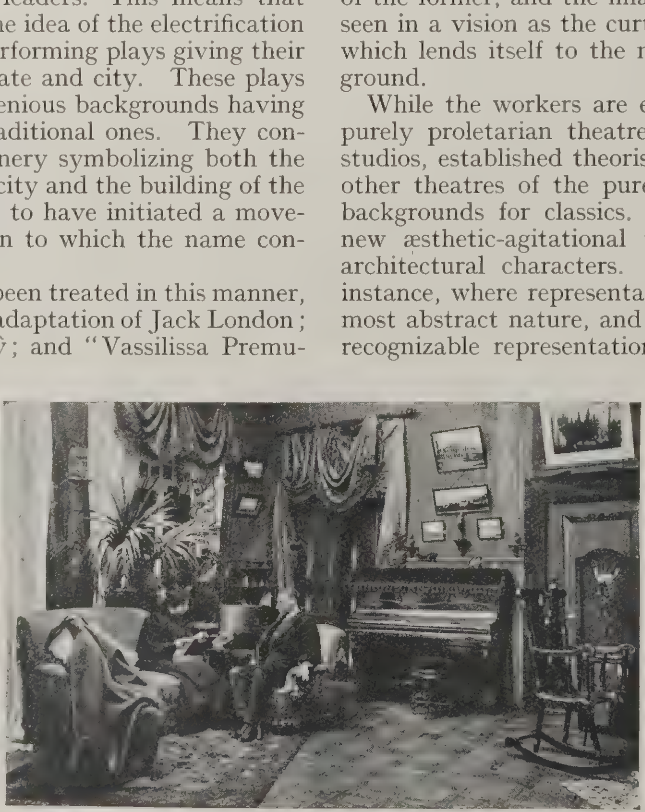


THE NEW MASS THEATRE OF THE SOVIET.

(*From "The Creative Theatre," by M. Kergentsev.*)

formulated by the Communist leaders. This means that the workers have caught on to the idea of the electrification of Russia and are writing and performing plays giving their own version of the electrified State and city. These plays are represented by means of ingenious backgrounds having nothing in common with the traditional ones. They consist of futurist architectural scenery symbolizing both the destruction of the old State and city and the building of the new. This scenery may be said to have initiated a movement in theatrical representation to which the name constructivism has been given.

Several important plays have been treated in this manner, among them "The Mexican," an adaptation of Jack London; "The Lena," a play by Pletnev; and "Vassilissa Premudraya," by Lunacharsky. A very important play, Mayakovsky's "Mysteria Bouffe," fully illustrating the method of constructivism, was given not long ago at the Zon Theatre—the largest theatre in Moscow. The opening performance was attended by the leading representatives of the Soviet Government. Subsequently vigorous attempts were made to introduce it to the widest public. The theme was the destruction of the earth by a flood (the revolution); the struggle for supremacy between the survivors — (the pure) proletarians and (the impure) bourgeoisie; the triumph of the former, and the final coming of the "Electric City" seen in a vision as the curtain falls. Such, briefly, is a plot which lends itself to the new order of architectural background.



IBSEN'S "NORA," PRODUCED AT THE MOSCOW ART THEATRE.

Banned by the Soviet Government on account of its bourgeois setting.

While the workers are engaged with their new ideas in purely proletarian theatres and an enormous number of studios, established theorists and practitioners are busy in other theatres of the purely cultural class, evolving new backgrounds for classics. These backgrounds are of the new æsthetic-agitational type, and contain conspicuous architectural characters. At the Kamerny Theatre, for instance, where representation and interpretation is of the most abstract nature, and the utmost is done to eliminate recognizable representational settings, there is an almost excessive use of stages at different levels and different angles.

A further use of architecture in plays is seen in certain mass performances in the open air of the political mystery-plays. Thus "The Taking of the Winter Palace" is played before the Winter Palace, and another mass play in which over 100,000 persons, mostly the untrained public, take part, is performed before the Bourse. Other instances could be cited, but sufficient has been said to show that architecture plays an increasingly important part in play representation in Soviet Russia.

Dutch Architecture, Old and New

Some Impressions of the A.A. Visit to Holland

With Photographs by F. R. Yerbury

THE A.A. annual excursion was revived this year for the first time since the war; Holland was the country chosen. The party, which numbered about thirty, made its headquarters at Amsterdam, a convenient base from which to visit most of the places of interest in the country. One week was too short a time to gain more than a general impression, but it was long enough to inspire all with the wish to return for a longer stay at the earliest opportunity.

The whole visit was an unqualified success, for which thanks are due both to Mr. Keppler and Mr. Versteeg, who so ably arranged the daily trips, and to all those architects who gave up so much of their valuable time to show the party round the various places visited.

The party arrived at Amsterdam on the morning of September 23, and were met at the station by Mr. Keppler, who took them to the American Hotel. After lunch the Amsterdam Exchange was visited, where the party met Dr. Berlage, who kindly showed them all over the building. The Exchange was built between 1899 and 1903, and is considered to be the first building in Holland inspired with the freedom of modern feeling. It was interesting to have seen it before viewing the more recent work of the modern school, which was seen later in the afternoon.

The work of Mr. De Klerk has been much illustrated in the English architectural press, but it is quite impossible to gain any correct impression of those buildings from photographs. The effect of the Dammernplantseon housing scheme is exceedingly fine, but is largely due to the beautiful texture of the Dutch brickwork and to the extraordinary craftsmanship displayed throughout. The architecture itself is striking and interesting.

The following day, Sunday, September 24, was spent at Haarlem, where the party was met by Mr. Weissman and Mr. Von Loghen. The Franz Hals Museum was first visited, and afterwards the Groote Kerke, which, as the views on page 479 show, is an imposing Gothic church of the fifteenth century. The scale and dignity of this church are certainly emphasized by the small houses and shops which are built close against its walls. The interior, like all Dutch churches, is whitewashed, and the effect is somewhat cold and unsympathetic, but the general proportions and sense of space are very pleasing. The vaulting here is made of cedar wood to imitate stone, and dates from 1530. A late Gothic screen, separating the nave from the choir, is supposed to be some of the finest woodwork in Holland. The decorative paintings on the piers, which date from the end of the sixteenth century, can be seen in the photograph.

Leaving Old Haarlem, the party went with Mr. Von Loghen to see his housing scheme at Tuinwyk. One of the attractions of this scheme is the successful use of colour on all the external woodwork. The lay-out consists of two

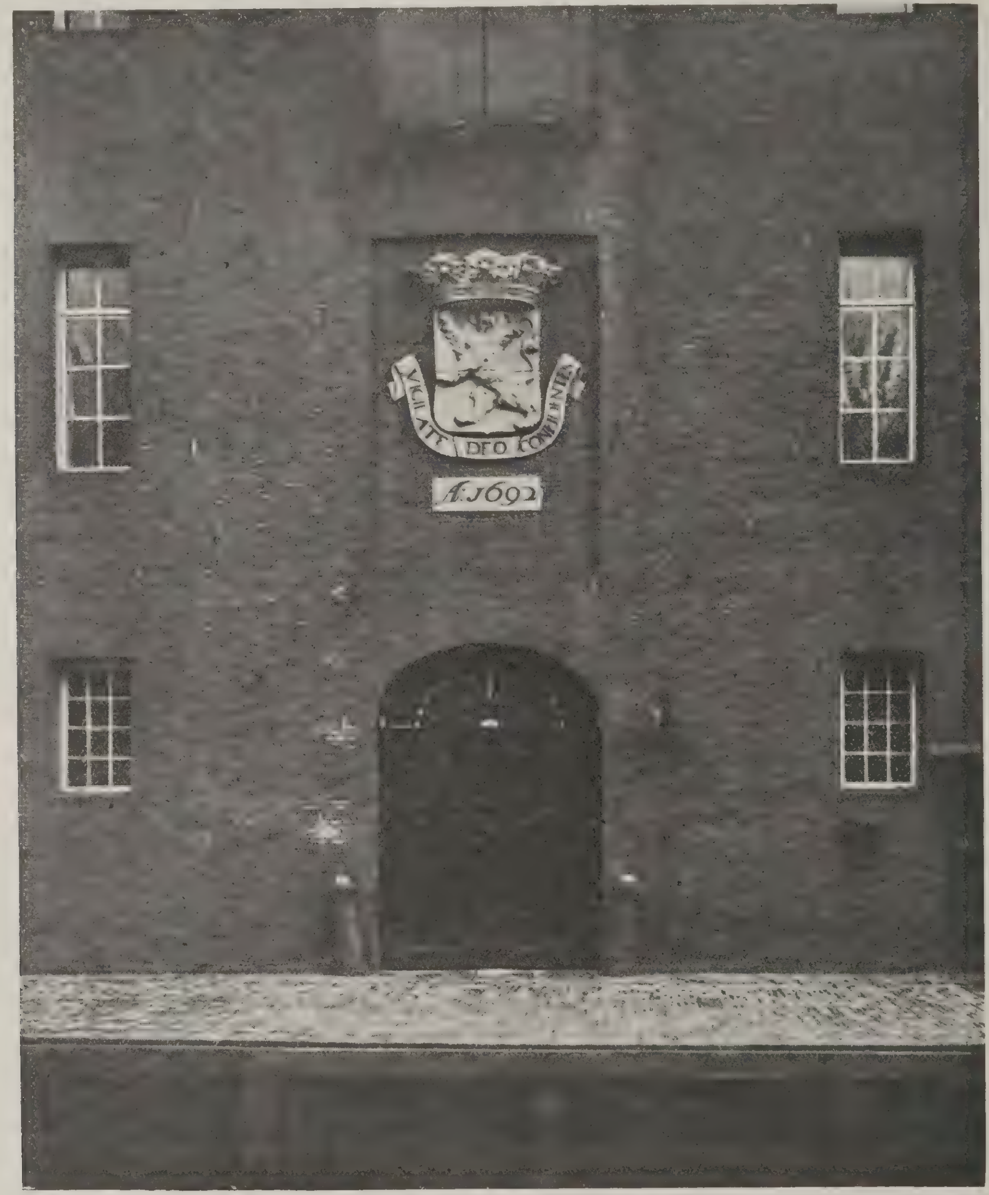
quadrangles, separated by a wide roadway. The backs of the houses look on to communal gardens within each quadrangle. Through the kindness of a friend of Mr. Von Loghen the party were able to see the inside of one of these houses, the interior arrangements of which are certainly some of the best in Holland. These houses were not built for the working-classes, their rental being about £80 a year.

On Monday the party went to Delft, where they met Professor Sluytermann, who took them to the art school of which he is the principal. The school building is a fine example of eighteenth-century Dutch architecture, and the studios seem to fill the double rôle of atelier and museum. The Nieuwe Kerk, which stands at one end of the Groote Markt, was afterwards visited. This church has a very fine tower, which can be seen in the photograph on page 478. The meat market and the arsenal are also illustrated; the latter, standing near the Rotterdam Gate, bears the old arms of the Dutch Republic and the date of 1692 (see above and opposite).



THE ARSENAL, DELFT.

The third photograph of Delft gives some idea of the charm of the old houses of which there are many in the town. Perhaps the most interesting thing seen in Delft was the glass factory where old stained glass is restored and new designed. The principal, Mr. Schonten, described how the work was done, and explained the difficulty which arises in restoring the old glass to the churches in Holland. Owing to the excessive whiteness of the interior, the contrast of the highly-coloured windows to the whitewashed walls causes a difference in value too sudden to be pleasing. In the evening the party were entertained at the American Hotel by the Bond of Netherland Architects, and Mr. Slothower gave a very interesting historical summary of Dutch architecture, which was much appreciated.

On Tuesday morning Mr. Jan de Meijer conducted the party round Old Amsterdam. After walking through the most interesting part of the city, they returned to the Industrielle Club, where they were entertained to lunch by the Municipality of Amsterdam, being received by Mr. Krannenburg. Here were met Mr. De Klerk and Mr. Kramer, who both went with the party afterwards to see their most recent housing schemes. The elevations were interesting, but the interiors on the whole were disappointing, most of the rooms being too small to be comfortable, and the staircases in many cases too steep. Taking the schemes as a whole, however, there was a great deal to be learnt from them, both in design and the use of material.

Next morning the party left Amsterdam in motor-cars to visit Utrecht, accompanied by Mr. Slothower and Mr. Versteeg. On the way a stop was made at Hilversum, where the acquaintance was made of Mr. Dudok, the architect of the housing scheme and several public buildings there. The communal bath-house, the first building visited, is, as will be seen from the photograph on page 482, a striking architectural composition in which the use of

AN OLD HOUSE IN DELFT.

different coloured bricks and painted woodwork plays a large part. The plan is a square, the baths being arranged on three sides, the fourth side consisting of waiting-rooms. Each bathroom has a tiled floor and dado, and the baths themselves are of granolithic composition. Three schools were also visited, one of which is illustrated (page 482). The square tower seen in the photograph is the stair hall. The light and cheerful interior of this school is particularly charming. Hilversum is one of the many places where the party would have liked to have more time, but they still had to see the cathedral at Utrecht, which Mr. Slothower is restoring.

The tower of Utrecht Cathedral stands apart from the choir, the nave having been blown down in 1674. Mr. Slothower has discovered recently two altar paintings which have been bricked over for some considerable time. These are being cleaned and preserved.

Returning to Amsterdam along the river Vecht, the party stopped at the castle of Zuilen, which was restored by the late Dr. Cuypers, and is a very interesting example of modern Gothic. On Thursday Mr. Krannenburg and Mr. Jonser, members of the Holland-England Society, very kindly escorted the party on a delightful trip to Edam and Volendam. The whole journey was by steam tram, a stop being made at Edam, where a visit was paid to the Old Museum, which is a typical Dutch house with a red-brick, crow-stepped gable. (See page 478).

Volendam is a picturesque old town with a fairly large fishing harbour. The inhabitants all wear national costume, which adds a good deal of charm to the place. On the way back a halt was made at Monnickendam, where there is an old red-brick church. In the evening the party were entertained at the Pavilijoen Vondelpark by the members of the Holland-England Society, where they met all those in Amsterdam who are interested in the friendly relations between the two countries.

Friday being the last whole day of the stay, the party went with Mr. Jan de Meijer by boat to Alkmaar.

It was with many regrets that Amsterdam was left on Saturday. The stay had been so pleasant and the various hosts so hospitable that all members of the party wished they could have prolonged their visit to study and enjoy more fully the architectural delights of Holland. I. M. C.

COMMUNAL BATH-HOUSE, HILVERSUM, BY DUDOK

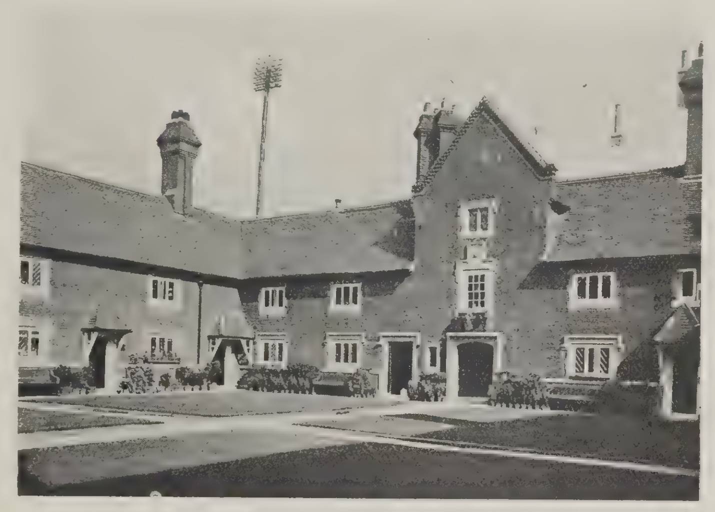
The Whitgift Hospital Difficulty, and How to Solve It

BEING more than seventy years old when he founded the almshouses at Croydon which keep his memory green, Archbishop Whitgift was in a position to appreciate the value of this "Harbour of Refuge" and rest for the aged. The figure of speech "Harbour of Refuge" is, of course, the title of Fred Walker's picture now hanging in the Tate, to the edification of thousands of simple souls who like to have their gentle emotions gently stirred; and the almshouses Walker depicted are at Bray.

Almshouses never fail to excite sympathy for the aged and infirm, who might chance to be homeless were it not for the tender compassion of the pious founders; let us call it that, even though the actual motive of the founder may have been, in some instances, less disinterested.

It may, indeed, be safely concluded that, in the majority of instances, the innumerable buildings of almshouse character that are scattered over the kingdom are so many monuments of the genuinely tender feelings of those who wished rather to manifest their love of their aged fellow-pilgrims than either to win for themselves "credit and renown" here below, or to reap hereafter the rewards of their charitable deeds.

Almshouses — whether they were called by that name or by any of the various titles of hospital, guest - house, infirmary, bede-house, religious house, "maison Dieu," God's house, or what-not—seem to have come into being in this country almost simultaneously with the introduction of Christianity; although few actual buildings of the kind have come down to us from much earlier than Tudor times.



A VIEW IN THE QUADRANGLE.

Even so, they are mostly very venerable and very deeply interesting examples of early domestic architecture, and, as such, would be well worth the cherishing even if this were all—even if the almshouses did not afford so striking a testimony to the ancient and enduring love of man for his fellows. Is it more than mere fancy that tender compassion is expressed in the gracious design, the peculiar charm with which almshouses are almost invariably invested?

In country places almshouses are comparatively safe from molestation. On the other hand, towns always envy them the space they occupy. It is as if the fussy, hustling citizen resented their silent rebuke of his noisy restlessness and sordid aims. The almshouse, mellow with age, centuries in arrears of the raw and garish buildings of to-day; its slow and ancient folk feebly pottering about among their old-fashioned flowers, or lolling dreamily, lazily, on their benches or in their arm-chairs; the quiet quadrangle, with the tiny chapel in one of its corners; the languidly chiming clock; the quaint old gables and the lichen-covered red-tiled roof—these things in combination create for the "business man" an alien and an enervating atmosphere, which he thinks deadly lethargic. They are all completely "out of date," and they remind him rather poignantly of whither he too is tending at express speed, of what, after all, may be the final pitiful result of all his strenuous activities and ceaseless anxieties. They remind him too pointedly that "getting on in life" has two distinct and rather opposite meanings.

He does not like these gentle reminders of impending feebleness and inevitable decay. Away with the almshouses! The chimes from their turret clock are out of harmony with the spirit of the times, and infect him with their drawling languor. Each time the clock speaks, it tells him that he has fewer hours to live and strive!

It is unfortunate that so very often the old almshouses abut upon the highway. Their situation attracts to them the undesirable attentions of the enterprising trader, who thinks so prominent a site should be "utilized"—his own horrible word—"to much greater advantage"—his own fearsome phrase. "Advantage" and "utility" are idols that are blindly worshipped by the profiteering person.

Appraising and covetous looks have been for generations cast on the Whitgift Hospital of the Trinity, which has the dual misfortune to occupy the best site in the High Street, Croydon, and to "stand in the way of improvements." Fatal combination of offences! At length the covetous eyes and itching palms have prevailed. A majority of the Croydon Corporation have resolved to promote a Parliamentary Bill for the widening of the High Street, which can only be effected by mutilating the fine old almshouses—the Whitgift Hospital of the Trinity—or, what is really a more merciful crime, by removing them altogether, and thus, as it were, putting them out of their misery.

Either to destroy or to mutilate this rare gem and priceless heirloom, this "haunt of ancient peace," this monument to piety and pity, would be sheer sacrilege. Wantonly and unnecessarily to destroy what cannot be restored is an act that can seldom or never be condoned; and the Croydon Corporation are deliberately proposing to demolish, or deface, or transplant, or transport—it does not appear that they greatly care what becomes of it, so long as they get rid of it somehow—a building that should be the joy and pride of every right-minded citizen, and is certainly venerated by every decent denizen of Croydon.

Stepping out of the narrow, noisy, and rather crooked High Street into the spacious and quiet quadrangle of the Whitgift Hospital, is comparable to passing from the turmoil of dusty Fleet Street into the serenity of the Temple, or out of the High at Oxford into some venerable college "quad." The sudden hush, the leisurely atmosphere, are, for a moment, almost startling in their intensity. Anyone less callous than a Croydon councillor of the iconoclastic majority would shrink with horror from the bare idea of profaning such an earthly paradise.

But the danger of destruction or mutilation of the Whitgift Hospital is imminent; for unhappily these hard-headed and hard-hearted men of business can point to hard facts that plausibly seem to support their high-handed action.

The first and principal of these "hard facts" that "daurna be disputit" is that the High Street of Croydon is neither so straight nor so wide as it should be, and these defects become hourly more apparent with the continuous increase of motor traffic of every conceivable kind.

But why interfere with the almshouses? Why not widen and straighten the street by setting back the unlovely buildings that vulgarize its opposite side? Why not, indeed? There is a reason that the ordinary map does not make clear. These "business premises" are built on the crest of a hill—perhaps the "Croiedune," or Chalk Down, from which the town is supposed to have got its name—and at their rear the hill slopes down rather sharply, so that to set back the shops would be to transfer them from a hill—or at all events from a plateau—to a hollow. What is worse, the consequent widening of the street would not be a simple process. Obviously, one side of the street would be aslant, and the cost of making it uniformly level would be somewhat heavy.

Nor would the trouble end there; for the street, however level it might be made, would still be a little crooked, because it happens to be the almshouses that make it so.

A visit to the spot confirms at a single glance the eulogies that have been lavished on the Whitgift Hospital, and also explains the ruthless but feebly conceived demand for its removal or mutilation, which would be the worst possible solution, or rather evasion, of an admitted difficulty.

In spite of almost irrepressible emotion, indignation, and regret, we have endeavoured to make a perfectly fair and impartial statement of the difficulties that have to be overcome. Nobody, therefore, can justly bring against us the deadly charge of sentimental bias.

Difficulties there certainly are in this matter of the Whitgift Hospital; but Englishmen are never daunted by difficulties, especially not by civil engineering difficulties. It is by overcoming them that the Englishman's superlative civil engineering skill and ingenuity have been developed to such an extraordinary degree.

Then, consider the high degree of accomplishment to which our town-planners have now attained. Surely the Croydon case offers but a simple problem for them to tackle. We do not for a single moment believe, and we most emphatically refuse to admit, that it is necessary to destroy, or to mutilate, or to remove, the venerable and beautiful Whitgift Hospital of the Trinity. Against the town councillors who would commit this insensate folly it were futile as well as indecorous to use harsh words. Doubtless they are to be credited with an honest desire to do what they think is best for the well-being of their town; but they have adopted a mistaken policy, and one that, so far from advancing the best interests of Croydon, will go far to bring discredit on it as a town whose governors are lacking in civic pride, and who share in rather an uncommon degree the common deficiency in civic sense. We do not use the word at all opprobriously; for civic sense is, indeed, a scarce commodity in the land. We may rest assured, however, that there is enough of it in Parliament to secure the instant and emphatic rejection of this ill-advised private Bill, the passage of which would be but a Pyrrhic victory for Croydon. May it be spared a "success" that would surely brand it with unforgettable ignominy.

Appended is a plan that shows very convincingly that the Whitgift Hospital problem is by no means insoluble. We are convinced that town-planning ingenuity, backed up by a fair degree of civic courage, would, in combination, be easily equal to a completely satisfactory solution of the supposedly insuperable difficulty of which the destruction of the almshouses would be no solution, but merely a shamefully weak evasion.

Let us conclude with a practical suggestion which ought to have occurred to corporate wisdom before wasting money on a Parliamentary Bill that, if it meet with its deserts, will most certainly be summarily thrown out. Let the corporation, which would seem to have "money to burn," refrain from throwing it away on a scandalously discreditable Parliamentary Bill, and promote with it a town-planning competition, the results of which will, we are confident, solve the street difficulty, save the almshouses, and redound to the credit of a corporation that for the moment is incontinently coquetting with indelible disgrace.

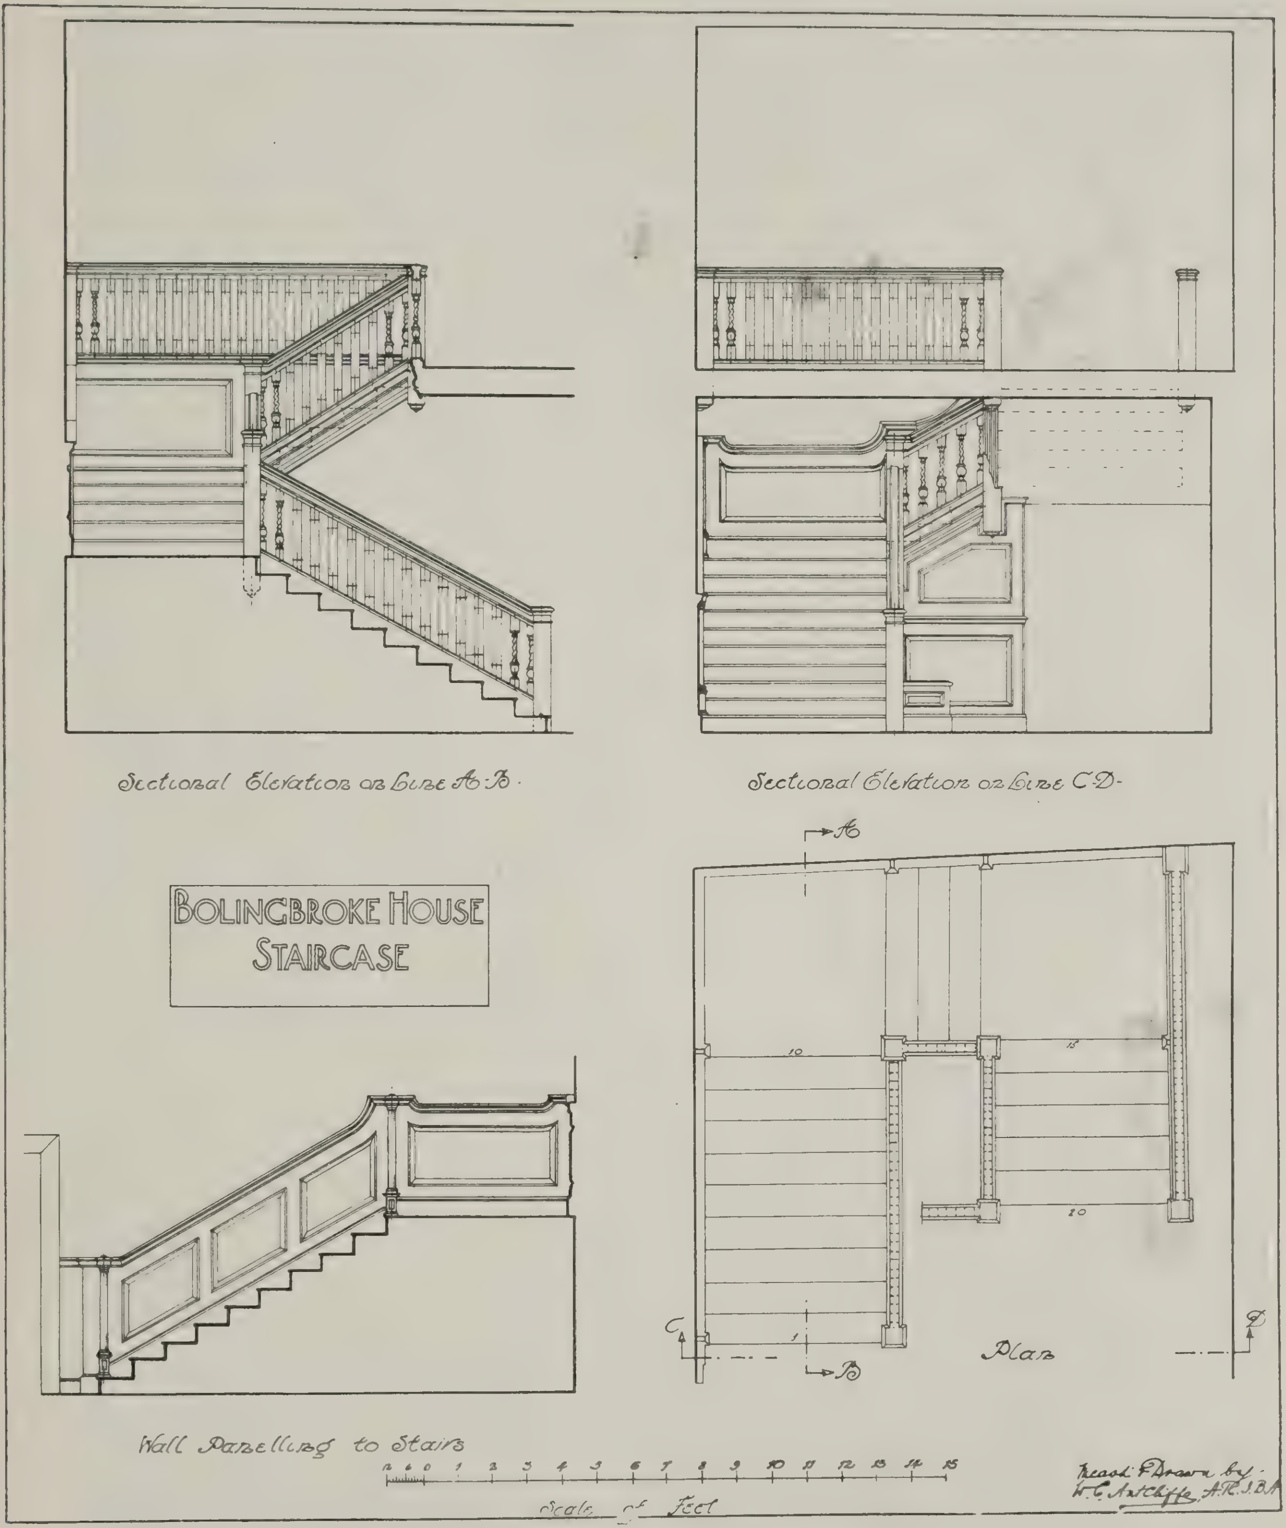
A SCHEME FOR SOLVING THE CROYDON TRAFFIC PROBLEM WITHOUT DESTROYING THE WHITGIFT HOSPITAL.

BY HAROLD WILLIAMS.

Measured Drawings. 16.—The Staircase at Bolingbroke House, Battersea.

Measured and Drawn by W. C. Antcliffe, A.R.I.B.A.



Bolingbroke House, as we have already recorded in these pages, is to be demolished, and there is reason to fear that the staircase which it contains—a remarkably fine specimen of early Renaissance design and craftsmanship—may disappear with it. We have therefore taken occasion to have the accompanying measured drawings prepared as a record.

(*See also pages* 486, 487).

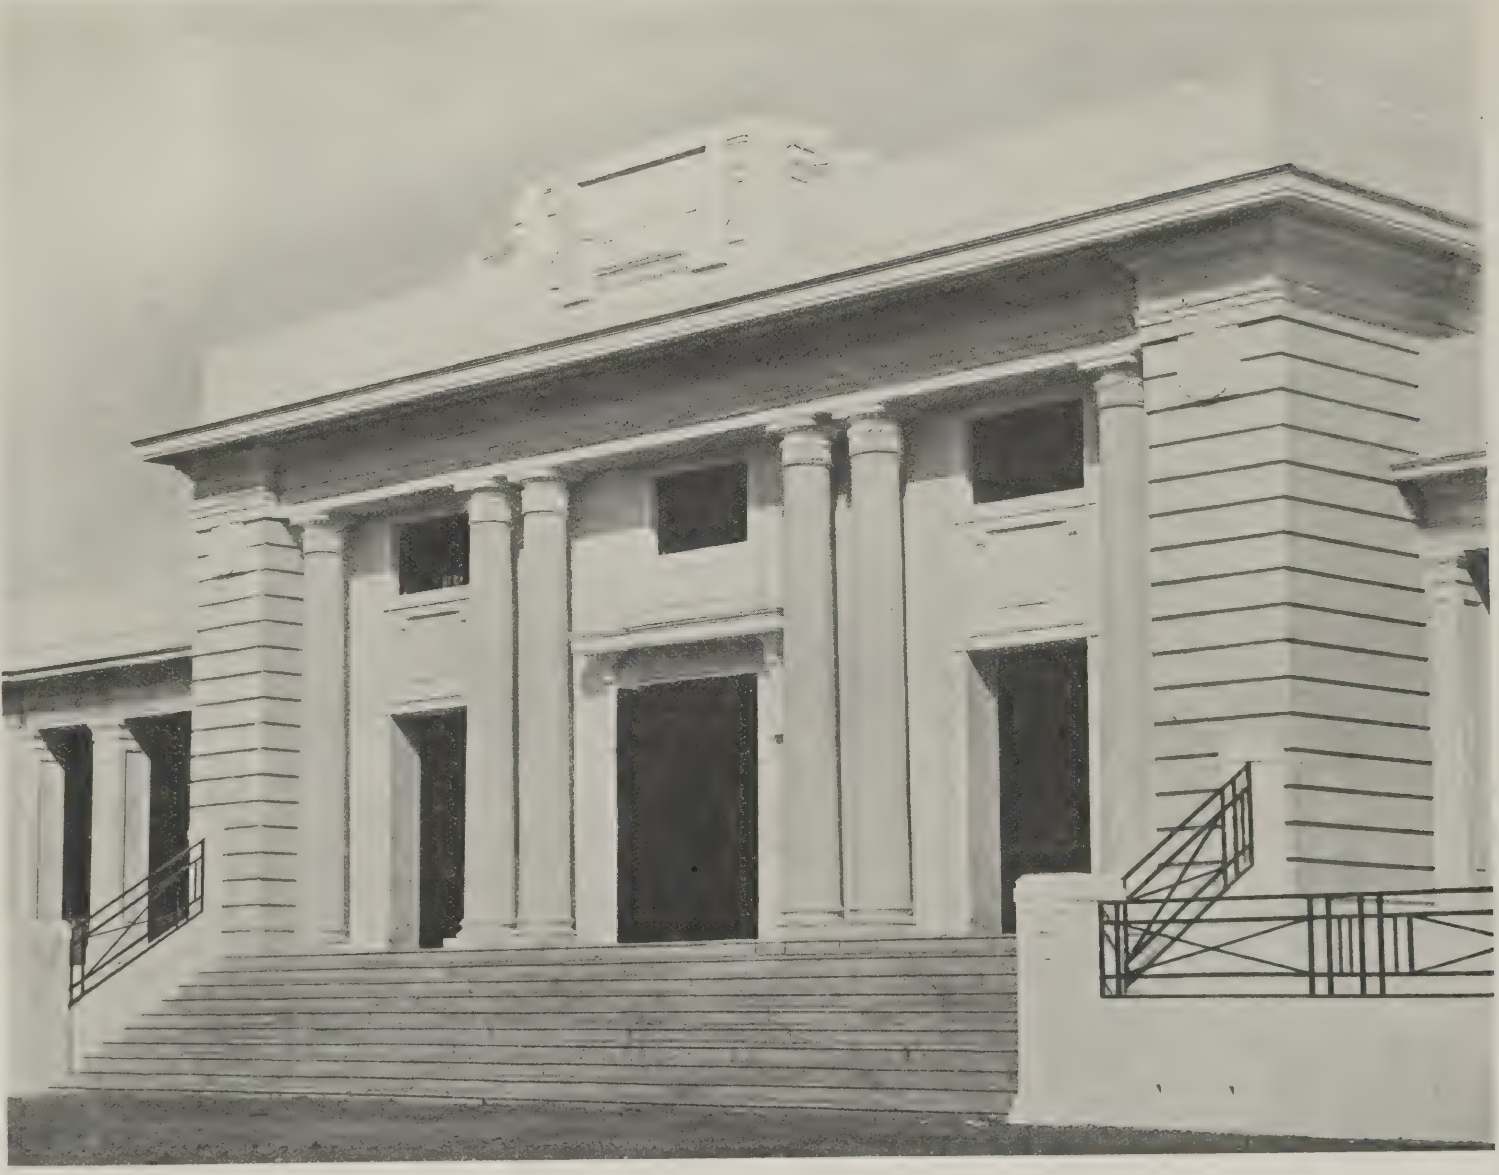
NEW OFFICES FOR THE IMPERIAL BANK OF INDIA, CUDDALORE. JACKSON AND BARKER, ARCHITECTS.

Current Architecture. 166.—New Offices for the Imperial Bank of India, Cuddalore

Jackson and Barker, Architects



This building, which has just been completed, consists of a central block containing the banking hall, with wings on either side providing accommodation for the administrative staff. The walls are constructed of brickwork faced externally and internally with fine polished Madras plaster. Some further particulars are given on page 498.

The Relaxation of Building By-Laws

IN view of the fact that the powers of local authorities under Section 25 of the Housing, Town Planning, etc., Act, 1919, have been extended by the Expiring Laws Act, 1922, to December 31, 1923, the Minister of Health has made fresh regulations with regard to the relaxation of building by-laws. Appended is the full text of the new regulations :—

These regulations may be cited as the Ministry of Health (Temporary Relaxation of Building By-laws) Regulations, 1922.

A local authority, notwithstanding the provisions of any building by-laws,[*] may, during the period for which Section 25 of the Housing, Town Planning, etc., Act, 1919, as extended by the Expiring Laws Act, 1922,[†] and by any subsequent enactments may be in operation, consent to the erection and use for human habitation of any building erected or proposed to be erected, which complies with the conditions set out in the schedule hereto.

The deposit to be received from a person appealing to the Minister of Health against the neglect or refusal of a local authority to give such consent as aforesaid, or against the conditions on which such consent is given, or against the decision of the local authority as to the period for which the building may be allowed to be used for human habitation, shall be the sum of ten pounds : provided that the Minister of Health may in any case, if he thinks fit, require a deposit of less than ten pounds or may dispense with a deposit.

The Interpretation Act, 1889,[‡] applies to the interpretation of these Regulations as it applies to the interpretation of an Act of Parliament.

Schedule.

CONDITIONS.

1. The whole ground or site of the building within the external walls shall, wherever the dampness of the site or the nature of the soil renders this precaution necessary, be covered with a layer of good cement concrete at least 4 in. thick finished shovel face.

2. (1) Each external wall of the building shall either

(*a*) to a height of not less than 6 in. above the surface of the ground adjoining the wall, be constructed of good cement concrete not less than 6 in. thick, or of brickwork composed of good whole bricks or stonework, all brickwork or stonework in the wall to be properly bonded and solidly put together with good lime or cement mortar and to be not less than 4½ in. thick ; or

(*b*) be carried at a height not less than 6 in. above the surface of the adjoining ground upon sufficient piers constructed of good brick, stone, or other hard and suitable materials properly bonded and put together, or of good cement concrete, or in the case of a building erected before the 13th October, 1919, and not subsequently re-erected, upon wooden piles or other supports of sufficient strength and in good condition.

(2) Each external wall or pier of the building shall rest on concrete or on some other solid and sufficient foundation.

(3) Every wall or pier of the building shall be provided with a proper damp-proof course of asphalt or slates laid in cement, or of some other durable material impervious to moisture, beneath the level of the lowest floor and of the lowest timbers, and at a height of not less than 6 in. above the surface of the ground adjoining the wall :

Provided that where application is made to a Local Authority for their consent to the use for human habitation of a building of a permanent nature existing at the time when the application is made and there are no signs of dampness in the walls and the soil is dry, the provision of a damp-proof course shall not be required if the following conditions are satisfied, namely :—

An impervious paving shall be provided outside the house at the ground level and adjoining all the external walls. This paving shall extend for a distance of at least 3 ft. from the walls, and shall be continuous with a skirting of impervious material carried up on the exterior walls for a distance of at least 6 in., and shall be sloped so as effectually to carry away all rain and waste water that may fall thereon from the walls of the house.

3. Every external wall of the building shall be constructed of good and suitable material and so as to be of sufficient stability and weatherproof.

4. The roof of the building shall be so constructed and supported as to be of sufficient stability and shall be covered externally with suitable fire-resisting and weather-proofing material.

Provided that it shall not be necessary to cover the roof with fire-resisting material if the following conditions are observed, namely :—

(*a*) The building shall not be of more than two stories in height and shall not comprise or form part of a block of more than four separate dwellings under one roof.

(*b*) (1) The building shall be distant

(i) at least 10 ft. from the boundary of its curtilage except at any point where its curtilage adjoins that of a dwelling-house forming part of the same block ;

(ii) at least 20 ft. from the nearest building, other than an outbuilding standing in the same curtilage, or a dwelling-house forming part of the same block ;

(iii) at least 30 ft. from the nearest public carriageway used or likely to be used for through traffic ;

(iv) at least 60 ft. from the nearest boundary of any railway on which steam engines are used.

(2) Every block of four dwelling-houses having a roof not covered with fire-resisting material shall be isolated by a distance of 60 ft. from any other dwelling-house having a roof not covered with fire-resisting material.

(3) Every group of four dwelling-houses having roofs not covered with fire-resisting material shall be isolated by a distance of at least 60 ft., every group of 24 such dwelling-houses by a distance of at least 180 ft., and every group of 96 such dwelling-houses by a distance of at least 540 ft., from any other such dwelling-house.

In this rule :—

A "group of four dwelling-houses" means any four dwelling-houses the buildings comprising which are so situated that there can be drawn, passing through all the buildings, a line on which the distance between one building and the next in succession is in every case less than 60 ft.

A "group of 24 dwelling-houses" means any 24 dwelling-houses the buildings comprising which are so situated that there can be drawn, passing through all the buildings, a line on which the distance between one building and the next in succession is in every case less than 180 ft.

A "group of 96 dwelling-houses" means any 96 dwelling-houses the buildings comprising which are so situated that there can be drawn, passing through all the buildings, a line on which the distance between one building and the next in succession is in every case less than 540 ft.

(4) For the purposes of this proviso all distances shall be measured horizontally to the nearest part of the building, other than the eaves or verge of the roof.

(*c*) Every chimney of the building shall be carried up to a height of not less than 5 ft. above the ridge of the roof in brickwork or other solid incombustible material, which, where the chimney passes through the material forming the roof, shall be not less than 9 in. thick and rendered externally.

5. Where the building is intended to form two or more dwellings, the dwellings shall be separated by solid partitions of incombustible material not less than 3 in. thick, carried up to the under side of the roof-covering and resting throughout their entire length on solid continuous walls which as regards construction and damp-proof course shall comply with the provisions of paragraph 3 of this Schedule :

Provided that where any such partition is over an open passage between two dwellings it may rest on a sufficient arch or bressummer of fire-resisting material.

---

[*] Section 40 of the Housing, Town Planning, etc., Act, 1919, enacts that, for the purposes of Part I of the Act, the expression "Building by-laws" includes by-laws made by any local authority under section one hundred and fifty-seven of the Public Health Act, 1875, as amended by any subsequent enactment, with respect to new buildings including the drainage thereof and new streets, and any enactments in any local Acts dealing with the construction and drainage of new buildings and the laying-out and construction of new streets, and any by-laws made with respect to such matters under any such local Act.

[†] The Expiring Laws Act, 1922, extends the operation of this Section to December 31, 1923.

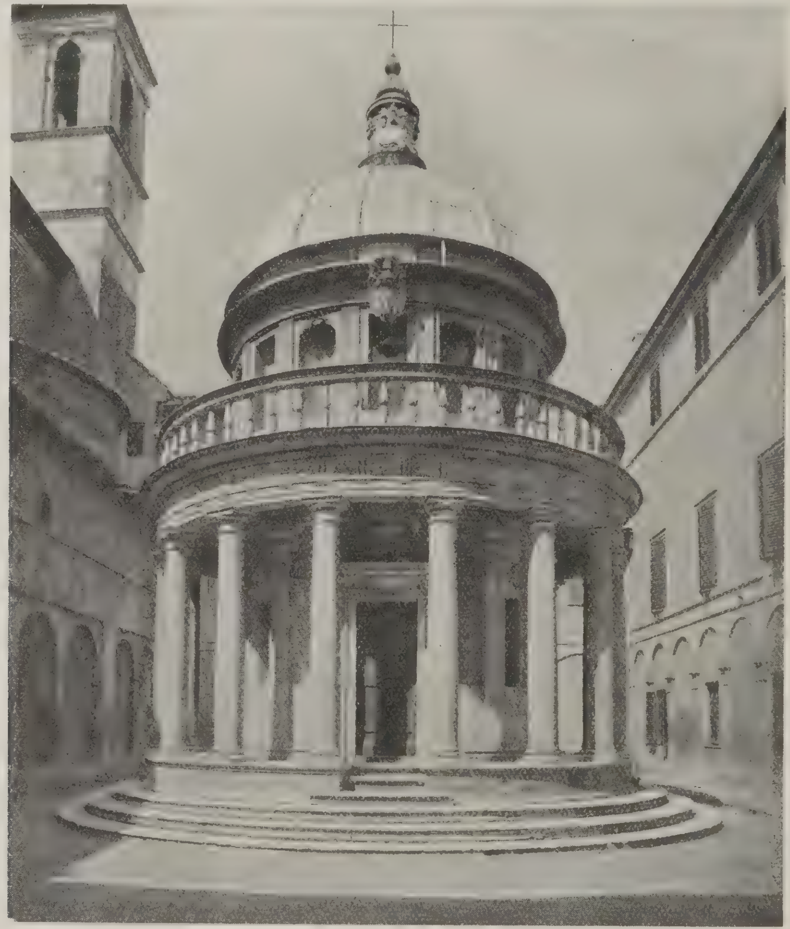
STUDENTS' SECTION

The Orders and their Application by the Italian Masters

By CHARLES GOURLAY, B.Sc., A.R.I.B.A., F.S.A. (Scot.), Professor of Architecture and Building, The Royal Technical College, Glasgow

DURING the revival of learning in the fifteenth and the following centuries in Italy, several architects —Alberti, Vignola, Palladio, and others— generally known as the Italian Masters, began to appreciate Classic Roman architecture. They travelled to Rome, diligently sketched and measured the Classic buildings there, and, with the object of advancing architecture by disseminating a knowledge of the Orders which formed the groundwork of Roman architectural design, they wrote books in which drawings of the Orders were included, giving definite proportions for their successors to follow.



TEMPIETTO OF SAN PIETRO IN MONTORIO, ROME (1502).
BRAMANTE, ARCHITECT.

Although, for a time, these fixed proportions were largely accepted, yet such usage could not continue for any lengthened period, and for two reasons; first, because the human mind cannot be bound down to exact proportions and details, and secondly, because the proportions and details of each Order must be varied to suit the nature of the design.

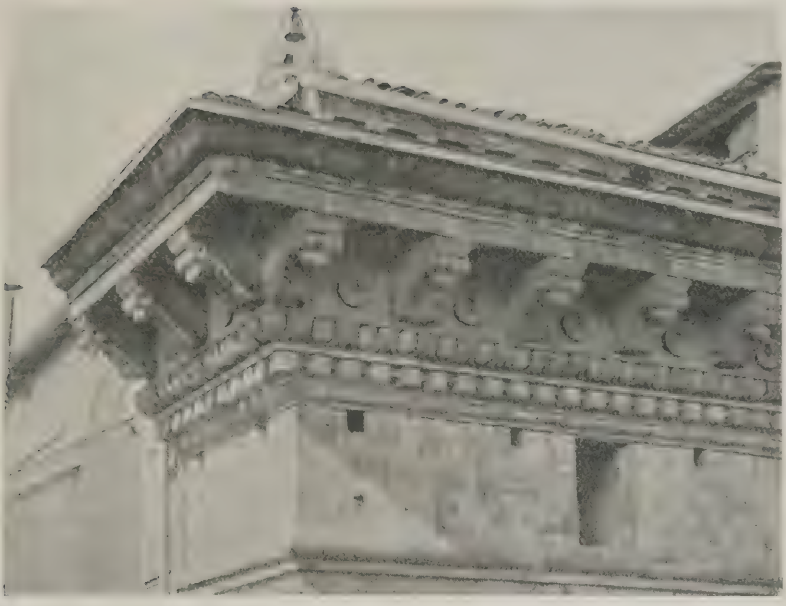
The true use of proportions and details of the Orders, as generally delineated in books, is for the training of the beginner in the sense of style, proportion, scale, and harmonious detailing, so that, possessing this knowledge as a groundwork, he may then proceed to the adaptation of the Orders to modern work under the guidance of his own sense of design.

The employment of an Order as a detached column set up as a memorial is a special application of the Order not dealt with in this article, the object of which is rather to emphasize the fundamental fact that the Orders should not be studied apart from buildings, because their application to buildings is the important point in the correct estimation of their value by architectural students.

The Tuscan Order is strong and bold in appearance, while the Doric is employed where an effect of strength and grandeur is desired. It is much richer than the Tuscan Order in that its shaft may be fluted, while its frieze is ornamented with triglyphs and guttæ, the metopes between the triglyphs being sometimes carved, although they are generally left plain in modern work.

The theatre of Marcellus, Rome, built about 23 B.C., is a design in which the Doric and Ionic Orders are applied decoratively to an arch system of construction. The Italian Masters, especially Vignola, based their Doric and Ionic Orders chiefly upon those in this building. Indeed, the bay design of this theatre influenced the development of the Orders during the Renaissance probably more than any other Classic building; and, because of the dignity of its design and the beauty of its details, still exerts a powerful influence in the design of large public buildings.

The Ionic is a more delicate Order than the Doric. While being graceful in its general form, it has a majestic effect when employed on a large scale on a façade. A fine example of its use is the Temple of Fortuna Virilis, Rome, dating from about 100 B.C. The weakness of the design of the capital of the Ionic Order consists in that its volutes



AN EARLY RENAISSANCE CORNICE, PALAZZO DEL GOVERNO, SIENA (1469–1500).
BERNARDO ROSSELLINO, ARCHITECT.

show only on front and back of the capital, its sides having bolster-shaped features, which do not always harmonize with the volutes. Hence the best way to use the Ionic Order is to place it between pilasters which have moulded capitals, for under such circumstances the side of the capital is seen in composition with that of the pilaster, and a successful result is attainable.

Owing to the difficulty of obtaining a satisfactory design by the use of the Ionic capital, efforts have been repeatedly made to execute a capital having its four sides all similar. This is done when, in plan, the central lines of the volutes project at the four corners at the 45 deg. angle, and as this type was preferred by the Italian Master, Scamozzi, it is generally called after him.

The portico of the Pantheon, Rome, dating from about 27 B.C., though re-erected in the second century of our era as it now stands, is one of the finest examples of the Roman Corinthian Order, and must have greatly influenced the work of the Italian Masters. The Corinthian Order is the most slender and delicate, also the finest in composition, of all the Orders. Only the capital of this Order may be carved, but the Order is generally employed with many of its other members ornamented, in which case a remarkably rich effect is produced.

The Arch of Titus, Rome, dates from A.D. 81, and is one of the earliest examples of the Composite Order, which is so-called chiefly because its capital is composed of the lower part of the Corinthian capital crowned by the Scamozzi type of Ionic capital. Its general proportions are similar to those of the Corinthian, below which it is placed by Chambers and some other authors, because its parts are fewer and its general effect bolder. But it is just because of these characteristics that it should rather be placed above the Corinthian, for it is then higher up and further from the eye at ground level, where a less refined detailing is required, and the minute members of the Corinthian would be too small.

There are no rules for the placing of one Order above another. Each story may be designed by itself, and then fitted, so to speak, the one on the top of the other, the several stories being properly proportioned to one another at the same time.

When it is desired to have arches above arches as well as Orders above Orders, it is necessary firstly to design the intercolumniation of the Orders; then, beginning at the lowest story, to design its arcade according to the Order employed; next, to do the same for the second story, generally keeping the opening the same width as that below, and so on, keeping in mind both the design of the arcade itself and its relation to the rest of the elevation.

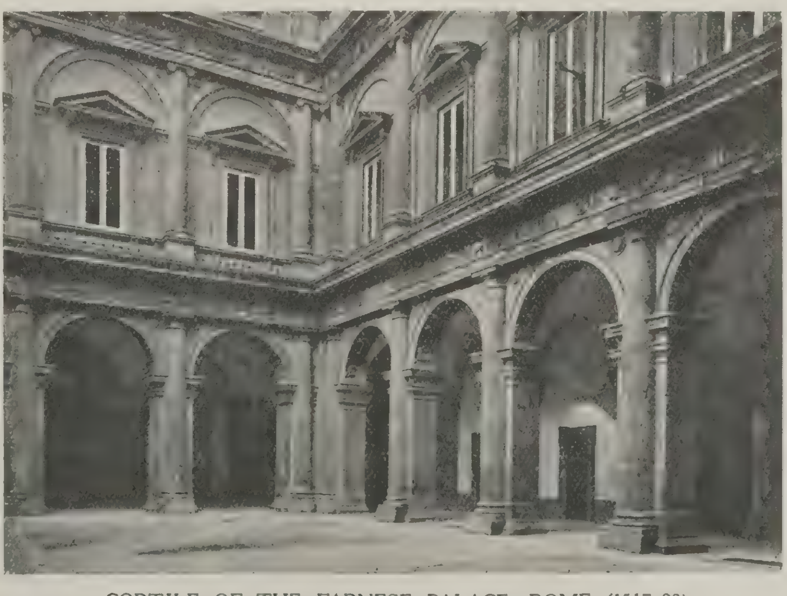
The finest example now remaining of the Classic Roman combination of arcades with the Orders and of their super-position is the noble, magnificent, and most effective design of the exterior of the Colosseum, Rome, which was begun in A.D. 72, the lower three stories being executed by A.D. 82, and the topmost story, completing the design as it now stands, in A.D. 222–244.

One of the finest of Italian Renaissance examples of such a composition is the loggias surrounding the Basilica at Vicenza, which were designed by Palladio and erected between A.D. 1550 and A.D. 1614. The lower arcade is here placed on a shallow step, while the upper is raised upon a pedestal, and thus the heights of the two stories are nearly equal.

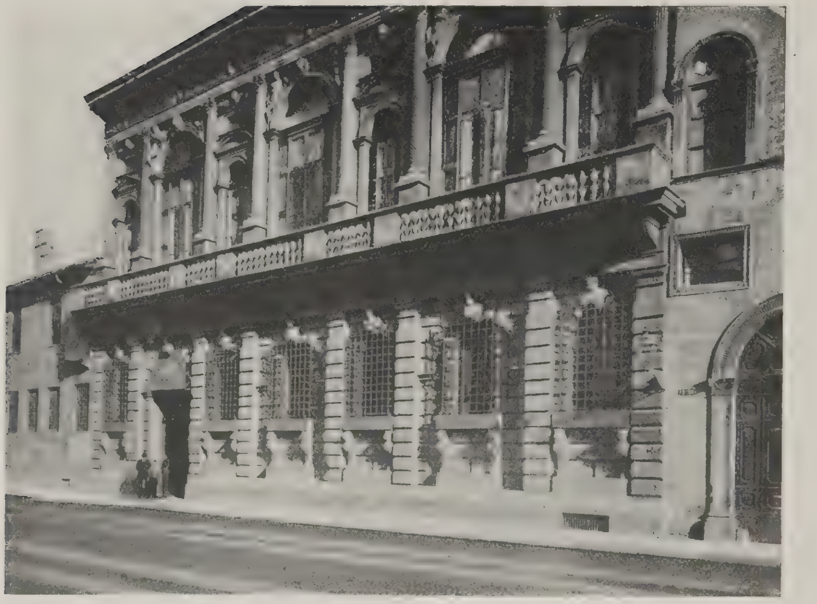
The Orders being merely the elements of expression in modern Classic architecture, it is in their application that the real value of a knowledge of them lies. The method of teaching the Orders now general is for students to make designs in which the Orders are employed. This way brings the student into contact with the difficulties which arise in the application of the Orders. But this method of teaching should be supplemented by the student's study of buildings erected by the Italian Masters, and if these are studied chronologically, they will enable him to observe how the Orders were used throughout the Renaissance to give varied architectural expression in design.

In early Italian Renaissance design the Order as such is often omitted, but the sense of an Order pervades the whole design. An example is the Palazzo del Governo, Siena, by Bernardo Rossellino, dating from A.D. 1469–1500. This palace is in a narrow street, and its crowning cornice is its chief feature. It is admirably adapted to the building, and it is very beautiful, but its proportions are very different from those given by the Italian Masters. The corona is remarkably narrow, and the modillions exceptionally large. The dentils are square-shaped in elevation and the egg-and-dart is not placed axially with them as it should be.

The façade of the Town Hall, Brescia, begun about 1489 by Formentone, should be considered as consisting of two parts, a lower and an upper, which are not well combined. The lower story, forming an open loggia, is one of the most beautiful compositions of its kind, but the actual opening is squat in proportion; while the jambs have been made as broad as possible to counteract this weakness. The Order is here placed on the ground level. The upper story has flat pilasters and is



CORTILE OF THE FARNESE PALACE, ROME (1517–80).
ANTONIO DA SAN GALLO, ARCHITECT.



THE BEVILACQUA PALACE, VERONA (1530).
SAN MICHELE, ARCHITECT.

quite on another scale from the lower one, but it has fine windows.

In the Tempietto of San Pietro in Montorio, Rome, by Bramante, dating from 1502, we have a masterly design, based on the Roman circular temples, in which the beautifully detailed Doric Order governs the whole and forms a singularly harmonious composition. There is not an extravagant or unsympathetic feature in the design.

The Corinthian Order doorway from the Palazzo Prosperi, Ferrara, built about 1521 by Baldassare Peruzzi, is one of the finest palace doorways in Italy. The proportion of the opening is very good as it has a height equal to twice its width. The columns are rather short, being only 9½ instead of 10 diameters in height, while the pedestal is low. The face of the broad jamb is finely treated by pilasters which carry the archivolt, and the entablature appears to be heavy, but the cupids sitting on the corners give a playful effect to the whole design.

In the façade of the Farnese Palace, Rome, by Antonio da San Gallo, 1517 (but the top story and cornice were added by Michelangelo in 1580), we have three equally high stories, each of which is marked horizontally by string courses, while the façade is made one harmonious whole by its great crowning cornice. The Orders are here used only as enrichment to the windows; those of the lower story stand on pedestals, and those of the uppermost story on brackets.

The two lower stories of the Farnese Palace Cortile, Rome, by San Gallo, show a close study of the Marcellus Theatre, Rome. The lowest story is an open loggia of the Doric Order, well and boldly designed, but the impost mouldings of the arcade are too heavy and tend to break the lines of the columns too much. The middle story is an Ionic Order arcade, which is filled in and occupied by finely proportioned and detailed windows, each one being crowned by a triangular pediment. The top story, by Michelangelo, has Corinthian pilasters dividing its bays, also windows having segmental pediments.

The design of the beautiful façade of the Bevilacqua Palace, Verona, by San Michele, dating from 1530, is remarkable because of the way in which strong features are combined with slender ones in its composition, as in the rusticated jointing of the piers below, and the delicate balcony above; while the fine deep shadow of the upper story aids materially in binding the whole design together. Generally Italian buildings are set out with equal bays, but they are unequal in this instance, and this is emphasized by the strong lines of the central and end columns and the slender effect of the wreathed columns between.

In the Palazzo Cornaro on the Grand Canal, Venice, by Sansovino, dating from 1532, the lowest story is double, is rusticated, and has attached Doric columns to its lower windows. The two upper stories resemble one another in design, having coupled columns, the lower of the two being Ionic and the upper Corinthian. The keystones of the arches project boldly and support the architrave between the columns. Oval-shaped windows are employed in the frieze of the top cornice. The whole design is flat in comparison with that of the Bevilacqua Palace at Verona, but it is a very dignified and, indeed, academic design.

(*To be continued.*)

R.I.B.A. Special War Examination

The Special War Examination of the R.I.B.A. will be held for the last time from December 11 to 15. Testimonies of study, forms of application, etc., should be submitted by November 4. Examination centres will be announced in due course. Relegated candidates will be required to take the ordinary examinations of the Royal Institute if they desire to qualify for the Associateship.

Northampton Polytechnic Institute

We have received from the Northampton Polytechnic a copy of the educational and social announcements for the session 1922–3. The Duke of Connaught, K.G., is president of the Institute, and the principal is Mr. R. Mullineaux Walmsley, D.Sc., F.R.S.E. The courses of the engineering day school are organized in two departments, namely, civil and mechanical engineering and electrical engineering. In each of these departments the work consists of lectures, exercise classes, laboratory work, drawing office and workshop practice, and for these purposes the Polytechnic is equipped with the most recent apparatus and tools, and the instructors are experts in the several branches of the work. The Polytechnic is one of the "qualified institutions" from which students can be presented as "internal students" for the engineering degrees of the University of London, and the civil and mechanical and the electrical engineering courses are recognized by the University. Mr. C. E. Larard, M.Inst.C.E., M.Inst.M.E., M. Iron and Steel Inst., Wh. Exh., is head of the civil and mechanical engineering department, and Mr. Walmsley and Mr. F. M. Denton, A.C.G.I., M.I.E.E., A.Am.I.E.E., are associate heads of the electrical engineering and applied physics department. A copy of the announcements may be obtained from the Northampton Polytechnic Institute, St. John Street, E.C.

SANSOVINO, ARCHITECT.

Reinforced Concrete Calculations for Beginners. I

By Prof. HENRY ADAMS, M.Inst.C.E.

THERE is no doubt that many young engineers, architects, and builders, and possibly older ones, too, have started on the road to master reinforced concrete, but have been turned back by the forbidding look of the formulæ. It is unfortunate that the usual calculations are somewhat formidable, and any attempt to reduce the difficulties should find a welcome in many quarters.

Reinforced concrete, or ferro-concrete, consists essentially of slabs, beams, and pillars, in which concrete and steel are used in conjunction, the tensile stresses being taken by the steel and the compressive stresses chiefly by the concrete. It may be desirable to explain to beginners what is meant by tensile and compressive stresses, and a little illustration will make this clear. If we take a piece of pine 1 in. square and 3 ft. long, or, better still, a piece of india rubber 1½ in. square and 1 ft. long, which any rubber manufacturer will supply, and mark parallel lines equidistant across one face, we shall have Fig. 1. If we now support this at each end and place or hang a weight on the centre we shall have Fig. 2. By careful measurement we shall find the parallel lines are now closer together at the top and further apart at the bottom than they were originally, showing that the upper portion is compressed, or under compressive stress, while the lower part is stretched, or under tensile stress. At some intermediate distance, say half the depth, it will be found that the distance apart of the lines is unaltered, showing that the material there has been neither compressed nor stretched. This is, therefore, called the neutral layer, or more usually the neutral axis, and marked NA.

Just the same action goes on in a reinforced concrete beam, but it is not so easy to distinguish the movement as the deflection under a load is so slight. There is this difference also, that the steel rods which are placed near the bottom to take the tensile stress are very much stronger than the concrete, so that the neutral axis will not now be at the middle of the depth, but at a level which will depend upon the percentage of the reinforcement.

When the concrete is stressed to 600 lb. per sq. in., and the steel to 16,000 lb. per sq. in., which are the authorized stresses, and the proportion of steel to concrete is ·675 per cent., the neutral axis will be ·36 of the effective depth below the upper surface. This is the percentage that gives the greatest economy in a slab or simple beam, but it cannot always be adhered to. The steel rods are not put quite at the bottom as they must have some cover to protect them in case of fire, and on this account the effective depth of the beam is measured from the upper surface to the centre of the steel rods. In any question of strength it is the effective depth that must be taken into account, as, for example, in calculating the percentage of reinforcement. Suppose, for instance, we have a reinforced concrete beam, 12 in. wide and 24 in. total depth, with $\frac{3}{4}$ in. steel rods having 1 in. cover of concrete below them, the effective depth will be $24-1\frac{3}{8}=22\frac{5}{8}$ in. If there are four $\frac{3}{4}$ in. rods each having a sectional area of ·4417 sq. in., the percentage of reinforcement will be

$$\frac{\cdot 4417 \times 4 \times 100}{22{\cdot}625 \times 12} = \cdot 65 \text{ per cent.}$$

If there had been four $\frac{13}{16}$ in. rods each having a sectional area of ·5185 sq. in., the effective depth would have been

$$24-1-\frac{13}{32}=22\frac{19}{32}, \text{ or } 22{\cdot}59375 \text{ in.}$$

and the percentage of reinforcement

$$\frac{\cdot 5185 \times 4 \times 100}{22{\cdot}59375 \times 12} = \cdot 765 \text{ per cent.}$$

So that to get the exact percentage for maximum economy something between $\frac{3}{4}$ in. and $\frac{13}{16}$ in. would be the required diameter of the bars, say, $\frac{25}{32}$ in.

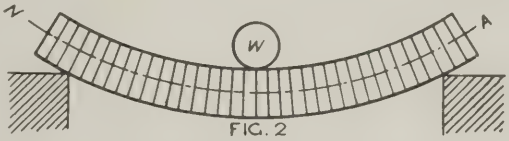

FIG. 2

Courses in Architecture

University College, London

Applications for admission to the atelier of the Bartlett School of Architecture at University College, London, for the study of advanced architectural design, should be sent to Professor A. E. Richardson, F.R.I.B.A., as early as possible. The new building in Malet Street for the atelier, presented by Messrs. Goodman and Lorden, will be available in October. The atelier will be open to those who have obtained the degree of Bachelor of Arts (Architecture) in the University of London, to those who have obtained the Certificate of Architecture of the School, and to others who have reached a standard of efficiency approved by the director. Applications for admission should be accompanied by statements of qualifications. The qualifications of each applicant for the use of the atelier are considered by Professor Richardson and submitted for the final approval of the Provost. Subjects will be set once a month, and the finished schemes are judged at the end of each month. There will also be twelve-hour subjects and other competitions. The fees are as follows: Annual subscription for membership, £1 1s.; fee for each monthly subject, £1 11s. 6d.

At the Bartlett School of Architecture the following courses of study are provided: The B.A. (Architecture) degree course of the university; the certificate course in architecture; the diploma course in architecture; advanced design class; evening courses in design and academic design; certificate course in town planning; diploma course in town planning and civic architecture; and diploma course in town planning and civic engineering.

The degree, diploma, and certificate courses are arranged to provide students with that systematic, practical training which is approved and recommended by the Board of Architectural Education of the R.I.B.A. Exemption from its Intermediate Examination is granted by the R.I.B.A. to students who receive a first class college certificate, and from its final examination (qualifying as Associate R.I.B.A.) in all subjects except professional practice, to students who obtain the degree or diploma. The courses of the school of architecture are not intended to supersede pupilage, although the terms of pupilage are generally modified considerably to students who have passed successfully through them. The degree course possesses the additional advantage of enabling students to continue their general studies up to the level of the Intermediate Examination of the University concurrently with commencing their professional training. The advanced design course affords students the opportunity of exercising their imagination on problems of considerable size, and of planning and designing on a large and dignified scale.

The department of town planning provides systematic courses of training for architects, engineers, and surveyors who desire to acquire expert knowledge in the laying out of towns. The courses of study in the University have the approval of the Town Planning Institute, and exemption from the qualifying examinations of the Institute are granted to candidates who have obtained the University Diploma in Town Planning.

In the degree course in estate management, town planning has been made an optional subject and courses in the department are arranged to meet the needs of students entering the estate management degree course. In the degree course in architecture, town planning is one of the subjects to be taken in the fourth and fifth years.

Architectural and engineering students who have already had their general training in architecture or engineering, as the case may be, are advised to proceed to a course in town planning. Students entering for one of the full courses, each of which leads to a certificate, must satisfy the Professor that their previous training has been sufficient to enable them to follow and profit from the course. The lectures and courses include town planning, civic architecture and landscape design, town furnishing, planting, municipal engineering, and municipal law.

The staff of the University is as follows :—

Architecture : A. E. Richardson, F.R.I.B.A., professor; Arthur Stratton, F.S.A., F.R.I.B.A., reader in architecture; Martin Briggs, F.R.I.B.A., lecturer in building construction; James Burford, A.R.I.B.A., assistant; J. D. M. Harvey, B.A., assistant; A. Stanley Furner, A.R.I.B.A., assistant; E. P. B. Musman, B.A., A.R.I.B.A., assistant in the Evening School.

Town Planning : S. D. Adshead, M.A., F.R.I.B.A., professor.

Engineering, Municipal : M. T. Ormsby, A.M.Inst.C.E.I., Chadwick professor.

Engineering, civil and mechanical : E. G. Coker, M.A., D.Sc., M.Inst.C.E., F.R.S., professor; A. H. Barker, B.A., B.Sc., lecturer, heating and ventilating engineering; E. Sprague, A.M.Inst.C.E., senior assistant.

Painting and Sculpture : H. Tonks, Slade professor; T. Borenius, Ph.D., professor, history of art; W. W. Russell, A.R.A., assistant professor; P. W. Steer, assistant professor; G. Thomas, assistant (sculpture).

Archæology : E. A. Gardner, Litt.D., Yates professor.

Hygiene and Sanitation : H. R. Kenwood, C.M.G., M.B., D.P.H., F.R.S.E., professor; A. G. R. Foulerton, F.R.C.S., D.P.H., lecturer; M. E. Delafield, B.A., M.B., B.C., M.R.C.S., L.R.C.P., D.P.H., assistant and lecturer.

Technical College, Cardiff

The Department of Architecture and Civic Design of the Technical College, Cardiff, is "recognized" by the R.I.B.A., which grants exemption from its own intermediate examination to students who pass successfully through the three years full-time (day) course. It is the stated policy of the R.I.B.A. to extend this exemption in the case of approved fourth and fifth year courses to the major portion of their own final examination. Full-time students in the department are eligible for the "Archibald Dawnay" scholarships. The candidates for these scholarships are nominated by the various "recognized" schools of architecture, the final selection being made by the Board of Architectural Education of the R.I.B.A.

The Principal is Mr. Charles Coles, B.Sc.(Lond.). The head of the department is Mr. W. S. Purchon, M.A., A.R.I.B.A. (Member of the R.I.B.A. Board of Architectural Education), and the assistant lecturer is Mr. R. H. Winder, M.A., A.R.I.B.A.

The following courses in architecture are provided :—

1. Degree Course. Joint courses as between the technical college and the University College of South Wales and Monmouthshire, leading in the case of matriculated students to degrees, have been provisionally approved. These courses consist of (a) Full-time (day) courses of study of three years' duration; (b) Full-time (day) courses consisting of two sessions of six months each.

2. Certificate course. This three years' full-time (day) course has been arranged for students who, not having matriculated, are unable to take the degree course. An entrance examination for the certificate course is held and the results of this examination accepted by the R.I.B.A. in registering candidates as probationers.

3. Diploma course. A full-time (day) course consisting of two sessions of six months each following the above.

4. Part-time day courses in architecture consisting of approved parts of the above courses and suitable for pupils already in architects' offices and others who are unable to take a full-time course of study; they are required to attend regularly, and to take the terminal and sessional examinations in the subjects they are studying.

5. Civic design. Students who have passed through an approved course of architectural training, and who have reached a sufficiently high standard may attend full-time or part-time day courses of studio work in civic design.

6. Evening atelier. Wednesdays, 6.15–8.15 p.m., with four-hour subjects (5.30–9.30 p.m.) about once a month. The object of the atelier is the provision of facilities for the study of architectural design and draughtsmanship for architects' assistants who cannot attend day courses, and who have passed through three years' articles or other approved training. The assistant lecturer conducts the atelier under the general supervision of the head of department, and the South Wales Institute of Architects (Cardiff Branch) has appointed Mr. Percy Thomas, F.R.I.B.A., to act as a visitor to co-operate with the staff of the department of architecture and to criticize the work in progress.

Scholarships, covering tuition fees and maintenance grants of £40 per annum for three years, are offered for competition to residents and non-residents of Cardiff, the examination being held in the last week of September each year.

An advisory committee, consisting of representatives of the technical instruction committee and representatives elected by the South Wales Institute of Architects, has been formed in connection with the above courses.

Contemporary Art

The Paintings of Mrs. E. Granger-Taylor

IT will always redound to the credit of the Grosvenor Galleries that they should have given the public such an excellent opportunity of seeing the work of this very talented artist. The exhibition of her works—now shown comprehensibly for the first time—is likely to make a lasting impression upon an easily jaded public. In this case, however, the impression is sure to be more lasting. Every accomplishment of technique and every endowment of vision is here, and those, in their variety and sureness, are bound to gratify the artistic sense of any one sincere and keen enough to enjoy not merely that which is obviously brilliant in technique, but that also which is rarely conceived.

It is indeed probable that Mrs. Granger-Taylor will leap into comparative fame with this exhibition of hers. Critics are, we are told, people with a recondite sense of genuine appreciation, but most of those on Press view day were ungrudging in their praise of the work submitted. Those who didn't relish her oil paintings could make it up with her pastels, and such as were left untouched by the wizardry of the pastels could be found who had a good, a very good, word to say for the water colours.

Perhaps the medium which this gifted lady wields with greatest ease and mastery is pastel. It may well be that comparisons are an idle and fruitless pursuit, but it will serve the purpose, I think, to say that Mrs. Granger-Taylor's pastels have a similarity of presentation to those of Professor Henry Tonks. They have the same effortless ease; the same depth of tone; the same objectivity. They are alike in texture, alike in allurement. They are so gushing and fresh. "Pink Jumper" (I, II, and III), "The Game" (66), or "Evening Sunlight" (58) are great accomplishments in the medium. In all of them, as indeed in all this artist's work, one notices at once a daring and consistent love of colour, bright and thurgistic harmonies, fearlessly blended, daringly juxtaposed, and surely affixed. It is so sincere and direct, and as it was first seen and conceived and executed, so with almost the same shock of verity and freshness, it fixes itself upon our astonished understanding. This kind of painting and drawing is good to see, and anyone fortunate enough to be conversant with it, in however passing a fashion, will be the richer for the æsthetic experience it will give.

Other works betray the influence of John. When I say "betray" I do the artist an injustice, as I am assured that the work, the ways, and wonder-fancies of her contemporaries are but seldom considered or entertained by her, certainly not consciously so. Be as it may, there is nevertheless a touch of John in some of her work. "Flannels" (78), "The Top of the Hill" (90), the "Striped Shirt" (82) will do, as instances. All very jolly, all instinct with life, the elemental life of happy, energetic people, of people with sap in their body and a will and a smile in their eyes. And lastly, there is a touch of that great genius, the mad and sublime Il Greco, in some of Mrs. Granger-Taylor's lesser works. It is unmistakable though faint; though seldom so, it does occur, and to the more esoteric element in the public, it makes a cogent appeal. "An illustration" (92), and especially "Gossips at the Gateway" (104), and "The Haughty Ladies" (103) bring that home.

Go and see them and you will receive in the doing little stabs of joy so often as you go from one drawing to the next, stopping and wanting to share your pleasure, and all the while those little stabs will drive home in you the joy of fine painting, the happiness of its power, and its ascendency over the more gossamer-like and rare qualities that lie in most of us.

Water-colours by Holmes, Alexander, and Hartwick

At the same galleries are to be seen water-colours by Sir C. J. Holmes, R. G. D. Alexander, and A. S. Hartwick, R.W.S. All are well able to make claims upon our pleasurable senses, but in varying degrees. There is no denying that Sir Charles, besides being a very successful director of the National Gallery, is also a water-colourist of talent, of great talent. His strength is that of lucidity and utter clearness. As I went round taking in many of the finesses of these fine landscapes, two ladies at the back did the same thing audibly, and the younger one crystallized one of their indubitable qualities when she said that all these water-colours "seem so simple and so clean." Clean is the word. They are clean. Sir Charles is no mystic or obscurantist. He sees a fine bit of landscape with an unerring eye for its possibilities. Then one conceives him sitting down at once and at once fixing the thing without any ambulation, and the power that is in the man comes out, and also his convictions and also his subtleties. "Moughton Fell" (6), "Grayrigg Forest" (7), the "Valley of St. John" (17), and "Above Seathwaite" (36), with its diagrammatic clearness, are particularly happy examples.

The standard of these forty-eight water-colours is very high, and it is due to the artist's conviction that water-colour work, for landscape at any rate, could have no surer or better guidance than that of our early water-colourists. Though totally different, they yet resemble them in their English vigour and sincerity. They are able. Sometimes dour, but always delightful. They should all be seen.

G. HOLT.

The Week's News

Town Hall for Greenwich.

The Greenwich Borough Council are considering the erection of a town hall.

Pithead Baths.

At Ellington Colliery the first pithead baths in Northumberland are to be erected.

Wandsworth Roadmaking.

To relieve unemployment, Wandsworth is to spend £72,000, making-up and paving seventeen roads.

Housing at Port Talbot.

Port Talbot Town Council are arranging to build parlour type houses at £450 each.

Monmouth Electricity Undertaking.

It has been decided to expend £6,000 upon improving and substantiating the town's electricity undertaking.

Berwick Developments.

Berwick Town Council have decided to establish a meteorological station in the Flagstaff Park at a cost of about £100.

Housing at Croydon.

Plans for over 150 new houses were approved at the last meeting of the Croydon Borough Coucil.

Restoration of a York Church.

The lantern surmounting the tower of All Saints, Pavement, York, has been restored under the supervision of Mr. George Benson.

Proposed New Pavilion for Bournemouth.

The Corporation are applying to the Ministry of Health for sanction to a loan of £100,000 to erect a new pavilion near the pier.

Southport School of Art.

Mr. Gordon Hemm, of Liverpool, architect, has been appointed to take charge of the evening department of architecture at the Southport School of Art.

The English Bridge at Shrewsbury.

As an alternative to the widening of the historic English Bridge at Shrewsbury, the town council are considering a proposal for a new bridge.

Housing at Bentley.

The Bentley Urban District Council have received the sanction of the Ministry of Health to loans of £15,000 for housing and £2,250 for street improvement and the acquiring of land.

Public Baths for Malvern.

Mr. A. J. Taylor, F.S.Arc., V.P.S.A., of Bath, is architect for the new public baths for the Malvern Urban District Council.

Barking Town Hall.

Barking Council refuse to bear the cost of restoring the historic Old Town Hall, and unless private funds are forthcoming it will be pulled down.

Oil Works for Cardiff.

A scheme has been prepared to establish oil works at Cardiff docks. The prime mover in the scheme is Mr. L. V Curry, of New York.

The International Theatre Exhibition.

The International Theatre Exhibition has been removed from the Victoria and Albert Museum to the Manchester City Art Gallery. The exhibition was opened by Sir John Martin Harvey.

Change of Address.

Mr. W. Braxton Sinclair, F.R.I.B.A., 31 Charing Cross, Whitehall, announces that his offices are now at 8 Buckingham Street, Adelphi, W.C.2. Telephone, Gerrard 1722.

The Chelsea Church Discovery.

The panel of fourteenth-century stained glass recently brought to light at Chelsea Old Church is now on exhibition for a short time at the Victoria and Albert Museum in Room 136 on the second floor.

Eastbourne's £13,000 Scheme.

Eastbourne Town Council has decided to proceed with the extension of the sea wall at Holywell, and the erection of additional bathing chalets at a cost of £13,000.

New Factory for Southampton.

Southampton Town Council have decided to sell the Millbrook waterside site to the Ford Motor Company for £5,500 without conditions for the erection of a factory.

Lincolnshire Church Extension Scheme.

There is urgent need of church extension in the ironstone area of North Lincolnshire. The clergy of the diocese have passed a resolution calling upon the General Committee to issue an appeal for funds. The cost is estimated at £50,000

Bournemouth War Memorial.

The war memorial which is being erected in the Upper Pleasure Gardens, just opposite the new Town Hall, is to be ready by November 11 for unveiling. It is to be the centre of a "temple of memory."

Ancient City Organ Rebuilt.

First built by Renatus Harris in 1703, at a cost of £350, the organ at All Hallows, Lombard Street, has just been rebuilt and enlarged, owing to the generosity of a worshipper at the church, who wishes to remain anonymous.

Bournemouth Tramways.

The reconstruction of the three remaining portions of the tramway track is to be proceeded with almost immediately, and the Ministry of Transport are to be asked to sanction a loan of £65,000 for this purpose.

Charterhouse Memorial.

Direct labour is to be employed in the construction, at Charterhouse, of a new chapel, designed by Mr. Gilbert Scott, R.A., as a memorial to Carthusians who fell in the war.

War Memorial at Durham.

Work has begun on a war memorial for the Esh Winning Miners' Lodge, Durham. It will comprise a concert hall, small hall, institute, billiards and games rooms, reading room, library, gymnasium, and small swimming bath. The cost is £8,750. Mr. J. A. Robson, of Langley Moor, Durham, is the architect, and the constractors are Messrs. E. R. Davison and Sons, Blaydon on Tyne.

New Tube Contract.

A contract for £258,468 has been signed between the London Underground Electric Railways and the Foundation Company, of Windsor House, Kingsway, W.C., for the building of the second portion of the Hampstead Tube extension, between Hendon and Edgware.

Hastings Music Pavilion.

The Town Council have decided to ask the Ministry of Health for sanction to the expenditure of £65,000 upon the erection of the music pavilion. It has been decided that the late Earl Brassey's Indian Museum should not be embodied in the building.

Nottingham New Park Gateway.

Nottingham City Council have approved the spending of £17,400 on a memorial gateway, 45 ft. high, with three arches, which will form the entrance to a park given by Sir Jesse Boot, on the bank of the Trent. The total scheme will cost £50,000.

Hull Housing Scheme.

The Hull Corporation Health Committee have approved the New George Street Housing Scheme. The Ministry of Health is prepared to grant £2,000 towards any deficiency in the carrying out of the scheme; 180 houses are to be erected on a site to be cleared of tenements condemned as unfit for human habitation.

Sir John Soane's Museum.

Sir John Soane's Museum, 13 Lincoln's Inn Fields, W.C.2, will be open free of charge during the hours of 10.30 a.m. to 5 p.m. on Thursdays and Fridays during October, and from 10.30 a.m. to 4 p.m. on those days during November. The special exhibition of the models and drawings of the Bank of England, which aroused so much interest in August, will be continued during the winter season.

The Institution of Structural Engineers.

On October 19 the Concrete Institute will hold an extraordinary meeting to confirm the resolutions, passed at the last meeting by 110 votes to 13, to change the name of the Institute to that of the Institution of Structural Engineers. In our issue for Sept. 20 we dealt with the reasons for the change of title and published the resolutions to be put to the meeting. A section of the new Institution will be devoted to concrete construction.

New Custom House for Hankow.

Plans for the new Custom House at Hankow, China, have been prepared and work on the foundations has begun. The building designed is a granite-faced structure, a conspicuous feature of which will be a central clock-tower some 150 ft. high, and it will be erected on the enlarged site at the extreme southern end of the British Bund on which the temporary Custom House (old British Municipal building) formerly stood.

The Palladian Bridge, Wilts.

We are asked to state that the photographs of the Palladian Bridge, Wiltshire, illustrated in our issue for September 13, were taken by Mr. R. H. Turner, who also assisted Mr. C. J. W. Lindley in measuring the structure.

Manchester Town Planning Exhibition & Conference

The town planning exhibition and conference, convened by the Manchester and District Joint Town Planning Advisory Committee, and now being held at the Manchester City Hall, is one of the most important ever held in this country. At the conference some of the foremost town planners are reading papers, and the exhibition includes maps, diagrams, and models showing the growth of, and the town-planning proposals with regard to, various towns in this country, in America, and on the Continent. Among those reading papers are Sir Henry Maybury, Professors P. L. Abercrombie and S. D. Adshead, Alderman T. Turnbull, and Messrs. H. H. Humphries, Ebenezer Howard, F. M. Elgood, George L. Pepler, E. G. Culpin, J. G. Gibbon, and Thomas Adams. The Committee represents over seventy local authorities, and covers an area of about 700 square miles.

New City Building

Sir Edwin Lutyens, R.A., is the architect of the new building for the Anglo-Persian Oil Company. The sites of Nos. 1-6 Finsbury Circus, 2 and 3 West Street, and 34-40 (even) Finsbury Pavement, including the superstructure site of Moorgate Station, and part of South Place Mews, have been purchased by the company for itself and its affiliated companies. The new building will provide over 120,000 ft. of floor space, which is necessary in order to avoid the use of different buildings in various parts of the City. It will be possible to concentrate the staff in the new building. The site, approximately an acre, possesses the advantages of an outlook over the open space of Finsbury Circus, and a long main road frontage in Finsbury Pavement. The centre of that frontage is exactly a quarter of a mile from the Bank of England.

The real development of the Moorfields district began about the year 1812, but it is in the last twenty-five or thirty years that it has attained first-rate importance. The Circus and neighbourhood now contain big blocks, including Salisbury House, London Wall Buildings, and Finsbury Pavement House.

British Empire Exhibition

At York House the Prince of Wales has met Sir William Meyer, High Commissioner for India, Mr. F. Noyce, Trade Commissioner, and Dewan Bahadur Vijayaraghava Achariya, the Indian Government's Commissioner to the British Empire Exhibition, and discussed with them India's share in the 1924 exhibition. His Royal Highness was shown photographs of the designs for the Indian and Burmese buildings to be erected at Wembley, and said he had seen the site and the models of the buildings on his last visit to Wembley, and had then expressed his admiration of the designs The Prince questioned the Exhibition Commissioner as to the arrangements which are being made in the different Indian States, and, on hearing that the Commissioner came from the Province of Madras, expressed the hope that the splendid handicraft which he had seen there would be worthily represented, and also that a fine show would be made by India representative of her greatly increasing modern industrial development. Speaking to Sir William Meyer, the Prince said he had been greatly impressed with the quality of Indian timber, and the use made of it for decorative purposes, and hoped that the fine hard woods and the finished products would be prominent at the exhibition.

List of Competitions Open

Date of Delivery.	Competition.
Oct. 31	Essay Competition. "The TrueFunction of the Technical Assistant in the Building Industry." Prize £5 5 0. Essays to the Secretary, Architects' & Surveyors' Assistants. Professional Union, 36 Victoria St., S.W. 1.
Nov. 1	Labour saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C.4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Jan. 15	Hospital for a typical small community in America. Competition open to all Architects. Premiums $500, $300, and $200. Apply The Modern Hospital Publishing Company, Inc., 22 E. Ontario Street, Chicago, Ill. Closing date for applications, November 15.
March 31	War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.
No Date	War Memorial at Birkenhead. Cost not to exceed £4,000. Premium 75 guineas. Assessor Major Gilbert Fraser, M.C., F.R.I.B.A. Apply Town Clerk, Birkenhead. The competition is open to all architects and sculptors of Birkenhead, Liverpool, and Chester only.

New Offices for the Imperial Bank of India

These offices (see pp. 488–9) have been erected at Cuddalore, South India, from the designs of Messrs. Jackson and Barker, of Madras.

The walls are constructed of brickwork, finished internally and externally with fine polished Madras plaster. The strong rooms are of reinforced concrete. The whole of the joinery is of Burmah teak, and the floors to the banking hall are of polished Cuddapah slabs.

The total cost of the main building at the present rate of exchange amounted to £5,000, which works out at a little over 6d. per cubic foot.

The general contractors were Messrs. E. C. Richards and Sons, of Madras. The roofs were constructed by the Kleine Patent Construction Co. (India), Ltd.—Agents, Messrs. Ewing & Co., Ltd. The cast-iron railings and grilles were executed by the St. Elizabeth Iron Works, Pondicherry. The whole of the labour employed was Tamil.

Photographing Noise

At the request of the Underground Railways Professor Low, of the Low Engineering Company, has recently carried out experiments to determine the cause of the unavoidable noise which one hears on the Underground Railways when the trains are in motion in the tunnels, and to devise means of reducing this noise to the lowest possible limit.

Professor Low first conducted experiments in the laboratory. These took the form of vibration tests on a miniature tube containing a microphone connected to shock-recording instruments. Having by this means gained some experience as to where to look for the cause of noise, he then set out to examine the railway cars themselves, and quickly located several causes. On the M.D.R. the design of the bogies or wheel-trucks under the cars was found to be one of the chief causes of noise. On the tube lines it was found that the roofs of the cars, which are constructed with an outer shell, formed a hollow chamber in which "noise" was greatly magnified. The windows were also sufficiently large to cause vibration, and consequently noise. Other minor causes contribute to add to the development of sound.

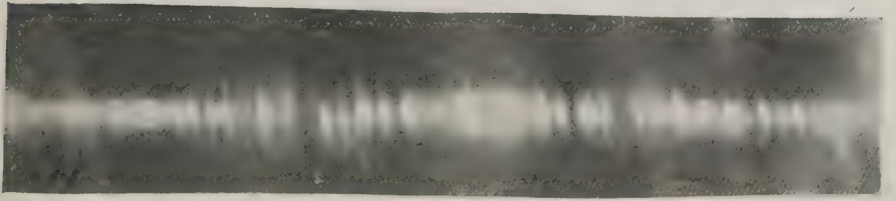
These sources of noise having been established, steps were then taken to eliminate them. The hollow roof was filled with asbestos. The windows were provided with a centre strut, thus dividing them into smaller panes, and a kind of wooden hood was fitted over the wheels in order that the noise created by their contact with the rails should be forced higher up the sides of the tube and above the level of the ventilator windows through which it formerly came. Thus equipped, the train was set in motion. The results were astonishing. It was found possible to conduct a conversation in ordinary tones from one side of the car to the other. Again, whereas in the ordinary tube car it was found impossible to hear the ticking of a watch held closely to the ear, in the experimentally soundproofed car the watch could be heard when held a foot away.

One of the most remarkable pieces of apparatus used in the course of the investigation was an instrument called an audiometer, invented by Professor Low. This instrument actually photographs noise, and by its aid it was a simple matter to visualize the results and determine the extent of their success.

We show herewith some examples of photographs taken. One illustrates the sound record of an ordinary Hampstead line tube car before steps were taken to reduce noise. Observe the irregular nature of the vibrations and their great length.

The bottom photograph is a sound record of the same car after having been equipped with devices for the reducing of sound. The reduction in the width of the vibrations and their regularity clearly indicates how far success was attained. The results of the experiments are now being closely considered by the Company.

THE AUDIOMETER "NOISE CAMERA."



SOUND RECORD OF A TUBE CAR BEFORE NOISE REDUCTION.

The Glasgow Housing Exhibition

The Glasgow Housing and Health Exhibition, now open at Kelvin Hall, Kelvinside, surpasses all previous exhibitions in both the number and the variety of the exhibits. It is the fourth exhibition to be promoted by the Glasgow Corporation, and many new features have been introduced. There are model houses, and a large number of exhibits showing the very latest ideas in building materials, decoration, furnishing, and labour-saving, cleaning, and other appliances. The Glasgow Corporation are well represented and all the departments have displays which show in a convincing manner what is being done to-day by the corporation in the interests of the people. Other special features are a competitive exhibit of amateur and professional photographic work, and one of competitive work by artisan and craft workers. In our last issue we published a description of the model houses, and this week we give the following particulars of some of the more important exhibits :—

British-Canadian Export Co., Ltd. (of Canada) and Associated Companies, G. E. W. Crowe, Agent, 83 Pall Mall, London, S.W.1. At this stand is shown the "Easiwork" kitchen dresser, which combines in one fitment a dresser, a large working table, and a commodious cupboard. Many different types of the "Easiwork" are available, and several models are on show. By its use considerable space may be saved in planning houses and tenements. A complete kitchen-scullery is possible in the small space of 7 ft. by 8 ft. The "Barnet" refrigerator (the new hygienic food storage) and the "Easiwork" porcelain table —a new kitchen table which requires no scrubbing—are also shown.

The Adamite Co., Ltd. (Roemmele, Webb & Co., for the Adamite Co., Ltd.), 28 Royal Exchange Square, Glasgow, are exhibiting "Colemanite" concrete hardener and waterproofer. This is a chemical liquid compound which is added to the gauging water and creates a very hard dense concrete. It is stated that a trowelled "Colemanite" surface is so hard and so closely knit together as to be dustless, impervious to oils and greases and to the action of most acids. "Colemanite" is used in a multitude of ways, and for nearly twenty years has had a good reputation. It is easy to use, and it is claimed that a one-inch sand-cement plaster (one-cement two-sand), which has been gauged with water to which "Colemanite" has been added, produces an ideal factory or warehouse floor at an added cost of less than one shilling per yard super. Specimen work is exhibited

Allan Ure & Co., Glasgow, are makers of the back-to-back living-room grate and scullery cooker, as supplied to London County Council, Glasgow and Manchester Corporations, and other local authorities. This grate does all kinds of cooking efficiently, and a hot bath can be had in one hour after kindling. The back-to-back oven can be heated with gas and a tip-up grill and ring can be fitted on hob. The company manufacture ranges, registers, interiors, mantel registers, railings, and general light castings. The showrooms of the company are at Springbank Foundry, 355 Keppochhill Road, Glasgow.

"Ronuk" Limited, of Portslade, Sussex, are showing "Ronuk" sanitary polishes for floors, furniture, linoleum, boots, leather, motor cars, etc., etc. The "Ronuk" home polisher, a practical and thoroughly serviceable polisher for home use, is also shown. It is brush, duster, and polisher combined. Visitors should make a point of seeing this labour-saving appliance demonstrated.

The Falkirk Iron Co., Ltd., 34 Bothwell Street, Glasgow. At this stand the latest designs of kitchen, living-room, and other fittings suitable for bungalow houses are to be seen. The exhibits include the "Thermostove" independent boiler, which has an attractive open fire, giving large supplies of hot water for all purposes. The firm also show their latest design of gas cooker, the "Smooth-top," and their three most successful living-room grates, the "Osborne," the "Trent," and the "Compax."

Rippers, Limited, 165 Gray's Inn Road, London, W.C.1, exhibit kitchen and office furniture, movable dressers, cupboards, and chair ladders.

William Maclean, Sons & Co., 127 St. Vincent Street, Glasgow, are showing "Sylvadure" wood preservative, to prevent dry-rot and decay in wood, "Dixie" disinfectant, "Jax" soap powder, and "Washing Kola."

Ewart and Son, Limited, 346-350 Euston Road, London, N.W.1. The exhibits on this stand are as follows: the "Victor" geyser, a cheap and efficient bath heater; the "Royal" geyser, for use where water is hard; the "Lightning" geyser—supplies hot or boiling water for any purpose required, is "foolproof," fitted with patent automatic safety dual valve and improved swing-out burner; the "Califont," which supplies hot water to any number of taps throughout the house; the "Ever-ready" boiler, which supplies boiling water for restaurant and factory use; the "Brilliant" geyser, for lavatory basins and kitchen sinks; the "Victor" geyser, with shower attachment and cast-iron porcelain enamelled receiver, for factory use; the "Radion" cylinder, with heat-controlling valve for domestic hot-water supply; improved nickel-plated hot-water circulating towel rail for wall; Ewart's improved "Euston" independent towel rail, gas heated; porcelain enamelled baths of high quality and finish; Ewart's improved basin bath for housing schemes; sanitary fittings, etc.

The exhibition closes on October 21. Music is being provided daily by H.M. Scots Guards and the Glasgow Professional Orchestra.

Samples of Malayan Woods in London

The Forest Authorities of the Federated Malay States are giving the users of commercial woods an opportunity of making personal acquaintance with the products of the Malayan forests. A few cabinets of samples have arrived at the offices in Cannon Street of the Malay States Information Agency, where they may be obtained. Each cabinet contains seventy samples, 4 in. by 3 in. and ½ in. thick, and each sample is named and initialled by Dr. F. W. Foxworthy, Forest Research Officer, Federated Malay States. The samples are smooth, but unpolished, and it is thus possible to appreciate the beautiful grain of some of the woods and to judge their suitability for cabinet or other woodwork. A full description of the woods is given in Dr. Foxworthy's bulletin, "Commercial Woods of the Malay Peninsula," also obtainable at the Agency. The bulletin contains other information likely to be of service to the trade. Tables show the specific gravity of the various woods, as well as the dry weight and seasoned weight in pounds per cubic foot, and a chapter is devoted to the possible uses of the woods under varying conditions.

A New Weather Bar for Windows and Doors

Messrs. Fredk. Braby & Co., Ltd., of Glasgow, have recently introduced a patented weather bar—known as the "Eclipse"—which may be applied to any single or double leaf casement or door opening inwards. Its parts are few and simple, it is automatic in action, and has no springs.

The "Eclipse" bar is screwed to, and occupies the full length of, the bottom rail of the window or door, and operates in association with two small fittings. One of these is a cam lever fixed to the outer reveal of the window frame, and the other—a plate with one edge cut on the slope—is sunk flush with the upper surface of the cill.

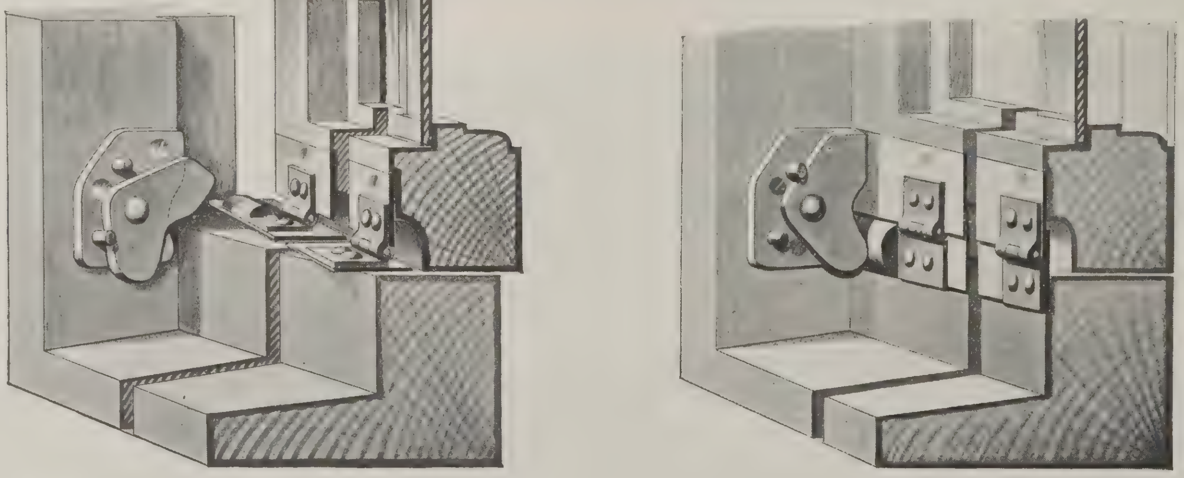
Reference to the illustrations will show that the bar consists of two overlapping plates hinged together at their extremities so that the lower one may assume either a vertical or a horizontal position.

When the open window or door is being closed, the vertically hanging flap of the bar comes in contact with the cill plate, which, by virtue of its shape, directs the lower part of the bar into a horizontal position, and thus enables it to clear the cill. The operating cam, as soon as it bears upon the convex projection on the lower or hinged portion of the bar, presses the latter downwards until it is once more vertical.

In its final position (see Fig. 2) it completely covers the junction between the casement and the cill or the door and step, and effectually excludes both wind and rain.

There are no fastenings or releases to adjust before the bar will operate, and the mere opening or closing of the window or door is sufficient to put it into the open or closed position.

"Eclipse" weather bars are made for any window or door from 18 in. upwards in width, and are supplied complete in brass, aluminium, or galvanized iron, ready for attachment. The actual fitting requires no special knowledge, and can be done by anyone.



HINGED BAR AND OPERATING CAM "OPEN." HINGED BAR AND OPERATING CAM "CLOSED."

THE "ECLIPSE" WEATHER BAR.

"The Charm of London"

IN one and the same issue of "The Times" were to be seen the paradoxical, if not mutually contradictory headings, "The Charm of London" and "London Dirt." Charm and dirt are not mutually antagonistic, sometimes they help each other. For many an artist soul, indeed, dirt of sorts is esteemed as an element in the charm of London; grime and grubbiness being held to be more interesting than spick-and-span cleanness, even as to the playwright or novelist the sinner is apparently more interesting than the righteous. And cleanliness, being proverbially next to godliness, is voted equally beyond the pale of romance.

Not that the charm of London is necessarily a grimy charm. We would repudiate the heresy and vote for the vacuum cleaner. According to a leader writer in "The Times," the charm of London is not its grime, but its infinite variety: "for above all cities, London offers to those that have eyes to see and ears to hear a free gift of strange contrasts and illuminating collocations." Some of these contrasts and collocations are whimsically enumerated. In London only may you hope to see a millionaire merchant or a gaitered Bishop swaying from a strap in time to the sudden sinuosities of a Tube; or you may have the luck to flush a peer of the realm taking a twopenny ticket in an omnibus; or an eminent limb of the law, attempting a premature boarding of the bus, will be heavily defeated in the ensuing encounter with the uniformed marshal of the waiting queue. Many other strange surprising adventures such as may be encountered in no other city of the world are of hourly occurrence in London; in whose streets also is unequalled richness of gibe, invective, and homely wit and wisdom.

All this from the witty leader in "The Times," who adds that "the inanimate, no less than the human, contributes its quota of suggestive contrast and association. Across London's fairest open space looms London's ugliest pile of building. . . . The shaft of a campanile that breathes Byzantium soars up from the narrow marches of Pimlico. Over the roofs of flats and offices it salutes the twin towers of a sister faith that tell of Norman England. They in turn pass on the greeting, across the river-bend, to the great dome which rears itself as the very hub of London's encircling wheel."

While Londoners will be duly grateful for this kindly appreciation of some of London's most salient characteristics and most prominent architectural features, and will be easily able to dot the author's i's and cross his t's, the stranger within our gates will be impatient of such mildly enigmatic allusions to St. James's Park, Queen Anne's Mansions, a turning off Victoria Street, Westminster Cathedral, Westminster Abbey, and St. Paul's. Such an evasion of names was no doubt intended as a compliment to the reader's sagacity in penetrating thin disguises; yet it rather ludicrously recalls certain venerable superstitions about the unluckiness of "naming names," whether the names be those of persons, of pixies, and other tricksy sprites, or of the prince of the powers of the air!

It may be through some sub-conscious survival of this strange superstition that the names of railway stations are commonly concealed amidst a maze of blatant overwhelming advertisements, and are uttered by the porters "indistinctly, but with unction."

This ancient taboo of naming might even be thought to account for the reluctance of newspapers to name the architect of a new building. Concerning this strange habit of newspaper writers, Mr. W. J. Locke did not write with undue severity in his foreword to Mr. Cope Cornford's charming book on "The Designers of Our Buildings," in averring that when an important new building is "opened with a flourish of royal trumpets, every newspaper fills a reporter's column with futilities concerning the royalty, the flourish, the trumpets, the mayor and the aldermen, the trowel, the royal costumes, the contractors, the bevy of unimportances present, the knighting of the Supreme Unimportancy who collects the money; but as often as not the name of the architect is omitted altogether," or, alternatively, if he is presented to royalty on the spot, two lines may possibly be devoted to this stupendous event, otherwise the trifling fact of the authorship of the building would not have been thought worth mentioning!

In respect of "naming names," however, and in many other matters relating to architecture, the lay newspapers are showing distinct signs of a change of heart, and "The Times" leader on "The Charm of London" may be regarded as one among many gratifying evidences of reform.

Turning to the more dubious aspect of the "Charm of London" in the letter to "The Times" headed "London Dirt," it is only fair to its writer to admit that he is under no illusion as to the charm of dirt. He does not allege it, and is no doubt quite aware that while dirt may occasionally commend itself to the artistic mind as being casually picturesque, grime is always regarded by the healthy normal mind as being essentially unhygienic. Then, *pace* the impressionist, grime anywhere is unsightly to the robust believer in cleanliness and tidiness—physical, moral, and mental.

Many a London building besides St. Paul's would be the better for the removal of its soot jacket, and the railway companies ought to make a handsome contribution towards the cost of toileting. To how great an extent the railways are responsible for these sooty deposits is strongly suggested by the writer of the letter on "London Dirt"—Mr. S. E. Lamming, of Edgware. He asks: "Do not the railways contribute as much as anything to the dirt in London's air?" His reason for assuming that they certainly do is the fact that each small engine on the suburban lines consumes about three tons of coal a day. Did the small engine but consume it thoroughly, the atmosphere would be the clearer and cleaner by the absence of many tons of soot which now defile it and disfigure our buildings. Mr. Lamming would have all railways compelled to use electric traction, and architects would welcome that ordinance as a preliminary step towards putting them below the surface, whether deep down in the bowels of the earth in the Tubes, or under the more shallow tunnels of the Underground, is a detail subsidiary to getting rid of a nuisance that, borne with stoic patience while there seemed to be no remedy, has become irksome and intolerable since alternative methods have been demonstrated. An entirely smokeless London is not yet possible; but the idea is now much less of a vague and futile aspiration than it was before the electrification of railways was accomplished, smoke-consumption was enforced by law, and gas-heating and cooking became popular. The charm of London will not disappear with its grime; for that charm depends on the substantial architectural value of its great buildings, and not on any mere sooty patina.

The P.L.A. Building

The opening of the Port of London Authority Building yesterday was no doubt a ceremony of national or international importance. What influence its existence will have upon the development of the Port of London we do not pretend to foretell, but its influence upon architecture is obvious and instantaneous. The great service such a building renders modern architecture—quite apart from its intrinsic architectural merits—consists in the publicity which it is able to make for itself. Architecture is suffering more than anything else to-day from lack of popular recognition, not because people do not like to think about architecture, but because they do not realize that architecture is worth thinking about. For the moment the very name, the very idea, has slipped their minds. The excitement, therefore, and the Press activity which buildings like the London County Hall and the Port of London Authority arouse, are as important for the welfare of architects and architecture to-day as any other factor one is able to mention.

Arterial Roads and Town Planning

Sir Henry Maybury, Director-General of Roads, Ministry of Transport, in a paper read on October 10 at the Town-planning Exhibition at Manchester, paid Lancashire a compliment that London should strive to deserve. In Lancashire, Sir Henry said, parochialism, "the bane of the road engineer," had been discarded, and "Manchester was grappling stoutly, whole-heartedly and broad-mindedly with a problem which, in the neighbourhood of London, was being only delicately fingered." This ought to provoke in London an emulous activity. He greatly encouraged the belief that the town-planning idea is being intelligently grasped by landowners in increasing numbers, and once again he emphasized the vital necessity of looking ahead—of intelligent anticipation of future developments and requirements in the matter of traffic accommodation. Foresight is an essential virtue in the town-planner.

Antiquated By-laws

Ministers seldom enlarge the recommendations of Departmental Committees. The Minister of Health is exceptional. In a recent circular to local authorities he makes this sane observation: "The Departmental Committee on Building By-laws recommended that all by-laws with respect to new streets and buildings should be reviewed at least every ten years; the Minister is inclined to think that this task should be undertaken at even shorter intervals in order that the local authority may be quite sure that their by-laws provide adequately for modern requirements." That is certainly an improvement on the Departmental Committee's recommendation. So very much may happen in ten years; and local by-laws should not be held immune from the universal laws of development and adaptation to changed conditions. Yet, as architects know to their frequent chagrin, local by-laws are sometimes actually older than the local authority which has been too somnolent to alter them; and it is especially easy to agree with the Ministry of Health that "local authorities are not warranted in retaining by-laws which may hinder private enterprise, and are not really required for safety or sanitation." A by-law that is not essential to either of these fine issues should be promptly scrapped. Any sort of law that is useless is a nuisance.

The Holyrood Memorial

The bronze statue to King Edward VII, which King George unveiled on October 9, completes a national memorial that is noble alike in conception and in execution. It is always a deed of æsthetic daring to add anything to or to take anything away from a building that is a part of a city's or of a country's history; but in the case of Holyrood, the building is unaffected except in so far as its environment may be said to modify its character, as all environment certainly does. It is the general opinion that what has been done at Holyrood—the enclosure of the palace forecourt in accordance with an architectural scheme prepared by Mr. Washington Browne, and the erection of a fine bronze statue of King Edward modelled by Mr. Henry S. Gamley—has not detracted in the least degree from the dignity and nobility of the venerable building. Rather the enclosure bespeaks a pious desire to set it apart from mean and sordid modernity.

The Public "Ignorance of Art"

Concerning the late Sir Thomas Brock, an over-zealous letter-writer in the daily Press has made a wholly gratuitous assertion of public apathy. He insinuates that the work of the deceased sculptor is now popularly ignored. Yet surely the fact is that no work by a modern sculptor is more widely known than that of Sir Thomas Brock; although Sir Bertram Mackennal has perhaps evoked even more admiration among the simpler folk by his charming embodiment, in Kensington Gardens, of Barrie's Puck-like phantasy of "Peter Pan." That Brock's work is popularly ignored is an exaggeration that is refuted by the daily gathering of groups of admirers around the Queen Victoria Memorial in front of Buckingham Palace. Truly our honest purblind British public are ignorant and indifferent enough in matters of art, especially architecture; but at last they are standing to attention, ready and willing to salute art in any shape, provided it makes some sort of appeal to their simple emotions: which appeal is, after all, a vital function of art, and reaches its highest expression in sculpture. The "public ignorance of art" is easier to exaggerate than to amend, and we deprecate all such attempts to quench the smoking flax.

Britain's Most Ancient Building

Interesting Roman remains are not confined to Rome. That indefatigable archæologist, Mr. W. C. Edwards, has made further important discoveries of the kind in London and has conceived some interesting theories about them. Taller buildings requiring deeper foundations, the excavators are delving deeper down into ancient history. For example, "what is probably the most ancient wall that has yet been found in London" has been unearthed at Cornhill. The footings were found 15 ft. below the surface, and above them were courses of tiles, four abreast, each 13 in. wide, making in all 52 in. On the south side of this wall, which had apparently formed part of a room or of rooms, two layers of plaster were finished with a further layer of white cement, "almost as thin as paper, on which designs had been painted by a very skilful artist." Mr. Edwards assumes for this wall an earlier date than the fourth century, and he supposes "that in this wall we have the most ancient building, and in St. Peter's and St. Michael's the most ancient churches in Great Britain." Another ingenious conjecture arising out of these discoveries is that "it is demonstrated that Gracechurch Street was not a Roman street. I am now inclined to believe," says Mr. Edwards, "that we owe Gracechurch Street to Saxon times, and that it was probably one of the works of Alfred the Great." In commending Mr. Edwards's vigilance, we do not necessarily accept his theories; archæologists are so sanguine about their own discoveries, and so sceptical about discoveries by others of their learned fraternity.

A MONTHLY CAUSERIE

Joking Apart

Service or Profit ?

THAT part of the works of man which is exemplified in the building of houses in our country places seems largely to be directed by those same aspirations which cause people to mark their appreciation of a beauty-spot by carving their names on its tree in commemoration of the day they broke bottles and scattered paper and eggshells there. England is being despoiled of her natural beauty, and the countryside defaced, by shoddy, pretentious, tasteless houses, little and big; very much as in the past our towns and cities have been reduced from objects of delight to subjects for tears. The localities so disfigured are among those which have the greatest natural charms, and though it cannot be affirmed that modern sensitiveness to the beauties of nature has been awakened by the desire of the populace to get away from the dispiriting influence of ugliness in the towns, it is a fact that, until the beginning of the so-called Industrial Revolution, there is no indication in our literature of the existence of such a sentiment. Whatever the cause, the public in these days seeks to satisfy, in country scenes, a craving which appears scarcely to have belonged to human consciousness two hundred years ago. It cannot be said what sensations, other than that of holiday freedom and adventure, are awakened by rural surroundings in the char-à-banc's characteristic load of sightseers; but the deep pleasure the ordinary lover of the country receives from scenes of natural beauty is chiefly due to an unconscious identification of himself—of humanity—with what he recognizes to be perfection. He becomes aware of the scheme of things as a vast glory which embraces all mankind, and his mind is accordingly elevated with a deep contentment. The presence of Cottages, Farms, Churches, and Mansions, adds to his delight in his surroundings; not, essentially, because they may be old, or picturesque, or fine examples of a style, but because, and only in so far as, they are sincere and represent humanity to his mind in a way that gratifies his esteem of humanity, for of nothing is human nature so jealous as of the good repute of humanity.

To-day houses are built that can have given no one any pleasure in their creation, which have afforded no satisfaction to the workmen who built them, and which are not what the people who live in them really, in their natures, desire or would choose if the choice were offered them and they exercised a choice. It may well be asked, therefore, why is it that a system of disfigurement which is universally deplored, which gratifies no one in the accomplishment, and which satisfies the desires of nobody, continues ? The condition is the more remarkable because both in England and in Belgium we can see, side by side with the thing that is deplorable, the thing that is admirable. Our garden villages and many of our housing schemes are admirable, and the small farms and homesteads characteristic of Belgium which are being built by the State to replace the havoc of war will in the future be the most delightful features of the landscape. In both countries the two classes of habitation, the admirable and the deplorable, may be clearly divided, for in neither Belgium nor England are there many houses that lie midway, and the two classes remain as distinct and as readily distinguishable as chalk from cheese.

It is clear, therefore, that we have not to deal with degrees, but with kinds; we have not to inquire to what extent certain principles have been followed, but must look for diverse principles.

If, then, we examine any house, however humble, which we recognize as belonging to the class of admirable buildings, we shall always find that it has been sincerely built to meet the needs of a dwelling, and that it exhibits the pride of the workman in his craft, the enthusiasm of the artist in his conception, and the desire of the owner, or instigator, to gratify his conception of what a human habitation ought to be. The honest ambition of the owner, the enthusiasm of the designer, the delight of the workmen in doing well the thing he knows how to do, which are essential to a house within our classification of "admirable," are all gratuitous and extraneous to the duties *necessary* to bring the house into existence. These gratuitous and extraneous services are not paid for, they are given freely out of man's instinctive desire to justify himself in his own self-respect; that is to say, the admirable quality of the house is due to that strongest impulse of normal healthy human nature, the passion to serve. The admirable class of dwelling-house comprises those only that are instigated and directed by the impulse to service.

It follows from the above that the existence of houses which are to be classified as deplorable arises from the absence of the motive of service, and the vast number of such dwellings scattered over the country is evidence of the extent to which this subversion of human nature has advanced upon society. A large majority of these houses have been built with no other motive than to bring money to someone's pocket: the conception of service has been displaced by that of profit. It is probable that the history of the world cannot show a single human achievement which is remembered with respect as advancing the cause of humanity and civilization which has been conceived, instigated, and carried out for the purpose of gaining money. It may also be said that no worthy building has ever been built to that intent, and that it will be found that nearly every meanly-conceived and meanly-executed building owes its miserable qualities of failure to this cause. Architecture cannot lie. Almost alone, perhaps, among the arts it will, soon or late, hold out its banner of secret disgrace or honour for all to see. There are other causes—lack of sincerity, vulgarity of taste, incapacity of designers, which account for many deplorable adventures in house building, but indirectly the root cause will be found to be this same one of the usurpation of service by profit as a motive of human achievement.

A vicious circle has been started. The public has been educated in ignorant and vulgar taste in houses by men who compete with one another in building and selling houses. The shrewd, hard-headed men of business who first, many years ago, divined that money could be made by exploiting the necessities of the people with shoddy insanitary homes, were in due course brought up short by Acts of Parliament compelling them to build honestly and have regard to the obvious needs of human beings. Thus robbed of fraudulent drains and deceptive walls as a source of gain they turned their attention to a matter that the Law would not meddle with—namely, sham architecture. The public has been so long surrounded and beset with features which have no justification except that they cost little, require no thought, look expensive, and give a false idea of value, that they have adopted, as representing Art and Architecture, forms and devices which owe their existence to no other cause than the ambition of unprincipled men to make money by them. These perverted tastes, and the hopeless ignorance of the ordinary man who is so courted and flattered by dealers in claptrap that he has perfect confidence in his own taste and takes no trouble to inform himself, have led to a demand for the false in preference to the true, which, in turn, strengthens the appeal of the stock-in-trade of the profit-monger. KARSISH.

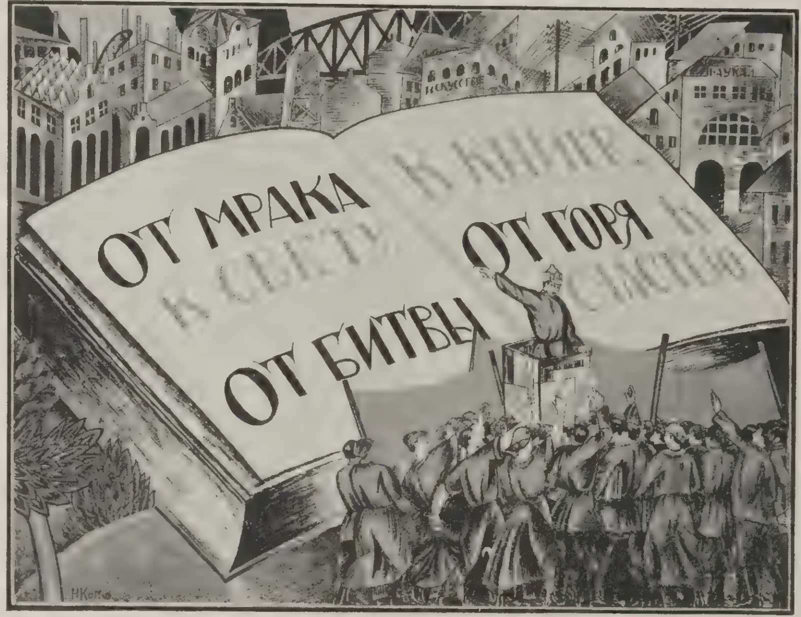
Rebuilding Soviet Russia

By HUNTLY CARTER

6. The Art Aspect of Propaganda

ONE of the most astonishing sights that greeted the visitor to Soviet Russia in 1920–1921, was the blaze of posters. Propaganda posters met one the moment one arrived at Jamburg on the Russo-Esthonian frontier, and thereafter spread themselves over vast Russia like a many-coloured sheet of flame seeking to lighten the dark places of the illiterate mind of the Russian population. As one proceeded great startling posters delivered their messages from every conceivable space. They covered the stations, lined the waiting-rooms. In city, town, and village-town they streamed in thousands across shops and houses and walls. Wherever one went, in telegraph office, in hotel, in private house, in factory, warehouse, in theatre, cinema, museum, they crowded round, seized the attention and the imagination and never let them go. They were a nightmare and an enlightenment. They made Soviet Russia a pandemonium and a breeding place of ideas.

This immense host of picture posters was sent forth by the Ministry of Popular Enlightenment to wage war on illiteracy and ignorance. Their business was to educate the workers, peasants, soldiers, sailors, and any unwary visitor who fell into their power, in the communistic way they should go. The general subject which they upheld was the building up of Communist Russia. Accordingly political economy, sociology, science, and economic history marched at their head under the banner of economic materialism, while philosophy, psychology and logic marched at their tail—which means they did not march at all, for proletarian ideology has no use for them.



EDUCATIONAL POSTER.

"From Darkness to Light, from Battle to Book, from Misery to Happiness."

So amid this host of posters one saw no commercial ones. There were no alluring towsled heads tempting you to buy someone's hair-restorer, or pink faces inviting you to invest in someone else's face-wash. There were hundreds and hundreds of carefully-thought-out appeals, not one of which begged you to buy G's nose-wear because it is so bracing. Nothing has ever moved me more than this never-ending exhibition of simple and strong-drawn pictures appealing to the mind and not to the pocket. They were as a multitude of voices summoning the worker to the vineyard, where for ten long years he shall sow vines and not gather grapes.

In saying this I do not wish to overrate the strength and determination with which the propaganda poster stood for the Communistic conscience and the new Communist Russia. The general appeal was exceedingly novel, and the general effect so unaccustomed that it took the breath away. But when one came to examine the whole thing in detail one found there was much to disagree with. It was exceedingly pleasant to study the very able art-work put into the majority of the posters. There were immensely big designs and great splashes of rich vital colour, masterly handling of line, and exceedingly successful attempts to get movement; in short, all the very best æsthetic qualities of poster making that achieved the purpose of art, namely, that of giving the spectator the æsthetic experience which the artist himself had had. And no wonder, for all this fine poster work had been done by the pick of the old intelligentsia, who were converted to Communism and its doctrine of art for life's sake, and by the new body of artists, the life-centred ones, as they may be called, who had emerged from the Revolution and counter-revolutionary war, and by the gifted workers, largely factory workers, clerks, and shop assistants, who had seized the opportunity afforded by Communistic policy to exercise their artistic abilities.

Among the professionals was Maiakovsky, one of the wildest of the wild men let loose by the Revolution, and a poet, playwright, and designer of undoubted genius. After writing flaming verse exhorting his fellows, poets, painters, draughtsmen, musicians, to come into the open and once more into the breach of life, he threw himself into poster designing with such energy and poured forth such a flood of original designs that there was not room on the walls of Russia for them all. And this simply because his exhortation began to work, bringing into the same field a body of poster designers, each requiring considerable wall-space for his own fine exhibition of poster pictures.

Besides the æsthetic appeal there was the propagandist one, and this was not always pleasing. On the political side it was of a bloodstained repulsive character, a sort of kow-towing to the mob instinct. A design of a proletarian rock planted with a red flag and with a capitalistic ship wrecked at its foot, and the bodies of the shipwrecked strewn about, was a comparatively mild affair. As a rule the Communist did not let the Capitalist off so lightly. I remember one blood-bespattered poster in which there was a working man, a big brawny son of toil; he was holding something that looked like a long skewer on which were impaled half a dozen or so unhappy-looking bourgeoisie. Both the worker and the landscape which formed the background were blood-red. Some of the fierce political posters exhibited quite a mania for picturing the worker as a sort of devil, either with a pitch-fork with which he gathers capitalists and priests together in a great heap with the object of treading them to powder under his exceptionally big feet, or with a sledge-hammer smashing the chains which encircle the earth, and, as it seems, smashing the earth at the same time.

TYPICAL "RED" POSTER.
"Have you voluntarily reported for the Army or Work?"

PROPAGANDA STAMP.

"Bad Improve and Good Construct."

PROPAGANDA STAMP.

"Smoke Stacks of Soviet Russia."

The scientific posters were far less offensive than their agitational brethren. Indeed, many of them were instructive to visitors as well as to natives. Striking comparative charts showed at a glance the mineral and other resources of the country, decreased and increased production, the losses, say, in rolling stock sustained during the war, revolution, and counter-revolution, and the recovery since; the state of the country under the Czars and its state when it is a workers' electrified Paradise; in short, facts and figures calculated to make the proletarian mouth water. Equally striking hygienic and sanitary posters told the peasant and worker all they need know about the care of the body, the house, and the workshop; what to do in cases of sickness and pestilence, and how to prevent them. Even such details as the care of the teeth and feet and preservation of the skin were loudly advertised. Anatomical drawings revealed the mysteries of the human inside, described the pathology of the heart, lungs, liver, and spleen. Expectant mothers were publicly instructed how to behave, and expectant fathers were warned of the dangers of misconduct. Along with the pathology went a pathological museum wherein all the staggering facts of disease might be examined and studied free of charge. Besides these there were posters giving facts on corn and other natural produce in health and disease, the influence exerted by climate, temperature, even astronomical bodies. The meaning of solar eclipse and tides; of everything in fact on land, in the water, and in the air having a bearing upon production.

3) НЕ ДЛЯ ЛЕНИ ОСТАВИМ РУЖЬЯ.-
4) А ЧТОБ КРЕПЧЕ ВЗЯТЬСЯ ЗА ЭТО ОРУЖИЕ!
РОСТА №581

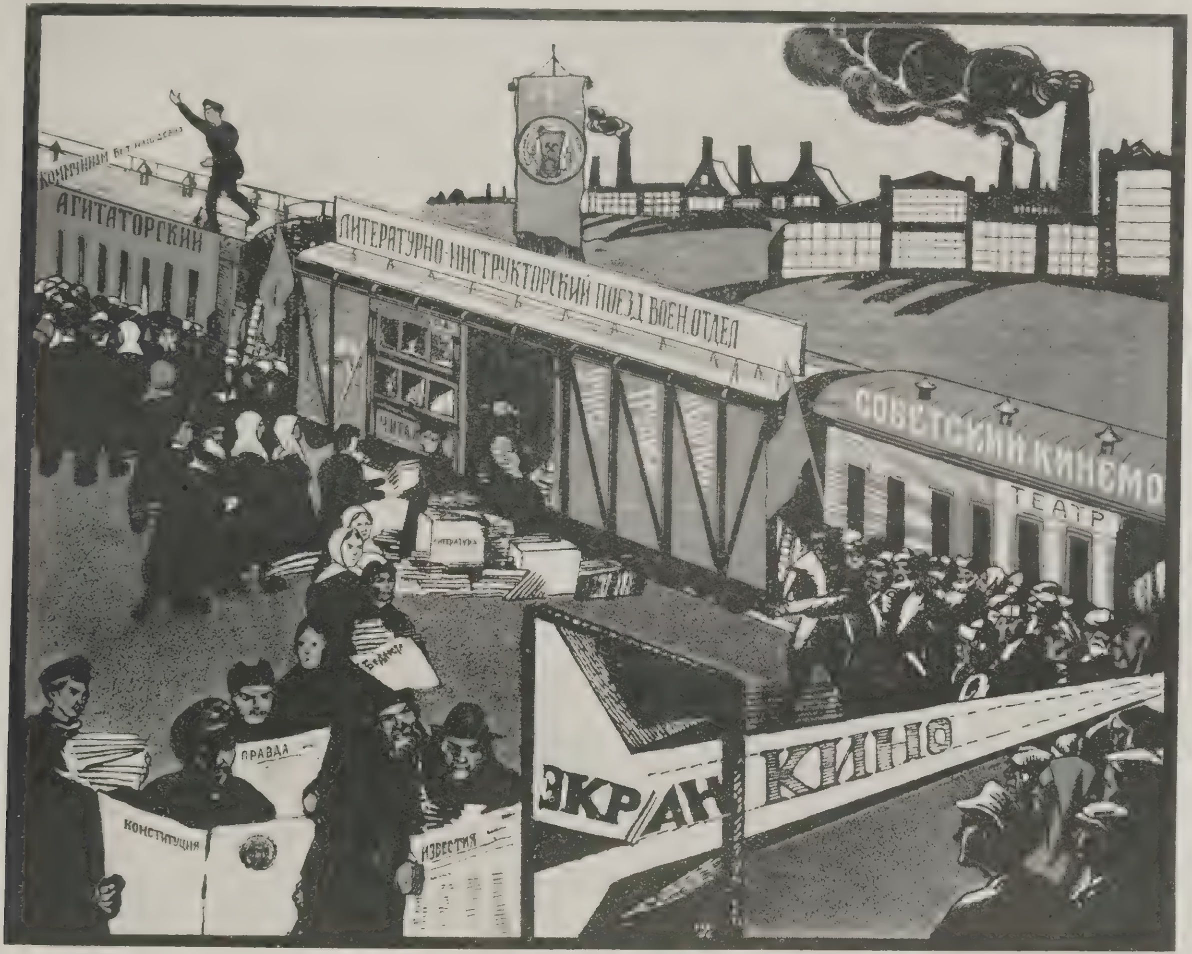
BOLSHEVIK POLITICAL POSTER.

"1. When the War is Ended. 2. Many Foes will Remain. 3. We will not leave the Weapons to the Idle. 4. But from them make stronger."

As for the educational posters, they were extremely instructive, for they threw a good deal of light not only on the mentality of the population, but on that of their instructors. For one thing, one could see quite plainly that the former were regarded as quite inferior stuff, which needed large helpings of economic materialism to fit it for the Communist heaven, while the latter were of the superior stuff of which heaven-born Communists are ready-made. You could, in fact, see that the peasants were held to be the most backward culturally and the poorest spiritually of any class in Russia. Every opportunity was taken to show them pictures of themselves, as in a looking-glass—dark, ignorant, the prey of landlord, priest, and capitalist. As a matter of fact the worker was not much better. Authoritative statistics on illiteracy have shown that in the Union of Leather Workers 60 per cent. of the members are illiterate; in the Union of Paper Workers there is the same percentage. But these figures were not flaunted on hoardings and house-fronts for the benefit of the workers. While the peasants were continually reminded of their shortcomings the workers were usually treated as though they had gone through the university and come out real professors, as Mr. Hooley might say. Still, the great importance of getting knowledge, and especially of imparting knowledge to children, was rubbed in with the utmost vigour. "Parents! send your children to school"; "Children! read books"; "Knowledge is Power"; "Reading is one of the duties of man." These and a hundred more inscriptions were seen urging the importance of knowledge, telling how to get it, advising its discussion in scientific, political, art, economic, and other forms, and imparting it in such alluring ways that men, women, and children read the posters in the great cities, towns, and villages of Soviet Russia as the populations of other countries read books and newspapers.

Posters did not exhaust the art and apparatus of propaganda. There were propaganda trains, propaganda printed sheets, propaganda frescoes, and mural designs. There were propaganda banners, propaganda act-drops and curtains in places of entertainment, propaganda airships, and propaganda inscriptions on paper-money, on official documents, on passports, on everything that offered a bare space. In fact, propaganda looked out from chaos like a myriad-throated herald announcing the dawn of a new Russia.

One picked up a passport to find the Soviet arms—a sickle and a hammer—supported on the left by the words, "He who does not work shall not eat," and on the right by "Workers of the world, unite." Or a rouble nóte, to read the latter exhortation in the languages of the six great trading nations of the future. As one passed along the boulevards and other main thoroughfares, agitational, satirical, and other mural designs, some of them of exceptional merit, caught and arrested the eye almost at every step. At the stations wagons stood displaying on their sides immense designs—futurist, symbolist, realist—and immense inscriptions. There were great drawings of the October Revolution and what it meant: the old rulers being kicked out by the new ones—the peasants and workers; the latter entering their kingdom in style, surrounded in wonderful homes by obedient wives and dutiful children, and all the quaint paraphernalia of up-to-date electric science; the former working in fields turned into paradises by electric ploughs and the latest mechanical appliances. And there were model schools in which model children were being taught by model teachers, all as spick and span as the milkmaids at a dairy show, and much more of the wonderful business. Appropriate inscriptions informed the onlooker that, "We are strong. No power in the world can overthrow us," and more to the same effect. Even the engines had something to tell you, and something to show you in the way of large portraits of Karl Marx and Lenin literally hung round their necks. In the waiting-rooms were immense frescoes representing some of the most desperate scenes of the Revolution with the workers always on top. Also on rostrums and pianos—and above them the omnipresent portraits of Marx, Lenin, and Trotsky—and, scattered about, agitation literature, and you guessed these were the oratorical webs in which unwary passengers were caught like flies and made to listen to inflammatory speeches. Then there were the celebrated propaganda trains, each forming a combined travelling conveyance, bookstall, library, cinema, and printing press, fitted up with all the conveniences for work and travel, and the facilities for publicity, and the means of accommodation for a large staff of lecturers, to say nothing of Red Army men and their crimson machine guns.



PROPAGANDA TRAIN POSTER. THE PROPAGANDA TRAIN—A COMBINATION OF A TRAVELLING LIBRARY, BOOKSTALL, PRINTING PRESS, AND CINEMA.

It will be observed that the foregoing is written in the past tense. The full glory of propaganda is no longer over the wide Russian land. By all accounts Russia is very poor, and therefore its propaganda ardour is abating. A good deal of the old efforts of Communist propaganda remain, but they are in tatters. No longer do amazing statistical and scientific cartoons, that were once the glory of the station platforms, catch the eye of the peasant and worker and form their minds for them. No longer do the travelling cinemas, libraries, and lecture halls perambulate the country printing and publishing, distributing papers, pamphlets, leaflets, and books, and exhibiting a wealth of educational pictures. Pre-revolution isolation has once more settled in the villages. The libraries are closed, newspapers are suspended, lecturers come not, propaganda has fled, and all the fine cultural work that it once did is fast becoming a memory and a dream.

OUTPOST N.Z. 2, ANZAC.

The War Cemeteries in the East

Designed by Sir John Burnet, A.R.A.

MUCH has appeared in the Press in relation to the British War Cemeteries in France and Belgium, but comparatively little is known of the equally important work that is being carried on in what was the Eastern theatre of the war.

Special difficulties, due mainly to climatic conditions, were attendant on the work, and the ingenuity with which these have been overcome is a noteworthy feature of the whole achievement.

Sir John Burnet, principal architect for the Imperial War Graves Commission for Palestine and Gallipoli, is responsible for the design adopted for about forty cemeteries located in Palestine and Gallipoli. In some cases the graves were not disturbed—merely suitably enclosed and memorial stones added; in others scattered bodies were collected and re-interred in one spot.

In Gallipoli the enclosure considered best suited to protect the cemeteries from the ravages on the soil made by the heavy rains consists of a dry stone-lined trench and embankment planted with rock-growing plants native to the country. Three sides of the cemeteries are thus treated, the front being enclosed by a low masonry wall. These enclosures are designed in simple level lines, culminating in a raised portion of walling on the highest side of the cemetery, of sufficient height to form a background for the cross, in front of which stands, in the larger cemeteries, the Great Stone of Remembrance. As a protection against the shifting nature of the soil, the cemeteries are surrounded external to the enclosures by a 30 ft. belt of evergreen timber, and internally with cypress trees. The construction of the enclosing embankment and trench is shown in one of the accompanying illustrations. Local labour and material are always used.

In Gallipoli flat stones are being used to mark individual graves, and it is interesting to note that in Mahommedan countries religious prejudices are respected, and the symbol of the cross is not given a more than necessary prominence.

Who is an Architect?

By IRVING K. POND, of America

THE first impulse is to turn to our dictionary; if it happens to be the "Standard" you will find that he is "One skilled in practical architecture; one whose profession it is to devise the plans and ornamentation of buildings or other structures and direct their construction."

This does not seem to settle the question, at least in law. As a matter of fact, the making of an architect in some States requires long and serious preliminary and technical training, while in another State a man not possessed of the same qualifications may be accepted as an architect. The first State says he isn't an architect and the second says that he is. They both say it by a standard of law.

The R.I.B.A., at a special meeting held in February of this year, seems to feel that an architect is one who has the qualifications which would entitle him to become a member of that body, and that any Parliamentary Bill for registration must limit the right to the title to those persons who have these qualifications. This led to an enlightening debate on "Unification," which appears to mean some provision by which all architects may find cover. Their problem is a difficult one since, if membership in their society is an essential, some folks will lose their right to practise if they cannot pay their dues.

We have not solved the problem in our country by Federal act; it is doubtful if we could, even though there were no constitutional barriers in the way. We have twenty-two definitions to date covering that number of States; some day we shall have forty-eight.

The American Institute of Architects has, in the past, met the problem in its own way, as far as related to its own membership, but one cannot help speculating as to the future attitude of this representative body. Can the Institute demand anything but the best in granting membership? If it doesn't insist on the highest standards, will not its field be limited to the States requiring the highest standard by law? It seems certain that the "Model Law" adopted by the Institute is a rule that it must use in testing the qualifications of candidates for membership.

It seems also fair to assume that a person calling himself an architect in a State where the lawful use of the title does not meet the accepted standards of the Institute may not be accepted for Institute membership unless such person can pass the examinations and requirements of the State having the maximum standard.

The architects have the companionship, in their journey, of lawyers, doctors, teachers, and others classed as members of learned professions. All kinds of expedients have been tried such as "reciprocal transfer"; but one State does not recognize the right of anyone in another State to govern its actions, or to examine its applicants for professional attainment.

One State says that you may be called an architect if you are a Canadian, but not if you are a Mexican; other States say that you cannot be an architect unless you have applied for American citizenship. We do not seem to let it bother us as it does our British brothers, even though it may be a little confusing to interstate societies.

A contributor raises the question "Who is an Architect?" It seems safe to say that the legal definition is merely in the making. His observations as to the statutory differences of definition now existing in various of our State laws on registration only sound a warning as to the difficulties that we shall encounter ere we come to a national agreement as to what is an architect. There are many complaints over the administration of the reciprocal features of our laws, and they spring, of course, from the differences to which we refer. If, for example, an architect passes a certain examination in order to be registered in his own State, does that entitle him to be called an architect in another State where the entrance examination is very much harder?

Our contributor speaks of the same difficulty in England, but here the trouble is occurring before registration. Parliament is unwilling to grant any law, it appears, until the architects come before it as a united body. "Unification," therefore, seems necessary as a first measure, but this calls not only for a merger of the Society of Architects with the R.I.B.A., but very likely requires that all architects now practising in the British Isles be admitted, without examination, to the R.I.B.A. Over this question there are strong differences of opinion, for many members of the R.I.B.A. cannot swallow the wholesale admission plan. The price seems far in excess of the ultimate value to be obtained by registration. But it is likewise true that there is probably no other way. Members of the American Institute of Architects, for example, in States where registration laws are now in force, had to suffer the humiliation of being registered in common with contractor-architects, builder-architects, and in one case, we remember, with an undertaker-architect. Of course this is not so bad as though they had been obliged to take these gentry into the Institute without examination, and we may well sympathize with the situation of our English confrères.

From the "Journal of the R.I.B.A." one sees that the vital present is challenging the attention of our British confrères; the same social and sociological tendencies which have been working through us have muddied their heretofore clear and limpid professional stream. The tendency to put art and professionalism in the straight-jacket of law is one which is now manifesting itself with our British brethren, as it has long manifested and still is manifesting itself with us.

Registration and Unification—how familiar they sound to us! Many of our States—twenty-three, to be exact—have registration or licence laws. One other State, in which literature alone seems to be considered an art, forces architects to register under an Engineering Act; the twenty-three regarding architecture more or less as an art, treat it as such, regulating matters only which bear upon the health and safety and physical welfare of the public, except that one, in establishing qualifications, seeks to pass upon the capacity to design. So, 50 per cent. of our States—and on the initiative of the architects themselves, acting from some confused notion of service to the public or (and?) from distinctly selfish motives—have passed laws regulating the practice of a supreme art! But regulation by law is in the air, and our British brethren and our own 50 per cent. as yet free and sane will have to come to it. There seems to be no inoculation against it. Materialism and legal and æsthetic formalism are stifling the spirit of freedom to create beauty in Great Britain as here in the United States. However, the R.I.B.A. has taken up, through its Committee reports, the principles of Registration and Unification, and seems likely to adopt and establish them in spite of wise cautions, while our A.I.A. has up to now been able happily to avoid the issue. But it is going to come in spite of us—or to spite us.

The architectural profession in both countries is becoming class-conscious. In Britain there always have been social classes which were conscious and self-conscious. Classes have existed in this country, but their self-consciousness has been regarded rather as a joke. But now in England, and the tendency is here too among us, classes are taking on a new alignment, and the barber, the plumber, the whitewasher, the architect, are becoming class-conscious and must needs demand legislation which shall protect them in their self-asserted "rights" against all comers.

How long, at this rate, will it be before we establish a caste system rivalling that of India in its wide ramifications, and this on a materialistic, as well as on a spiritual basis? And as to Unification—some of the British reactionaries fear the effect of that. And I, "if"—like Cæsar—"my name were liable to fear," would fear with them. A class, especially an Artist Class, can be unified only in name, and in those things in which the law, not the law of the spirit, but man-made law, can compress men into its mould. There can be true unity only when things of the Spirit—not selfish materialism or expectation of individual advancement—compel a fellowship of kindred souls. Souls are not necessarily kindred because the accompanying minds have decreed that the body should practise architecture.

Then the questions arise: How shall art be free? How may art escape the fetters which formal education and "class-consciousness" are binding about it? How, at the same time, shall the public be protected in its physical well-being as affected by sanitary or unsanitary, safe or unsafe, buildings? The answer is easy. Establish a practicable building code: district, state, and national. Permit a building to be built from any set of plans which are in consonance with the provisions of the code, no matter who makes those plans—be he painter, sculptor, baker, mason, or architect. License the builder to erect a structure in accordance with those plans, and if you can't get class-consciousness out of your system, or if your soul is burdened by the awful responsibility of the architect to the public, then protect the term Architect—with a big A—by examination along purely material and physical lines. Leave the spiritual man to grow with the spiritual growth and development of the race; and the public will be sufficiently protected; will be given a choice, through knowledge, as between the architect and the mere builder or designer, and that is all the protection the law need give the public. The public in this case is generally a wilfully ignorant or self-sufficient individual who needs the lessons of experience.

The "Journal of the R.I.B.A." and the "Journal of the Society of Architects" give considerable space to architectural education. I read these documents and pronouncements without any noticeable quickening of the pulse—as I do those emanating from our own architectural press. I am much more concerned with our primary and secondary educational procedure and with the curricula of our colleges; for I assume that before "the great globe itself" dissolves architects mostly will be recruited from the ranks of educated, cultured men of wide sympathies and understanding. In a future day, let us hope not too remote, educated and cultured men will have been taught to observe and to record their observations in sketch and drawing throughout the period of kindergarten, school, and college days. And, too, they will have been taught to use their hands in modelling and making, and their brains and imaginations in creating, in many fields. So that by and by they will be able to co-ordinate and correlate the activities of body and brain, of hand and heart. Then we will have a race prepared to create and enjoy art and capable of producing architects. The race is in no hurry to produce architects; that is an hysterical desire of individuals and schools.

My hasty glance over these British journals and peridicals informs me that along with laws and education our brothers across the Atlantic interest themselves, as some of us do, in another form of "straight-jacket" for art: that is, the geometrical basis of art as expressing itself in formulæ involving fixed and unalterable proportions and ratios between triangles, or squares, or diagonals, or diameters. Some write books in earnest advocacy of these spontaneity—crushing and spirit-breaking formulæ—and some review them sanely, which is altogether an achievement. [The foregoing article is quoted from the "Journal of the American Institute of Architects."]

The Port of London Authority's New Building

T. EDWIN COOPER, F.R.I.B.A., Architect

LOOKING over London from either the northern or the southern heights, one may espy a new landmark. It is the white, massive tower of the Port of London Authority's new building, challenging the dome of St. Paul's, and dominating all the lesser spires and domes that rise from the maze of miry streets surrounding the ancient Tower.

Broadly considered, the building is undoubtedly one of the most impressive of latter-day structures in the metropolis; the curious tradition that the mightiest interests of the great city of London should be housed in congeries of inconspicuous, dingy buildings seems to have died at last. Here is a building worthy of the administration which controls London's enormous maritime industry.

Without interruption from any who might desire to secure the adoption of some favourite idea as to the form a building of this character should take, and obviously without any restriction as to pounds sterling, the architect, Mr. T. Edwin Cooper, F.R.I.B.A., has provided, in the manner of the English Renaissance, a block of buildings on a scale that is altogether new to modern London.

The building stands on the site of Catherine Court, a seventeenth-century precinct frequented by the ubiquitous Mr. Pepys. Its cost—well over £2,000,000—would have caused the busy diarist to gasp.

It may be recalled that the building is the outcome of a competition held as long ago as 1912. The architect's original competition designs have been departed from considerably, so far as the external elevations are concerned, though the plan remains virtually the same.

It is the principal elevation that shows the greatest changes. In the original design the Corinthian columns of the portico were imposed on arcading: the arcading has now disappeared, and the columns rise from the steps. But the most noticeable change is to the tower. Previously in the same Renaissance manner as the remainder of the building, and showing a columned treatment, the tower has now taken on a more solid dignity. The surmounting finial has disappeared, leaving the top square and uncompromising—a bald statement—but tremendously impressive and original in its effect. The tilitarians may object to the spending of money on a feature that serves little if any practical purpose; but this tower, standing, as it were, at the gateway of the City, serves a very definite purpose in symbolizing the maritime greatness of the Port. Merely as a dramatic gesture it is worth while.

In the front niche of the tower is a giant figure of Father Thames, and at the sides emblematical figures of Commerce and Navigation. The sculpture is the work of the late Albert Hodge (who died after drawing the designs for the tower groups) and Mr. C. L. J. Doman.

The building is of five storeys, with a frontal portico of Corinthian columns carried up through three storeys. The side and rear elevations, if not particularly striking in the architectural sense, are plainly and effectively composed. Portland stone has been used throughout.

The most important condition put before competitors was " the provision of a fine hall, in which the Departments scheduled can be accommodated, glazed enclosures being provided generally for the various chiefs. This apartment to have good architectural character, and to be arranged for easy supervision and accessibility for the public." The great circular rotunda, so conspicuous a feature of the original design, has been retained, with its radiating corridors, to the angles, giving access to the administrative offices on all four sides of the building. Over the circular counter of the rotunda will be paid the ship dues of London. The dome of this hall has the distinction of being greater in diameter than that of St. Paul's, and it is probably the biggest reinforced concrete dome in Europe. Its diameter is 110 feet and its height 68 ft., and it is finely coffered. The Corinthian columns around the wall are of solid marble, and the walls are lined with ivory-tinted Subiaco marble, quarried in Italy.

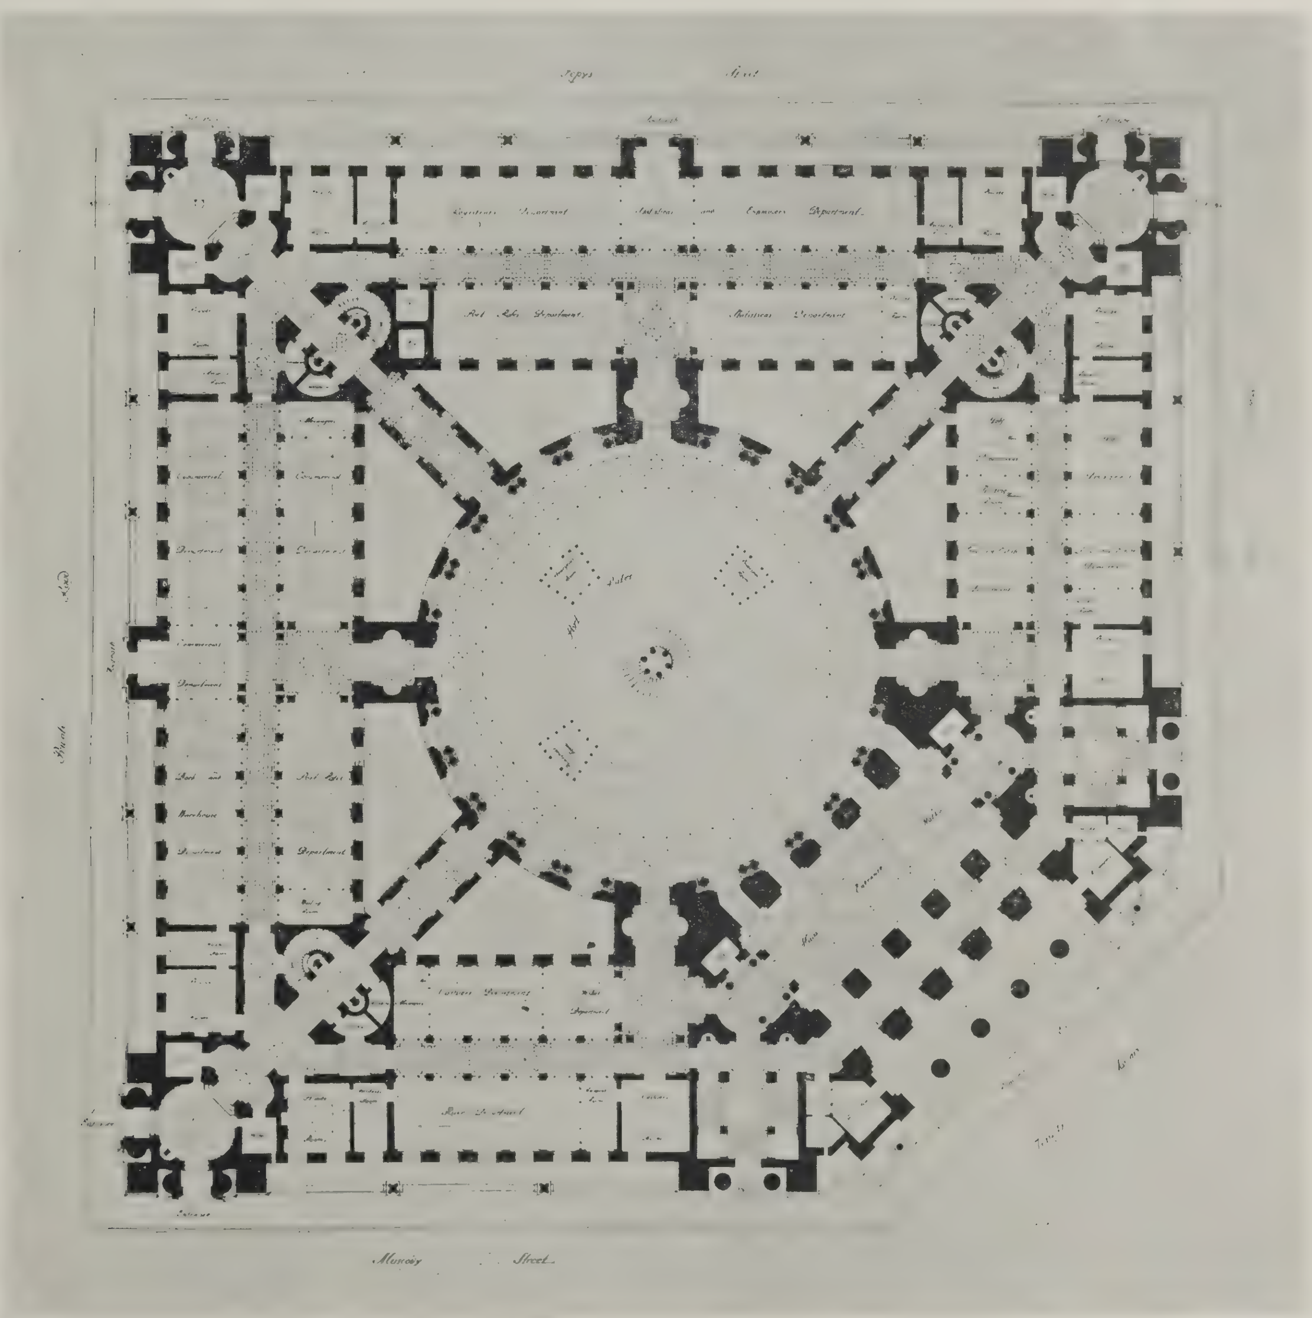
The business public passes between rows of small offices, each partitioned off by glass set in highly polished woodwork. The light from the windows in the external walls, and that from the part-glass dome is thus distributed throughout the greater part of the ground and first floors.

The plan takes the form of a square with one angle cut off to make a colonnaded entrance from Trinity Square. As will be seen, each corridor gives exit direct to the street. The staircase (to be observed in the very centre of the rotunda) gives access to the basement, where the strong-rooms and book-rooms are.

The illustration of the interior must be deferred to a later issue, as some of the rooms, at the moment of preparing this number for press, are not ready to be photographed. Some description of the principal apartments may, however, be given.

The building contains rooms for all the members of the Port Authority and offices adequate for the staffs of the numerous sections, which in the aggregate must be somewhere near those of some of the great Departments of State in Whitehall.

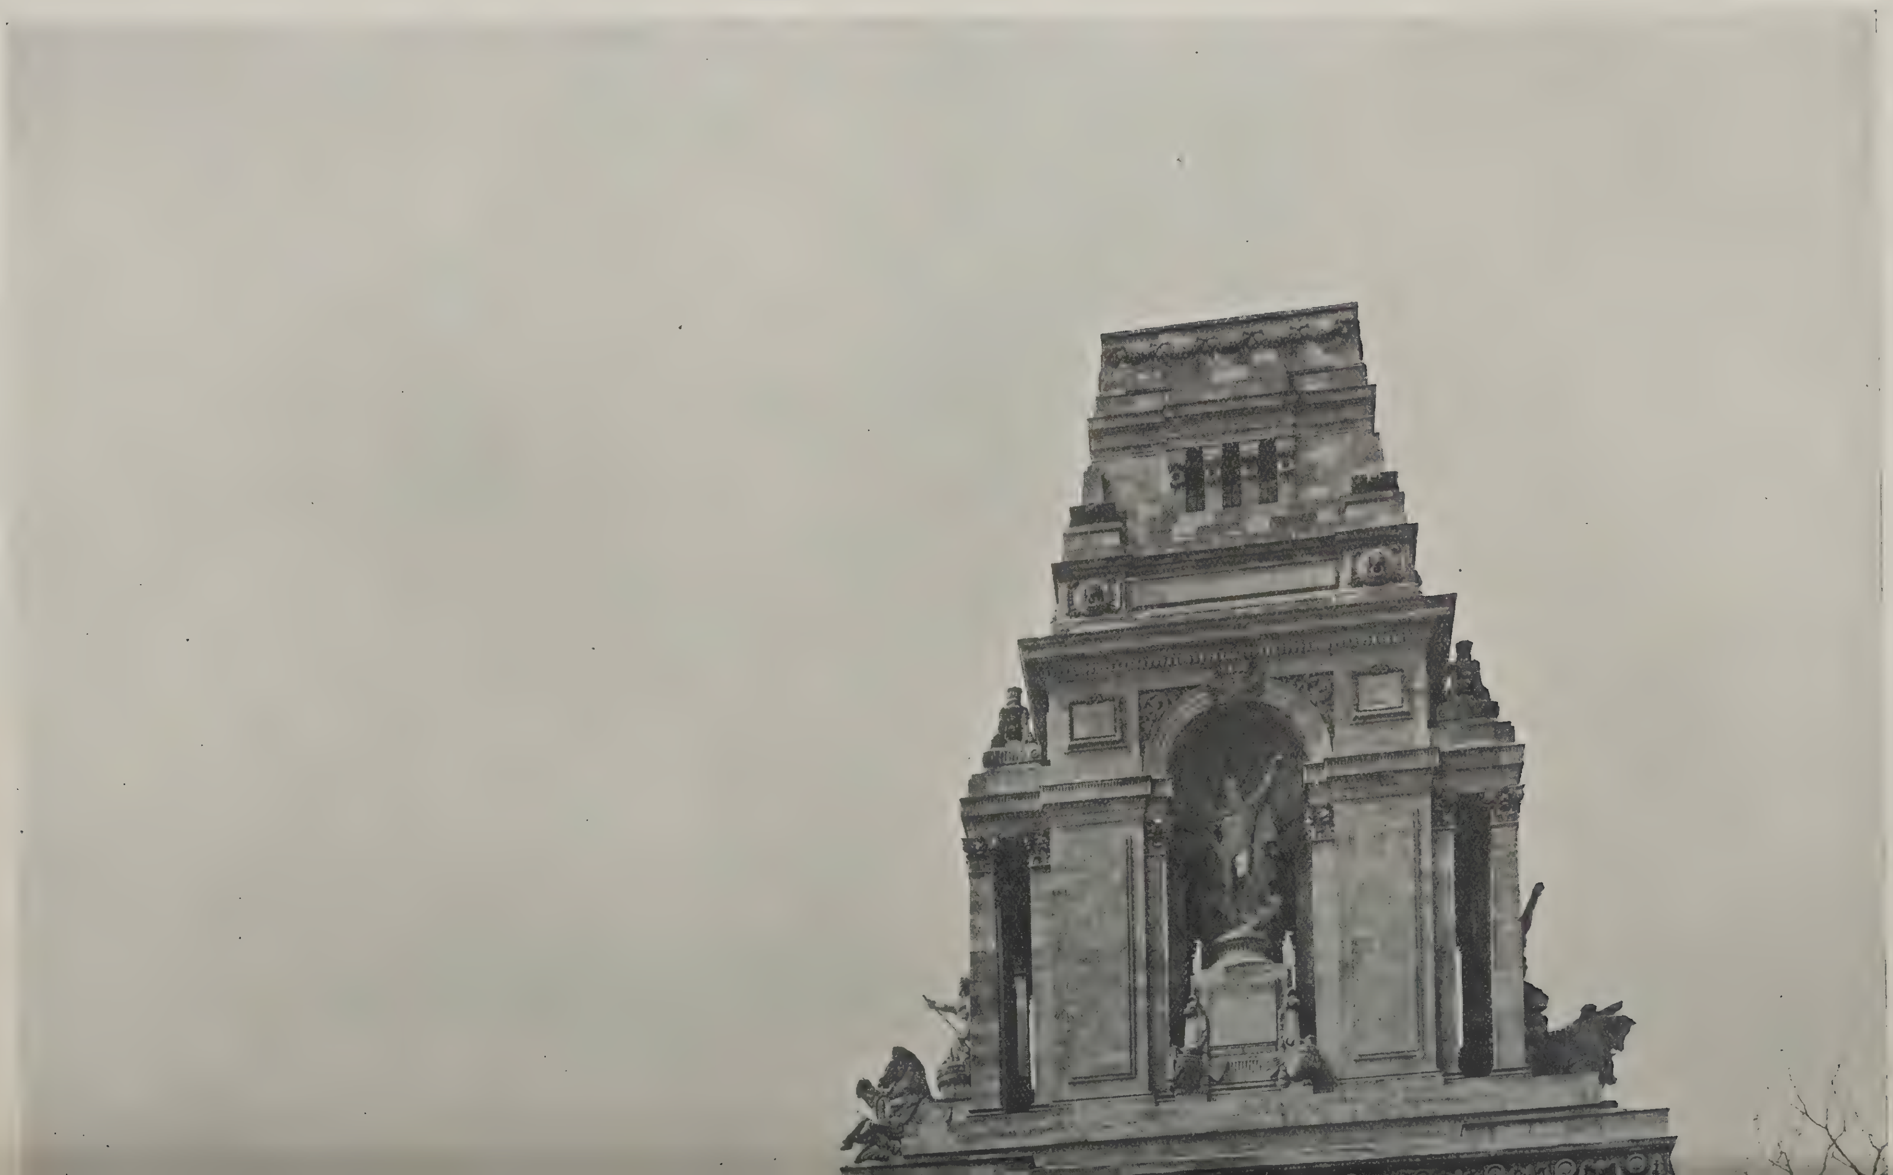
On the ground floor are the business departments to which the public will have access. From the entrance hall are two main staircases on either side, rising from the basement to the top floor. Each is carried by four square

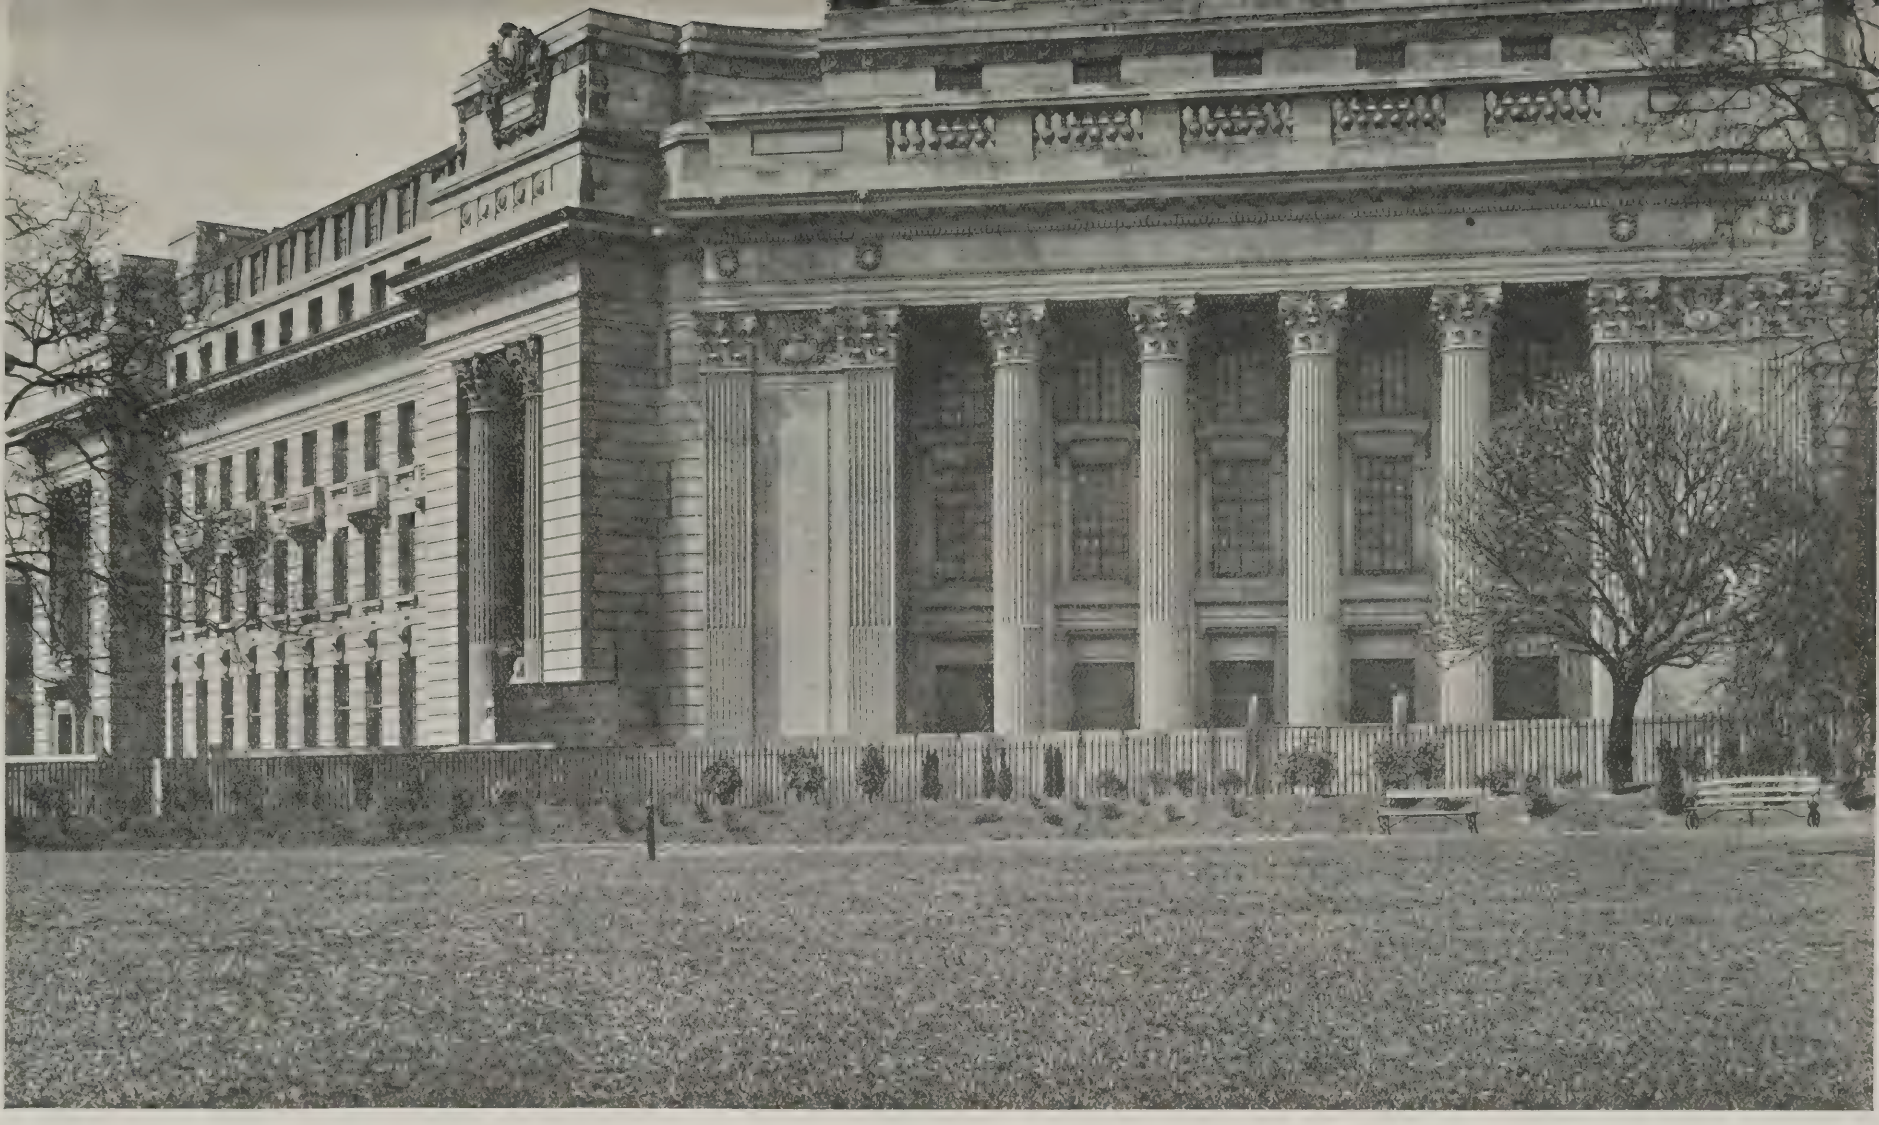


GROUND-FLOOR PLAN OF THE P.L.A. BUILDING.
T. EDWIN COOPER, F.R.I.B.A., ARCHITECT.

Current Architecture. 166.—The Port of London Authority's New Building, Trinity Square, London

T. Edwin Cooper, F.R.I.B.A., Architect





The new building for the Port of London Authority, just completed, is the outcome of a competition held in 1912, which was won by Mr. Cooper on the strength of a design that displayed great cleverness in the plan and boldness and dignity in the elevations. The building as carried out shows a number of modifications upon the original design, especially with regard to the principal elevation: the arcading, which was a feature of the ground-floor storey, has disappeared, the columns of the portico now rising from the steps; the tower has also been remodelled. The building is remarkable for its external sculpture, the front niche of the tower containing a giant figure of Father Thames with figures at the sides emblematical of Commerce and Navigation. Other groups are placed at ground-floor level within the pavilions flanking the entrance front. The sculpture is the work of the late Albert Hodge and Mr. C. L. J. Doman. The plan retains the feature which formed so striking an element of the original design—a great circular rotunda with public space around. Here will be paid the ship dues of London. The diameter of the dome to this apartment is 110 ft. and its height 68 ft. The building, which is carried out in Portland stone, with a rich use of decorative materials internally, has cost well over £2,000,000.

piers, and the walls are lined with polished marble. The open balustrades are of finely worked bronze and iron, and the landings have large apses.

On the second floor are the members' rooms, committee rooms, and dining-rooms. The main room here is a lofty board room, entirely panelled in dark brown English walnut with elaborate carving in the English seventeenth-century manner by Mr. G. Haughton of Worcester. This apartment—which is in the front of the building, overlooking Trinity Square and the Tower of London—is 60 ft. long, about 40 ft. wide, and 38 ft. high.

There is a suite of apartments for Lord Devonport, the chairman of the Authority, this gentleman's own room being in walnut throughout, with quartered panels and a polished steel fireplace surrounded by richly carved Italian marble. The ceiling bears medallion heads—Neptune having a prominent place. The secretary's room and the reception-room are treated with oak. Medallions similar to those found upon the ceiling of the chairman's room, are in most of the other rooms, bearing the figured heads of the great navigators who at various periods left the Thames on voyages of exploration or adventure.

The furniture, too—for the clerks, mostly of solid oak—has been designed by or for Mr. Cooper, and is in harmony with the interiors.

The building is wonderfully true to its purpose, and, maybe, when even St. Paul's has disappeared and Macaulay's New Zealander stands upon the bridge, one shall still be able to point to the great dominating tower of the home of the P.L.A. H. J.

The general contractors were Messrs. John Mowlem & Co., Ltd., and the following firms were among the sub-contractors engaged upon the building: F. J. Barnes, Ltd., Portland, Dorset: and Bath and Portland Stone Firms, Ltd., Bath (Portland stone); Wouldham Cement Co., Ltd., West Thurrock, Grays, and G. and T. Earle, Ltd., Wilmington, Hull (cement); London Brick Co., Ltd. (Fletton bricks); Joseph Brooke and Sons, Hipperholme, Halifax (stone steps and landings); Wm. Oliver and Sons, Ltd., J. Gliksten and Son, Ltd., and Sydney Priday and Sons (hardwood); James Gibbons, Ltd., Wolverhampton (locks, and door furniture); G. Matthews, Ltd. (grates); Haywards, Ltd. (iron circular staircases and pavement lights); Mumford, Bailey and Preston (heating and ventilating); British Luxfer Co., Ltd. (fireproof glazing); Cope & Co. (tiling); Dorman, Long & Co., Ltd. (steel erection); Matthew Hall & Co. (plumbing); W. H. Heywood & Co. (patent glazing); Higgins and Griffiths (electric light fittings); Hollis Bros. & Co., Ltd., Jameson Chambers, Hull (wood block flooring); F. de Jong & Co., Ltd. (fibrous plaster); Lawford & Co. (asphalting); A. and F. Manuelle (granite); Wm. J. Rasey (glazing); Geo. Rome & Co., Ltd. (plastering); Wm. Smith (steel windows and ironwork); Smith, Major and Stevens, Ltd., Abbey Works, Northampton (lifts); Whitehead and Sons, Ltd. (Subiaco marble, architectural carving, and plaster modelling); J. Mowlem & Co., Ltd. (screens, counters, and all wall panelling); A. Emanuel and Sons, Ltd. (sanitary fittings); J. P. White and Son, Bedford (furniture and fittings).

NOTE.—Where no address is given the firm in question has a London office.

Enquiries Answered

Oregon Pine Fittings.

H. D. writes: "I am having some fittings, i.e., bookcase, cupboards, etc., made out of Oregon pine. How can this wood be treated so as to produce the pleasant dark colour which old eighteenth-century fine panelling, etc., assumes after the removal of the old paint work? I do not wish to use ordinary stain as this usually spoils the effect of the grain of the wood owing to the fact that the soft wood absorbs more stain than the hard."

—If it is not desired to apply stain, the only alternative I know is to await the action of light, which will in about ten years impart the rich dark colour referred to to almost any soft wood untreated in other ways. I have some American whitewood furniture which in that space of time has acquired a beautiful soft brown tone. To ensure a pleasant surface and colour in the meantime the woodwork should be finished clean from the tool—not glass-papered—and friction-polished by the use of handfuls of pine shavings applied with plenty of "elbow-grease." E.

Red Paint Coming Through.

C. R. writes: "About twenty years ago some old plastered chancel walls were decorated with a diaper pattern in red. They have since been distempered, but the red came through; they were then painted with oil paint, with a like result in course of time. The walls are at times a little damp, chiefly from condensation on the surface. Apparently some chemical treatment is needed to destroy the action of the pigment if nothing can be found to cover it up. Will you give me your advice? I have had similar trouble with white paint upon woodwork previously red."

—This is a frequent trouble in cases where "Fast reds," vermilionettes, signal red, or similar pigments of coal-tar derivation are used, and as they are cheaper than mercuric sulphide (vermilion) they generally are used. They will continue to "bleed" or ooze through any coat of paint applied over them, but probably a coat of silicate solution would enable a succeeding coat to be applied with some chance of standing. E.

Iron Slate Nails for Copper.

C. R. writes: "What is the best method of dealing with unauthorized deviations from drawings or specifications in cases where time and client will not allow of the work being done over again? For example, iron slate nails were substituted for copper. A deduction of the difference in cost between copper and iron would neither compensate the client nor impress the contractor sufficiently to make him more careful."

—The deduction of difference in value of nails would obviously be a quite inadequate recognition in this case, but if the client refuses to have the unauthorized substitution rectified (which would be the proper course), I should say that any alternate settlement could only be by agreement or by litigation. The damage suffered may prove considerable, as I have seen many instances, where, though slates, battens, and roof timbers were sound, roofs have had to be stripped and relaid at an age of, perhaps, twenty years, owing to ungalvanized iron nails having rusted so badly that numerous slates were slipping. E.

Estimating Cost of Work.

A. L. writes: "Could you advise me as to what you would consider a safe price to take in estimating the cost per cubic foot of: (1) public halls, and (2) public baths, to be erected in North Lancashire? The elevations will be of Accrington brick with Portland stone dressings, and the south front nearly all of stone. Both public hall floors to be on springs for dancing. If possible, in the case of the bath, give cost per cubic foot excluding fittings and an approximate cost of the latter, including the laying of a supply pipe main from the sea, 400 yd. from nearest south building line and about 5 ft. below street level."

—It is very difficult to give any idea of the cost of specific buildings at the present time as so much depends upon local conditions and prices are varying from day to day. The present prices are still from 100 to 125 per cent. in advance of pre-war prices for most building materials and labour. Public halls might possibly be built at the present time for 1s 9d. to 2s. per foot cube, and public baths without the fittings for 2s. 3d. to 2s. 6d. per foot cube, and with fittings 3s. per foot cube. Swimming baths 1s. per foot cube. To provide and lay a 4 in. supply pipe 400 yd. long and 5 ft. deep, might cost somewhere about £250.

HENRY ADAMS.

Architecture in the Lay Press

Mr. Walcot in the United States

"WILLIAM WALCOT, British etcher and painter, has sailed for the United States to utilize America's wealth of architectural achievements as subject material for his peculiar talents, which are already well known on both sides of the Atlantic. His visit to this country is at the invitation of some 3,000 American architects represented in such organizations as the Architectural League and the Beaux Arts.

"The plan to have Mr. Walcot come here has been crystallizing among American artists and architects for some time, and The World' has just been advised of his definite decision to accept the invitation rom his fellow craftsmen, who are making arrangements for a series of dinners, university lectures, and other functions n his honour.

"His prospective hosts in this country believe that America, though lacking in maturity of civilization, will, nevertheess, offer his versatile talent a fruitful ield for his play of imagination. They believe he will 'capture' the spirit of our ndustrial civilization, in the words of one American artist, finding in scenes that are prosaic to the too accustomed eye those evidences of a distinct spirit which he has caught and pictured in so many other ettings.

"The Woolworth Building, the East River bridges, sights in which the layman perceives only or chiefly mere bulk or ommercial enterprise, will, it is believed, hold for Mr. Walcot the keynote to the eal, inner spirit of this country. And an appreciation of some such possibilities n his visit is what led to the invitation or him to come here.

"London has served to demonstrate his apacity for getting into the inner signicances. In etchings and water-colours he has portrayed her familiar scenes in the ight of the whole atmosphere and meanng of Great Britain's history and her spirations. His pictures are 'part of he life of the cities,' as an eminent British critic expressed it. Probably New York and Chicago will be chosen as he backgrounds for the similar work which he is expected to do while on his our here."—"The New York World."

Home of the Navy for Two Hundred Years

"The Admiralty buildings in Whitehall each their 200th anniversary this year. Work on them was begun in 1722, and ompleted four years later. The buildings eplaced a fine mansion, Wallingford House, which was built in the second year f the reign of Charles II for William, Lord Knollys. Later it was acquired by William III, who turned it into an Admiralty office. Erected by Ripley, the resent buildings were described by Horace Walpole as 'most ugly,' but they re full of interesting memories. It was n the captains' room, dimly lit by wax apers, that Nelson's body lay in state n the night of January 8, 1806, having een brought up the river from Greenwich n a procession of gunboats and state arges. Next day the coffin was placed y men of the 'Victory' on a magnificent funeral car drawn by six led horses, and so England's greatest sailor was taken to burial in St. Paul's. In 1895 blocks of new offices were added in the rear of the older building, and extensions were made again in 1900 and 1905. In the old boardroom, with its great naval paintings and splendid carvings by Grinling Gibbons, there was formerly a dial over the chimney-piece, connected with a weather-vane on the roof, so that the Lords of the Admiralty, as they sat round their table, could look at the clock and tell how the wind blew for their fleets at sea."—"The Daily Chronicle."

Sky-Scrapers Coming?

"Is the era of the London sky-scraper at hand? We have had an attempt to brighten London. Now we are promised plans to heighten London. A committee has actually been appointed by the Association of Retail Distributors to consider the question. The committee, which is representative of the heads of the great department stores, has under its terms of reference a two-fold object:—

> "To negotiate with the L.C.C. regarding the height of future store buildings.
>
> "To arrange with fire offices a new basis for the assessment of the fire risk in modern stores.

"The scope of work, as decided at the first of a series of meetings (over which Mr. A. E. Cowper, of Messrs. Selfridge, presided) gives promise of important developments. It is likely to have its effect not only upon city stores, but upon all future buildings in every large centre of population. The services of experts will be enlisted, and with their assistance the committee will endeavour to define in a series of carefully drafted regulations, the Standard I Store.

"In such a building the fire risk would be reduced to a minimum. Every detail in safeguarding the shopping public and the large number of employees will be considered. Among the questions upon which it is proposed to take evidence from the experts are:—

> "The height and nature of future store structures, whether of steel or reinforced concrete.
>
> "The broad principles in the design and outlay of new stores, including all questions of lighting, heating, fireproof and waterproof stores, and wide staircases giving direct access to the street.
>
> "Fire-resisting, preventing, and fighting appliances, and the organization of house fire brigades.

"Communications are invited from manufacturers and others who are producing the various materials and apparatus which are necessary to build a perfect store. The committee will also endeavour to secure a new insurance rate for a Standard I Store."—"The Daily News."

£250 Houses in Sight

"The need for new houses has been variously estimated, and a round figure of 500,000 is often urged and accepted. It is not necessary here to discuss needs in terms of numbers, as they will vary with the standard of housing adopted as essential. Probably, even now, everyone possesses some shelter which is more or less worthy of the name of house or habitation, but how far the standard is that which a housing reformer may desire is another question. Already there have been erected, with Government assistance, approximately 175,000 houses. Under the existing scheme the total number to be provided is fixed at 220,000. . . . We are within sight of the £250 house, that is to say, the house which should be sold at £300 inclusive. One may hope, therefore, that the great independent agencies of supply may again be utilized in the provision of this essential to life. In many cases prospective tenants could and should be encouraged to obtain their own houses. Why do they not? Is it that the virility, independence, and self-reliance which have resulted in a world-wide empire and world-wide enterprise have been sapped? This is scarcely credible. It can only be that undue encouragement has been given to look to the State for the provision of houses, and the idea has been fostered that it is a serious inconvenience to own a house of one's own. . . . I can say with confidence that in the housing of the people we lead the way for the whole world."—Sir Charles T. Ruthen in "The Sunday Illustrated."

The Surviving Arch of Old London Bridge

"Were it not for the distractions of the hour, it cannot be believed that there would be any risk of one of the most hallowed relics of London's history being callously destroyed. Yet this seems to be in prospect unless the pressure which the Society for the Protection of Ancient Buildings brings upon Sir Robert MacAlpine at its interview proves strong enough to gain a reprieve for the surviving arch of the original London Bridge. When one speaks of 'the original London Bridge,' one alludes, of course, to stonework. There has always been a London Bridge as long as there was a London. There would have been no London without the bridge. It was simply the town at the bridge-head. None of London's institutions is in an equal sense 'bone of its bone.' It was already a world-famous institution when it was mentioned by Dante. . . . The bridge of which the last arch, just brought to light on the north side of the river, is now threatened, dates from about the year 1200. It withstood the hand of time for six centuries. This relic ought to be as sacred as anything in London's architecture. The contractor in whose hands the decision appears to lie shows himself not insusceptible to the claims of history, since he is willing to remove the stones and put them together again elsewhere. But the proposal, while well meant, misses the essential point. A monument is not of masonry alone; it is the masonry plus the site. Every lover of London's past must feel that to remove this arch, except under some overwhelming necessity, is in a very real sense the destruction of a piece of history itself."—A Correspondent of "The Observer."

STUDENTS' SECTION

Reinforced Concrete Calculations for Beginners. II

By Prof. HENRY ADAMS, M.Inst.C.E.

WE must now go a step further and see how to find the position of the neutral axis in a reinforced concrete beam according to the dimensions and the percentage of reinforcement.

Let A_s be the area of the reinforcement in sq. in., and A_c the effective area of concrete, then $A_c = b \times d$, the breadth multiplied by the effective depth. Let $p =$ the ratio of steel to concrete, or $\frac{A_s}{A_c}$; thus for 1 per cent. reinforcement $p = \frac{1}{100} = {\cdot}01$. Let $k =$ the fraction of the effective depth at which the neutral axis occurs, then $k \times d$ will equal the actual depth of the neutral axis below the compressed surface.

Before we can go any further it is necessary to explain what is meant by the elastic modulus, or coefficient of elasticity (E). The elastic modulus is the direct stress on any material divided by the deformation under stress, or tensile stress per sq. in. of section divided by the elongation in inches per inch of length. Thus for mild steel a bar with a sectional area of ½ sq. in. will be stretched, say, ·006 in. in a length of 8 in. by a pull of 11,200 lb. Then $\frac{11200}{\frac{1}{2}} = 22{,}400$ lb. tensile stress per sq. in., and $\frac{{\cdot}006}{8} = {\cdot}00075$ in. elongation in inches per inch of length, giving us $\frac{\text{stress}}{\text{strain}} = \frac{22400}{{\cdot}00075} = 29{,}866{,}667$ for the elastic modulus of mild steel. It usually varies between 29 and 30 millions, the latter being taken for the sake of having round numbers. This modulus of elasticity is often called the "stress-strain ratio" from the way it is obtained. In old books the modulus of elasticity, or "Young's Modulus of Elasticity," will be found described as "the force that would extend a bar 1 in. sq. to double its length." This, of course, is absurd, as nothing but very flexible indiarubber would conform to it; the statement should have been extended by adding "if the elongation could proceed at a uniform rate in proportion to the force applied." It is found that the elongation is only regular up to a point about half-way to the breaking weight, called the "elastic limit," and in mild steel this is also the "yield point" because there is a sudden jump in the elongation. Concrete is a much weaker material, and has, consequently, a lower elastic modulus. In the calculations for reinforced concrete it is necessary to know the ratio or proportion in this respect between the two materials. Let E_s be the elastic modulus of steel and E_c that of concrete, and m the ratio of the two. Then $m = \frac{E_s}{E_c} = \frac{30{,}000{,}000}{2{,}000{,}000} = 15$.

Now we are in a position to state the formula for position of neutral axis, which is $k = \sqrt{(p^2 m^2 + 2p.m)} - p.m$. We shall not attempt to prove the formula or show how it is derived as that can be done later on from a text-book.

Take the beam we considered before, 12×24 in., with an effective depth of 22⅝ in. to the centre of four ¾ in. rods, giving ·65 per cent. reinforcement.

$p = \frac{{\cdot}65}{100} = {\cdot}0065$; $m = 15$, then

$$\begin{aligned} k &= \sqrt{(p^2 m^2 + 2p.m)} - p.m \\ &= \sqrt{({\cdot}0065^2 \times 15^2 + 2 \times {\cdot}0065 \times 15)} - {\cdot}0065 \times 15 \\ &= \sqrt{({\cdot}00004225 \times 225 + {\cdot}195)} - {\cdot}0975 \\ &= \sqrt{({\cdot}0095 + {\cdot}195)} - {\cdot}0975 = \sqrt{{\cdot}2045} - {\cdot}0975 \\ &= {\cdot}4523 - {\cdot}0975 = {\cdot}355, \end{aligned}$$

the fraction of the depth at which the neutral axis will exist. The effective depth of beam is 22·625, which, multiplied by ·355, gives the actual depth of neutral axis as 8·03 in. from the upper surface.

Now, although the calculations are somewhat troublesome, it is worth while finding out how the position of the neutral axis would be altered by taking the larger reinforcement of four ⅞ in. rods. ⅞ in. diam. = ·6 sq. in. area, ·6×4 = 2·4 sq. in., 12×22·56 = 270·72;

$$\frac{2{\cdot}4 \times 100}{270{\cdot}72} = {\cdot}886 \text{ per cent.}$$

$p = \frac{{\cdot}886}{100} = {\cdot}00886$; $m = 15$, then

$$\begin{aligned} k &= \sqrt{(p^2 m^2 + 2p.m)} - p.m \\ &= \sqrt{({\cdot}00886^2 \times 15^2 + 2 \times {\cdot}00886 \times 15)} \\ &\qquad - {\cdot}00886 \times 15 \\ &= {\cdot}532 - {\cdot}1329 = {\cdot}399, \end{aligned}$$

and 22·56 × ·399 = 9 in. below top surface. So that increasing the percentage of reinforcement has lowered the neutral axis. The two results are shown in Figs. 3 and 4.

(To be continued.)

The Architectural Schools

The Architectural Association

The Architectural Association's educational work has developed since 1847, until at the present day the schools practically supersede the pupilage system, which in London and many provincial centres has been abandoned as a method of training those who propose to make architecture their profession.

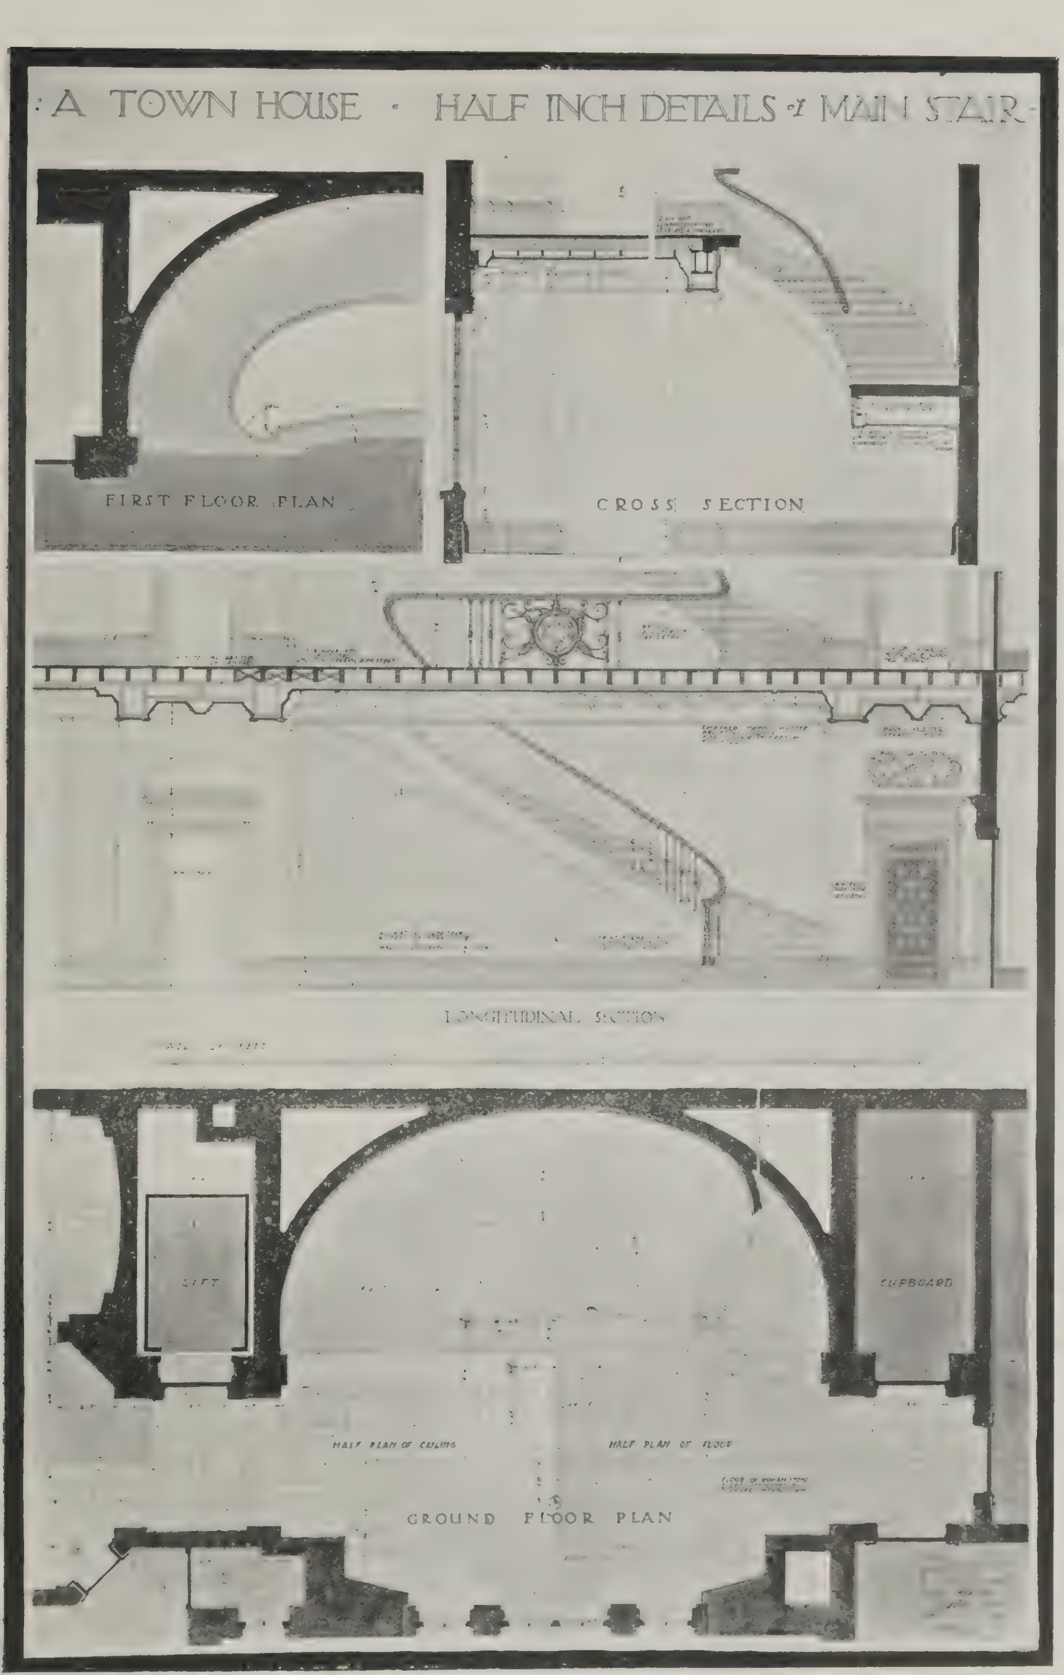
The development of the school has eliminated the need for students to sit for the various graded examinations, passes in which were necessary before admission could be gained to the recognized professional architectural bodies. The standard aimed at by the school is rather higher than was generally considered necessary in the past for qualification as a trained architect.

The work carried out in the five years forming the complete course has been systematized and carefully graduated with a view to obtaining the best results from the average student, and not with the idea of "forcing" and obtaining startling results from a favoured few. A brief capitulation of the various years and the work done in each is as follows :—

The first year students study the elements of buildings both in their architecture and construction. They receive explanations of the *raison d'être* of each element, these being synchronized with historical lectures showing the application of first principles. Geometry, perspective, freehand, sciography and colour values, etc., are taught progressively, but pure design is only studied sufficiently to form a basis for construction. The lessons learned in technique and theory are finally applied during each of the three terms in the execution of classic detail such as the "Orders."

In the second year the students specialize in portions of the practical and theoretical instruction given. More complex details of construction are studied and architectural design progresses based on historical periods—at first, compositions based on elements of the best examples of the principal periods, and, finally, original designs inspired by historical styles. Courses of lectures on history, decoration, construction, and the theory of design continue throughout all the years in the graduate course, and are synchronized with the practical work in the studios, while freehand and drawing are, of course, also studied.

The third year allows increased scope for design, there being no restriction to periods or styles, and construction is more advanced, working drawings being prepared with the design subjects as a basis. Twelve-hour studies in design are frequent, and the teaching of composition in mass and detail occupies a proportionately larger time than in the second year. Design and construction are taken as one



HALF-INCH DETAIL WORKING DRAWINGS OF A STAIRCASE FOR A TOWN HOUSE.

(By a Student of the Architectural Association.)

subject and not dissociated, and every effort is made to fit students for the commencement of outside work in architects' offices which will follow during the graduate course. A necessity for the architectural student is attention to measured work and outdoor sketching, and every encouragement is given for the prosecution of these during the holidays and during the summer term.

In the fourth and fifth years, forming the graduate courses, the curriculum is arranged to provide further training to an enhanced standard. The time spent is almost evenly divided between advanced design and construction, with the addition of special subjects, such as "decoration" and "town planning." It is also required that the students show proof of at least six months' experience in practical building work either during or after these years, before the final diploma is granted.

In order to provide training facilities for those students who have not had an opportunity of benefiting by a full course in the day schools, the Association provides an evening studio or "atelier" of design, independent of the day schools, where instruction is given to students who have had previous training and experience, but who wish to perfect themselves in architectural design.

The instruction at the A.A. Schools aims at applying a combination of the most satisfactory features found in the best similar institutions in this and other countries. In the study and working out of design the student is encouraged to absorb the lessons of all fine past traditions; with this as a basis, the school attempts to develop the capacity for logical thought and reasoning necessary for solving modern architectural problems, together with the technique necessary for expressing such solutions. The school does not desire to perpetuate any one style or "manner" in architecture, but encourages original thought, realizing that the individuality of the architect is as varied as the problems which he will later be called upon to solve. On the purely technical side the school aims at preparing students to meet the practical realities of the profession with trained knowledge.

A medal is presented annually by the Société des Architectes Diplomes par le Gouvernement, Paris, to the best diploma student in the school.

The teaching staff of the school is as follows: Director of Education, Robert Atkinson, F.R.I.B.A.; Principal, Howard Robertson, S.A.D.G., M.S.A.; First Year, E. H. Evans, A.R.I.B.A., G. D. G. Hake, A.R.I.B.A.; Second Year, E. R. Jarrett, A.R.I.B.A.; H. St. John Harrison, A.R.I.B.A.; Third Year, R. A. Duncan, A.R.I.B.A.; V. O. Refs, A.R.I.B.A., G. G. Clark; Fourth and Fifth Years (Graduate Course), L. H. Bucknell, A.R.I.B.A.; Atelier, H. Chalton Bradshaw, A.R.I.B.A. (Rome Scholar, 1913); Town Planning, L. H. Bucknell, A.R.I.B.A.; Architectural Decoration Course, L. H. Bucknell, A.R.I.B.A., T. B. W. Champneys; Art and Decorative Design Subjects, W. M. Keesey, A.R.C.A.; Garden Design Course, Hugh R. Dixon; Construction, P. H. Farmer.

The lecturers are: P. H. Farmer (mechanics; construction, second year); C. E. Varndell, F.R.I.B.A. (construction, third year; surveying, sanitation); H. Chalton Bradshaw, A.R.I.B.A. (history of architecture, first year; general history of architecture, second year; Greek and Roman history of architecture, second year; Renaissance); R. A. Duncan, A.R.I.B.A. (history of architecture, second year; mediæval); W. Harding Thompson, A.R.I.B.A., M.T.P.I. (theory of town planning); C. H. James, A.R.I.B.A. (communal planning and housing); Wm. Harvey, Gold Medallist, R.A. (Owen Jones' Student), (geometry and mathematics, first year; stereotomy, second year); Oscar Faber, D.Sc., A.M.I.C.E., O.B.E., etc. (reinforced concrete, steel construction); Hamilton H. Turner, Q.S.A. (professional procedure and practice, fourth and fifth years); Lawrence M. Tye, M.I.E.S. (electric lighting, fourth and fifth years); F. Broadhurst Craig, M.I.H.V.E. (heating and ventilation, third, fourth, and fifth years). The house master is W. T. Ching, A.R.I.B.A., and the librarian, Hope Bagenal, A.R.I.B.A.

Royal College of Art School of Architecture

The professor of the School of Architecture of the Royal College of Art is A. Beresford Pite, M.A., F.R.I.B.A., Hon. A.R.C.A., and the assistant instructor is L. M. Austin, A.R.I.B.A., A.R.C.A. The school has two courses. The lower division provides an auxiliary course for the schools of drawing and painting, design and sculpture. This course deals with the relation of the arts to architectural history and style; the spaces and forms of buildings that are decorated in colour or enriched with sculpture; the employment of the crafts in furnishing and completion; and the study of geometrical draughtsmanship for technical purposes. The upper division course is for the specialized study of architectural design by students intending to become architects.

Lower Division.

Students enter upon a course, suitable for their calling, in the architecture school, upon the recommendation of the professor of their own school; such a course may be taken as preliminary to or at subsequent periods of their college career. The general syllabus of the lower division includes historical design in craftsmanship based upon studies in the Victoria and Albert Museum; lectures and exercises in design, dealing with woodwork, Renaissance ornament, the mediæval crafts; Greek studies at the British Museum; with special studies from time to time—*e.g.*, Renaissance colour decoration of buildings, the employment of sculpture, etc.

Upper Division.

This division undertakes specialized study with a view to the Associateship in architecture. The standard of admission to the course corresponds with the qualification of entrance scholars in architecture, viz., the Intermediate Examination of the R.I.B.A., It is intended for those who have had preliminary training in an architect's office for two or three years, or have undertaken art school studies in conjunction with courses in building construction. Students are advised to undertake the course of the lower division as preliminary to the specialized study of this division. The aim of the course is the special study of the art of design in architecture, its objects and means of expression. It is based upon historical studies and upon modern requirements and materials.

Students of other schools of the College who have taken the lower division course may, with the permission of the professors, prepare designs combining architecture with colour decoration or sculpture in this division.

Post Diploma Study.

Advanced studies are continued. Designs for the prize competitions of the British School at Rome and of the R.I.B.A. may be undertaken. Measured surveys of buildings away from the College may be undertaken, the drawings being worked out in the school. Collaboration with painters, sculptors, and designers in a complete scheme for a building or for an important design may be arranged under the joint advice of the professors. Special studies with a view to the student's professional career may be made under the advice of the professor.

Entrance Tests.

The following are the works to be submitted and the entrance tests to be passed for the School of Architecture:—

(*a*) The works to be submitted by a candidate are five drawings, half double-elephant size, as follows:—

(1) and (2). Examples of two of the Greek and Roman orders of architecture. Each drawing should have two columns of one order complete, the columns being not less than 10 in. high, with details three times the scale of the column, and diagrams showing the application of the drawing to the whole building.

(3). A drawing of classic detail from the round, shaded.

(4) and (5). Two sheets of measured drawings of an existing building or portion of a building.

(*b*) The examination or test of the candidate at the College consists of making a drawing, to be plotted on the spot, from measurement, and executed in five days, of some architectural object in the Victoria and Albert Museum selected for the purpose.

Time allowed: 6 days.

Leeds School of Art

The Department of Architecture and Civic Design of the Leeds School of Art was founded in 1902, by the efforts of the Leeds Education Authority, and under the patronage of the Leeds and West Yorkshire Architectural Society. Since then the department has grown in numbers and importance, and to-day it is one of the most important centres of architecture in the North of England. In 1915 the department became a "recognized school" by sanction from the Board of Architectural Education, and students passing successfully through the prescribed courses are exempt from the Intermediate Examination of the R.I.B.A.

This year a diploma course has been founded, on the successful completion of which students will be awarded the "Diploma of the School of Architecture." The diploma course, which consists of the fourth and fifth years of study, represents a much more advanced standard of professional education, and indicates a high standard of excellence in design and art generally. It is the aim of the school authorities to bring the diploma course to the standard required by the Board of Architectural Education for exemption from the Associateship Examination of the R.I.B.A. at as early a date as possible. The school authorities are at present negotiating with the Board a scheme for "recognition" of the part-time course, whereby students successfully completing this course may be exempted from the Intermediate Examination of the R.I.B.A.

An arrangement has been made whereby students of the architectural department will attend day courses on building construction, etc., at the Central Technical School. These courses have been arranged specially for the students of the department, and the syllabus of study brought into line with the requirements of the Board of Architectural Education.

The Leeds and West Yorkshire Architectural Society take a deep interest in the work of the department of architecture, and their Council nominate representatives to visit the department periodically to inspect its work. The department has, therefore, unique advantages, in that students are afforded expert guidance in general art and drawing by attending classes in the other departments of the School of Art; training in construction and allied subjects at the Technical School; and the guidance and helpful criticisms of professional architects.

No classes take place on Friday evenings, these evenings being set apart for the meetings of the Leeds and West Yorkshire Architectural Society.

Students entering the department are required to produce evidence of a secondary education, and to pass an entrance examination in drawing and geometry. Students who fail to pass this entrance examination are required to take the preparatory course, at the end of which they may again submit to examination. If possible, students take the Matriculation examination of the Northern Universities' Joint Matriculation Board, or the Oxford or Cambridge Senior Local Examinations before beginning their architectural studies.

The entrance examination held in the department is accepted by the Board of Architectural Education as exempting successful students from the Probationership Examination of the R.I.B.A.

The staff of the school is as follows: Chairman, W. H. Thorp, F.R.I.B.A.; Principal, Harold H. Holden, A.R.C.A., A.M.C.; Head of Department, Joseph Addison, A.R.I.B.A., A.T.P.I., A.M.C.I.; Assistant Master, F. W. H. Allison, A.R.I.B.A.; Demonstrator, Walter C. Bickerton, A.R.I.B.A.

Lecturers and Demonstrators: Joseph Addison (Head), architectural design, town planning, civic design, history of architecture, etc.; F. W. H. Allison (Assistant), perspective sciagraphy, and rendering; W. B. McKay, M.R.S.I. (Head, Building Dept., Technical School), building construction, building science, structural work, etc.; J. V. Priestley (Tech. School), builders' quantities; H. E. Simpson (Head, Design Dept.), colour decoration and lettering; A. W. Pope, A.R.C.A. (Head, Painting Dept.), life drawing and antique; R. T. Cotterill, A.R.C.A. (Head, Modelling Dept.), stereotomy (practical) and modelling; J. E. Corr, A.M.C., freehand drawing.

Cambridge University School of Architecture

Following is a table of the lectures proposed by the Board of Architectural Studies, 1922–1923. [*All lectures, unless otherwise stated, will be given in the School of Architecture, 75 Trumpington Street.*]

Michaelmas Term, 1922.	Lent Term, 1923.	Easter Term, 1923.
School of Architecture under the direction of Mr. Theodore Fyfe, assisted by Mr. Hughes: Freehand and Architectural Drawing, Construction, Design, Materials and Practice of Architecture. Every weekday, 9–1, 4–7. £15 15s.	The same continued.	The same continued.
Mr. Lyon. Supervision in Design.*	The same continued.	The same continued.
Practical freehand drawing (for Engineering Students). W. 2. £1 1s.	The same continued.	Architectural Sketching Class. Th. 2.15.
First and Second Examinations in Architectural Studies 1923.		
I. GENERAL HISTORY OF ART.		
Mr. Fyfe. (*Mus. Class. Arch.*) The Classical Arts to the sixth century A.D. Alternate F. 5. Oct. 13.†	The same continued.	The same continued.
Prof. E. S. Prior. (*Mus. Class. Arch.*) European Mediæval Art, A.D. 300–1150. Alternate F. 5. Oct. 20.	The same continued. A.D. 1150–1350.	The same continued. A.D. 1350–1550.
Mr. Hughes. English Architecture, A.D. 1066–1640. Tu. 5. Oct. 17.†	The same continued. T. 5.†	
Prof. Beresford Pite. Development of Mediæval Construction. W. 4.30. Oct. 18.†	Renaissance Architecture. W. 4.30.†	Renaissance and Modern Architecture. W. 4.30.†
Prof. E. S. Prior. (*Mus. Class. Arch.*) Flemish Art. Alternate F. 3.30. Oct. 27.		
Mr. A. B. Cook. (*Mus. Class. Arch.*) Greek and Roman Sculpture. M. F. 12.10. Fee 10s. 6d. Greek and Roman Architecture. Tu. Th. 12.10. Fee 10s. 6d.	The same continued. Tu. Th. 12.10.	Greek and Roman Painting. S. 10.
Mr. Kaines Smith. (*Magd.*) Historical Painting (4 lectures). F. Nov. 3. 5.30 p.m. No fee.		
Mr. Vulliamy. (*Arts School.*)		
Mr. Constable. (*Arts School.*) Italian Art in the time of Dante† (6 lectures, times to be announced).		
French Art in the 17th and 18th centuries† (6 lectures, times to be announced).		
Mr. Bullough. (*Arts School.*) General Æsthetics. W. 5.30. Oct. 18.		
II. ELEMENTARY DESIGN AND DRAWING.		
Mr. Fyfe. General review of the work of the School. Tu. 9. Oct. 17.	The same continued.	The same continued.
Mr. Hughes. Construction: the building of a house.*		
Prof. Beresford Pite. Planning (demonstrations and criticisms on design-subjects). Th. 9. Oct. 19.	The same continued.	The same continued.
III. PROPERTIES OF MATERIALS, ELEMENTARY MECHANICS, PRACTICAL MATHEMATICS.		
Mr. Moullin, Mr. Fyfe, and Mr. Hughes. Lectures and Classes.*	The same continued.	The same continued.

I. Courses will also be arranged for candidates for Parts I and II of the examination in Architectural Studies and the Special examinations in Architectural Construction and History of Art.

II. Courses in the History of Art as a principal subject for the Ordinary B.A. Degree will also be arranged. Several of the above courses will be suitable for candidates, who should consult the Secretary of the Board, Mr. Edward Bullough, Gonville and Caius College.

It should be distinctly understood that Parts I, II, and III are based on the requirements for first-year students only in the official "Regulations for the Architectural Examinations." They are not intended to cover all the requirements for second- and third-year students.

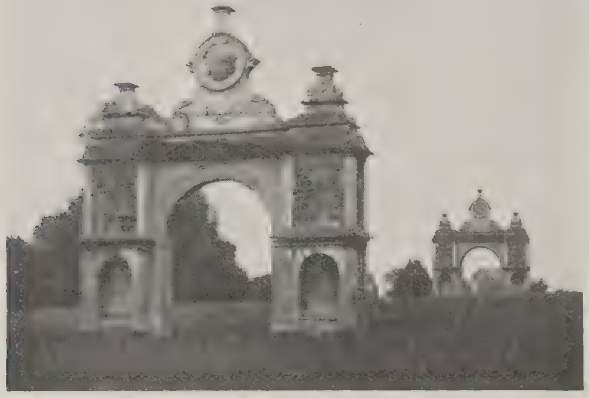
* Times to be arranged at the beginning of each Term. Students are requested to put themselves at once into communication with Mr. Fyfe, School of Architecture, Trumpington Street (opposite Pembroke College).

† External Students will be charged half a guinea.

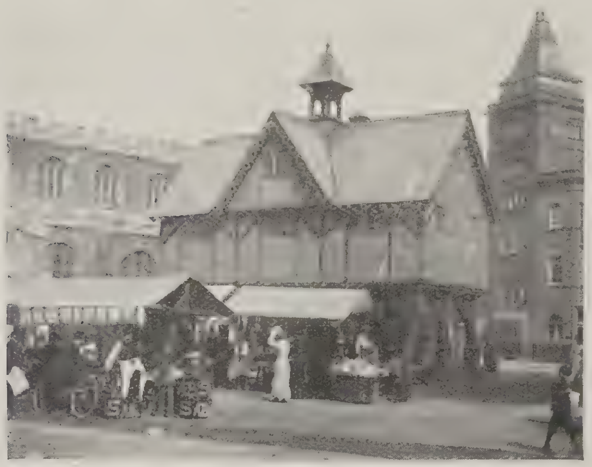
A Pictorial Review

Illustrations of Topical, Practical, or Curious Interest

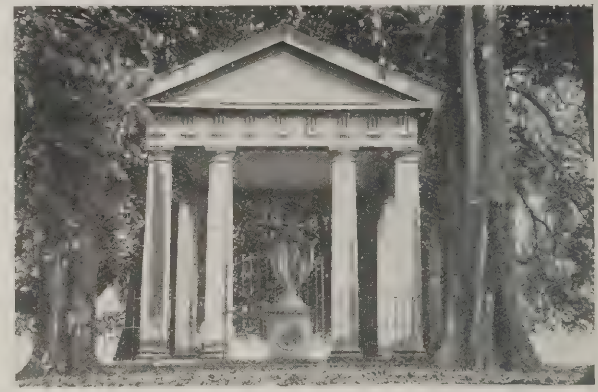
Readers are invited to send in sketches and photographs for publication in these pages. A fee of 2s. 6d. will be paid for each illustration accepted. Contributions should be accompanied by short explanatory notes.



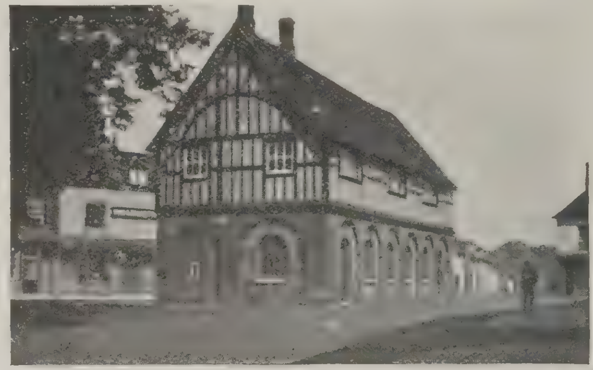
" Holmby Arches "—all that remains of Holmby House, in Northants, built in 1585 by Lord Chancellor Hatton, and referred to by Sir Thomas Heneage as " the best and most considerate house that yet mine eyes have ever seen. It shall hold the pre-eminence of all the modern houses I have known or heard of in England." Holmby Arches are interesting specimens of early Renaissance work—bearing the date 1585. They stood on each side of the quadrangle in the front of the house, which was demolished by order of the Parliament about 1647.—J. B. TWYCROSS.



In the middle of Market Harborough Market Place stands a curious structure on arches, around which on market days the traders erect their stalls. The building was once the Grammar School, erected and endowed in the seventeenth century by Robert Smyth, a wealthy citizen of London. The school is now carried on in more commodious premises.—J. B. TWYCROSS.



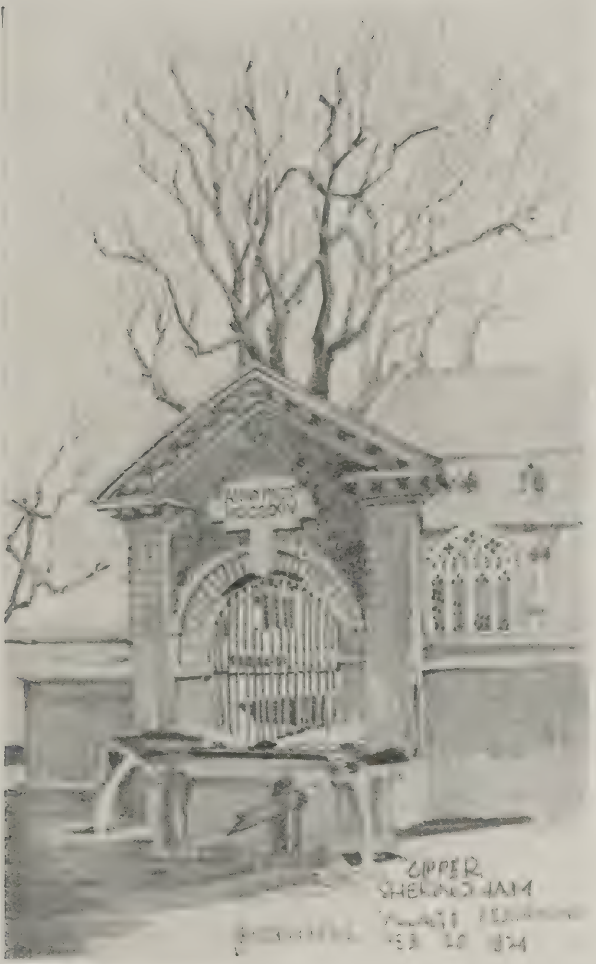
The curious eighteenth-century 'Town Hall " in Gatton Park, Surrey. Gatton was one of the most notorious of the " rotten boroughs " which were swept away by the Reform Act of 1832. In the Town Hall the free and independent electors of Gatton (who in 1832 numbered five !) were wont to record their votes. J. B. TWYCROSS.



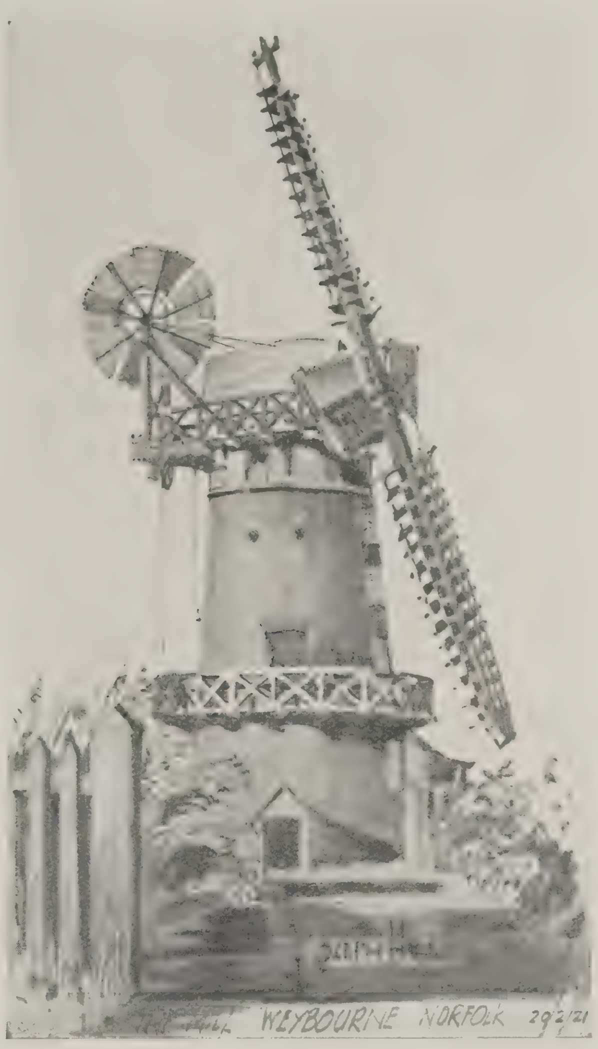
Alcester Town Hall (1600–1641) is a half-timber upper hall supported on Doric columns. The whole ground floor was enclosed by the Marquis of Hertford in 1874, and fitted up as a Petty Sessions Court.—HANKS AND CROWDER.

The Ponte Vecchio, Florence, erected in 1345 by Taddeo Gaddi, stands on the site of several older structures dating back to classical times. It is notable for its picturesque old shops overhanging the river. Ever since the bridge was built these shops have been the exclusive property of the local goldsmiths.—J. B. DOWNES.

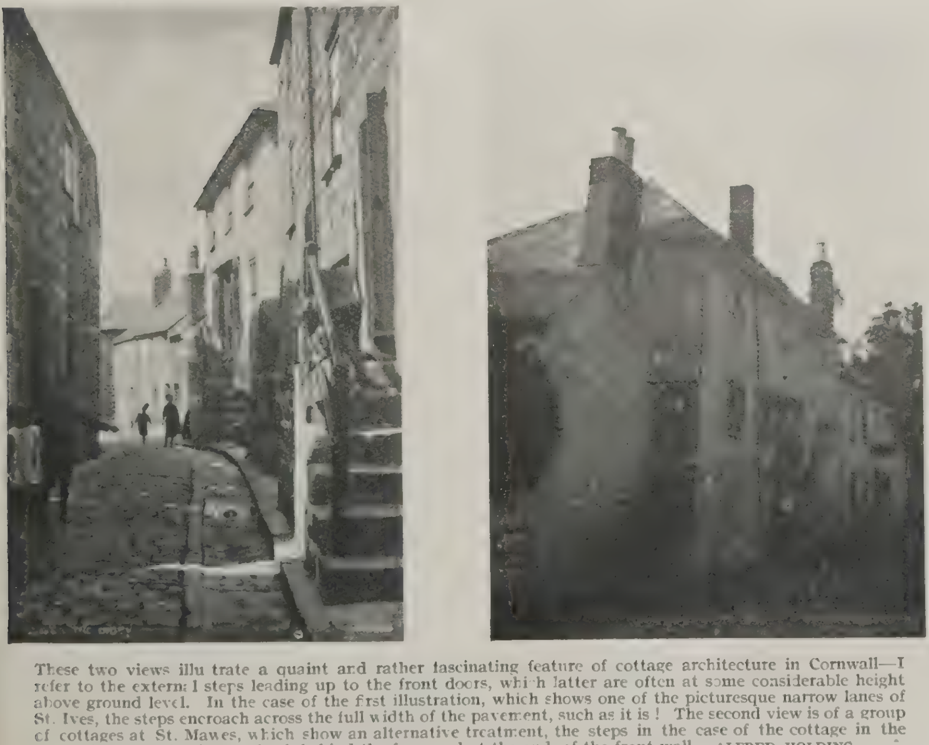
A Pictorial Review



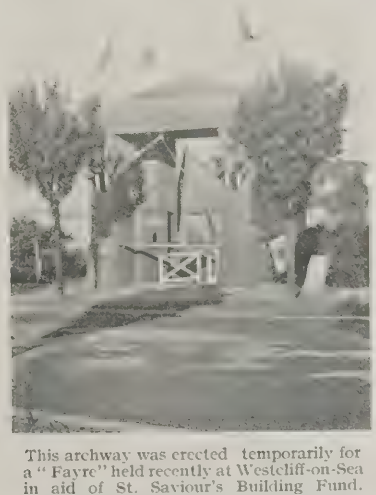
This old memorial, at Upper Sheringham, takes the form of a small reservoir, consisting of a brick basin and wall, circular on plan, and constructed around a natural source of clear water, which has been led to a point where the road is widest. Red bricks of good texture and rich colour are relieved by flints as infilling. The water flows under a wrought-iron grille of simple design into a trough for the use of horses and cattle, and the overflow passes into a drain; there are also points to draw off water for human consumption. This pleasant treatment of a subject which is utilitarian, as well as decorative in the highest sense, forms a small memorial worthy of passing down to posterity.—JOSEPH HILL.



It is unfortunate that many of our English windmills are rapidly falling into disuse and disrepair; this condition is usually followed by complete ruin, and we are gradually losing a delightful series of buildings. Throughout Norfolk there are ruins of mills to be seen in almost every village, and it is, alas! rare to find one in working order and good repair. The mill at Weybourne is fortunately well preserved, and forms a most pleasing landmark; it occupies a commanding site above the village, is well proportioned, and of great dignity.—JOSEPH HILL.



These two views illustrate a quaint and rather fascinating feature of cottage architecture in Cornwall—I refer to the external steps leading up to the front doors, which latter are often at some considerable height above ground level. In the case of the first illustration, which shows one of the picturesque narrow lanes of St. Ives, the steps encroach across the full width of the pavement, such as it is! The second view is of a group of cottages at St. Mawes, which show an alternative treatment, the steps in the case of the cottage in the foreground being set back behind the face, and at the end, of the front wall.—ALFRED HOLDING.

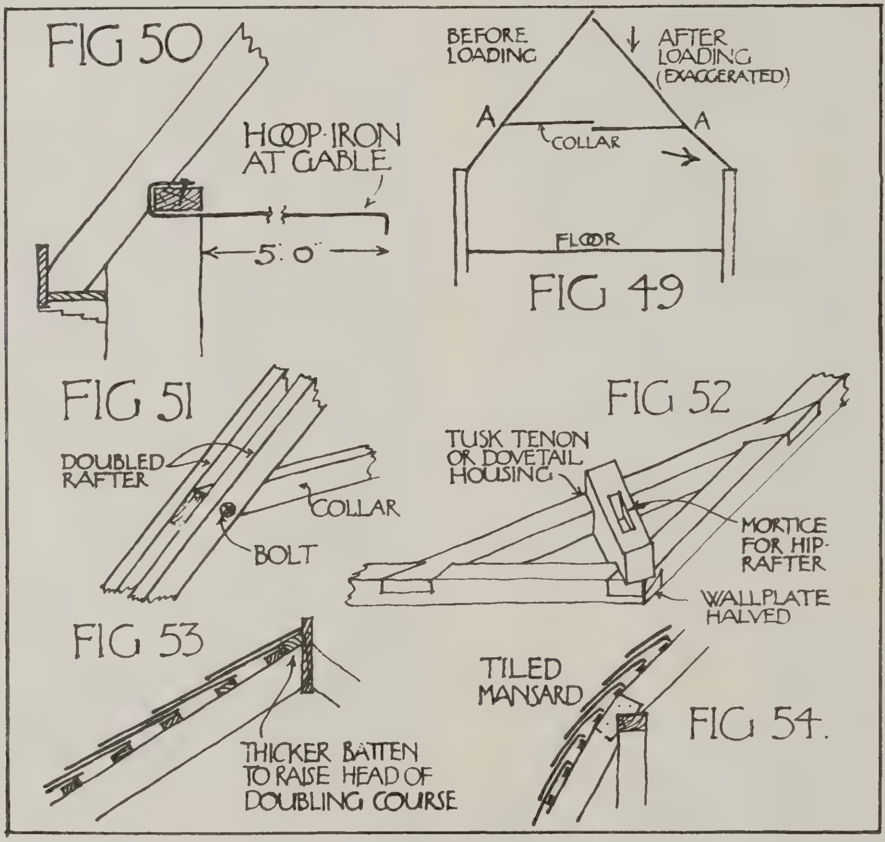


This archway was erected temporarily for a "Fayre" held recently at Westcliff-on-Sea in aid of St. Saviour's Building Fund. The construction was carried out with a light timber framing, covered in canvas, and sized, and then painted. The arch was 18 ft. wide by 23 ft. high overall. The ticket offices were placed in between the two side piers which were 3 ft. square.—S. C. C.

Little Things that Matter. XVI—Counteracting the Weaknesses of Collar Roofs

By EDWIN GUNN, A.R.I.B.A.

THE collar roof, so often used in cottage design, has several notable structural weaknesses, which, though not fatal, are troublesome unless they are counteracted. One of these is that the tie afforded by the ceiling joists does not prevent the lower part of the rafters from spreading; thus the laying of the tiling results almost invariably in a slight deflection about the point A (Fig. 49), with a consequent movement of the wall-plate—or possibly the inclination of the wall. It is desirable to counteract this tendency. At the gable ends this may be done by building in hoop-iron at the springing, as shown in Fig. 50, and carrying it back, say, 5 ft. into the gable wall, and wrapping the opposite end round the wall-plate and securing it by a spike or screw. Intermediately, every fourth rafter or so should be 1 in. thicker than the common rafters, and the collar housed in to that extent by a dovetail housing. As an alternative, two rafters of the ordinary scantling may be used, with the collar clipped between them and the whole bolted together, as in Fig. 51. This latter method is a good one in all cases where the roof is trimmed for dormers, as one of the coupled rafters remains uncut.



For the further stiffening of collar roofs, a longitudinal runner suspended on hangers spiked to the ridge is useful, particularly if it is used in conjunction with light purlins strutted therefrom. It should be noted that collar roofs are often over-timbered in the effort to stiffen their somewhat weak form. Much better results are obtained by an extra inch on the rafters than by heavy purlins. Even if the purlins stiffen the roof they add weight to the total to be borne by the rafter feet, and so often rob more than they confer.

Small valleys, such as dormer intersections, are much better without valley rafters. They should be treated merely by laying valley boards on the main slopes to receive the feet of the jack rafters, and supporting the feet of the main rafters on trimmers or beams across the opening, as shown on Fig. 20 (see issue for Feb. 22). This treatment eliminates the severe thrust of the valley rafters and avoids what is sometimes a very awkward feature in the interior, viz., a bit of timber to be wrought or cased breaking up the continuity of the plaster ceiling.

Although a hip has less thrust than a valley, it is unwise in the case of a main roof of hipped form to omit the old-fashioned dragon (or "dragging") tie (Fig. 52), even where this will necessarily show in the rooms. In the latter case the projection may be ceiled over below, and a plastered spandril formed above it. This provides a rather interesting feature, which is by no means unsightly.

I have found it helpful to specify that the end rafters next to the gables should be fixed 1 in. higher than the common rafters to assist in tilting up the tiling at the verge, and so prevent water from overrunning the gables in times of heavy rain. This is easily accomplished by reducing the notching of the end rafters over the plates and the purlins.

In slated roofs it should be remembered that the topmost batten next to the ridge should be ½ in. thicker than the remainder so that the under-ridge course of slates will bed properly and not "ride" (see Fig. 53). Tiles do not require this precaution, because they are assured of bedding well by the camber in their length, but slates, being straight, depend on the eaves' tilt for clearance, and the short under-ridge course loses this. Incidentally, for this reason, it is an advantage if the slopes of a roof intended to be covered with slates have a slight sag or concavity; therefore, if the rafters are found to have a slight curvature when fixing, the *concave* side should be placed upwards.

The camber of the tiles, which makes it possible to ignore this point in tile roofing, also renders it quite easy to pass from one slope to another, as in a curb or mansard, where the slopes do not differ by more than, say, 15 deg. (see Fig. 54). Hundreds of old roofs in the Home Counties demonstrate this, but an unnecessary lead apron is often added in present-day work.

The Manchester Town Planning Exhibition and Conference

An important town-planning exhibition and conference, convened by the Manchester and District Joint Town Planning Advisory Committee, was held in the Town Hall, Manchester, during last week. The Committee represent an area of over seven hundred square miles, embracing over seventy local authorities. At the conference, papers were read by some of the foremost town-planners in this country. The exhibition included maps, diagrams, and models showing the growth of, and the town-planning proposals with regard to, various towns in England, in America, and on the Continent. Appended are extracts from two of the papers read before the Conference. Extracts from some of the other papers will be published next week.

Regional Planning

By Professor Patrick Abercrombie

It would be difficult to say which country originated the idea of Regional Planning; but so far as I have been able to gather from some years' study, the metropolitan district of Massachusetts has been the first to put Regional Planning into execution. It must be understood that the term "Regional Planning" is intended to signify something much wider than the need that has always been felt, and has been very largely exercised in the past, for a single town to obtain control of developments which, though they may be outside the borders of its jurisdiction, are manifestly merely offshoots of its own growth. The ideas of Greater London, Greater Paris, Greater Berlin, and Greater Brussels are certainly no new things; though it may be remarked that the carrying out of these extensions of civic powers has frequently remained at the stage of suggestions and ideas evolved by the central town but resisted by the smaller communities on the score of cost: furthermore, the bugbear of city extension has always been at the back of these one-city regional schemes.

In this country there has been a danger, as has been pointed out by one or two thoughtful critics, of our perpetuating on a larger scale some of the errors of the estate development of the nineteenth century, in which schemes of development, which may be good in themselves, have not been sufficiently wide in their outlook to meet neighbouring needs.

The Commission's Report on the South Wales Coalfield, mutilated though it was in publication (owing to short-sighted notions of economy), is nevertheless the "Case for Regional Planning," as Mr. Aldridge's book is for Town Planning. Once for all, backed by all the evidence of mine owners, workers, local authorities, is the need for joint action definitely demonstrated. The South Wales Report was not really a Regional Survey (though so-called), and much less a Regional Plan, but a preliminary study and proof of the need for Regional Planning; and it is well worth reading as a text-book as to what Regional Planning means and what a Regional Plan should contain.

What was not, perhaps, laboured as fully as it might have been was the need for Regional Survey prepared in a graphic manner in order to emphasize the essential unity of the region. Whether or not it is essential to prepare a survey for an individual town (the argument against the need for one being that those who know their city well should carry the survey of it about in their heads) there can be little doubt of the need for a survey where many authorities are involved, and the facilities for study of joint problems have not hitherto existed. Roughly speaking, the more fully developed the area the greater the need for a complete survey. Where, as in the case of the Doncaster Regional Planning Scheme, the land is still largely agricultural with only one or two towns and a group of villages, the survey can be reduced to a minimum. Road traffic, the materials for a survey of which it is hoped will in future always be available from the Ministry of Transport, is naturally the first that will be demanded. In the case of Doncaster, however, there was a special need which was very largely at the basis of the whole scheme, namely, the probability of surface subsidence owing to coal working. The effect of this survey was to restrict all residential development to land above the 25 ft. to 30 ft. contour with all the consequential need for careful planning and grouping of the population. In the Manchester district the beginnings of a Regional Survey was in existence at the time the Joint Committee was formed, a survey that was prepared owing to special war conditions, and though by no means complete it is to be hoped that at least in two of its aspects, Road Traffic and Open Spaces, it will prove useful to the scheme that is at present being evolved. In the case of the Chester and Deeside Regional Planning Scheme no direct preliminary survey work was undertaken. There perhaps the most necessary thing was a study of the existing mineral resources; but again, as in the Doncaster area, the land being largely undeveloped, careful scrutiny and study on the spot was enough in most cases to make clear the general trend of developments.

It also happened that this Deeside scheme formed part of a wider Regional Survey centering at Liverpool University with its headquarters in the Geographical Department. This survey, which aims at having each section prepared by an expert in the subject, with the necessary co-ordination secured by constant meetings of the heads of sections, is the most comprehensive framework of a Regional Survey that has yet been attempted. Its promoters consider that one of the chief functions of such a survey is to give the guiding lines upon which all future development should be based, in other words, that it would not simply content itself with being a record of the existing state of affairs, but should aim at foreshadowing the lines of growth. Thus, taking, perhaps, one of the most interesting patches of country geographically to be found in the north, namely, the Wirral Peninsula, it will have to be determined, if a satisfactory scheme is to be evolved, what is the probable destiny of this piece of country. Is it to be preserved as a gigantic residential suburb of Liverpool, or are factories to be encouraged to spring up in almost any situation they wish? Both banks of the Mersey, it is acknowledged, are, and are about to be, industrialized, and the far side of the Dee, for which a regional scheme has already been prepared, has been shown unquestionably to tend towards industrial development, though of a different type from the Mersey. The Liverpool Regional Survey Association contends, and I think rightly, that this is no simple problem to be resolved offhand, but that it requires a graphic presentation of all the facts, not only of to-day but of yesterday, in order to have some possibility of visualizing to-morrow.

Turning to Regional Planning proper, it will be obvious that a different method of approach is necessary in different localities—where less development has taken place greater freedom of suggestion is possible. Thus at Doncaster, with large tracts of land debarred from housing, it was necessary to indicate clearly-marked centres at which residential development could take place and should be encouraged in order to provide communities of workpeople for the factories, which would be located on the low-lying land. Furthermore the collieries, at present situated at an average of about three to four miles apart, themselves promote the growth of separate village communities. The result, therefore, instead of a single homogeneous town of the size, we will say, of Sheffield or Leeds, should be a series of communities complete as to their civic functions, but of a size limited in most cases to 20,000, though extending in one or two cases to 50,000 inhabitants, separated by farm land or park strips, but all communicating directly with Doncaster as their natural metropolis for trade, culture, and recreation. It will be seen that a very complete and even drastic system of zoning was necessary to secure development upon these lines, and it would be interesting to watch how the town-planning schemes are adequate to realize the objects of the plan.

In the Deeside scheme there are many extremely interesting and complicated problems, not the least being that of the City of Chester itself. The rôle which Chester should play in the regional development was very carefully gone into by the Committee, and the interesting position was observed of a town voluntarily deciding to keep factory development of the "heavy trades" type at arms' length, foregoing the consequent increase of rateable value in order that its amenities should not be destroyed. While at the same time this must not in any sense be regarded as indicating that Chester was not prepared to develop very materially as a reaction to industrial development lower down the Dee, it meant that a full regional consideration showed that its true function and interests lay in other directions than directly industrial. Here again outside Chester itself it was possible to evolve an almost detailed zoning plan for the lower Dee Valley, in which the heavy trades flanked the river, the residential areas occupying rising ground on both sides, and (perhaps the most hopeful feature of the scheme) an agricultural belt separating the two. This agricultural belt is not to be used for residential purposes unless the latter were necessary for agricultural pursuits, and the only change in its use to be permitted is that it may eventually practically all be absorbed for recreation space.

The south Teeside is not so far advanced as the Doncaster and Chester ones, but there it would seem that the road question is the dominant factor. A great backbone is required to give a sense of structure to a region which for five miles is an almost continuous industrial development of comparatively recent growth; and beyond again it is required to act as the means of opening up residential development and giving access to the seaside.

The Manchester district, like that of South Wales, being already largely developed, presents greater problems for the purposes of drastic zoning, as it must be extremely difficult at this stage to impose restrictions on the limited amount of free land which is left. But it would seem that, in the direction of positive planning suggestions, there is scope as well as manifest necessity for producing a south-east Lancashire and North Cheshire Park System. If some definite standard, such as one acre per 250 people, were agreed upon, and the most likely land scheduled, it should be possible on the lines of the Boston Park System to evolve a satisfactory series of open spaces quite irrespective of the local authorities in which the different parts were situated, but distributed in such a way as to meet the needs of the populations contiguous.

Progressive Town Planning

By George L. Pepler, F.S.I., Past President, Town Planning Institute

FIRST may I be allowed to say how much I appreciate that the invitation to address this conference came from the Manchester and District Joint Town Planning Advisory Committee, under whose auspices the conference and exhibition are being held. As having had something to do with the beginnings of that Committee I may be prejudiced, but it does seem to me unquestionable that its work is already proving of immense value to this region and that its possibilities are boundless.

Many aspects of town planning are being dealt with, largely in relation to its fundamental importance in the field of economy and industrial efficiency. This is naturally the thought uppermost at the moment, as our huge war effort has left us in arrears and we are perforce beginning to appreciate that we can no longer afford the haphazard and therefore wasteful ways of the past. To-day only the nation whose business is conducted on the most efficient and economical lines can hope to survive, and it is just because this extra efficiency is now so necessary that town planning is coming to the fore; also the less money we have to spend the more important it is, by careful planning, to make it go a long way.

The American business man, although starting town planning later than we did, and even having taken longer than some of our merchant princes, such as Lever, Cadbury, Rowntree, to tumble to this aspect of the case, has recently caught up and is boosting town planning in his own city with the object of making it the most efficient and delectable spot on God's Earth.

The method of town planning is first to study and analyze, regionally as far as possible, existing local conditions and prospects (it is extraordinary how little thought has been given to this in the past, and how much ignorance there often is—because the facts have never been collected, collated, and published—as to the resources and possibilities of a neighbourhood and as to the origin of disabilities that are experienced but not understood), followed by the preparation of an outline plan assigning to each part the use that would seem best to forward the prosperity of the community, and laying down the line of intercommunication.

That is, after careful study of what is, the most skilful plan is made of what ought to be, so that as development takes place it may be diverted in the best channels. Although lack of provision in the past has landed us in much expense and loss of efficiency to-day, prophecy also has dangers and, therefore, schemes will contain elastic provisions, so that details shall not be fixed until the proper destiny of the section in question is determinable. Should the whole conditions of the district suffer a complete change, then a new scheme can be prepared to supersede the original one.

Motor traffic is increasing every day, and, therefore, in our town plans we have not only to provide for the needs of to-day, but must have regard to the requirements of to-morrow, otherwise we must expect to suffer from congestion of the arteries, a disease that saps efficiency and one very expensive to cure after building development has taken place.

Up till the advent of town planning all roads were being made of the same width and construction for whatever purpose they were to be used, and this is, of course, necessary when there is no general plan which will, in effect, dictate the use. Now that areas can be allocated to specific uses, and the direction of roads controlled, it is possible to design a road in accordance with the traffic it will have to bear, and the wasteful uniform method need no longer be followed.

Another progressive feature that will appeal to the public and to local authorities is aviation. The importance of this matter can hardly be exaggerated in connection with town planning. Firstly, sites that offer good landing facilities are not common, and therefore it is most necessary to reserve the right one; secondly, linking up the aerodrome with a good road service will enormously increase its efficiency. I believe that there is no other city in the country with such a well-situated aerodrome as the Manchester one.

I suggest it is worth considering whether the town planning committee of a council or region should not become in effect a development committee, continually investigating the town's activities, in co-operation with the people responsible for them, in order to see how the various parts are functioning, detecting the obstacles that impair efficiency, noting where there is overlapping and, therefore, waste, ascertaining for which activities there is the greatest future, and how the accomplishment of that future can be helped forward by arrangement or rearrangement of site facilities.

They would, for instance, study the vital statistics and compare them on plan with housing conditions, etc., and find out the weak spots, e.g., bad housing conditions, lack of recreation facilities, that were handicapping the progress of the town. They would similarly compare traffic statistics and find where money was being lost by traffic blocks or constant slowing down, and where accidents were happening.

They would, perhaps, discover areas neglected in favour of others further afield on account of lack of transport facilities, and that, given those facilities, might be developed to the advantage of the town by keeping it compact instead of straggling, and so save waste of time and money between home and work.

They would study the industrial areas and consider how their efficiency might be improved, both as regards the public services they depend on and as regards the possibility of expansion, or the facilities that might be provided to attract new industries, either entirely, additional, or supplementary to sound existing ones, or to supplant those that are dying.

They would put the result of all these investigations on paper, plotted so that their lesson would be obvious to the ordinary citizen, and also they would show on paper in graphic form their plans for guiding development along the most progressive lines, so that everyone in the town would become aware that they were members of a live organism, the progress and healthy development of which depended on all the citizens pulling together towards a definite end.

Also any manufacturer either local or from outside would be able to appreciate at once what were the possibilities of the district, and have firm ground on which to base his business enterprise.

It is a common complaint to-day that the ordinary man takes little interest in local government. To my mind this is easily understood, because the ordinary man has not been brought up to realize his citizenship—he has rarely ever had access to an easily read up-to-date plan of his town—and it has not been obvious that he was called upon to do his bit towards achieving a definite goal. This was a maxim of one of the pioneers of flying: "If you know what you want, you can do your part and get others to do theirs. Most people don't know what they want." Let the City Fathers show their constituents in graphic form a plan of the type of city they are aiming at, and I believe they will at once arouse their interest and enthusiasm.

Personally I would recommend doing this in sketch form before you make your final statutory plans, because you want the constructive criticism of all your citizens, especially those who are developing industries, and this can hardly be forthcoming until something tangible has been put before them.

There are many matters of principle that want to be freely discussed; for example, is it sound to let a town spread and spread from one centre, or must not that centre get hopelessly congested and, therefore, might not a better plan be to develop subsidiary centres, closely in touch with the main centre, but kept distinct by intervals of open space utilized for recreation and food production? The type of town plan you adopt depends entirely on the answer to this question, provided you are prepared to face up to the consequences of adopting the method you know to be sound.

Another problem to face is the amount of playground space that is really required in order to keep people physically fit, and how it ought to be spaced so that the drudgery of reaching it may not impair its benefit.

Questions like this can only be solved if the citizens appreciate the issues involved, balance the considerations, make up their minds what is best for the town as a whole, and support it through thick and thin. They would be in a much better position to do so if from infancy they had been brought up to understand their surroundings. Let us then encourage the modern tendency for history, geography, and political economy to be taught to pupils mainly by study of their own town and district, and let us include in that the projected plan, so that when the children grow up they shall be fully conscious of the importance to themselves and their neighbours of the prospects of the place in which they live.

The Week's News

Bournemouth Pier Improvements.

During the winter Bournemouth pier is to be repaired and the lighting improved at a cost of £15,000.

Future of Grosvenor House.

It is asserted that Grosvenor House will shortly be acquired by a financial syndicate, who propose to erect on its site a block of residential flats.

Fulham Baths.

The cost of reconstructing Fulham casual wards into public slipper baths by the Borough Council will be about £25,000.

New Forth Bridge.

A report on a scheme for the erection of a huge bridge over the Forth at Alloa at a cost of £171,000 has been approved by the Stirling County Council.

New Hotel for Glasgow.

A new hotel is to be erected in Glasgow on a site near the Central Railway Station. The promoters have acquired the corner properties at Wellington and Waterloo Streets. Plans are being prepared by Mr. W. Inglis, I.A.

The Lighting of Churches.

Lecturing on British architecture at Lincoln, the Bishop of Lincoln said it was a pity that modern church architects did not follow the example of mediæval ones, and provide plenty of windows in church.

Golders Green Tube Station.

The Ministry of Health has sanctioned the application of the Hendon Council for a loan of £1,900 as their contribution towards the cost of alterations and extensions to Golders Green Tube station.

Change of Addresses.

Mr. J. V. Downes has moved to 19 Norfolk Square, Paddington, W.2.

Mr. Hamilton H. Turner, F.S.I., surveyor, has moved to 18 Queen Anne's Gate, Westminster, S.W.1.

Brighton War Memorial.

Brighton war memorial, recently unveiled, consists of a colonnade of square piers, in the centre of which is a small domed shrine containing an altar table. In front of the memorial is a lily pond, while the tablet to the memory of the fallen contains 2,600 names.

New Theatre for Bridgwater.

It is proposed to erect a theatre in Bridgwater fully equipped for both pictures and dramatic productions, with accommodation for adequate staging, etc., the building to be also available for public meetings. Preliminary plans have already been prepared by a local architect.

Bridge or Tunnel?

The question of a bridge or tunnel between the two sides of the Mersey has been discussed, and a report is to be received from two engineers which will show the cost, and enable the municipalities to say whether they are prepared to carry out the scheme.

£25,000 Pavilion for Margate.

Margate Town Council has adopted a proposal to construct a bathing pavilion on the Marine Terrace sands at an estimated cost of £25,000. The pavilion will provide accommodation for 300 persons, and hot and cold shower-baths. It is hoped to have it ready by next season.

Public Works at Uruguay.

Nearly nine million pesos are to be spent in the building of cheap houses and administration building, the construction of a slaughter-house and a municipal bakery, public lavatories and baths, sanitary works, markets, construction and repair of roads, a public restaurant, and other public works.

£1,000,000 British Contracts.

Contracts amounting to upwards of £1,000,000 for the reconstruction of many of the devastated villages in the Department of the Aisne have been entrusted to Messrs. William Airey and Son (Limited), of Leeds. The possibility of employing British labour in France is being considered.

London War Memorials.

The 30 ft. base of the Royal Air Force memorial at the head of the Whitehall Stairs on the Victoria Embankment is nearly completed. The memorial has been designed by Sir Reginald Blomfield, R.A. Its base is of plain stone, and it is surmounted by a pedestal on which will rest a bronze eagle, the work of Mr. Reid Dick, A.R.A. The Royal Fusiliers' memorial, in Holborn, takes the form of a statue 8 ft. 6 in. in height, mounted on a pedestal of Portland stone The statue, which is by Mr. Albert Toft, represents a private of the Royal Fusiliers in full equipment, grasping in his right hand a rifle with fixed bayonet.

Eastbourne's £150,000 Scheme.

Between £150,000 and £200,000 is involved in new schemes to increase the attractions of Eastbourne. The Chamber of Commerce has sent a resolution to the Town Council asking for two big new schemes. One is the construction of a miniature yachting harbour, and the other the building of a large concrete bathing pool.

Concrete Buildings in Bombay.

In view of the proposal of the Bombay Development Department to construct a number of reinforced concrete tenements for the housing of industrial labour, it is understood that a committee of engineers representing local bodies and Government Departments will shortly be appointed to investigate the utility of reinforced concrete construction in Bombay City.

Improvement Scheme at Ramsgate.

Progress is being made with the scheme of expansion on the West Cliff at Ramsgate. A new boulevard road is to be started this month. The scheme also provides for a bathing pool, under-cliff walk, and a cliff promenade nearly to Pegwell Bay. The plans which won the third prize in the competition organized by the Corporation have been adopted for the actual lay-out.

Big City Fire.

Fire broke out in a six-floored building at 14 Chiswell Street, E.C., with an extensive front in Finsbury Street, occupied as offices and show-rooms by a number of firms. The outbreak occurred on the third floor. The lower floors of the building were affected by water. The two upper floors were extensively damaged, and the loss is estimated at several thousands of pounds.

The Birmingham War Memorial.

The clearing of the site for the Birmingham War Memorial is proceeding, and the foundation stone will be ready for laying soon after Christmas. The committee have provisionally approved of four groups of statuary representing the various arms of the service which took a prominent part in winning the Great War. They are the work of Mr. Albert Toft.

Building Trades Wages.

It is stated in the interim report of the National Federation of Building Trades Employers that wage reductions have been arranged by the National Wages and Conditions Council during the past twelve months equal to 29s. 4d. per week for craftsmen and 36s. 8d. per week for labourers, which represent a very substantial contribution by the industry towards getting back to normal post-war conditions. The effect is to stabilize conditions as to wages and hours until next spring.

Nottingham War Memorial.

The Nottingham City Council has decided in favour of the erection of an archway on the Victoria Embankment as the civic war memorial. The cost of the work is £17,400. The arch will form the entrance to the 36½ acres of ground which are to be laid out as a park and playing fields, and the levelling and making of these will cost a further £33,400. The land was given some time ago by Sir Jesse Boot. The scheme is designed by Mr. Wallis Gordon, the acting city architect.

British Industries Fair, Birmingham.

The British Industries Fair (Birmingham), which is to be held from February 19 to March 2, promises to be more imposing and attractive than any of its predecessors. Many old exhibitors have already arranged to take increased space, and steps are being taken to attract new ones. Arrangements are also well under way for inviting many thousands of the most important buyers of our own, foreign, and colonial countries. The Birmingham section of the Fair will run concurrently with the London section. The British Industries Fair (Birmingham) was first held in 1920, and has been held annually since. It is growing rapidly in importance and significance.

R.I.B.A. Archibald Dawnay Scholarships.

Owing to Mr. C. S. White, of the Architectural Association School of Architecture, being unable to take up his R.I.B.A. Archibald Dawnay Scholarship, a fresh Award has been made in favour of Mr. C. H. Hutton, of the Liverpool University School of Architecture. The Scholarship, which is £25 per year for two years in value, is intended to foster the study of advanced construction.

New Piccadilly Bank.

In connection with the erection of their new bank premises on the site of the old St. James's Vestry Hall in Piccadilly, the London Joint City and Midland Bank have engaged the services of Sir Edwin Lutyens. Sir Edwin has designed a Piccadilly frontage in harmony with the church, which will individualize the new building. At the same time, it has been pointed out to the Westminster City Council that in the new plans submitted in conformity with Sir Edwin's scheme the design is of a much less expensive character than the first, and it is doubtful whether it could be made to comply with the requirements of the lease as to expenditure unless the interior is fitted in very expensive manner. Subject, however, to the consent of the County Council to the amendments and to the observance of the undertaking to spend not less than £25,000 on building, the bank's new plans will be approved by the Westminster City Council.

Coming Events

Wednesday, October 18.

Glasgow Chapter of the Incorporation of Architects in Scotland.—"Architectural Alliances." By Mr. James Lochhead, F.R.I.B.A., President.

Thursday, October 19.

Institution of Mechanical Engineers.—Conversazione.

Friday, October 20.

Institution of Mechanical Engineers.—General meeting. Presidential Address by Dr. H. S. Hele-Shaw, F.R.S.

The Concrete Institute.—Council meeting 5 p.m. Extraordinary general meeting to confirm resolutions *re* change of title, etc. 6 p.m.

The Royal Technical College Architectural Craftsmen's Society, Glasgow.—"The Historical Development of Glasgow Cathedral." By Professor Charles Gourlay, B.Sc., F.R.I.B.A., F.S.A. (Scot.).

A. and S.A.P.U. Metropolitan Branch.—Smoking concert at Carr's Restaurant, 264 Strand, W.C. Admission free. 7 p.m.

Saturday, October 21.

A. and S.A.P.U. Metropolitan Branch.—Visit to Sir John Soane's Museum. Conducted by Mr. A. T. Bolton, F.R.I.B.A., F.S.A., Curator. Admission free. 2 p.m.

Tuesday, October 24.

Liverpool Architectural Society (Incorporated).—"The Liverpool Architectural Society (Incorporated): Its Origin and History, 1848–1901." By Mr. E. P. Hinde, F.R.I.B.A.

Thursday, October 26.

Institution of Mechanical Engineers. Midland Branch.—"Importance of Testing Materials for Manufacturing Purposes." By Mr. P. J. Worsley. North-Western Branch. Annual Dinner.

Saturday, October 28.

A. and S.A.P.U. Metropolitan Branch.—Visit to R.N. College and Greenwich Hospital. Mr. T. C. Agutter, F.R.I.B.A., architect to the College, will conduct the party.

The Grand Avenue, Stowe

As certain alarmist rumours seem to be current about the ultimate fate of the Grand Avenue at Stowe, Mr. Clough Williams-Ellis, the purchaser, would like it to be known that his sole object in securing this feature in one lot was to ensure its preservation in perpetuity, as being historically part of Stowe as well as one of the chief glories of Buckinghamshire. He felt that its destruction as an avenue or its exploitation as building land would be a calamity both for the school and the town of Buckingham too disastrous to be contemplated. As an architect practising in London with a property in North Wales he has no special connection with Buckinghamshire, and only desires that its amenities should be preserved. The conservation of natural beauties and historically of architecturally interesting buildings is one of his chief interests and a cause that he has furthered both by "direct action" and by his writings. As Mr. Williams-Ellis cannot hold this isolated piece of property indefinitely, he hopes that a local trust may be formed to take it over and conserve it intact for ever. To such a trust, we understand, he would be willing to hand over his bargain, and, if the Avenue (itself almost as much of a "National Monument" as Stowe Palace) can be thus secured against destruction Mr. Williams-Ellis will do his utmost to help the matter forward. Though the School Committee felt unable to purchase the Avenue themselves, it is understood that the suggested trust may count on their active co-operation and support. For the present the Town Clerk of Buckingham is acting as treasurer for the Avenue Trust Fund, and will gratefully acknowledge subscriptions. The Grand Avenue at Stowe, one of the (if not the) finest in England, runs in a straight line across undulating country, from the guardian lodges in Buckingham to the great Corinthian arch through which the central Portico of Stowe is seen across the park and lake.

List of Competitions Open

Date of Delivery.	COMPETITION.
Oct. 31	Essay Competition. "The True Function of the Technical Assistant in the Building Industry." Prize £5 5 0. Essays to the Secretary, Architects' & Surveyors' Assistants. Professional Union, 36 Victoria St., S.W. 1.
Nov. 1	Labour saving Bungalows. Prizes of £300, £125, and £75 are offered by "The Daily Mail." Apply to "Ideal Bungalow," "Daily Mail," 130 Fleet Street, London, E.C.4, by above date.
Nov. 1	New Building for the "Chicago Tribune." Prizes total 100,000 dollars. Applications had to be sent to "Chicago Tribune," 5 Rue Lamartine, Paris, by Aug. 1.
Jan. 15	Hospital for a typical small community in America. Competition open to all Architects. Premiums $500, $300, and $200. Apply The Modern Hospital Publishing Company, Inc., 22 E. Ontario Street, Chicago, Ill. Closing date for applications, November 15.
March 31	War Memorial for Port Said, Egypt, to the memory of the soldiers of the Australian and New Zealand Forces who fell in Egypt, Palestine, and Syria during 1916, 1917, and 1918. Premiums: 250 guineas, 100 guineas, and 50 guineas. Apply High Commissioner for Australia, Australia House, Strand, W.C.
No Date	Designs and Estimates for a Public Hall and Baths, etc., to be erected at Lytham. Premiums of 100, 50, and 25 guineas will be awarded under the advice of Mr. A. W. S. Cross, M.A., Vice-President of the R.I.B.A., as professional Assessor. Apply Mr. Chas. A. Myers, Clerk to the Council, Council Offices, Lytham. Deposit £1 1s.
No Date	Bournemouth. Plans for a pavilion to cost £100,000 at Pier Approach. Premiums £300, £200, and £100. Apply Municipal Offices, Bournemouth.
No Date	War Memorial at Birkenhead. Cost not to exceed £4,000. Premium 75 guineas. Assessor Major Gilbert Fraser, M.C., F.R.I.B.A. Apply Town Clerk, Birkenhead. The competition is open to all architects and sculptors of Birkenhead, Liverpool, and Chester only.

Old Cranleighan Society Cricket Pavilion Competition.

The R.I.B.A. request Members and Licentiates not to take part in the above competition because the conditions are not in accordance with the published regulations of the Royal Institute for Architectural Competitions. A similar request has also been issued by the Society of Architects.

Some Points in the Law of Heating Engineers' Contracts

MR. ROBERT FORTUNE, Barrister-at-Law, in reading a paper "On Some Points in the Law of Heating Engineers' Contracts" before the Institution of Heating and Ventilating Engineers, discussed the position of a heating engineer employed by the building owner or his architect in the character of a consulting engineer to supervise the installation of suitable heating apparatus as part of a general building on a given site. He said that unless the contract of employment was one which the parties contemplate as being about to last for more than a year, so as to fall within Section 4 of the Statute of Frauds, no written retainer was necessary, but such contracts, when made with corporations or public bodies, must be in the form required by law for such contracts. Proceeding, he said: Thus Section 174 (i) of the Public Health Act, 1875, requires that every contract made by an urban authority whereof the value or amount exceeds £50 shall be in writing and sealed with the common seal of such authority. In Hunt *v.* Wimbledon Local Board, 4 C.P.D. 48, an urban authority orally directed their surveyor to employ an architect to prepare plans for offices. The plans were prepared and approved but no building was erected thereunder because the plans were of too expensive a nature; so, although the plans were partly used, the Court held that the corporation could not be said to have received the benefit of them, and it was held that the architect could not recover any remuneration.

Now the authority of such a consulting engineer must depend upon the terms of his appointment. He may be employed to consult with and advise his employer to prepare drawings and obtain tenders and to superintend the carrying out of the scheme approved by the employer or his architect.

Generally an engineer has no implied authority to enter into a formal contract so as to bind the employer, although the tender may be for a sum not exceeding that which the employer is willing to expend, since the preparation of a formal contract is a matter for a lawyer. Thus in Hamer *v.* Sharp, L.R. 19 Eq. 108, a written request was made by an owner of freehold property to an estate agent to obtain a purchaser for it, and it was held that the estate agent had no authority to enter into an open contract for sale. On the other hand, the contract between the building owner and the contractor may provide that the building owner shall have the right to nominate or select certain specialists to execute special works or supply special materials, for which provisional sums or prime cost items are received in the contractor's contract sum, and to employ the specialist independently of the contractor; and it often happens that the building owner or his architect negotiates with such specialist the details of such special work before the order for it is placed; and this has given rise to very difficult questions as to whether the principal placing the order was, in fact, the contractor or the building owner, and whether the architect had any authority in negotiating a contract with the specialist to bind the building owner, or the contractor, in accepting the specialist's price, any authority to contract with the specialist as the agent of the building owner.

In Leslie & Co., Ltd. *v.* The Managers of the Metropolitan Asylums District, 68 J.P. 86, by a contract between the contractors and the building owners, it was provided that "the managers (the building owners) *reserve to themselves the right to employ other parties to execute the works for which provisions are made, and to deduct the full provided amount* (*i.e., the prime cost plus* 10 *per cent.*) *thereon from the contract sum.* In such cases the contractors are to allow such parties every facility for the execution of their several works simultaneously with their own. The managers are to be at liberty to omit any provisional sums or quantities. The contractors are to pay the sub-contractors the amount provided in the contract for such purpose, or less or more, as may be certified, and the payments thus made will be considered as work done by the contractors, and will be included in the certificate to the contractors next following such payment. No payment is to be made to such sub-contractors, except upon the architect's certificate. The contractors are to pay such amount as may be certified from time to time within seven days from the date of the certificate, and should the contractors neglect or refuse to make such payment within the said period, the managers shall be at liberty to pay the amount thereof to such sub-contractors, and to deduct from the contract sum the gross amount which the contractors have included in their estimate in respect of such work and their profit thereon, the amount so to be deducted not being less in any case than such amount so certified." Chimney-stacks and heating apparatus were to be provided by specialists. Specialists were appointed to execute this work by the architect, to give the orders, and did so, and the work was executed. On a claim by the building owners against the contractors for damages for delay caused by these specialists it was held that the specialists were employed by the building owners, and that the architect's negotiations with the specialists were on behalf of the building owners and not of the contractors.

In Hobbs *v.* Turner, 18 "Times" Law Reports 235, a building contract provided that the work should be done for a lump sum, and that certain provisional sums for work to be done by specialists should "*be paid and expended at such times and in such amounts and to and in favour of such persons as the architect shall direct,* and sums so expended shall be payable to the contractor without discount or deduction by the employer to the said artists or tradesmen." The architect selected H. to supply certain of this special work, and this work was sent and invoiced and debited to the contractor. The architect certified for the amount to which H. was entitled, and sent the certificate direct to the building owner. H. sued T., the building owner, on the certificate, and it was held that the building owner selected the specialist and might pay him any sum he pleased, and, on the construction of the contract, the contractor was only the agent of the building owner in ordering such work, and as there was nothing in the sub-contract restricting H.'s rights to having recourse to the contractor, the building owner was liable.

But in Hampton *v.* Glamorgan County Council, 1917 A.C. 13, the facts were as follows: A builder contracted with a county council to build a school in accordance with the specifications and directions of the council's architect for a lump sum of £13,600, the specification containing certain provisional items, including the following: "Provide the sum of £450 for a low-pressure heating apparatus," and a hot-water engineer submitted a scheme to the architect for the heating of the school for £391, and by the direction of the architect this scheme was accepted by the contractor. During the progress of the work the builder paid to the engineer £200 on account, but he was unable to pay the balance.

In an action by the engineer against the council as building owners for the payment of the balance of his account, the House of Lords, affirming the Court of Appeal which reversed Horridge, J., who had followed the case of Crittall *v.* London County Council, 75 J.P. 203, held upon the construction of the building contract that the builder was to erect the school for a lump sum, including, if required, the heating apparatus up to a cost of £450, and that the builder, in employing a specialist to put up the heating apparatus, was acting as a principal and not as the agent of the building owners, and that the action accordingly failed.

In this case Lord Shaw of Dunfermline said this, at page 23: "Coming, therefore, to the specific contract before us, I am free to admit that the argument presented to us was, up to a certain point, right. I refer to the earlier portion of the correspondence by the architects. I am willing to assume for the purpose of the argument presented that the architect in such circumstances is acting as agent for the building owner. My Lords, as is fairly well known, the position of the architect is this, that he is charged with the duty of articulately settling what are to be the items supplied under these 'specialist' contracts, and making certain selections, and even, in certain contracts, of nominating certain merchants. In the present case, however, the facts do not stop with that initial correspondence. When the stage of actual contract was being reached the architect was approached on the subject by Messrs. Hampton, and he then made his position perfectly clear. It was this: 'You must deal with the contractor.' Accordingly, Messrs. Hampton did deal with him, and they obtained, not in express terms, but by what in admission is by its implications equivalent thereto, the acceptance by Mr. Shail, the builder, of their (Messrs. Hampton's) contract."

In every case of contract it is necessary to keep firmly in mind with whom the contract is, and to be able to point to the evidence which establishes privity of contract, that is to say, a contractual relationship between the two contracting parties, the essence of a contract being that it is a relationship established by an offer by one party and the acceptance of that offer by the other party constituting an agreement upon certain terms.

As was said by Lord Esher, M.R., in Le Lievre *v.* Gould (1893), 1 Q.B. 491: "The question of liability for negligence cannot arise at all until it is established that the man who has been negligent owed some duty to the person who seeks to make him liable for his negligence. What duty is there when there is no relation between the parties by contract? A man is entitled to be as negligent as he pleases towards the whole world if he owes no duty to them."

On the other hand, a contracting party may, by contract, protect himself from almost every liability short of fraud. Thus a shipowner may, by an exception covering himself from liability for losses to consigners or consignees by "any act, neglect, or default whatsoever" of servants, protect himself from liability for losses even by the felonious acts of his own servants. Marriot *v.* Yeoward (1909), 2 K.B. 987.

The case of Hampton *v.* Glamorgan County Council to which I have referred shows the great hardship which may be cast upon a specialist who has entered into a contract with an insolvent contractor where the building owner does not desire to assist the specialist to obtain payment, although the whole of the specialist's work may have been satisfactorily performed, and emphasizes the importance of the specialist having a contract which cannot be disputed as having been made with the building owner either by the owner himself or by his architect or consulting engineer under an express authority given for that purpose.

R.A. Exhibition of Decorative Art.

The President and Council of the Royal Academy are making arrangements for the Decorative Art Exhibition to be held in January and February 1923. The exhibition is primarily intended to illustrate and promote the application of the arts, in their several forms, to the permanent decoration of buildings. It is thought that the time has arrived for a public review of the possibilities in this field of art.

The exhibition will include architectural decorations in painting, mosaic, tapestry, sculpture, carving, or metalwork; designs, cartoons, or models for such decorations, and designs for stained glass; and there will also be an arts and crafts section, which is being arranged in collaboration with the Arts and Crafts Exhibition Society, and will be limited to exhibits by members of that Society and others invited to submit works.

Works will be received at the Royal Academy on December 15, 16, and 18. Any application for forms and labels, and other information, should be made during November to the Secretary, Royal Academy, Piccadilly, W.1.

Heating and Ventilation of Cinemas

Mr. J. Stanley Beard, M.S.A., a prominent architect specializing in the construction of cinemas, has made some important experiments with regard to the heating and ventilation of these buildings. He has over twenty-seven fine picture halls to his credit. Describing his experiments in the "Cinema" he says: There are two separate and distinct systems of ventilation and heating employed with varying results to-day, one being known as the Plenum system, which consists of forcing warm fresh air into the building under pressure, and the other a vacuum system, which consists of extracting the foul air from the building by means of powerful extractor fans, and allowing fresh air to find its way into the building through special inlets, usually placed behind the radiators, to warm the incoming air.

Both of these systems have disadvantages. In the case of the Plenum system, a large hall cannot be adequately and quickly heated, as the inlets being placed in the side walls are thus 70 or 80 ft. apart, with the result that the centre of the hall is of a very much lower temperature than that of the sides.

The objection to the vacuum scheme is that in foggy weather fog is drawn into the building, thus spoiling the picture, and on a hot summer's day the building cannot be kept cool. Further, the air in the building being subjected to continual extraction, much inconvenience is caused by draughts when the entrance or exit doors are opened. During the past two years I have been experimenting with a system combining the good points of both the above schemes with gratifying results, and by this means I have found it is possible to overcome the disadvantages of both by employing only the good qualities of each.

Under this system fresh air is brought in to a properly constructed chamber, from a point well above the street level, to ensure obtaining fresh air free from dust and impurities. The air is washed, oxygenated, and heated in turn in winter and then forced into the building through specially constructed ducts and inlets. In summer the air is washed, oxygenated, and chilled. Powerful vacuum fans, to control outlets, are placed in the ceiling. Large fans, made to run in harmony with the latter, are responsible for forcing the air into the building in such a manner that the extraction is slightly less than the propulsion. By this means the air in the theatre is under a slight pressure all the time, and no draughts result from the opening of doors or windows.

To overcome the difficulty of heating the building quickly, especially the centre of the hall, a separate duct is run under the floor of the theatre, controlled by a damper. This duct is of a large capacity, and is employed to force heated air into the centre of the building before the public are admitted, and the damper is closed entirely before the patrons take their seats.

It would appear from current events that the policy of running continuous programmes is in the near future likely to be changed, and in the case of a house running, say, three distinct shows a day, my system can be employed to added advantage, as by employing the central sub-floor duct, the air in the theatre can be speedily and rapidly changed, and the theatre re-warmed with fresh air within a period of fifteen minutes.

This system represents not mere theory, but the result of practical experience, and from the tests already carried out at the New Prince of Wales Picture Playhouse, Lewisham, I am more than gratified with the result.

The Development of Building Estates

The first of a series of special lectures on building problems and materials has been delivered at the School of Architecture, Surveying, and Building, of the Northern Polytechnic Institute, by Mr. B. W. Adkin, F.S.I., vice-principal of the College of Estate Management, who took for his subject "The Development of Building Estates." The chair was taken by Mr. R. L. Roberts, M.A., member of the governing body of the Institute, who was supported by Messrs. Richard Parry, D.Sc., F.S.I., principal of the College of Estate Management, and Reginald S. Clay, B.A. (Cantab.), D.Sc., principal of the Northern Polytechnic Institute.

Mr. Adkin dealt with the subject under two headings: (1) What is a Building Estate and (2) how is a Building Estate developed? After dealing with the increase in the population, and the historic growth of the Administrative County of London, Liverpool, and Birmingham, the passing of the Public Health Acts, Metropolis Management Act, Local Government Acts, Housing of the Working Classes Act, and the Housing and Town Planning Act, the lecturer touched upon the various periods of activity and depression in residential building, and passed on to the main theme of estate development from the standpoint of a speculating builder having very moderate means, but more than a small amount of ambition.

Mr. Adkin traced step by step the progress of the negotiations and operations from the acquiring of the site, the building of the houses, the advances from the freeholder, and the creation of ground-rents to the ultimate satisfactory issue which showed both the land-owner and the builder to have obtained a comfortable profit from the building operations. Plans showing the development of two estates were exhibited, and an explanation of the guiding lines given.

The chairman, in moving a vote of thanks to the lecturer, spoke from the stand point of a building contractor, and Dr. Clay seconded the proposal.

Mr. J. H. Axten also spoke and called attention to the importance of employing competent architects in the preparation of designs for the buildings in order to prevent the monotonous repetition of houses built to the same design. He deprecated the practice of speculating builders obtaining a plan from unqualified persons engaged at a slender fee, and using it "ad nauseam." He also quoted instances of the exorbitant charges made by land-owners under the old methods of development, and instanced the gain in every direction from a modern scheme of town planning.

The next paper will be read at 7.0 p.m., on October 26, by Mr. H. R. Cox, of the Associated Portland Cement Manufacturers, on "The Manufacture of Portland Cement."

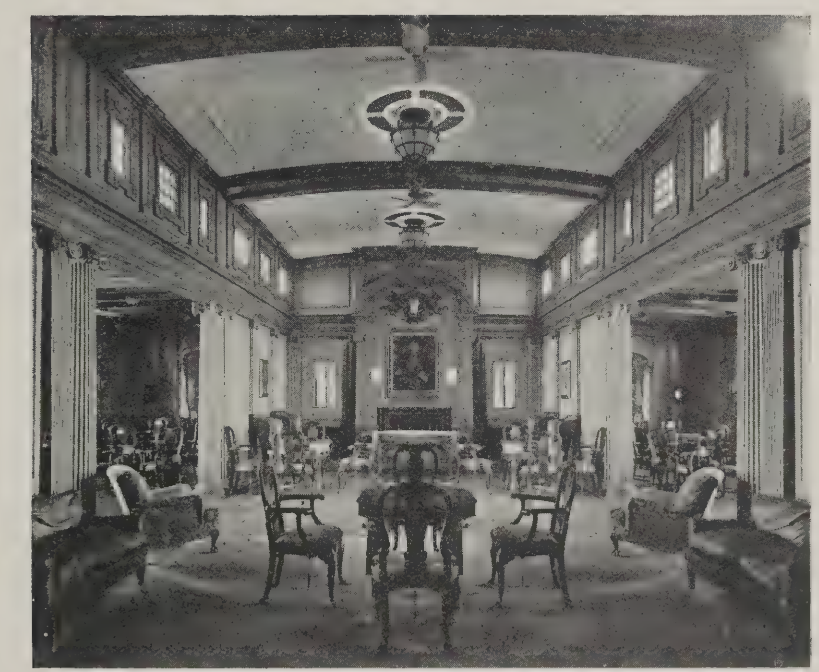
THE ARCHITECTS' JOURNAL
& Architectural Engineer

With which is incorporated "The Builders' Journal."



Canadian Pacific Steamships, Ltd.

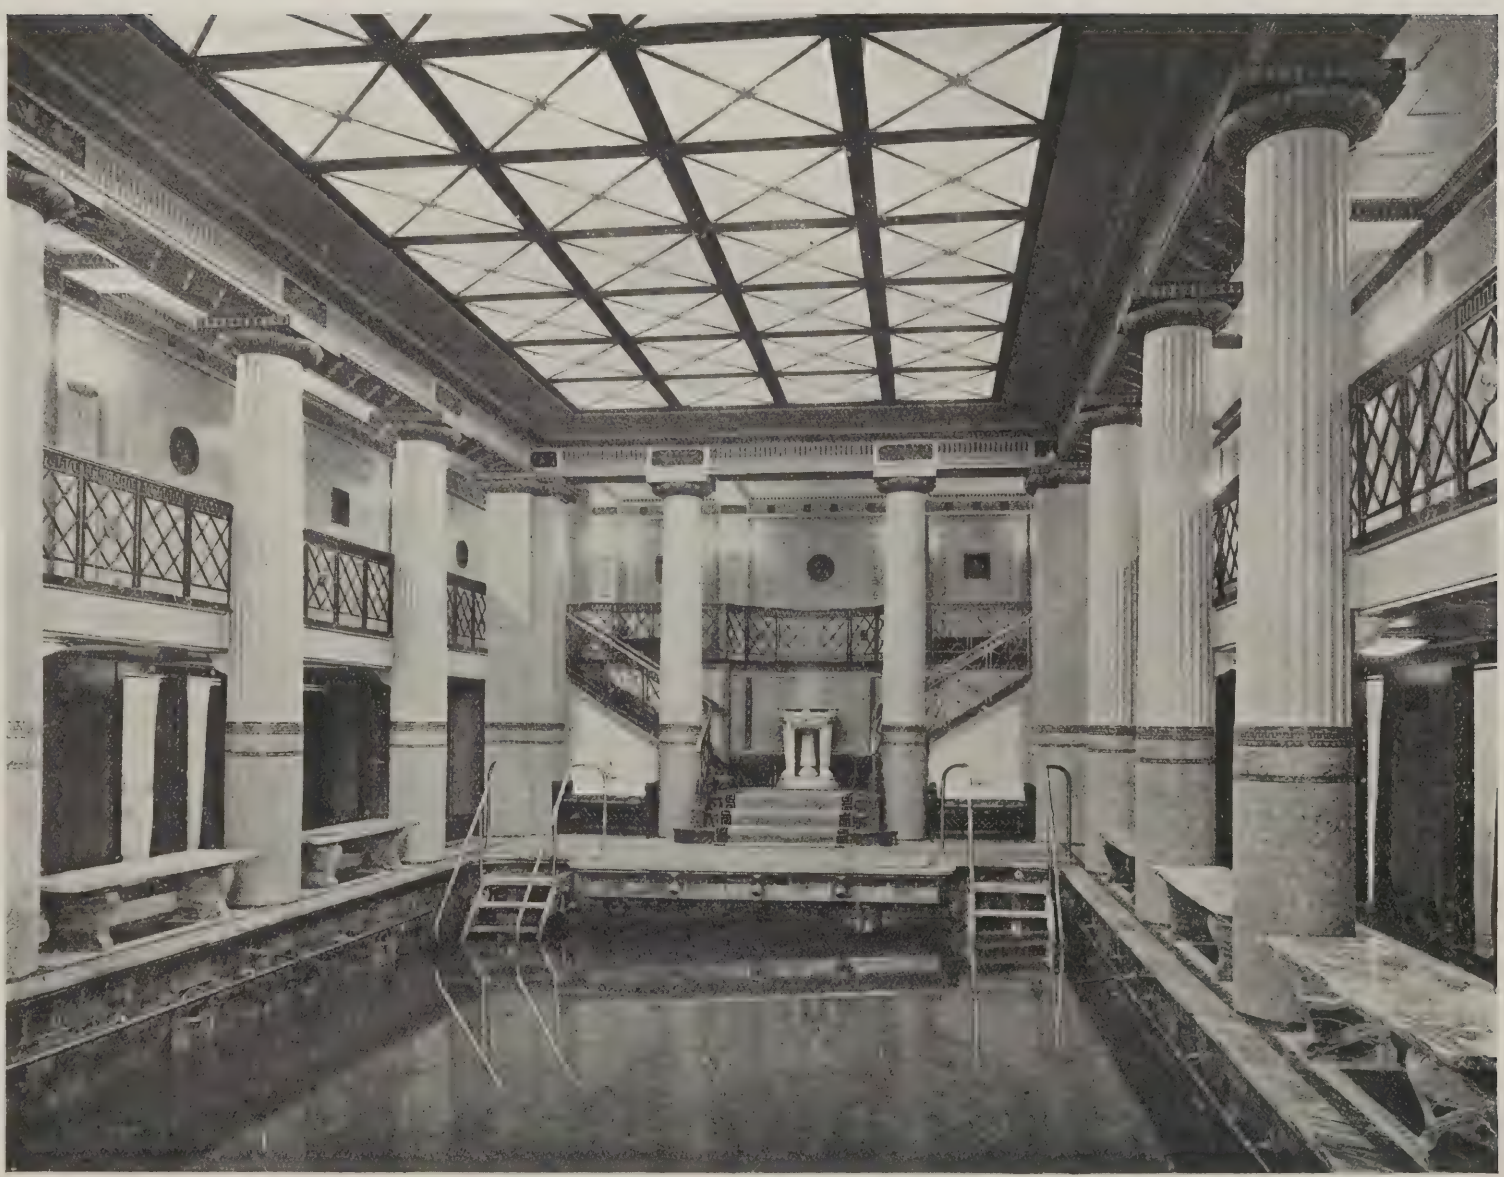
THE "EMPRESS OF CANADA": FIRST-CLASS SMOKING-ROOM.

GEORGE A. CRAWLEY AND PARTNERS, ARCHITECTS.

(See page 583.)

27-29 Tothill Street, Westminster, S.W.1.

The Swimming Bath of the "Majestic."



White Star Line.

The "Majestic" (of 56,000 tons, and the largest liner in the world) includes in its accommodation a fine swimming bath designed in the Pompeian style. Situated on the bottom deck, immediately above the boilers, and midway between the two foremost funnels, the basin of the bath has an area of 820 square feet, and a depth of 9 feet at its deepest part. There are thirty dressing-rooms for bathers. Steam and electric baths are also provided. (See also pages 562—565.)

The Architecture of the Ship

"IT was not possible to starch the sea," wrote Ruskin, "and precisely as the stiffness fastened upon men, it vanished from ships. What had once been a mere raft, with rows of formal benches pushed along by laborious flaps of oars, and with infinite fluttering of flags and swelling of poops above, gradually began to lean more heavily into the deep water, to sustain a gloomy weight of guns, to draw back its spider-like feebleness of limb and open its bosom to the wind, and finally darkened down from all its painted vanities into the long, low hull familiar with the overflying foam; that has no other pride but its daily duty and victory. Through all these changes it gained continually in grace, strength, audacity, and beauty, until at last it has reached such a pitch of all these that there is not, except the very loveliest creatures of the living world, anything in Nature so absolutely notable, bewitching and, according to its measure, heart-occupying as a well-handled ship under sail on a stormy day. Any ship, from lowest to proudest, has due place in that architecture of the sea; beautiful not so much in this or that piece of it, as in the unity of all, from cottage to cathedral, into their great buoyant dynasty."

So Ruskin wrote in the "Harbours of England" nearly forty years ago. But steel and steam have revolutionized the building of ships, and "the great wall-sided liner" has a different beauty, though still a beauty all its own.

It is in the interior that the greatest changes have occurred. The smoky cabins with their swinging lamps, in which one could never forget, even in dead calm, that one was at sea, have been succeeded by the Corinthian-columned, white-marbled, soft-carpeted and rubber-floored saloons of the ocean greyhounds of to-day. The savour of the sea does not penetrate; the ship's bell is not heard. Wherefore most passengers sail unmindful of the perils of the deep that encompass them, and only the sudden stopping of the engines can give them any alarm. As a contributor points out in an article in this issue, on "The Ocean Liner," it is a very human weakness for some to want to imagine themselves on terra-firma, to escape from all thought of the ship —"and the steamship companies and their architects have to take cognizance of this." By the use of familiar and traditional forms such as column, architrave, and entablature, a feeling of land security is created which gives the unwilling seafarer the atmosphere, if not of his home, then of his hotel. Apparently it matters not if, in a heavy sea, the orders of architecture roll from side to side like a temple on rockers, or if the fireplace at one moment yawn beneath and at the next arch above one's head. Perhaps in a few years our great ships will float as smoothly as though on rails, when these phenomena will not occur.

But it has become a very nice question as to the propriety of decorating a sea-going ship into the semblance of a grand hotel; as to the following of tradition, or the allowing of some architecture of the sea to develop naturally along its own lines. "We have had the 'gin-palace' design, and we have had the 'period' design; shall we not by intimate realization of what a ship is, in the future be able to arrive at the 'ship' design?" Modern construction is, unfortunately, upsetting all the accepted art forms, from the ribbed back of the early folios to the half-timbered walling of a Tudor house. If, nowadays, we wish to have these before us, they are empty shams, existing not from sheer necessity, but from the doubtful desire of ornamentation alone. And a modern liner being what it is, a thing of steel plates and girders and rivets, it would seem to be no worse to clothe it with plaster and paint in one of the orthodox land styles, than to affect some sentimental sea-style reminiscent of Trafalgar and the "wooden walls."
